All well ventilated mines must contain overcasts, and the costs of these structures soon run into considerable amounts, if they are not carefully planned and constructed. There are few mine foremen or even superintendents who take the trouble to ascertain accurately just what it costs to erect an overcast so that he can tell you how much was spent per cubic yard for concrete or what the walls and roof cost separately.

Fig. 1 shows the type of overcast now being constructed in the mines of The Consolidation Coal Co. in the Fairmont Region. Blank spaces are left in the blueprints, and dimensions to suit the location are supplied. Since the sheets of "Self-sentering" are sold in even foot lengths, the distances between walls are made to correspond. Thus for an 11-ft. sheet 2 in. are deducted for the 12-in. rise and two or more inches on each side for bearing spaces, leaving the distance between walls 10 ft. 6 in.

This style of overcast makes use of the terra-cotta blocks, the 5x8x12-in. block being laid to give 8-in. walls. On top of each wall is placed a layer of concrete on which is set a small steel rail 2 in. from the edge of the wall. Then the reinforcing sheets of "Self-sentering," which come already shaped, are placed abutting on the flanges of the rails and the center line or middle of the reinforcement supported by a 3x5-in. wood stringer; then the concrete is spread on the top as required on the plan. After the concrete sets, the wood stringer is knocked down and a coat of cement mortar plastered underneath. Not a single wood form is required on the whole structure, except around the iron rails on top of the walls, and even this can be eliminated by standing a row of the terra-cotta blocks on the 5-in. side just outside of the rails, thus making them serve as forms.

There are times when it is necessary to deviate from the arched-roof type on account of the skew of the air bridge, in which case it is more economical to use the flat roof. Fig. 2 presents a design of this kind where the roof is supported by three or four old boiler tubes, the reinforcement being suspended from these tubes or pipes by means of wire of sufficient strength to carry the weight. This type of overcast also needs only temporary supports along the middle while the concrete is being placed, thus saving considerable labor and material in the construction and emplacement of forms.

The New Coal Crusher That Must Soon Be Installed over the Land

A German Coal-Screening Plant

Special Corespondence

SYNOPSIS—A typical German installation, preparing many different sizes of coal for market and for coking.

The universal attention which is being given to the development of up-to-date coal-handling equipment and practice is as pronounced in Germany as elsewhere. The accompanying illustration shows a coal screening and washing plant installed at Shaft No. V, of the Rheinpreussen coal mine.

At this plant, the loaded pit cars arriving at the height of 9 m. (approximately 10 ft.) above the first pit-bank level, are sent direct to the screening plant. Brakes on cars taken from the second and third pit-bank levels, permit of their being lowered to the first level. The track from this point has a gradient of 2 per cent., allowing the cars to run by gravity to the dumps, which are mechanically operated and which discharge the coal onto the shaking screens.

The screens are double decked, the upper openings being 85 mm. (approximately 3¼ in.), while the lower deck has small perforations. The screens are provided with veil plates. By this arrangement the coal below 3¼ in. is discharged into a storage hopper, while the larger coal goes onto picking tables and loading booms. If the veil plates are closed no separation is made, and the entire run of mine is loaded directly into railway cars.

Two additional shaking screens are provided, being furnished with rectangular holes of adjustable size, varying from 40 mm. to 80 mm. (from approximately 1½ in. to 3 in.). These produce what is called best mixed coal, which is loaded into railway cars by means of loading booms, which are raised and lowered by power.

In order to be able to weigh the loaded railway cars immediately, scales are built into the tracks and are operated from the picking-table platform. The refuse which is removed from the coal on the picking belt is thrown into trucks, which are hoisted to the pit-bank level, from whence they are run to a dump or otherwise disposed of in stowing processes.

Each screening system is driven by a shaft and belts from an electric motor, which is installed in an inclosure. The empty cars after dumping return to the shaft by gravity, and are there lifted to the pit-bank level by means of creepers or car hauls.

General View of Tipple, Washery and Coke Ovens

A coal-washing plant of two units is directly attached to the screening plant, and has a capacity of approximately 200 tons per hour. The dust coal, or that under 5 mm. ($\frac{3}{16}$ in.) is screened dry and mixed with the washed fines. Four varieties of nut and coke coal are produced, the shale being rewashed. The nut coal stored in bunkers under the pit-bank floor is delivered to the dust screens in the washery by two bucket elevators, the feed for which is mechanically controlled. After the removal of particles under 5 mm. in diameter, which is stored

in a steel tank underneath the screen, the coarser material flows in a launder to a main washery, where it is cleaned.

Provision is made by reversing shutters in the nut launder to flush the washed nuts to the bell mills, above the dredger sump, into which they fall after reduction, and are treated like fines.

In order to be able to mix foreign fines with those here produced, a bucket elevator is installed, which conveys this material arriving in railway cars, which are dumped into a storage pit, onto the distributing tray above the tower.

Above the coking-coal storage tower, which has a capacity of about 4000 tons, four distributing trays are installed, with four scrapers each. The fines arriving here on the draining belt are discharged onto these trays by two parallel screw conveyors, one for each system. By reversing the direction of rotation of these conveyors, provision is made to fill the whole tower from the belt conveyors of one system if the other is not in operation. In the bottom of the storage tower 96 discharge gates are fitted. These deliver the drained fines into larries, which carry them direct to the coke ovens.

The shale from the washers is discharged into conveyors, from whence it is delivered into bucket elevators. These discharge onto belt conveyors, where draining is accomplished. The refuse material is then delivered to shale crushers. Provision is also made for washing this material over again after being crushed.

The coal separated from the shale in the washing process flows to the dredger sump, while the shale is delivered to a tower by a bucket elevator. From this tower it is discharged into trucks, by which it is conveyed to the dump, or transported elsewhere for stowing purposes.

Shale, rock, etc., arriving on pit-bank level are dumped and uniformly fed to jaw crushers erected on the level of the picking belts. These crushers reduce it to the desired size, and discharge into a steel storage box underneath. From here the crushed material can be delivered into railway cars or into the shaft for stowing purposes. The former arrangement is at present in use; the latter may be supplied later on.

The water from the preliminary draining screens and belts flows into clarifying spitzkasten, where the sludge gradually settles. This is discharged from time to time through launders into the sludge sump, from whence it is delivered onto the preliminary draining screen by a centrifugal pump.

The washed nut coal is conveyed by water to the nut screen where it is classified into five sizes—four nut sizes and one fines. The four nut sizes are carefully transported by spiral conveyors into their corresponding storage bunkers, from whence they are delivered to a fixed spraying screen, and after being rinsed with fresh water are directed onto the nut-loading belt, thence by adjustable loading booms into the railway trucks. The raising and lowering of these booms is effected by power, the dead weight being counterbalanced.

If the washer is not in operation, the nut coal is delivered directly into the nut bunker by reversing the shutters of the feeding bucket elevators. It is then loaded into railway cars by adjustable chutes. The fines are carried by the wash-water from the nut-classifying screens into dredger sumps, from whence they are delivered into the two fines washers by two bucket elevators. After being rewashed they are conveyed by launders into preliminary draining screens above the draining belts, and thereafter onto the draining-belt conveyors, which move slowly, thus giving ample time for the water to be removed.

The Passing of the Mine Mule

Quite some time after the close of the Civil War and old negress, seeing for the first time a motor-driven street car, exclaimed: "Fore Gawd, dem Yankees ain't satisfied wid 'mancipating de niggers, dey dun freed de mules."

Yankee ingenuity today is taking another great stride in the emancipation of these humble but faithful servitors. The mine mule is giving place before the encroachments of mechanical equipment, and the prediction is made that a few years will suffice to complete its displacement in all of the larger workings.

The mule-drawn car is a relic of the past that has come down to the present. A time-honored institution, but a detriment to efficiency in modern coal-mining methods. The mule, also, has been one factor in the haulage problem constituting a considerable item of expense. Its elimination was foreordained.

Recently, the Long Branch Coal Co., of Long Branch, W. Va., made public certain comparative data regarding the relative costs per month of mule haulage and gasoline haulage, which may be summarized as follows:

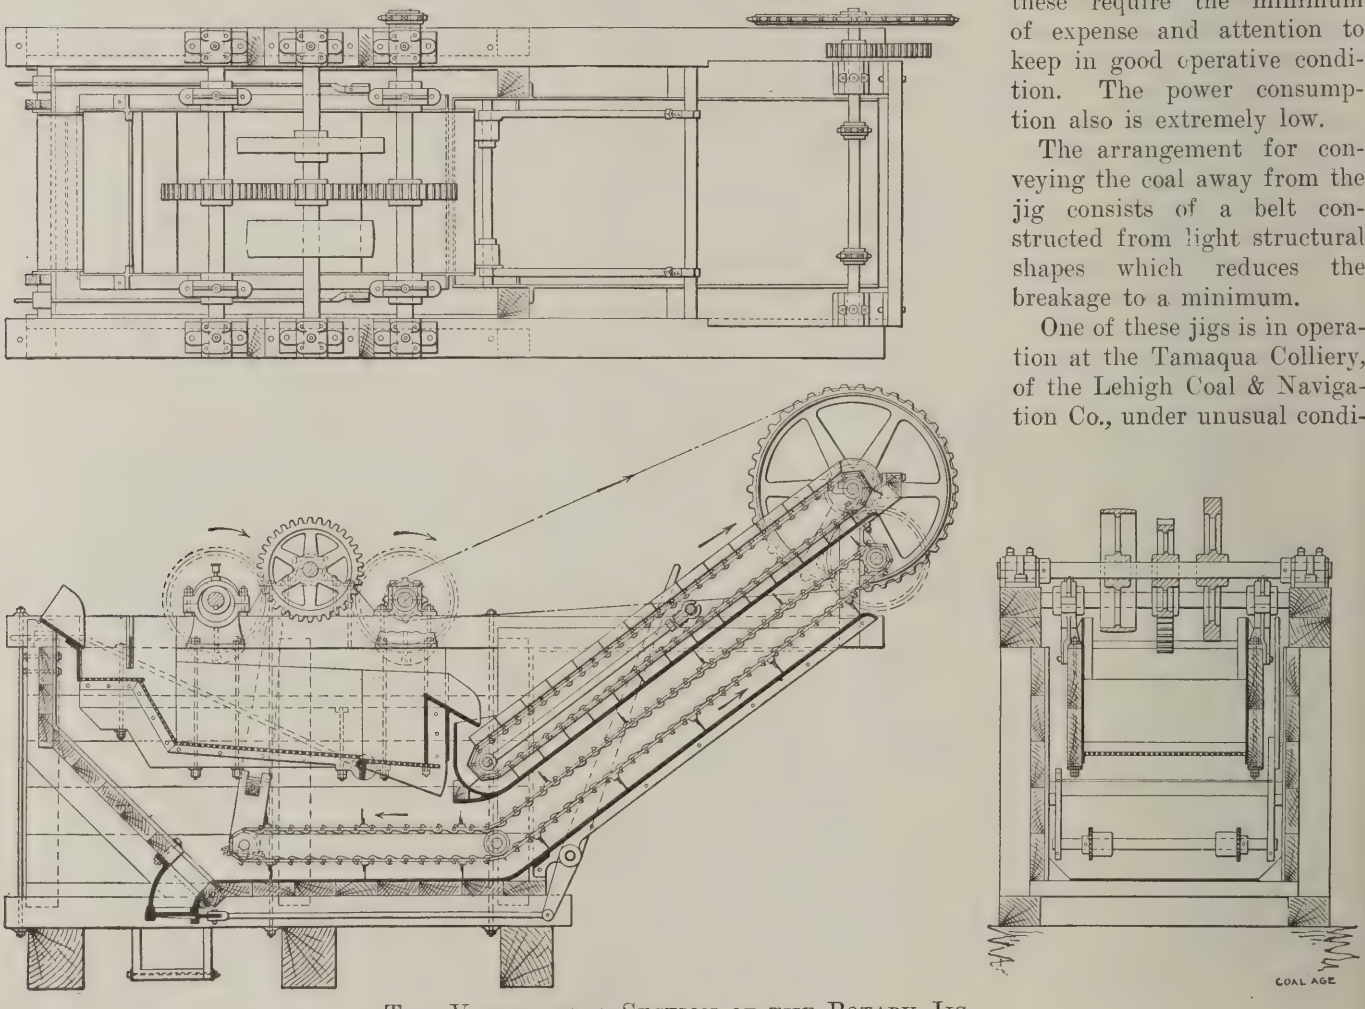
Total cost mule haulage, $810 per month.
Total cost gasoline haulage, $529.63 per month.
Decrease in haulage cost, $280.37 per month.
Total coal tonnage by gasoline locomotive, 11,601 tons.
Total coal tonnage by mules, 7848 tons.
Increase in coal tonnage output, 3753 tons.
Operating cost per day, gasoline haulage, $21.19.
Operating cost per ton gasoline haulage, $0.046.
Operating cost per ton-mile gasoline haulage, $0.0304.
Reduction in haulage cost per ton, $0.058.
Reduction in haulage cost per ton-mile, $0.0696.

In short, the comparison shows an increase in mine tonnage, and a decrease in haulage cost.

The gasoline locomotive used in the preceding test was manufactured by the Milwaukee Locomotive Mfg. Co. It is an effective combination of automobile propulsion and locomotive construction. It is a vertical-type engine with vertical cylinders. The important parts are six or eight times as large as those used on the ordinary automobile. The bearings are larger and the whole idea of construction is that the machine shall be fit for heavy work. There is a three-dog arrangement on the flywheel, which prevents the chance of back-firing when the engine starts. The governor is worked with a worm gearing which prevents the locomotive from racing and also cuts down the consumption of gasoline. It has lever control throughout and dry-plate transmission.

The Long Branch Co. found their locomotives capable of hauling eight loaded mine cars at a trip, over a 3000-ft. haul, with an average grade against the load of 3 per cent.

Assuredly, the course of the mine mule is almost run.



Some authorities doubt the efficiency of stone dust to prevent explosions, especially if firedamp is present in greater or less quantities. The Altofts collieries of England have abandoned the stone dust zones and substituted a general scattering of the stone dust wherever coal dust is found. Experiments made at Liévin, France, have shown that this method is useless as far as stopping a powerful explosive wave that has gotten a good start.

A New Rotary Coal-Washing Jig

By E. A. James*

A new departure in coal- and ore-jig design is shown in the accompanying drawing of the "Rotary Jig," manufactured by the Mauch Chunk Iron Works, Mauch Chunk, Penn., under the Rotary Separator & Engineering Co. patents.

Since the water tank of this machine is suspended from eccentrics, this jig gives a rotary impetus to the material to be separated, thus overcoming the sluggish travel produced by the jigs having only straight vertical acceleration, thereby, approximately doubling the capacity.

Two Views and a Section of the Rotary Jig

Anyone familiar with jigs and jigging realizes that the capacity of a machine of this kind is not governed by the time taken to make the separation, but rather by that consumed in freeing the apparatus of both the coal and slate after the separation has been accomplished, preventing meanwhile the remixing of the coal with the impurities.

The rotary motion gives a forward and upward acceleration to the material and during the recovery, when the laws of freely falling bodies in a liquid medium have full controll, the coal and impurities settle to their distinct and separate positions. Thus, the rate of travel and efficiency of separation are greatly increased. By means of the variable directions of the lines of force, pieces of flat material cannot keep their greatest resistance area opposed to the action of the jig; consequently their separation is accomplished as readily as cubical or fractured material.

This machine is equipped with an automatic slate discharge, which works with the highest efficiency due to the rotary motion. Another advantageous feature is the self-flushing design, in as much as the tank requires no flushing, whatever, as all waste material no matter how small, is removed with the slate and other impurities. It is claimed that this feature gives the "Rotary" the distinction of consuming less water than any other type of jig.

The general design is compact and simple, occupying little floor space. There are but few wearing parts, and these require the minimum of expense and attention to keep in good operative condition. The power consumption also is extremely low.

The arrangement for conveying the coal away from the jig consists of a belt constructed from light structural shapes which reduces the breakage to a minimum.

One of these jigs is in operation at the Tamaqua Colliery, of the Lehigh Coal & Navigation Co., under unusual conditions. It is taking all material that passes through a 2⅝-in. mesh and over a ½-in. mesh from the slate ends of 17 Lehigh Valley jigs and washing all sizes simultaneously.

The material fed to this jig contains from 90 to 95 per cent. of rock and slate, which taken in connection with the wide range of sizes makes the test a severe one. The percentage of coal in the slate discharge from the "Rotary" jig, based on the average obtained from daily tests, is about one-half of one per cent. The coal from this machine is conveyed back to the breaker and rejigged.

While the above instance is cited to show the efficiency of this machine, its use is not limited to separating the slate tailings from other jigs as it is designed for general work.

*Mauch Chunk, Penn.

Coal-Washing Efficiency Calculations

By G. R. Delamater

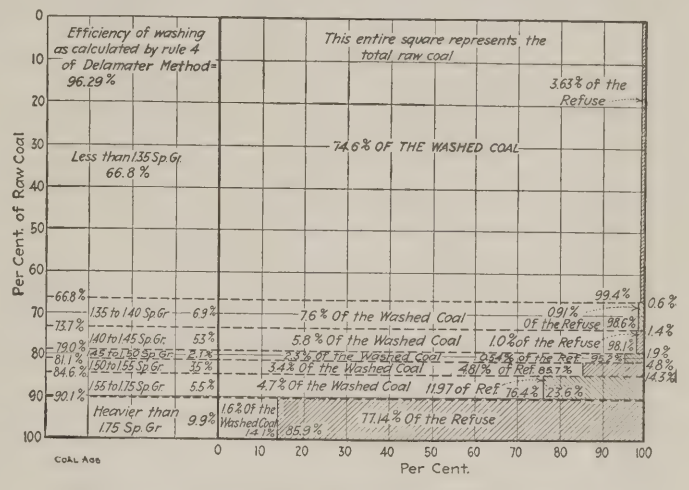
SYNOPSIS—There are several kinds of jig efficiency. One depends on the ash removed, another on the coal saved and a third on the power used or wasted in washing. The last efficiency is relatively unimportant. The washery expert should endeavor to obtain not pure coal but a fuel of such purity as will secure the most profit on the market. Learning how much of such fuel there is in the coal as he receives it, it is his duty to obtain as much of it as possible, eliminating as far as he can all parts of the coal which would give an inferior ash analysis.

In the issue of *Mines and Minerals,* of March, 1912, I presented a paper under the title of "Standardization in Coal Washing." Little discussion followed, as a result, in the columns of the engineering journals, but the subject has been taken up with me in a personal way many times, some approving of my method of calculating coal-washing efficiencies and others pointing out possible faults but none offering a solution of the problem.

I have applied that method of calculating the efficiency of washing to a great many tests which I have made in different parts of the country and have found it impossible to apply it in some washeries and in many others I have found that the resulting figures were not all that could be desired, though they were helpful to a certain extent.

From the objections given by those who have investigated the subject with me, together with a careful study of the various conditions I have found existing in different washeries, I have compiled a new set of formulas, which I have applied to many washing plants and found satisfactory.

In presenting these new formulas, it is my hope that those interested in the subject will, through the columns of Coal Age and other engineering papers, point out any features which appear to them to be objectionable or in error, and if possible, offer suggestions which will assist in devising a satisfactory method of calculating coal-washing efficiencies.



Hancock's Table

One of the replies to my previous paper was received from Arthur Langerfeld, in which he speaks of the necessity of making float-and-sink tests with baths of different densities, in order that the amounts of the materials of various specific gravities may be determined, thus, for instance, showing the amount of "bone coal" present. The reader will, no doubt, be interested in a chart compiled by David Hancock, consulting engineer and chemist, of Birmingham, Ala. A specimen of this chart was included in a paper written by Mr. Hancock, under the title of "Coal Washing in Alabama," published by the Alabama Geological Survey.

As I wish to use this chart in presenting my formulas, I reproduce it here with some slight alterations in the figures shown on the original chart in order that an exact check may result throughout all the calculations, though the figures given by Mr. Hancock check remarkably with the theoretically correct figures resulting from actual float-and-sink tests and analyses made, and show that these were conducted with care and accuracy. The results also indicate careful and accurate sampling.

In his explanation, Mr. Hancock says:

"I have devised a chart upon which can be shown, graphically, the composition of the run-of-mine coal,

Hancock Chart of Washery Performance

washed coal and refuse." The chart here presented is a specimen representing the work done by Stewart jigs cleaning a coal of which separations by the float-and-sink tests, gave the results shown in Table I.

TABLE I. TESTS AND ANALYSES OF RAW COAL

A	B	C	D	E	F	G	H
	Specific Gravity of Materials	Percentage Relation of Each Material to Coal	Percentage of Ash in Each Material	Percentage of Ash in Terms of Raw Coal	Combining Materials of Different Specific Gravities	Percentage Resulting from Combinations	Ash Content of Combinations Per Cent.
a	Less than 1.35	66.8 ×	7.68 =	5.13	a only	66.8	7.68
b	1.35 to 1.40	6.9 ×	14.60 =	1.01	a and b	73.7	8.33
c	1.40 to 1.45	5.3 ×	18.54 =	0.98	a, b and c	79.0	9.01
d	1.45 to 1.50	2.1 ×	23.82 =	0.50	a, b, c and d	81.1	9.40
e	1.50 to 1.55	3.5 ×	28.42 =	0.99	a, b, c, d and e	84.6	10.18
f	1.55 to 1.75	5.5 ×	35.78 =	1.97	a, b, c, d, e and f	90.1	11.74
g	Heavier than 1.75	9.9 ×	55.66 =	5.51	a, b, c, d, e, f, and g	100.0	16.09
Raw coal		100.0 ×	16.09 =	16.09			

Note:—From the above data, the theoretically correct ash content of the raw coal is 16.09 per cent. Mr. Hancock's analysis is 15.94 per cent. a difference of only 0.15 per cent.

The raw coal was thus divided by float tests into seven parts representing materials of seven different specific gravities. The ash content of the lightest of these is 7.68 per cent. while that of the heaviest is 55.66 per cent. The percentages of these different materials are also given in Table I.

Explanation of the Hancock Chart

In constructing the chart, a perfect square is drawn to a convenient scale, the area of this representing the total raw coal. At the left side and bottom, scales reading from 0 to 100 are laid off as shown. On the left-hand scale, the percentages of each of the materials shown in Table I are laid off and dotted lines are projected across the chart from these points. Thus, all that area within the square

between the top of the chart and the first dotted line represents the material of a specific gravity less than 1.35, while that area between the first and second dotted lines represents all that material of a specific gravity between 1.35 and 1.40, and so on through all the parts of the raw coal shown in Table I.

Using baths of the same specific gravities as used in the raw-coal tests, exactly similar float-and-sink tests are made of the washed coal and the refuse produced by the jigs.

The percentages of these several materials in the washed coal and refuse as determined by the float-and-sink tests will be in terms of the washed coal or refuse. To complete the chart, the percentages of each specific-gravity material (in terms of that material) found in the washed coal and in the refuse must be determined. Tables II and III show the way in which these figures are obtained.

TABLE No. II. TESTS OF WASHED COAL AND CALCULATIONS THEREFROM.

A	B		C		D	E	F
Specific Gravity of Materials	Percentage of Each Material Obtained by Float and Sink Tests of Washed Coal.		Percentage Relation between Washed and Raw Coal.		Percentages in Column B Converted to Terms of the Raw Coal.	Percentage Relation of Each Material to Raw Coal. (C in Table I.)	D ÷ E Percentage of Each Material Carried by the Washed Coal.
Less than 1.35....	74.6	×	89.0	×	66.4	66.8	99.4
1.35 to 1.40.....	7.6	×	89.0	×	6.8	6.9	98.6
1.40 to 1.45.....	5.8	×	89.0	×	5.2	5.3	98.1
1.45 to 1.50.....	2.3	×	89.0	×	2.0	2.1	95.2
1.50 to 1.55.....	3.4	×	89.0	×	3.0	3.5	85.7
1.55 to 1.75.....	4.7	×	89.0	×	4.2	5.5	76.4
Heavier than 1.75.	1.6	×	89.0	×	1.4	9.9	14.1
Totals.....	100.0		....		89.0	100.0	....

TABLE No. III. TESTS OF REFUSE AND CALCULATIONS THEREFROM.

A	B		C		D	E	F
Specific Gravity of Materials	Percentage of Each Material Obtained by Float and Sink Tests of the Refuse.		Percentage Relation between Refuse and Raw Coal.		Percentages in Column B Converted to Terms of the Raw Coal.	Percentage Composition of the Raw Coal. (C in Table I.)	D ÷ E Percentage of Each Material Carried by the Refuse.
Less than 1.35....	3.63	×	11.0	=	0.4	66.8	0.6
1.35 to 1.40.....	0.91	×	11.0	=	0.1	6.9	1.4
1.40 to 1.45.....	1.00	×	11.0	=	0.1	5.3	1.9
1.45 to 1.50.....	0.54	×	11.0	=	0.1	2.1	4.8
1.50 to 1.55.....	4.81	×	11.0	=	0.5	3.5	14.3
1.55 to 1.75.....	11.97	×	11.0	=	1.3	5.5	23.6
Heavier than 1.75.	77.14	×	11.0	=	8.5	9.9	85.9
Totals.....	100.00		....		11.0	100.0	....

The percentages of washed coal and refuse, as given in Column C of these tables, is ordinarily obtained by actual weights. If all the work done is correct, the totals of Columns D should equal in their respective tables the percentages of washed coal and refuse. Mr. Hancock's figures for the percentages were 89.2 and 10.8, respectively, and the correction which I made here is negligible. The totals of Columns D for tables Nos. II and III added together should, of course, equal 100. Likewise, percentages for like materials given in Column F of Tables Nos. II and III, added together, should equal 100, or the total of each material in the raw coal.

Lay off the first figure in Column F. Table III, on the upper dotted line of the chart, using the horizontal scale. Erect a vertical to the solid line at the top of the chart. Thus, all that area to the left of this line represents the material of less than 1.35 specific gravity which is in the washed coal while the area to the right represents the amount of that material in the refuse. Proceed in a similar manner with the second figure in Column F, Table III, but drop the perpendicular down only to the next dotted line on the chart. Proceed similarly for each remaining figure in Column F, Table III. When completed, cross line or shade all that area representing the refuse and the chart then clearly represents the composition of the raw coal, washed coal and refuse.

Limiting Density

Mr. Hancock did not state just what the requirements of this plant were nor does he declare where the division must be made to satisfy the market in a demand for "good coal." He did not speak of a division for "pure coal" being made at a specific gravity of 1.35, that is, the pure coal would only amount to 66.8 per cent. of the raw coal. As this would involve a larger waste of coal than they would probably desire to sustain in that field, and as he has stated that the washed coal as produced by the jigs ordinarily contains 11.9 per cent. ash; and as, moreover, it is understood that the plant where these tests were made was in active operation and producing a washed coal suitable for the requirements of the plant, it is to be taken for granted that this figure of 11.9 per cent. ash was satisfactory. Referring to Table I, having a specific gravity exceeding 1.75, the reader will note that the combined ash content of all the materials on the previous page is equal to but 11.74 per cent., and the division between washed coal and refuse should therefore be made as shown. The specific gravity of the "permissible" bath for float-and-sink tests would, therefore, be 1.75.

Mr. Hancock's chart is certainly valuable and shows clearly just what the jigs are doing. It unquestionably would be of great assistance in locating the causes of low efficiencies of a jig or plant not giving satisfactory results. It would also be helpful in determining the exact cause why one type of jig failed to equal the efficiency of another, or exceeded it, as the case might be.

An Efficient Washer Produces a Coal of a Given Degree of Impurity

Regarding my method of efficiency calculation presented in 1912, one of the objectionable features is that it cannot be employed for the calculation of the efficiency of a plant which is producing a washed coal with an ash or sulphur content higher than that of the float from the permissible bath float-and-sink test. The float resulting from that test will hereafter be termed "standard washed coal." Its percentage we shall describe as the "standard percentage of washed coal."

The use of that method was based entirely upon the analyses of the washed coal being within the limits placed for ash and sulphur. Again, it is certain that any variation in the washed coal must result in a certain proportionate variation in the refuse and it would, therefore, appear that a method of calculation of efficiency should be possible wherein only the washed coal need be considered and such resulting figure should indicate what the refuse is without further calculations with the refuse figures.

A commercial washery may, under ordinary circumstances, produce a washed coal of which the ash and sulphur contents are within the limits set for that plant,

yet the ash and sulphur contents of the washed coal may at times exceed these limits. Again, if the ash or sulphur or both are less than standard, such condition can only exist by virtue of a reduction in the percentage of washed coal produced under that of the standard percentage. In either case the plant is operating at a loss, as compared to standard or perfect separation and the efficiency calculation should properly indicate certain reductions in efficiency.

In reconsidering this efficiency question, I have held these features in mind and the method of calculation presented herein covers all of these conditions insofar as I have been able to determine, though others may be able to point out discrepancies.

In presenting this new method, I have used the data contained in Mr. Hancock's chart to show more clearly the application of the method. In that which follows, the ash only is mentioned, but the method applies in exactly the same manner where sulphur enters into the problem. This is fully explained in the latter part of this article.

The Permissible Ash Content

In any coal-washing proposition, the first step is to ascertain just what is permissible as the maximum ash content of the washed coal, and this is based entirely upon the intended use of the coal, or the competition. For instance, if the washed coal is to be used in the manufacture of coke, and for good and sufficient reasons the ash in the coke cannot exceed 11 per cent., and yet such a percentage is not objectionable, and if it is known that 8 per cent. of the ash in the coal will give 11 per cent. of ash in the coke, then 8 per cent. of ash is the permissible ash content of the washed coal. Reducing the ash below that figure in such a plant causes a loss in percentage of washed coal produced, and, as previously determined, there is no gain by the reduction of ash below 8 per cent. If there is any object in a lower ash, such as an increase in the market value of the coke, then it is necessary to determine whether the valuation of the difference between the amount of washed coal produced with an ash content of 8 per cent., and that of the washed coal of a lower ash content, eliminates the increased profit of the better-grade coke. This should be one of the considerations in determining the permissible ash content of the washed coal.

In considering Mr. Hancock's washing proposition, it is assumed that all material of a specific gravity less than 1.75 is accepted as standard washed coal. The theoretically perfect separation of this coal by washing and one which would represent an efficiency of 100 per cent., is, therefore, as follows:

Ash content of the raw coal = 16.09 per cent.
Washed coal = 90.1 per cent., with ash content = 11.74 per cent.
Refuse = 9.9 per cent., with ash content = 55.66 per cent.

We have seen that Table II shows the composition of the washed coal as produced by the Stewart jigs, as shown on Mr. Hancock's chart, while Table III shows the composition of the refuse.

A permissible bath test of the washed coal would, therefore, show 98.4 per cent. float and 1.6 per cent. sink, while the same test of the refuse would show 22.86 per cent. float and 77.14 per cent. sink.

Table IV shows the calculations to determine the ash content of the washed coal and refuse, as produced by the jigs.

TABLE No. IV. ASH CONTENT IN WASHED COAL AND REFUSE

	Washed Coal.				Refuse.			
	A	B		C	D	E		F
Specific Gravity of Materials	Result of the Float-and-Sink Tests of the Washed Coal.	Percentage Ash Content of each Material.		Percentages in Column B Converted to Terms of the Washed Coal.	Result of the Float-and-Sink Tests of the Refuse.	Percentage Ash Content of each Material.		Percentages in Column E Converted to Terms of the Refuse.
Less than 1.35....	74.6	× 7.68	=	5.73	3.63	× 7.68	=	0.28
1.35 to 1.40.....	7.6	× 14.60	=	1.11	0.91	× 14.60	=	0.13
1.40 to 1.45.....	5.8	× 18.54	=	1.08	1.00	× 18.54	=	0.19
1.45 to 1.50.....	2.3	× 23.82	=	0.55	0.54	× 23.82	=	0.13
1.50 to 1.55.....	3.4	× 28.42	=	0.97	4.81	× 28.42	=	1.37
1.55 to 1.75.....	4.7	× 35.78	=	1.68	11.97	× 35.78	=	4.28
Heavier than 1.75.	1.6	× 55.66	=	0.89	77.14	× 55.66	=	42.94
Totals.....	100.0	.....		12.01	100.00	.....		49.32

From Tables Nos. I, II, III and IV, it is seen that the actual washing test fell short of the theoretically perfect separation in four respects.

(1) The ash content of the washed coal is 12.01 per cent. instead of 11.74 per cent. or a difference of 0.27 per cent.
(2) The percentage of washed coal produced was 89.0 per cent. instead of 90.1 per cent. a difference of 1.1 per cent.
(3) The ash content of the refuse is 49.32 per cent. instead of 55.66 per cent. or a difference of 6.34 per cent.
(4) The percentage of refuse produced was 11.0 per cent. instead of 9.9 per cent. or a difference of 1.10 per cent.

Any variation from the theoretically perfect separation, as shown in Table I, results in a lower efficiency of washing. To make sure that this is true, regardless of the exact location of the several misplaced materials, certain assumptions are made in Table V.

By referring to the Hancock efficiency chart, it is found that the amount of less than 1.35 specific-gravity material found with the refuse from washing is a very

small percentage (0.6 per cent.) of the total of this material carried by the raw coal. In order that the most favorable variation may be shown, or the one most likely to show as high an efficiency as is obtained in the theoretically perfect separation, it is assumed that a test of the washed coal charted on a Hancock chart shows that all of the materials *a, b, c, d* and *e,* in Table I, have gone to the washed coal where they belong, and that the variation from the theoretical occurs in part of material *f,* being found in the refuse, and that this is replaced in the washed coal by an equal amount (by weight) of the material *g,* the percentages of washed coal and refuse remaining the same as the theoretically perfect, or 90.1 and 9.9 per cent., respectively.

In Table V, this interchange of location of these materials is shown in different amounts, the results clearly indicating the effect caused thereby on the efficiency of the separations made.

It will readily be seen from the data given in Table V that any other combination that may be made, with the percentages of washed coal and refuse held to the same figures as the theoretically perfect, will result in a reduced washing efficiency, though in some instances, the reduction may be so slight as to be hardly worth consideration, yet the fact remains and should be considered in determining efficiencies. It is, of course, self-evident that any increase from the theoretically perfect percentage of washed coal will increase its ash content, and any reduction in the percentage of washed coal will decrease its ash content; except, that should there be any sink in the washed coal when tested in the permissible bath (and there always is in commercial washing), there will be a reduction in percentage of washed coal, while the ash content may remain the same as the theoretically perfect.

As an example of this, referring to Table V, suppose the washed coal is made up of materials *a, b, c, d* and *e,* and that *f* has all gone to the refuse and in place of it 3 per cent., in terms of raw coal, of material *g* is found in the washed coal. The result would be a washed coal amounting to 87.6 per cent. instead of the theoretically perfect 90.1 per cent., while the ash content of this washed coal would be 11.74 per cent., or the same as the theoretically perfect.

Table VI is made up in a similar manner to Table V, but differs in that none of material *g* is found in the washed coal, which has the effect of varying the percentages of washed coal and refuse. This again shows the decreased efficiency of washing through variations from the theoretically perfect separation.

From what has been presented, the following facts are derived:

(1) That it is impossible to reduce the ash content of the washed coal below the standard analysis except by a reduction in the percentage of washed coal below that of the standard percentage.

(2) That if the percentage of washed coal agrees with the standard percentage, the ash content will be higher than the standard ash, so long as there is any sink in the washed coal when tested on the permissible bath, and as there always is in commercial washing, it is impossible to reach the perfect percentage of washed coal and stay within the limit for ash.

(3) That a condition may exist wherein both the percentage of washed coal and its ash content will be above the standards.

From these facts and from the data contained in the tables, the following conclusions may be drawn:

To arrive at any method of stating coal-washing efficiencies in figures, which will apply universally, the composition and percentage of the refuse need have no bearing on the proposition, as it is directly affected by the variations in the composition and percentage of the washed coal. The washed coal then may be considered alone in arriving at such a method and in doing so there are four conditions affecting the efficiency. They are:

(1) If the percentage of washed coal is standard, but the ash content is above standard, then the ash analysis alone is the basis for calculating the washery efficiency.

(2) If the percentage of washed coal and also its ash content are above standard, then both of these differences are the basis for calculating the washing efficiency.

(3) If the ash analysis is standard but the percentage of washery coal is below standard, then the percentage of washed coal alone is the basis for calculating the washing efficiency.

(4) If both the ash analysis and the percentage of washed coal are below standard, then both of these differences are the basis for calculating the washing efficiency.

Quantity of Washed Coal Standard and Ash Content Excessive

In the first condition, with the percentage of washed coal standard, if the ash content of the washed coal should be the same as that of the raw coal, then no re-

sults have been obtained, and instead, a loss has resulted equal to the percentage of refuse resulting from washing. In such case it can truthfully be said that the efficiency of washing is zero. If the ash content of the washed coal should be standard, then the washing efficiency would be 100 per cent. From this we find that the true method of calculating the efficiency for such a condition would be as follows:

Formula A

$$\text{washing efficiency (condition 1)} = \frac{\text{raw coal ash} - \text{washed coal ash}}{\text{raw coal ash} - \text{standard washed coal ash}}$$

Both Quantity of Washed Coal and Its Ash Too High

In the second condition both the percentage of washed coal and its ash content are higher than standard. It may be said, as in the first condition, that if the ash content of the washed coal is the same as that of the raw coal, the washing efficiency should be considered as zero. But the method of calculation should be applicable for use in the comparison of coal-washing machines. We can imagine two machines (a) and (b) washing the same coal and both producing a washed product having an ash content the same as that of the raw coal. But machine (a) might discharge washed coal of an amount equal to the standard washed-coal percentage, while (b) might produce a higher percentage of washed coal than (a). Thus the loss through the operation of machine (a) will be greater than that occasioned by the working of machine (b). To attain an efficiency figure to use for the comparison of these two machines under such conditions, it is, therefore, necessary to bring the percentages of washed coal into the calculations and the following would apply to such a condition:

Referring to Table I, assume that the washed coal from the jigs contains all materials *a, b, c, d, e* and *f,* and also 4.9 per cent. (in terms of the raw coal) of *g,* making a total washed coal of 95 per cent. The ash content of this mixture would be 14.47 per cent. Applying formula A only:

$$\frac{16.09 - 14.47}{16.09 - 11.74} = \frac{1.62}{4.35} = 0.3724 \text{ or } 37.24 \text{ per cent.}$$

If machine (a) above mentioned is producing 90.1 per cent. washed coal analyzing 14.47 per cent. ash, the efficiency would be 37.24 per cent. If machine (b) is producing (as is possible) 95 per cent. washed coal analyzing 14.47 per cent. ash, it is certainly doing better work than machine (a). Admitting that the following condition cannot exist, but for the purpose of making my contention clear on this point, it could be said that machine (b), producing 100 per cent. washed coal, with an ash content of 14.47 per cent., would have an efficiency of 37.24 per cent. by analysis and 100 per cent. efficiency by percentage of washed coal produced. The average efficiency in such case would be $\frac{100 + 37.24}{2} = 68.62$ per cent. This coincides with formula A, for in that calculation the efficiency by percentage of washed coal produced is disregarded, or would be equal to 100 per cent. To carry out this principle for the calculation of efficiency by percentage of washed coal when higher than standard, the formula *B* at the foot of the page is derived.

The formula *C* for condition 2 will also be found at the bottom of the page.

Applying this to the first above mentioned condition for machine (b):

$$\frac{\frac{95.0 - 90.1}{100.0 - 90.1} + \frac{16.09 - 14.47}{16.09 - 11.74}}{2} = 43.37 \text{ per cent. eff.}$$

Ash Content Standard and Washed Coal below Required Figure

In the consideration of condition 3, the ash content is standard, but the amount of washed coal produced is less than it should be, as figured by a float-and-sink test of the raw coal. It is at once evident that the only way to determine this efficiency is by a direct calculation using only the figures for the percentage of standard washed coal and the actual washed coal produced or, if the standard, washed coal is 90.1 per cent., and the actual production is 85 per cent., the efficiency would be

$$\frac{85.0}{90.1} = 0.9434 \text{ or } 94.34 \text{ per cent. efficiency}$$

As the ash content of the washed coal is standard, that efficiency is 100 per cent., and the true final efficiency is the average of these two, or

$$\frac{94.34 + 100.0}{2} = 97.17 \text{ per cent. efficiency}$$

It is, of course, impossible to have a condition wherein the percentage of washed coal is standard and the ash content below standard, so that need not be considered. For condition 3, the following formula is, therefore, derived:

Formula D

$$\text{washing efficiency (condition 3)} = \frac{100 + \frac{\text{percentage of washed coal produced}}{\text{percentage of standard washed coal}}}{2}$$

From this it is evident that Formula *E* at the bottom of the page should be used for condition 4.

In going back over these formulas, it is quite evident that conditions 3 and 4, as they will always be found in practice, will show a higher efficiency than conditions 1 and 2, which is as it should be, for a washery that is pro-

Formula B

$$\text{efficiency} = \frac{\text{percentage of washed coal produced} - \text{standard percentage of washed coal}}{100 - \text{standard percentage of washed coal}}$$

Formula C

$$\left.\begin{matrix}\text{washing efficiency} \\ \text{(condition 2)}\end{matrix}\right\} = \frac{\frac{\left(\begin{matrix}\text{percentage of washed coal produced} - \\ \text{standard percentage of washed coal}\end{matrix}\right)}{100 - \text{standard percentage of washed coal}} + \frac{\text{raw coal ash} - \text{washed coal ash}}{\text{raw coal ash} - \text{standard washed coal ash}}}{2}$$

Formula E

$$\text{washing efficiency (condition 4)} = \frac{\frac{\text{ash content of washed coal produced}}{\text{ash content of standard washed coal}} + \frac{\text{per cent. of washed coal produced}}{\text{standard per cent. of washed coal}}}{2}$$

ducing a washed coal with an ash content above standard is not desirable because the higher-ash coal would have to be sold at a reduced price.

On the other hand, a coal that carried ash of a lower percentage than standard might bring a higher price and the loss would be only through the reduced amount of coal produced. The maximum amount of such reduction would, as previously stated, be based entirely upon the extent to which it could be carried without eliminating the profit derived from the higher market value of the lower-ash coal. At the same time, it is impossible in actual practice to carry conditions 3 and 4 to the extremes to which 1 and 2 may be carried and the variation of a few per cent. below standard in the percentage of washed coal does not affect the efficiencies nearly as much as would a few per cent. increase in the ash content above the standard figure.

Proposed Rules Algebraically Expressed

From the data presented, I therefore derive the following formulas for the calculation of washery efficiencies and obtain the rules for their use.

Let X = efficiency of washing; a = percentage of raw-coal float from the permissible bath test (standard washed coal); b = percentage of washed coal produced by washing; c = 100 per cent. = raw coal; d = ash content of the raw coal; e = ash content of the raw-coal float from the permissible bath test (standard washed coal); f = ash content of the washed coal produced by washing. Then:

Rule 1—If the ash content of the washed coal is of a higher percentage than standard and the percentage of washed coal is standard, calculate the efficiency of washing by the following formula:

$$\frac{d - f}{d - e}$$

Rule 2—If both the ash content and the percentage of washed coal are of a higher percentage than standard, calculate the efficiency of washing by the following formula:

$$\frac{\frac{b - a}{100 - a} + \frac{d - f}{d - e}}{2}$$

Rule 3—If both the ash content and the percentage of washed coal are standard or, if either one or both are less than standard, calculate the efficiency of washing by the following formula:

$$\frac{\frac{f}{e} + \frac{b}{a}}{2}$$

Rule 4—If the ash content of the washed coal is higher than standard, and the percentage of washed coal is less than standard, calculate the efficiency of washing by the following formula:

$$\frac{\frac{d - f}{d - e} + \frac{b}{a}}{2}$$

If, in stating the efficiency of washing, the rule by which it is calculated, is also given, it will at once be understood whether the plant is producing a washed coal product with an ash or sulphur content above or below standard.

In calculating the efficiency of washing of an entire washery, the formulas as given will apply, providing the percentage of washed coal and its ash content are derived from the entire washed-coal product of the plant. If these figures are derived from each individual jig, then the efficiency figure in each case will represent each individual jig and to determine the total plant efficiency from these figures, multiply the efficiency of each jig by its washed-coal tonnage production. Add the resulting products from all jigs together and divide by the sum of the washed-coal tonnage capacities of all the jigs.

Example:

Jig (a) Efficiency = 98.0 per cent. × washed coal tonnage or 10 tons per hr. = 980
Jig (b) Efficiency = 90.0 per cent. × washed coal tonnage or 20 tons per hr. = 1800
Jig (c) Efficiency = 86.0 per cent. × washed coal tonnage or 30 tons per hr. = 2580

60 5360

Then:

$$\frac{5360}{60} = 89.33 \textit{ per cent.} = \textit{total efficiency}$$

The following calculation gives the efficiency of the Stewart plant, represented by Mr. Hancock's chart:

Ash content of the raw coal = 16.09 per cent.; washed-coal ash = 12.01 per cent.; washed coal = 89 per cent.; standard washed coal = 90.1 per cent.; ash content = 11.74 per cent.; a = 90.1 per cent.; b = 89 per cent.; c = 100 per cent.; d = 16.09 per cent.; e = 11.74 per cent.; f = 12.01 per cent.

Rule 4 would apply to the conditions at this plant.

Efficiency of washing =

$$\frac{\frac{d - f}{d - e} + \frac{b}{a}}{2}$$

or,
$$\frac{\frac{0.1609 - 0.1201}{0.1609 - 0.1174} + \frac{0.890}{0.901}}{2} \textit{ or } 96.29 \textit{ per cent.}$$

If one formula could be compiled that would apply on all the conditions which may exist in washeries as herein outlined, the method of calculation would be simplified, but I have been unable to determine any such formula which would be satisfactory.

An Automatic Continuous Coal Drier

By A. J. Sayers*

The problem of properly drying coal after washing is one which has troubled the industry for many years. It will be pleasing, therefore, to many coal producers to learn that a satisfactory coal-drying machine has been invented by C. A. Wendell. This device is fully protected by patents and the exclusive rights to manufacture and market it have been secured by the Link-Belt Co.

The machine, in general, consists of three main parts, the frame, feed-spouts and the container. There is also a sluice and a hopper. The feed spouts are fastened to an inner solid shaft and are driven by suitable transmission so that they may revolve at any desired speed independent of the container.

The container, which is driven through a hollow shaft consists of a top plate, a bottom plate provided with openings which are closed by trap doors, and an outer inclined wall. This outside wall is made up of screens with suitable perforations. Outside of these, a water col-

*Engineer, Link-Belt Co., Chicago.

lector is set and so arranged that the water which is thrown through the screens is collected and made to follow the sloping sides up to the top edge, where it is discharged by centrifugal force into a sluice to be led away. The container is driven through suitable transmission to any desired speed independent of the feed spouts.

The discharge doors in the bottom plate of the container are made to open and close automatically by means of cams attached to the revolving shaft on which the feed spouts are fastened. The material being dried is continually and automatically discharged from the container after having been kept in the machine for a time sufficiently long to give it the degree of dryness desired. It is discharged into a hopper and removed by a suitable conveying apparatus.

Centrifugal Force Aids Discharge

The easy discharge of the material is accelerated by placing the screen at a certain slope so that when the coal is sufficiently dried and the doors in the bottom are opened, it will slide downward and out into the hopper. The centrifugal force aids in making this operation almost instantaneous.

After the machine has been put in motion and attained its full speed, the material to be dried such as coal, for instance, is fed into the spouts. The centrifugal force will then throw this coal in a steady stream against the perforated frame forming the outside of the container so that a thick bed is gradually formed as the spouts slowly pass by each and every point of the container, the spout traveling faster than the drying screen.

As the spouts slowly gain on the container, the cams which are fastened to the same shaft and thus travel at the same speed and are always in the same fixed relation to the spouts open and close the discharge doors just far enough ahead so that no material can be discharged into that part of the container which is being emptied of its contents. In other words, the distance between the cam and the spouts is just large enough to permit of a gradual opening and closing of the door before the material discharged from the spout can get into this place. This means that there is always an empty section about the size of a door opening just ahead of the spout and just behind the cam.

This empty space is continually being filled and the material to be dried has to stay in position until the cam again opens and closes the door and the then empty space is refilled from the spout which follows close behind it.

As this performance is continually repeated it will be seen that the material handled can be made to stay a longer or shorter time as needed or according to how long it takes to drive the moisture out of the material by simply changing the relative speeds beween the cams and spouts with regard to the container. A similar result may be obtained, or the dryness of the material can be adjusted by a lighter or a heavier feed.

To illustrate how long material is permitted to remain in the machine at a certain combination of speeds, let us assume that the speed of the container is 250 r.p.m., while that of spouts and cams is 251 r.p.m., one revolution per minute faster than the container. As a consequence, each discharge door is opened and closed once every minute by each cam and as two cams are used in this design, each door is operated twice per minute allowing the material to remain in the container about 25 seconds or during 104 revolutions.

This machine is self contained, strongly built with few working parts. These are subjected to but little wear on account of the relatively low speed of the revolving elements in relation to each other. All shafts are supported by babbitted, brass-bushed or ball bearings. All parts are easily accessible for inspection or replacement. The perforated screens against which the material lies while drying and which must take the wear caused by the downslide at the opening of the doors are easily replaced by simply cutting them loose and cold-riveting new parts to the heavy iron frames.

The Wendell drier is a machine which automatically receives and discharges the material and moisture it handles, and while it is intermittent in its drying action, its performance is continuous. The entire operation is accomplished by the aid of centrifugal force and gravity and no scraping or plowing devices are required. Excessive wear is thereby eliminated while the power consumption is comparatively small.

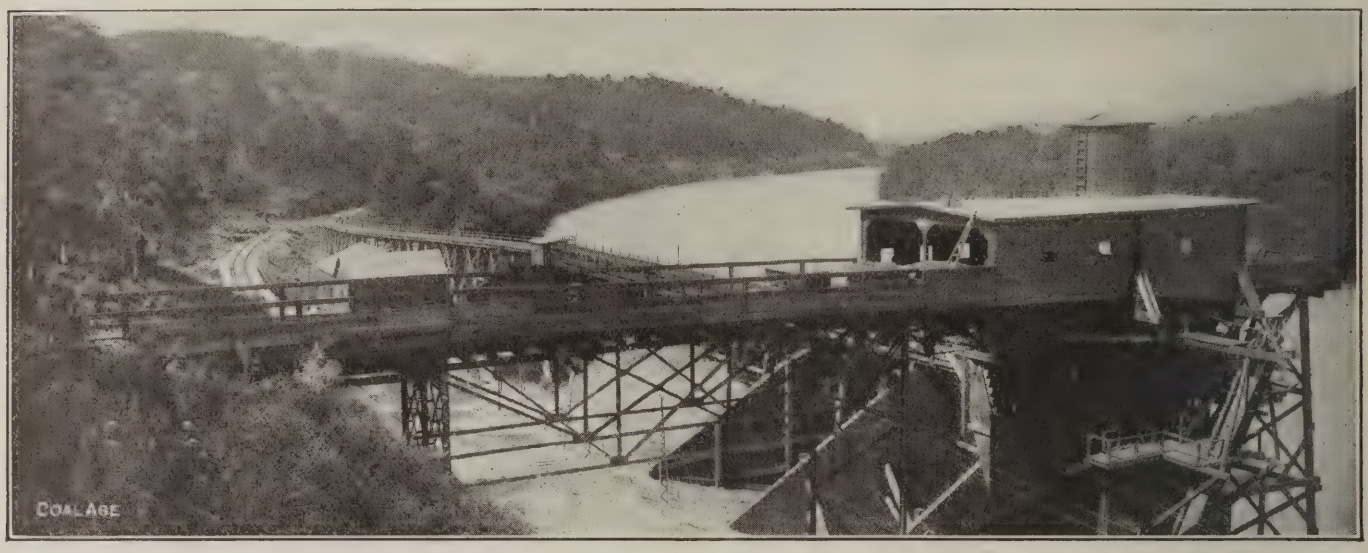
Recent Scale Conferences

The members of the miners' scale committee of District No. 2, which comprises central Pennsylvania, met at Clearfield, Apr. 22, at 11 o'clock. The joint conference of the scale committees of miners and operators met at 2 o'clock the following day in the Dimeling Hotel.

The miners demanded that a uniform wage scale be paid for inside and outside labor, that eight hours constitute a day's work for all men employed in and around the mines, that pillars and stumps be drawn by hand and not by machine, and that local inequalities be taken up locally for adjustment, these differences including pushing of cars and compensation for removing rock in rooms, headings or breakthroughs to make necessary height. The operators refused to make any concessions. On Saturday, the miners agreed to submit the question to a referendum.

Latest reports from Peoria, Ill., on Apr. 28, state that the operators refused to grant a 4 per cent. increase demanded by the miners in the southern field.

Bituminous Examinations



Notices are being sent out, in the several bituminous districts of Pennsylvania, announcing that examinations for certificates of competency for mine foremen, assistant mine foremen and firebosses, will be held May 5, 6, 7 and 8, 1914. In most cases, the examination for fireboss certificates is held on the last day named, May 8. Applicants for certificates must be citizens of the United States, of good moral character and known temperate habits, at least 23 years of age and must have had at least five years' practical experience after 16 years of age, as miners or mining engineers, or men of general work inside of the mines of Pennsylvania.

The Colorado Strike

SYNOPSIS—The disturbance in Colorado has been permitted to grow until, no longer a strike, it has assumed the proportions of a war. Probably 87 persons have been killed and at least 9 plants have been burned. The State militia is without pay and consequently campaigning is hampered. Both northern and southern Colorado are affected.

The investigation of the Colorado strike by Congress has done no good and perhaps much harm. A board of inquiry will never aid peace by allowing men to vituperate one another if, after stirring up strife, it then departs and leaves them to plant blows to match their evil words. Our courts would be a source of weakness rather than strength, if they did not adjudicate and follow up their decision with the civil power. If Congress and the President can do nothing better, let them not invite the disputants to air their grievances in a powerless court. Such action can, at least, only weaken the effectiveness of the local control.

LUDLOW, CENTER OF VIOLENCE

The first breach of the peace in the new development of the Colorado situation occurred near Ludlow, Colo., on Apr. 20. The militia declares that a detachment of 17 soldiers under the command of Lieut. Linderfelt, which had advanced to investigate the origin of certain rifle discharges, was fired upon by strikers in the Berwind Cañon. The militiamen fled and took a position on Tank Hill, the strikers entrenching themselves at Arroyo, half a mile away.

The story told by the strikers declares that the fighting commenced with an exchange of shots between strikers and troops in the Ludlow colony. It is said by J. R. Lawson, Colorado member of the executive board of the United Mine Workers of America, that five militiamen interfered with some Greeks at their sports on Sunday the 19th. No fighting resulted, however, but on Monday the 20th, Major Hamrock, of the militia at Ludlow, sent for Louis Tikas, the leader of the Greeks, to demand of him the release of some men from the camp. Lawson says this Greek leader never returned but he declares he does not know, however, who fired the first shots.

The firing in all lasted 14 hours. Machine-gun fire was directed on the strikers' camp at Ludlow Station, which was burned to the ground. Under the tents, holes had been dug and covered with boards and there were several noncombatants caught in these shotproof pits when the camp burned. As a result of the day's engagement, it is stated that one soldier was killed, one fatally injured and one less seriously wounded. On the other hand, 14 in the strikers' ranks were killed and considerably over 20 wounded. Among the dead was the Greek leader Louis Tikas. The bodies of 11 children, two women and one man were found by a searching party of the American Red Cross on the 22nd.

The situation for the militia was quite serious, there being about 100 soldiers to about 400 armed strikers. The number of these latter was continually increasing.

FIGHTING SPREAD ALL OVER TRINIDAD DISTRICT

On the 22nd, fighting commenced at Delagua, which is at the head of the branch railroad that runs westward from Ludlow. The guards, 15 in number, apparently went out to meet the strikers and a fight occurred about a mile from the camp. After a few minutes' fighting, the guards retreated, pursued by the strikers, who attacked them in the mine building. Militiamen in steel cars sent up from Ludlow reinforced the guards and repulsed the strikers.

The Aguilar district lies over a high range of hills in a different cañon from that in which Delagua, Hastings and Ludlow are located. Aguilar is about seven miles northeast of Ludlow. Shortly after the Delagua battle, hostilities broke out at Aguilar, and soon the strikers had 35 persons, including five women and three children, entrapped in the mine of the Empire Coal Mining Co. They set fire to the tipple house and are alleged to have dynamited the mine with bombs, sealing the exit for those who used the mine as a place of retreat. However, whether this occurred or not, all the persons were ultimately liberated or rescued.

EIGHT PLANTS ARE FIRED

The full force of the Colorado militia was called out on Apr. 22 and ordered to mobilize at Denver and to await further orders. However, as money is lacking, it was impossible to utilize these forces to advantage. The payment of the militia was already scandalously in arrears. On the same day several union miners at El Paso, Curtis, Patterson and other union mines left Colorado Springs for Trinidad, and all the miners quit work.

The following plants were reported on fire on Apr. 23. Primrose mine of the Colorado Fuel & Iron Co. (Primrose Coal Co.) at Rugby, Mine No. 4 of the Southern Colorado Fuel Co., the Empire mine of the Empire Coal Mining Co., the Southwestern mine of the Southwestern Fuel Co., the Green Cañon mine of the National Fuel Co., and the Rugby mine of the Colorado Fuel & Iron Co. The Royal and Brodhead mines are also in ashes. In all, eight mines in the Trinidad field had been destroyed by the strikers, who comprised about 1000 men.

THE TRUCE IN THE TRINIDAD DISTRICT

On the 24th a truce was arranged between Acting Governor Fitzgerald and Horace Hawkins, the attorney for the miners; Governor Ammons being in Washington, D. C., The state militia promised not to fire unless first fired on. The new force of militia had meanwhile arrived in the district and fearing the train might be dynamited, had detrained six miles from Ludlow and marched into that village. Part of the miners had intended to intercept the train at Lynn near Aguilar, but others desired to hold up the forces at another point. As a result of the disembarkation, and the division among the strikers, the troops met with no resistance.

The strikers withdrew from Lynn and Aguilar, and all the persons imprisoned in the Empire and Southwestern mines since the 22nd were found alive and unharmed. Several women and children who had taken refuge in the mine had been permitted by the strikers to leave on the 23rd, before the evacuation, and were escorted from the district by their captors.

HOSTILITIES BREAK OUT EVERYWHERE

On Apr. 26 the Chandler mine, over 80 miles in a straight line northeast of Ludlow, situated in Fremont County, and being the property of the Victor-American Fuel Co., was taken by the strikers. On the 27th two companies of militiamen drove off the invaders, but a mine of the Colorado Fuel & Iron Co., known as the McNally plant, was burned down. This mine is ¾ of a mile west of Walsenburg. During the night seven mine guards were shot at the Walsen mine near Walsenburg.

On the 27th evidences of the unrest appeared at Hecla, a mine of the Rocky Mountain Fuel Co., 22 miles north of Denver and about 190 miles in a direct line from Ludlow. The mine was attacked by strikers, but none of the 49 guards was injured. A posse of 200 men was reported as speeding from Boulder to the rescue.

At the Vulcan mine, near Lafayette, there was trouble at 10:30 p.m., and for half an hour a fight was waged between miners and mine guards. The Gorman mine near Marshall was also attacked by strikers at the same hour, but machine guns on the tipple were brought into action, and the attack was repelled.

This northern field had been comparatively quiet, but when the militiamen were moved to the south to cope with the trouble there, violence developed in the sections thus vacated.

THE PRESIDENT ACTS

On Monday, Apr. 27, a long conference was held between the President, Secretary Garrison and Senator Thomas. No decision was reached as to the advisability of sending troops to Colorado. On the previous day, Martin D. Foster, chairman of the Committee of Mines and Mining in the House of Representatives, met John D. Rockefeller, Jr., and is said to have discussed the possibility of arbitration. He declared that his mission was without result.

On the 28th President Wilson ordered three troops of the Sixth Cavalry at Fort Leavenworth, Kan., to go to Trinidad, and two troops of the Twelfth Cavalry at Fort D. A. Russell, Wyo., to go to Cañon City. He issued a proclamation urging that domestic violence cease, and in a telegram to the Governor urged that the militia withdraw.

The number of lives lost in the events just described is, at least, 87. It is likely that no accurate estimate will ever be made.

A Preparation Plant in a River Tipple

The majority of coal mines throughout the country ship their product by rail only. In certain localities, however, particularly along the Ohio River and its tributaries, many tipples are equipped for shipping by either rail or water, and some few by water only.

ing screenings to the barges and baskets for lowering the lump.

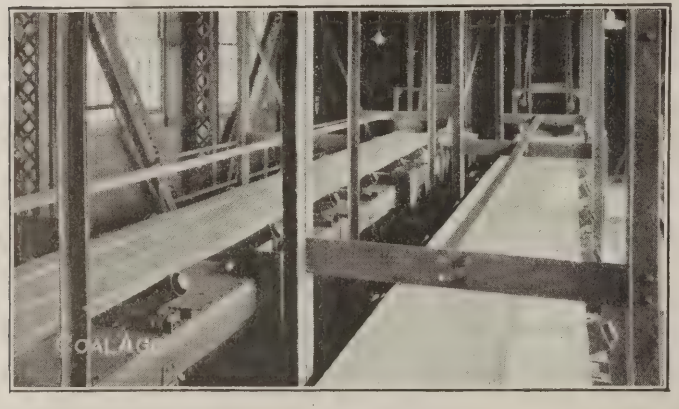
As the structure must be above flood level, the distance to the barges is considerable at low water, and varies decidedly with the stage of the river. Hence, while the screenings may with impunity be spouted down, the lump must be lowered more carefully to avoid breakage.

Mine cars are brought to the upper floor of the tipple

General View of the Tipple

The plant of the Crucible Coal Co., located at Arensberg, on the Monongahela River, just above Connellsville, has a tipple of the latter type. The building extends out over the river and is equipped with spouts for deliver-

by electric locomotives. The plant is duplicate, that is, there are two dumps, two sets of screens and two picking belts. The fine coal passing through the screens drops into chutes below, which underneath the lower tipple



The Delivery Ends of Picking Belts, Spouts for Screenings and Lump Chutes to Picking Belts

floor unite into a single spout leading down to the barges.

The lump coal, passing over the screen, is fed onto two rubber picking belts, which pass between two files of men, who remove the bone from the product. The number of pickers is, of course, varied, according to the quality of the coal.

Each of these picking belts is 42 in. wide and runs over 34x36-in. head pulleys, and 30x44-in. tail pulleys, these being placed about 62 ft. apart on centers. Troughing idlers, placed every 5 ft., carry the upper part of the belt, while flat return idlers placed on 10-ft. centers carry the lower part. The power is applied through belts, gearing and chains, from a 60-hp. motor, which operates the entire tipple equipment. The speed of the picking belts is 60 ft. per minute, at which rate they will carry 130 tons each per hour, or 260 tons for the two.

Below the level of the picking platform and between the two belts is a third belt conveyor, running in the opposite direction. Onto this narrower belt the pieces of bone removed from the coal are chuted. This refuse is carried out of the shore end of the tipple to the bank, and discharged into pit cars for hauling away to the dump.

THE TWO PICKING BELTS, LOOKING TOWARD SCREENS

The capacity of the refuse conveyor is 60 tons per hour, thus allowing for the disposal of impurities equal to nearly one-quarter of the total tonnage handled. This is, of course, an excessive allowance, but provides capacity for handling all the bone and slate which may be removed during the most irregular feeding.

This belt is of rubber, 26 in. wide, with a thick wearing surface. The head and tail pulleys are on approximately 108-ft. centers, allowing the conveyance of refuse from the extreme outer end of the tipple to the bone track on the shore.

The head pulley of this conveyor, which travels at 60 ft. per minute, as do the picking bands, is at the shore end, the drive being accomplished by a long riveted drive chain.

The desired results are here obtained in a satisfactory and efficient manner. The market coal proceeds continuously from the mine car to the river barge, while the bone or refuse is effectively separated by hand picking, which, if carefully and thoroughly done, is the surest and best means, and returned to the shore for disposal, either to a dump or if desired, for filling. The complete installation was designed and furnished by Dempcy-Degener Co., of Pittsburgh, representing the Webster Mfg. Co., in the Pittsburgh district.

The Eccles Explosion

A severe explosion took place, in the afternoon of Apr. 28, at Mines Nos. 5 and 6, of the New River Collieries Co. These workings are located at Eccles, Raleigh County, on the Virginian R.R. It is believed that 203 miners are entombed and perhaps none of these can be rescued alive. However, only 4 dead bodies have as yet been recovered. Fifty-nine men, all from mine No.6 , have been rescued. The two shafts in mine No. 5 were rendered useless by the explosion. One shaft in No. 6 was also so severely injured as to be unavailable for escape or rescue.

The explosion occurred in No. 5 mine and was communicated to No. 6. However, all but 13 men of those who entered the shaft at this latter mine this morning have been accounted for. The shafts are about 600 ft. deep. Apparently no smoke appeared at the mouths of the shafts.

Superintendent Thomas Donaldson, from No. 3 mine, Superintendent M. E. Kent and General Superintendent F. B. Bayles, all of the New River Collieries Co., and an expert rescue crew, were lowered down the only shaft in working order at No. 6 mine and brought up several living and four dead men.

West Virginia Institute to Meet in Cumberland, Md.

The summer meeting of the West Virginia Coal Mining Institute will be held in Cumberland, Md., on June 2, 3 and 4. The announcement to this effect was made today by Prof. E. N. Zern, of the School of Mines at the University of West Virginia, the secretary of the organization. Prof. Zern made his announcement after the choice of Cumberland by the members of the executive committee had been confirmed by President Neil Robinson.

The invitation, which came from the business organizations of Cumberland, was received some time ago as were invitations from several cities in the northern part of the state. Cumberland was selected because of its easy accessibility and because a number of the Maryland operators and miners wanted to entertain the West Virginians.

The coming session of the Institute will be "practical." A number of interesting papers will be read on practical mining questions rather than theoretical subjects. Practical mining men from the surrounding coal-mining states will attend the Institute meeting and will take part in the proceedings. The detailed program will be announced later.

More Wireless Telephony in English Mines

The Fife Coal Co. has introduced "wireless" telephony into its Lindsay colliery, at Kelty, in the county of Fife, Scotland. The current is carried through the rails in the gangways. Only four receivers have been installed, one in the hoist room, another at the foot of the shaft, a third at 2850, and a fourth 4950 ft., respectively, from that point. The receivers weigh about 50 lb. Each instrument has a battery of four cells, any of which will produce a current at 15 volts pressure.

Who's Who in Coal Mining

Robert U. Patterson

Major Robert U. Patterson, Medical Corps, U. S. A., is one of the most prominent figures in the first-aid work that is now being carried on by American coal-mining companies. Major Patterson is in charge of the first-aid department of the American Red Cross, and a considerable part of his time and attention has been taken up with the development of first-aid work in coal mining.

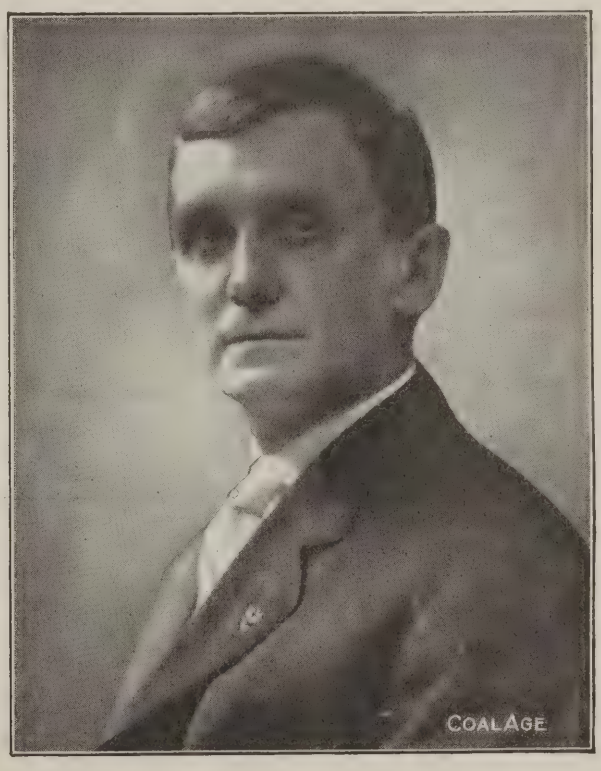
He was born June 16, 1877, and graduated from McGill University, Montreal, Canada, in 1898. Major Patterson was an interne in the Montreal General Hospital from 1898 to 1900. Following this, he served one year as surgeon at the coal mines of the Anaconda Copper Co., Belt, Mont.

In June, 1901, Robert Patterson was commissioned 1st Lieutenant of the Medical Corps, United States Army. He was an honor graduate of the Army medical school in 1902. He then served in the Philippine Islands until 1905, experiencing active service in the Department of Mindanao under Generals Pershing and Wood against the Moros. During this time much of his attention was devoted to combating the epidemic of Asiatic cholera in the Philippines.

He served at Presidio, San Francisco, 1905, to 1906. Was present and took part in the relief work following the earthquake and fire. After this Major Patterson served with the U. S. army in the Cuban pacification from 1906 to 1909, following which service, he was stationed in Washington, D. C., and Fort Niagara, N. Y.

From 1910 to 1913 Major Patterson acted as director of ambulance companies for the maneuver division, Fort Banks, Mass., and San Antonio, Tex. He reported for duty in charge of the first-aid department of the American National Red Cross, June 5, 1913.

Coal men throughout the country have a warm affection for Major Patterson and appreciate in full the valuable service he has rendered the "Safety Movement" in American coal mining.



MAJOR ROBERT PATTERSON

John Hewitt

John Hewitt, general manager of the Vandalia Coal Co., Terre Haute, Ind., is one of the live wires of mining in the middle west. Born in England in 1860, Mr. Hewitt started life in this country as a coal miner, at which occupation he worked until 1888. He had obtained a fair education in the common schools of England, and this enabled him to serve as bookkeeper for the Island Coal Co. from 1888 until 1890. In this latter year he was promoted to mine superintendent for the same company and held this position until 1905.

He severed his connection with the Island Coal Co. to become district superintendent of the Vandalia Coal Co., in Indiana, which position he held until 1911, when he was appointed general superintendent of all operations for the same concern. At the present time he is general manager of all the mines of the Vandalia company, besides serving as a director of that corporation.

JOHN HEWITT

Editorials

The Senate and the Railroads

We are about to make our first experiment in the national ownership of railroads. We intend to build a railroad in Alaska, and we will probably administer it in the same manner as, hitherto, such roads have always been conducted under private ownership.

A correspondent writing from Washington, D. C., tells us that the Committee on Public Lands of the United States Senate believes that an economical and adequate protection of coal lands is essential to the development of the territory and the successful construction and operation of the government railway. Consequently, the committee suggests that the government should retain control over all coal-mining operations.

For so believing and for so acting in the conduct of their own business the privately owned railroads in the United States have been haled into court, for, in public opinion, private capital may not protect itself by any such manner of prudent precaution. Many railroads have feared that rivals paralleling them up the same creek or river might give their property no reason for existence and in order to secure their share of trade, have opened mines themselves. But it is wrong, all wrong, so to do unless the trick is turned by Congress.

Congress may let the government destroy private property by every form of discrimination and profitless operation, but it will not allow private capital to build up a competitive enterprise which might starve by careful and enterprising management such public utilities as have been or are well suckled by Congressional appropriations. We cannot blame Congress for looking after the interest of the Nation. For what other purpose are Congressmen appointed? But we do blame them for so bitterly opposing private capital which has exercised only the most elementary forethought.

The Situation in Colorado

The labor troubles in Colorado could hardly be worse and we can well understand why there has been a demand that United States troops be sent to the scene of action. No matter how responsible state troops may be, there is always possible the suggestion that they are controlled by the fear of local capitalistists or by the apprehension of the labor vote. Especially is this true at this time in Colorado, where the coal-operating concerns are large and labor organizations active, and either may well be dominant forces politically.

It cannot be said that United States troops can be controlled either by the operators or the labor element and their integrity will be less questioned because their ranks have not been recruited for the particular service they will render in Colorado, so that animus against the labor element or against the companies cannot be said to affect the quality of the personnel. Unfortunately the militia of Colorado is said to be full of irresponsible gunmen, and the people of the United States are unable to determine if malice or right judgment is back of such attacks on its integrity.

In the United States troops, which are the arm of the whole country, the people of the United States have probably as much confidence as the people of Colorado have in their militia. They are willing to remain ignorant of the cause of the trouble so long as the men on whom they rely are in charge of the situation.

It is well, therefore, for Colorado to seek that help, not so much because its militia is inadequate, but because it cannot but fear the effect of the current aspersions on its honesty of purpose. Moreover, if peace is desired, as surely it is, nothing is more sure to effect it without bloodshed than the overmastering power of the United States army.

Let us hope that no state pride, no desire for anarchy, no mere love of states' rights, no fear of injury to private political interests, will prevent the Colorado people from asking, and Washington from granting, every needed assistance in settling this disturbance.

Congressional investigations are foolish waste of time, and create worse conditions rather than better. But the United States army will see to it that harmful conditions do not continue in the territory in its charge and will achieve that which no inquiry can ever do. It will guarantee the freedom of the law-abiding people in Colorado, to work or refrain from working and to come and go without restraint. In doing so, perhaps it may be necessary to do some things for which the militia of Colorado has been unsparingly condemned, but with good reason we permit the army to do what we are chary of conceding to the militia of any single state.

We are sorry to see that the President is only sending 360 men to quiet an uprising scattered over an area of several hundred square miles and is asking that the militia disband. We have no doubt that the companies detailed to the service are sufficient to do the fighting, but the force is wholly inadequate for the policing of so vast an area, especially if the operators are asked to give up the guns with which they are defending what is left of their properties.

Scientific Preparation of Coal

Hopelessly unscientific is the attitude of many operators to washer problems. They have never yet determined what is the percentage of ash, it will pay them best to leave in the coal. They decide that to meet the demand of the market some removal of impurities is necessary; they are aware that they cannot by any method attain to an ashless product, but they do not seriously apply themselves to the questions: How much ash may I leave in my coal? What proportion of the whole product of my mine will I then be able to sell? and What percentage of ash will enable me to secure the largest profit?

When coal is purchased by a standard specification

throughout a large part of the operator's selling field, it is possible to know just what degree of coal waste the purchaser is willing to pay for. In other fields where better coals are on the market the operator can determine for himself just what purity his coal must have, to meet competition. Better coal than that, it is not well for him to supply except at a higher price.

It seems a crime to the general public for an operator to figure just how much dirt he will sell as coal, but as the dirt is so integrally a part of his product, he would have to throw all his coal away if the public wanted an absolutely pure fuel. The purchaser who buys washed coal has in a sense to decide how much of the coal he is willing to pay the operator to discard.

It will be well for operators to read G. R. Delamater's article in this issue. Perhaps the method of determining the efficiency of washers, he there propounds, may not meet with general approval. We believe that perhaps efficiency in extracting ash should be stated separately from the efficiency in saving coal. There is no advantage in combining such figures by any such crude arrangement as summing them and dividing them by two. In some places the saving of coal is more important than the efficient removal of the ash; in other cases ash is more to be feared than coal loss. Until we know the location we cannot weight efficiencies or decide with nonchalance that the arithmetical mean gives even a reasonable result.

But we think that Mr. Delamater's paper will set the reader thinking of the technical and business questions involved even if he get somewhat weary of the figures and doubtful of their determinative value. He will learn what 100 per cent. efficiency in coal washing is, even if he never finds just what proportion of that efficiency he is obtaining in practice. He can say at least, I am losing such a percentage of coal above what the float-and-sink test determines is necessary and my ash percentage is higher than it should be with the percentage of coal I am discarding. This ability to analyze conditions is a great advance over the old hit-or-miss methods of the past.

Absenteeism

A few years ago many of our mining corporations were directed from the nearest presentable village, usually the county seat. But that time has passed away. The center of control is now at some big city. Though the directors and the president are absentees, they naturally want to keep in touch with the mines, so they bring their general managers up to the cities also.

And they, in turn, desiring to keep posted on their work, bring the chief engineers and some other men. And if this does not happen, these men leave and return to the mines repeatedly with the rhythmic rebound of a ball, and thus lose time, expend energy and waste money in the ceaseless travel. Every man who moves cityward brings others with him or spends his time traveling in the opposite direction.

Meanwhile the mines are neglected; the human side of mining is overlooked; improvements, residences, churches, which should be built in the villages, go to the city. The uplifting effect of superior mental culture and the exhibit of refining comfort are removed to urban centers. The problem which is personified by Ireland develops uninterruptedly in the United States. The time given to the mines is short, unsympathetic and begrudged, and the consideration the mines receive is wholly financial. The whole question to the owner is whether the mines are profitable to him, or not.

The criticism of Rockefeller, Jr., in the recent Colorado investigation revealed the difficulties of absenteeism, but did not explain how it could be avoided. But much of it can and will be removed if people once realize how unfortunate a condition it creates.

The Coal Age

Very glibly the coal men refer to this as the Coal Age, the period in which human effort is replaced by the energy of fuel and the burden of humanity is laid on the broad back of stored solar energy.

But he who would feel assured that we are in the Coal Age will do well to stay away from a coal mine and travel to some place where coal is expensive. For we who are most vociferous about the reign of coal are most deplorably lacking in the use of its energy.

Almost every ton of coal produced in the United States is loaded into mine cars by hand and much of it is double shoveled. Hardly any of the coal is drilled by machinery preparatory to shooting. A large proportion of it is still hand mined, pushed by men to the heading and hauled by mules to the tipple or at least to a parting. Dumping is usually partly performed by the strong arms of the dumpers as dump feeders are but rarely installed.

All in all, we doubt whether the mine managers are aware that this is really a Coal Age in any real sense of the word. It is true there are difficulties confronting mine managers, for the material is not brought to the machine as in a shop but *vice versa* and the factory is continually being extended and is often so poorly roofed as to be unsafe without continual care and even then the roof is so treacherous as to prohibit the use of workshop methods. But there are many mines where the roof is good and conditions favorable for installations of real mechanical efficiency. Yet even there we do not have them and, on second thought, why should we?

Very rarely, we will even risk contradiction by saying never, do we find a mechanical engineer in charge of mines. They come, these managers, from almost all lines of human endeavor except the machine shop or the department of mechanical engineering of a college. We never think of putting a machinery man in charge of a coal corporation.

No wonder we find such a slight resemblance between a mine and a factory but see instead large and rambling workings, two men or even one man to a room, no routing of work, no concentration of effort and really no adequate attempt at control.

We wonder at the cheapness of coal, yet how grossly inefficient our methods are. As we go along the aisles of a machine shop, every one is working but at a mine the hoisting engineer on a slope sometimes waits half an hour for a hoist, the dumpers are taking a meal in the middle of the forenoon as there are no cars. The motormen are waiting on the gatherers, and these in turn on the miners. Everywhere we go, a crowd of waiting, not working, men confronts us. It is all so cheerful and easy. Let us sit down now and take a smoke or a bite! After all the only place to enjoy a listless life such as David Grayson sketches is not on the country road but in the mine.

Sociological Department

Coal Company Makes an Exhibit of Practical Housekeeping

SYNOPSIS—At Lambert, Penn., and Gary, W. Va., an attempt is being made to encourage a higher standard of living through training the women and children in the arts of housekeeping by a practical demonstration in a simple, but model house.

The coal mining subsidiaries of the United States Steel Corporation have started an experiment in training their employees in practical housekeeping. Among the companies which have engaged in this work are the H. C. Frick Coke Co. and the United States Coal & Coke Co.

Some time ago, Miss Ida Tarbell, the well known publicist, introduced C. L. Close, manager of the Bureau of Safety and Sanitation of the United States Steel Corporation, to the practical housekeeping center of Miss Mable Kittredge on the East Side of New York. There is nothing pretentious in this work, only three rooms modestly furnished and they are only small rooms such as the poorer people of that section of the city inhabit.

Not an Elaborate Experiment

But training in sanitation and housework should be done in such homes as the students are living in. At least, the excellence of such rooms should but little exceed that of those which have to be kept in order by the pupils. A little interest in better furniture and equipment may be advantageously stimulated, but on the whole, the main lesson is how to do with what the pupils already possess.

And this lesson taught by Miss Kittredge has been followed by the coal-mining subsidiaries of the United States Steel Corporation of which Thomas Lynch is president. At Gary, W. Va., and Lambert, Penn., two ordinary miner's houses were taken and fitted up. At Lambert, the H. C. Frick Co. has taken one side of an 8-roomed house and furnished the 4 rooms at an expense of $259.32, a cost of $64.83 per room. The United States Coal & Coke Co. expended, at Gary, $210.89 in furnishing a 3-roomed house at an expense of $70.29 per room.

District Nurses Placed in Charge

The district nurses actually live in these houses and they exhibit how a house can be orderly and yet serve as a home. All the furniture was bought at the store in the vicinity of the houses equipped. The nurses show their pupils how to clean house, to cook, to sew, to take care of garbage, to clean up the yard, to plant flowers, to trade at the store, to ventilate the rooms, to take care of the sick and the babies, and teach anything which tends toward good morals.

The experiment is new, but we can easily see how it will reduce drunkenness by increasing the comfort of the houses and by providing a rival to the saloon for the possession of the earnings of the workers. It will advance the real patriotism of the families. Some people regard Americanization as the mere accepting of a new nationality, where as Americanism is better regarded as a creed, a belief of the workingman in himself, his future, his duty, his mission and his self respect. These things the practical housekeeping experiment will foster.

The Foreign-Born Adopt Lower Scale of Living Here Than at Home

The hope animating this experiment is that the foreign-born population will adopt an American standard of living. Strange to say, it is seriously to be suspected that the alien does not live as well here as in his own country, for he looks upon the United States as a temporary abiding place, a country in which to make money to be spent at his native home.

Moreover, the spirit of the pioneer is in the wanderer and no family restraints compel him to maintain appearances. When he returns to his home in Southern Europe, you find for the first time, that he has an appreciation of good clothes and creature comforts, for he prepares to dazzle the companions of his youth by purchasing an entirely new and pretentious outfit.

We do not suppose that the United States Steel Corporation has in view its personal advantage primarily in this development. But surely, it will be no small gain to have its working men and their families healthy and happy. Work will be steadier, a better class of men will be secured, the tonnage will be increased, and the houses will be better kept.

The Work of the District Nurses

The nurses will continue their duties as general wards of the health of the towns. They will make their house-to-house visitations, instructing the mothers and children as they go. The need is indeed great. A doctor, not with the Steel Corporation, once stated that delirium tremens was not uncommon among the children of foreign miners. The men divide up their potations with the younger members of the family who are even less able than their elders to assimilate the alcohol.

It may be remarked that Miss Kittredge has written a little book on "Practical Homemaking," which is published by the N. Y. Century Co. It is a simple little book and contains no reference to what is often pretentiously called "Social Science." So much of what is published is suitable to college graduates and Chatauqua students. This book is a simple description of how to live, and there is more to learn about that than some people think.

We forget how much we have already assimilated and what a large amount the more ignorant of our immigrants need to learn. Many of our cleanly habits are now no longer "reasoned" but a result of a second nature. To some of our less fortunate employees, we must use much reasoning and demonstration, to make them appreciate what we are mentally incapable of doubting.

Discussion By Readers

A Useful Hitch

Referring to the description of a useful hitch, given in Coal Age, Mar. 14, p. 435, I want to describe another hitch that will serve the same purpose but permit the load to be released with greater ease, provided it is a rod or bar that cannot be slipped out of a knot. I thought this would be of interest to readers who are sometimes required to make such a hitch.

Referring to the accompanying illustration, *AB* represents the rope to which it is desired to attach a load, say

How to Make a Releasing Hitch

at a point *C*, Fig. 1. First make a loop at *C*, as shown in Fig. 2, and wrap the double end around the load *RR*, as shown in Fig. 3. Now, doubling the rope at *D*, insert it through the loop *C* and tighten by pulling on the end of the rope at *B*, which will give the knot shown in Fig. 4.

Finally, again doubling the rope at a point *E*, pass this through the loops *C* and *D*, in a similar manner as before, and tighten the entire knot by taking a strain on the rope *A*. The finished knot will appear as shown in Fig. 5.

To unfasten the knot and release the load, it is simply necessary to pull the end *B* of the rope, when the entire knot will fall to pieces. This knot was shown to me by an old boatman on the upper reaches of the river Thames, England. He used this knot to tie the painters of his boats to the iron rings in the wharf.

Safety or Refuge Chambers in Mines

Letter No. 3—The article by Charlton Dixon, Coal Age, Mar. 21, p. 498, drawing attention to the need of providing refuge chambers in mines, is a most important and timely subject to discuss in Coal Age, especially at this time when "Safety First" is being so much preached, and practiced to such an extent by some of the largest coal corporations in the United States and Canada.

Personally, I believe that such refuge chambers should be provided in every coal mine that employs 50 or more men underground, and that this should be made compulsory by law, in every state or province in which coal mines are located. I advocated the installation of refuge chambers in coal mines, some time since, in an article entitled Safety First—the Slogan Cry, Coal Age, Vol. 3, p. 790. In that article, I advised that such a station should be provided for each district in the mine and connected to the surface by a compressed-air line carried through boreholes. I suggested telephone connection with the offices on the surface, and an equipment of first-aid cabinets, stretchers, medicine chests and supplies of concentrated food packed in damp-proof cases; also electric lamp installation, rescue apparatus, compressed-oxygen cylinders and pulmotors, for use if needed.

To observe how previous disasters testify to the need and value of such refuge stations in mines, we need only to take a glance backward at the history of coal mining in this and other countries. The Courrières mine explosion that occurred in France, Mar. 10, 1906, and which was the greatest disaster in mining history, claimed the lives of practically 1200 men. There is evidence that hundreds of these men lived for days after the explosion and some of them existed for two weeks on the bark of mine timber and the putrid flesh of horses.

At the Monongah disaster, Dec. 6, 1907, which claimed 361 lives, a refuge chamber in the mine would have been the means of saving a large number of those who were lost. In that disaster, some of the men were found with their heads in the ditch, striving to obtain a breath of fresh air traveling along the floor of the entry.

At the Primero explosion, Jan. 31, 1910, when 75 lives were sacrificed, at least eleven men must have lived for hours after the disaster, since one man found with these eleven was resuscitated after hard work and lived.

At the Fernie disaster, in British Columbia, May 23, 1902, when 127 men lost their lives, 58 of these lived for 48 hours, when they finally succumbed to the gas which leaked through the stoppings.

A refuge chamber would have saved 26 men, at the Bellevue mine explosion, in Alberta, Dec. 9, 1910, when 31 men were killed, including one of the rescue party. Had such a chamber been provided in this mine, the number killed would have been reduced to five. I found 21 men lying along the ditch, at a compressed-air charging station near chute No. 84, striving for fresh air. All of these would have been saved, had a refuge hole been available. In this disaster, eight men were rescued on the same entry, 10 hours later, at a point over 2000 ft. inby. All entrapped in the mine might have been saved, had they known that that portion of the mine was unaffected by the explosion and fled hither.

At the mine fire that occurred at Cherry, Ill., Nov. 13, 1909, where, according to the Illinois Coal Report, 267 lives were lost, written messages, several of them very pathetic, addressed to the dear ones on the surface, were found with the bodies of the victims. One of these messages showed that some of the men were conscious up to 48 hours after the fire started. The men had constructed several paddle fans, from parts of drilling ma-

chinery and pieces of boards. As stated in one message, these were made with the forlorn hope of stirring up the air, to enable them to reach the shaft. In this disaster, 21 men saved their lives by erecting a barricade or stopping in one of the entries, building it with powder cans, stones and mud. These men were rescued seven days after the fire occurred.

At Delagua, Colo., Nov. 8, 1910, there was a fire and an explosion in which 33 men were killed by the deadly gas or afterdamp and 46 by the violence of the explosion. It is probable that a large percentage of those killed by the afterdamp, could have been saved had a refuge chamber been provided in this mine. Four men were rescued seven or eight hours after the explosion occurred. These were found behind a brattice, which they had erected to keep back the afterdamp.

In the Price-Pancoast mine fire, at Throop, Penn., Apr. 7, 1911, when 73 lives were lost, it is possible that many could have been saved in a refuge chamber.

The above are only a few cases that can be produced to demonstrate the fact that many lives can be saved by providing refuge chambers to which men entrapped in the mine could retreat. I want to again urge that there should be such a provision made in every mining law.

Windham, Mont.

The Air Factor in Mine Explosions

The article by John Verner, Coal Age, Apr. 11, p. 603, revives the subject to which he has often drawn attention; namely, the counter-current as a strong factor in propagating a mine explosion.

In this connection, I would like to ask Mr. Verner to explain, on his theory, the effects produced by two experiments made in England and one made in France. These are No. 25, of the Altofts series and No. 263, of the Eskmeals series, in England; and No. 287, of the Liévin series, in France.

In each of these cases, an extraordinary or abnormal force was developed; but, so far as the writer knows, no lucid explanation for the phenomena observed was offered by the committee in charge of the experiment. I have suggested that "detonation" was the only possible explanation of these phenomena. I would ask Mr. Verner where he can find any evidence of a "counter-current" in the cases I have named.

The fifth report of the Explosions in Mines Committee, p. 8, says:

> The method that we have employed in our large gallery has been to use one cannon only, and to place in front of its muzzle a tube about 3 ft. in diameter and 10 ft. long, with a layer of coal dust strewn evenly along it. On the cannon being discharged into this tube a dense cloud of ignited dust is driven forward, and this displaces and ignites coal dust placed on shelves around the gallery. No air current is used.
>
> That this means of ignition produces an inflammation capable of developing into an explosion of great violence, under suitable conditions, is evident from an experiment (No. 263), in which an explosion in the large gallery was communicated, through a funnel-shaped junction, to the 3-ft. gallery strewn with coal dust (½ lb. to each linear foot).
>
> In this case the violence of the explosion set up in the small gallery was such as to rip it open at four separate places, after the flame had traveled 200 ft. down the small gallery. This experiment shows that we have at command a method of ignition of coal dust by which explosion both of moderate and of a violent character can be developed in our experimental galleries.

In experiment No. 263, coal dust was laid for 200 ft. on the floor of the large gallery, and for 400 ft. along the small gallery and at the bend joining these two galleries. I wish to direct Mr. Verner's attention, particularly, to the difference between these two experiments, quoted from the British records; namely, that in one case there was no ventilating current, while, in the other case, the ventilating current was present; but explosion developed in both cases.

Many authorities claim that a dense cloud of coal dust is necessary to produce an explosion; but later experiments have shown that so little as 0.023 oz. per cu.ft. of air is quite sufficient to propagate an explosion. This quantity is so slight that it cannot be detected with the naked eye. It remains yet to be proved that inert dust will prevent the extension of an explosion, to the degree that its advocates claim. On the other hand, the fresh coal dust continually arising from cars in transit and floating in the mine air will, in most cases, amount to more than the amount stated above (0.023 oz. per cu.ft. of air) as necessary to produce explosion.

In closing, permit me to say that I do not recall a single case of mine explosion where the explosive combustion of suspended dust occurred under conditions restricting the power of the "reverse impulse" to induce a strong draft of dust-laden air moving in an opposite direction to that of the flame. In the cases I have mentioned, the speed of the explosive wave must have been far too great to allow of the operation of a reverse impulse such as Mr. Verner suggests.

James Ashworth, Mining Engineer.

Vancouver, B. C., Canada.

Gasoline Motors in Mines

In view of the fact that much has been written regarding the advantages of gasoline motors in respect to mine haulage, I think it would be well to discuss or draw attention to some disadvantages of this class of locomotives for use in coal mines. It seems strange that many writers in dealing with this subject seem to attach little importance to the discharge of the engine as vitiating the mine air. It has even been advocated that these motors be used on intake haulage roads. In my own experience, as mine inspector, I have only come into contact with one instance where gasoline motors were employed in the mine. I regard them as a nuisance, because of the pollution of the mine atmosphere by the exhaust gases of combustion. The trouble and danger are greatly aggravated by the use of a poor quality of gasoline, or by a defective engine, resulting in the incomplete combustion of the gasoline. In one instance, I recall, when the air was badly fouled in the entry, only three of the four cylinders of the engine were working, with the result that the gasoline from that cylinder was vaporized without being consumed and exhausted into the air. Complaints, in this mine, were numerous, although there was 2000 cu.ft. of air in circulation, per ton of weight of the motor, which is double the allowance stated in the Article, Coal Age, Vol. 4, p. 979.

Mine Inspector.

———, Ill.

Fan Ventilation

Referring to the discussion in regard to the installation of a 6-ft. disk fan to improve the circulation in a mine ventilated, at the present time by a 12-ft. centrifugal fan producing 80,000 cu.ft. of air per min. under a 3.5-in. water-gage, COAL AGE, Apr. 18, p. 658, permit me to ask:

Assuming the above circulation is insufficient and that it is suggested to install a 6-ft. disk fan on the other side of the mine from the present fan, both fans to work in parallel, while ventilating separate sections of the mine but using the same return air course for a distance of one mile; if the resistance of the return air course is, say 1.5 in. water gage and the 6-ft. disk will only produce 1.2-in. water gage, will these fans work successfully together? I have never seen a 6-ft. disk fan, in operation at a mine, produce over 1.2-in. water gage.

I have in mind an instance where an 8-ft. disk fan was installed to improve the circulation in a mine, under similar conditions to those suggested by Mr. Hopkins, except that, instead of one main-return airway, both fans discharged into an upcast shaft 80 ft. deep; but this plan did not work successfully.

CONSTANT READER.

Punxsutawney, Penn.

When two fans are operated in parallel, that is to say, both fans blowing or both exhausting, there is no reason why the installation should not be effective, to the extent of the capacity of each fan. As stated previously, COAL AGE, Mar. 28, p. 539, it is always necessary, in such case, to balance the respective circulations. It is also necessary not to expect or demand a greater service of either fan than that of which it is capable. For instance, Constant Reader here assumes that the resistance of the return airway used in common by both fans will equal a 1.5-in. water gage, and states that the 6-ft. disk fan to be installed will only produce a 1.2-in. water gage, which, if true, would not be a successful installation.

The statement on p. 539, relating to the capacity of a disk fan, should read 50,000 cu.ft. per min., against a water gage varying from 1 to 1.5 in. For the same power driving the ventilator and allowing for a decrease in efficiency when working under a higher gage, it might be assumed that the 6-ft. disk fan would circulate, say 20,000 cu.ft. of air against a water gage of 3 in., which would make due allowance for the resistance of the section of mine ventilated by this fan, in addition to the assumed resistance of the main-return airway. Whether or not this quantity of air would be sufficient for the ventilation of that section would depend wholly on the conditions in the mine in question.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Dividing by 10, 100, 1000, Etc.—To divide a whole number by 10, 100, 1000, etc., point off as many places from the right of the number as there are ciphers in the divisor. Thus,

$$52{,}687 \div 100 = 526.87.$$

To divide a decimal number by 10, 100, 1000, etc., move the decimal point as many places to the left as there are ciphers in the divisor, prefixing ciphers, if necessary, to complete the number. Thus,

$$145.675 \div 10 = 14.5675$$
$$3.463 \div 100 = 0.03463$$
$$0.025 \div 1000 = 0.000025$$

DECIMAL EQUIVALENTS OF FRACTIONS

Fraction	Decimal	Fraction	Decimal	Fraction	Decimal	Fraction	Decimal
1/64	0.015625	17/64	0.265625	33/64	0.515624	49/64	0.765625
1/32	0.03125	9/32	0.28125	17/32	0.53125	25/32	0.78125
3/64	0.046875	19/64	0.296875	35/64	0.546875	51/64	0.796875
1/16	0.0625	5/16	0.3125		0.5625	13/16	0.8125
5/64	0.078125	21/64	0.328125	37/64	0.578125	53/64	0.828125
3/32	0.09375	11/32	0.34375	19/32	0.59375	27/32	0.84375
7/64	0.109375	23/64	0.359375	39/64	0.609375	55/64	0.859375
1/8	0.125	3/8	0.375	5/8	0.625	7/8	0.875
9/64	0.140625	25/64	0.390625	41/64	0.640625	57/64	0.890625
5/32	0.15625	13/32	0.40625	21/32	0.65625	29/32	0.90625
11/64	0.171875	27/64	0.421875	43/64	0.671875	59/64	0.921875
3/16	0.1875	7/16	0.4375	11/16	0.6875	15/16	0.9375
13/64	0.203125	29/64	0.453125	45/64	0.703125	61/64	0.953125
7/32	0.21875	15/32	0.46875	23/32	0.71875	31/32	0.96875
15/64	0.234375	31/64	0.484375	47/64	0.734375	63/64	0.984375
1/4	0.25	1/2	0.5	3/4	0.75	1	1.

For the sake of illustration, the following example is given, showing two methods of operation.

Example—Reduce the fraction 1/64 to a decimal.

Solution—Annex decimal ciphers to the numerator and divide by the denominator, continuing the operation as far as desired, or until the division is complete. Thus,

```
64)1.000000(0.015625
   64
  ---
  360
  320
  ---
   400
   384
   ---
    160
    128
    ---
     320
     320
     ---
```

A shorter method is to divide by any simple factors of 64, by short division; thus,

```
8)1.000
  ---
8)0.125000
  ---
0.015625
```

The Coal Age Pocket Book

When the division is complete and there is no remainder the decimal expressed by the quotient is the exact equivalent of the original fraction; otherwise the value of the decimal is only approximate.

PERCENTAGE

The term "percentage" is derived from the Latin words "per centum," meaning, by the hundred. This is abbreviated in English and written "per cent."

The expression indicates a certain rate or proportion referred to 100, and any given percentage, therefore, expresses the number of parts in one hundred or the parts per hundred.

How Written—Percentage, expressing hundredths, is usually written numerically as a decimal; thus, 3 per cent. (3/100) is written 0.03; 15 per cent., 0.15; 40 per cent., 0.40; 2½ per cent., 0.025, etc.

Illustration—The return-air current, in a certain mine, contains, say 5 per cent. of gas. This means that in each 100 volumes of the current, there are 5 volumes of gas. The gas, therefore, forms 5/100 of the total volume of the current. If the current measures 100,000 cu.ft. per min. the quantity of gas is

$$0.05 \times 100{,}000 = 5000 \text{ cu.ft. per min.}$$

Again, a certain slope road in a mine, has a grade of 12.5 per cent., which means that the slope dips 12½ ft. in each 100 ft. of its length. If the length of the slope is 2000 ft. the total dip or fall is

$$0.125 \times 2000 = 250 \text{ ft.}$$

In other words, the elevation of the mouth of the slope is 250 ft. above that of the foot of the incline.

Example—What quantity of marsh gas is being generated in a mine when the return-air current measures 60,000 cu.ft. per min., and a careful test made in that airway shows 2.3 per cent. of gas is present in the current?

Solution—The quantity of gas carried in the return-air current is

$$0.023 \times 60{,}000 = 1380 \text{ cu.ft. per min.}$$

Example—How much air will be required to be circulated in the mine, in the last example, to reduce the percentage of gas in the return airway to 1.5 per cent.?

Solution—The volume of gas generated in the mine is 1380 cu.ft. per min. If this is 1.5 per cent. of the circulation, the latter must be

$$1380 \div 0.015 = 92{,}000 \text{ cu.ft. per min.}$$

Example—In the same mine mentioned in the two previous examples, what would be the percentage of gas in the return airway if the circulation was suddenly reduced from 60,000 to 40,000 cu.ft. per min.?

Solution—Assuming that the quantity of gas given off in the mine remains unchanged, the percentage of gas, after the circulation was reduced would be

$$\frac{1380 \times 100}{40{,}000} = 3.45 \text{ per cent.}$$

Inquiries of General Interest

Mine Resistance in Fan Ventilation

I would like to have the following questions answered in COAL AGE:

1. What effect has mine resistance on the water gage produced by a ventilating fan?

2. Is it not possible for a mine-ventilating fan to develop the same water gage when running at a high speed and discharging into the open atmosphere, that it would if made to discharge into the mine?

3. In my opinion, the speed of the fan and not the mine resistance, governs the water-gage reading. Is this correct?

4. Assuming that a ventilating fan, substantially built and 25 ft. in diameter, produces 250,000 cu.ft. of air per minute, against a 3-in. water gage, at a speed of 70 r.p.m.; is it not possible to double the capacity of this fan, so that it will produce 500,000 cu.ft. per min., by increasing the speed of the fan?

5. Will a fall of such size as to reduce the area of the main-return airway in a mine 75 per cent., be indicated by the water gage in the fan drift showing an increase of pressure?

P. H. DEVERS.

Nanticoke, Penn.

We will endeavor to answer these questions in the order in which they are asked:

1. For the same speed of the fan, any *increase* in the resistance offered by the mine airways to the passage of the ventilating current, is accompanied by a corresponding increase in the water-gage reading in the fan drift; and, likewise, any *decrease* in mine resistance is accompanied by a corresponding decrease in the water-gage reading.

2. There will be, practically, no water-gage reading when a fan discharges directly into the open atmosphere, whatever the speed of the fan, assuming, of course, that the fan is blowing. It should be remembered that whether the fan is blowing or exhausting, the water-gage reading is due to and caused by the resistance of the mine to the passage of the air current. This resistance is sometimes called the "drag" of the air. If this resistance is cut off, the water-gage reading drops at once to practically zero, whatever the speed of the fan. (Beard's Ventilation of Mines, Introduction and pp. 42 and 96.)

3. The speed of the fan governs the water-gage reading *only* by increasing the circulation in the mine and thereby increasing the mine resistance. But, the speed of the fan cannot be said to "govern the water gage," inasmuch as when there is no mine resistance there is no water gage produced, though the speed of the fan be kept constant or even increased.

Properly speaking, *the fan operated at a given speed creates what the mine resistance causes.* The operation of the fan gives velocity to the air, which develops a certain resistance in its passage through the mine, depending on the velocity of the current. This resistance, per unit of sectional area in the fan drift, is measured by the water-gage reading. It is for this reason that the same fan, running at the same speed, produces different water-gage readings, at different mines, according to the quantity of air such mine will pass under a given water gage. The product of the two factors, *quantity* and *pressure,* determines the *power on the air* and is the proper index of the capacity of the fan.

4. It is generally assumed that the volume of air in circulation, in fan ventilation, is proportional to the speed of the fan. By this rule, a fan producing 250,000 cu.ft per min., at 70 r.p.m., would produce 500,000 cu. ft. per min., at a speed of 140 r.p.m., assuming the conditions in the mine remain unchanged. As a matter of fact, however, the *efficiency* of the fan decreases as the speed increases, but not in the same proportion.

Practically, the fourth power of the speed of the fan varies as the fifth power of the quantity of air in circulation, for the same mine or airway. In other words, the fourth power of the speed ratio is equal to the fifth power of the quantity ratio. By this rule, the above fan would produce at 140 r.p.m. about 435,000 cu.ft. per min., in the same mine or airway. To produce 500,000 cu.ft. per min. or double the previous circulation, would require, by the same rule, a speed of 166.5 r.p.m., owing to the decrease in the efficiency of the fan at the higher speed.

5. Assuming the fan is exhausting, a fall in the main-return airway of such size as to reduce its area 75 per cent. or, say from 60 to 15 sq.ft., would certainly add to the resistance of the mine. As a result, for the same power applied to the fan shaft, the fan would run a trifle faster, which, however, would hardly be appreciable; but a smaller circulation of air would be produced under an increased water gage.

In case the fan was blowing and the same fall occurred in the main-return airway, the circulation would be partially blocked, as before; but, in this case, the mine intervenes between the fan and the obstruction; and, as a result, the increase in water gage might be less than in the previous case, owing to greater leakage of air under the increased pressure.

Height of Barometer in Millimeters

Kindly state what is the normal height of the barometer, at sea level, in the metric system.

X.

Shenandoah, Penn.

The universally adopted standard reading, for the normal height of the mercurial barometer at sea level, in the metric or French system, is 760 mm. This is equivalent to a height of $760 \times 0.03937 = 29.92 +$ in., in the English system.

In accurate calculations, all barometer readings are reduced to "standard readings," which assume a temperature of 0° C., or 32° F. of the mercury column.

Examination Questions

Mine Manager's Examination Held at Springfield, Ill., April 20, 1914

Ques.—Commencing at the southwest corner of a piece of land and running a line 1720 ft. north, thence east, 2650 ft.; what will be the length of the remaining side of this piece and how many acres will it contain?

Ans.—This piece of land lies in the form of a right triangle, the third or remaining side being the hypotenuse, and its length is

$$\sqrt{2650^2 + 1720^2} = 3159.25 \; ft.$$

Since there are 43,560 sq.ft. in an acre, the number of acres in this piece is

$$\tfrac{1}{2} \; (2650 \times 1720) \div 43{,}560 = 52.32 \; acres.$$

Ques.—How many tons of coal are there in the above piece of land, the coal seam being 6 ft. thick and the specific gravity of the coal 1.26, allowing 27 cu.ft. per ton of coal in place, and 35 per cent. for waste in mining?

Ans.—The cubic contents of this seam underlying the tract of land described in the previous question, when the thickness of the coal is 6 ft., is

$$\tfrac{1}{2} \; (2650 \times 1720) \times 6 = 13{,}674{,}000 \; cu.ft.$$

Allowing 27 cu.ft. per ton of coal in place and 35 per cent. for waste, making 65 per cent. of the coal mined as lump coal, the weight of coal mined on this basis is

$$0.65 \; (13{,}674{,}000 \div 27) = 329{,}188+ \; tons.$$

The specific gravity of the coal does not, in this case, enter the calculation, since the weight of the coal is given as a ton per cubic yard.

Ques.—The total rubbing surface of a square airway being 160,000 sq.ft., the length of airway, 5000 ft.; if the quantity of air passing is 80,000 cu.ft. per min., what is the velocity of the air current, in feet per minute?

Ans.—The perimeter of this airway is found by dividing the total rubbing surface by the length of the airway; thus, $160{,}000 \div 5000 = 32$ ft. The airway being square, the length of one side is $32 \div 4 = 8$ ft.; and the sectional area of the airway is $8 \times 8 = 64$ sq.ft. The quantity of air in circulation being 80,000 cu.ft. per min., the velocity of the air current is $80{,}000 \div 64 = 1250$ ft. per min.

Ques.—How many cubic yards are there in a rectangular shaft 360 ft. deep, 12 ft. long and 6.5 ft. wide? What will be the cost of excavating this shaft at $1.93 per cubic yard?

Ans.—The sectional area of the shaft is $12 \times 6.5 = 78$ sq.ft. The cubic contents is then $78 \times 360 \div 27 = 1040$ cu.yd.

The cost of excavating this shaft at $1.93 per cu.yd. is $1040 \times 1.93 = \$2007.20$.

Ques.—What horsepower will be expended in circulating 20,000 cu.ft. of air against a mine pressure of 1.75 lb. per sq.ft.? If the quantity of air is increased to 30,000 cu.ft. per min., what will be the horsepower?

Ans.—The horsepower of the first circulation is found thus,

$$H = \frac{Qp}{33{,}000} = \frac{20{,}000 \times 1.75}{33{,}000} = 1.06 \; hp.$$

To increase this circulation in the same mine will require an increase of power in proportion to the cube of the quantity. In other words, the power ratio is equal to the cube of the quantity ratio. The required horsepower, in this case, is

$$H = 1.06\left(\frac{30{,}000}{20{,}000}\right)^3 = 1.06\left(\frac{3}{2}\right)^3 = \frac{1.06 \times 27}{8} = 3.57 \; hp.$$

To circulate the larger quantity of air (30,000 cu.ft. per min.) against the same water gage (1.75 lb. per sq.ft.) will require the power to be increased in the same ratio as the quantity, or half again as much power; thus, $1.06 \times \frac{3}{2} = 1.59$ hp.

Ques.—In what time can an engine of 40 effective hp. pump 4000 cu.ft. of water from a depth of 430 ft.?

Ans.—Since 1 hp. is equal to 33,000 ft.-lb. per min.; and, the weight of 1 cu.ft. of water being 62.5 lb., the time required, in this case, is

$$\frac{4000 \times 62.5 \times 430}{40 \times 33{,}000} = 81.4 \; min.$$

Ques.—What is the breaking strain and safe working load of a good steel hoisting rope 1⅜ in. in diameter?

Ans.—The breaking strain of a crucible-steel, 6-strand, 19-wire, hoisting rope is 39 tons; and, since the strength of rope increases with the square of the diameter, the breaking strain of a 1⅜-in. rope of the same kind is

$$Breaking \; strain = 39 \times 1.375^2 = 73.73 \; tons.$$

Assuming a factor of safety of 5, which is common practice in moderately deep shafts, the safe working load for this rope is $73.73 \div 5 = 14.75$ tons

Ques.—A sample of firedamp taken from the mine is found to have a specific gravity of 0.9; what are the proportions of the mixture?

Ans.—Assuming that this mixture contains only pure mash gas (CH_4) and air, and indicating the percentage of gas in the mixture by x, the specific gravity of the gas referred to air being 0.559, the relative weights of gas and air, in 100 parts of the mixture, are as follows:

$$\text{Gas} = 0.559 \, x$$
$$\text{Air} = 1 \; (100 - x)$$

The total relative weight of 100 parts of this mixture is, therefore, $100 - x + 0.559 \, x = 100 - 0.441 \, x$. The relative weight of the same volume (100 parts) of air is $100 \times 1 = 100$. Since the specific gravity of the mixture is equal to the ratio of the relative weights of equal volumes of the mixture and air, we have

$$\frac{100 - 0.441 \, x}{100} = 0.9$$

and

$$x = \frac{100 - 90}{0.441} = 22.67 \; per \; cent.$$

The proportion of gas in this mixture is, therefore, 22.67 parts in 100 parts of the mixture; or there are 22.67 parts of gas to 77.33 parts of air, or one part of gas to 3.41 parts of air.

Coal and Coke News

Washington

In the advanced rate case before the Interstate Commerce Commission during the hearing on Monday, Apr. 27, exhibits were filed on behalf of the Pittsburgh Coal Co. dealing with the financial condition of railroads in the eastern territory over a period of 16 years. It is claimed that the gross returns of the transportation companies in 1913 were the largest in their history. The charge was made that the increase of these revenues last year over 1912 for all roads exceeded $131,000,000, or more than 10 per cent. The Pennsylvania Lines show an increase of nearly $40,000,000, or 11 per cent.; the New York Central Lines more than $32,000,000, or nearly 12 per cent.; and the Baltimore & Ohio Lines more than $9,000,000, or about 10 per cent.

The exhibits seek to argue that, contrary to the belief of the public, it has not been the increase in wages to employees, but the large increase in expenditures for maintenance of equipment and way and structures that is primarily responsible for the railroads' claim of reduced net earnings. One of the exhibits shows that the principal expense item consisting largely of wages bears a less proportion to the total operating expenses in 1913 than for any single year since 1898; that maintenance of equipment bears a larger proportion to total operating expenses than for any single one of the 16 years preceding, and maintenance of way and structures a larger proportion in 1913 than for any year since 1907. The exhibits show that the two principal items of maintenance expenses have increased enormously over any preceding year and that if these expenditures had not been so unusually large in 1913, the railroads would have been able to show for that year larger net earnings than for any previous year.

On the question of increased wages which the railroads have emphasized in their campaign for an increase in rates, the exhibits show for all the Pennsylvania Lines that in 1913 less than 50c. out of every dollar of operating expenses went for transportation-traffic expenses, the latter item consisting most largely of wages to employees. This 50c. was the lowest of any single year since 1898. For the New York Central Lines nearly 54c. out of every dollar spent in 1913 went to the transportation and traffic item, this amount being the lowest since 1906; and for the Baltimore & Ohio Lines this item in 1913 showed also 54c. out of every dollar of operating expenses, being the lowest since 1908 with the exception of 1910.

In contrast with this wage item of operating expenses, the exhibits show the encroachment of maintenance of equipment and of way and structures upon the total operating expenses of these large systems. In 1913, for every dollar spent for operating expenses by the Pennsylvania Lines, 44c. went to these two maintenance items, exceeding any other single year since 1900; for the New York Central Lines the same general statement is true since 1906, maintenance in 1913 absorbing 43c. out of every dollar. For the Baltimore & Ohio Lines, in 1913, the two maintenance items also required 43c. out of every dollar, being exceeded in only four of the preceding 16 years.

One conclusion that seems inevitable from an examination of these statistics and diagrams is that the question before the Commission, instead of being one of insufficient revenues, or one of increase in rates, is really a question of its approving of these unusual maintenance expenditures by the roads. If these largely increased maintenance expenditures are approved by the Commission and are justified as normal it would seem that an increase in rates might naturally follow; that if this approval is not forthcoming, then it would seem that the increased gross earnings of the railroads in the Eastern territory are more than sufficient for the normal needs of the carriers provided their maintenance expenditures are kept within bounds. The question of these unusual expenses for equipment and way and structures promises to become overshadowing.

HARRISBURG, PENN.

The belief now exists here that the Interstate Commerce Commission will not order a rehearing for the industrial railroad lines which were denied joint rates with other railroads under a recent order. The Commission issued an order in January that the industrial railroads were not entitled to the proportion of the through rate they had been getting, and ruled that such a division amounted to a rebate.

There has been no positive assurance as to what the commission will do, but it is generally understood that the attitude is taken that the industrial railroads have had ample opportunity to present their side of the case without a rehearing. The consensus of opinion is that the order of the Commission will stand.

Shippers depending upon the industrial railroads, other than those controlling the short lines, are complaining that the new arrangement has resulted in serious discrimination against them. With their through rates cancelled, it will be necessary for the industrial lines to increase their tariffs, thus making the through rate much higher than heretofore.

The Consolidated Coal & Coke Co., which has its mines located along the Union R.R., has already filed a complaint with the Commission, declaring that the new tariffs of that line are such that it is impossible for the coal company to compete with the other coal operators of the Pittsburgh district. Because of the new rates the mine has been closed and the miners thrown out of employment.

The Consolidated Co.'s mine is located in Allegheny County and it is expected that other coal operators along the Union, the Monongahela Connecting and other industrial railroads will file a similar protest.

The industrial lines protested vigorously against being denied a share of the through tariffs with the trunk lines, but the commission has so far refused to modify its order.

The other initial lines are fearing under the operation of the Interstate Commerce Commission's order inhibiting monetary allowances in the guise of through rate divisions to certain terminal railroads, notably the Union, Monongahela Connecting and the St. Clair in the Pittsburgh district, the Wabash-Pittsburgh Terminal is suffering acutely, not having received any freight from any of the three industrial lines mentioned since the first instant, when the commission's order became effective. Practically, the only access to the tonnage producing concerns of this district for the Wabash-Pittsburgh Terminal is by way of the rails of one or the other of the terminal lines in question.

PENNSYLVANIA

Anthracite

Shamokin—Five hundred men and boys at the Hickory Swamp Colliery operated by the Susquehanna Coal Co., recently went on strike because some non-union men reported for duty.

Pottsville—Four men were killed at the Pine Hill Colliery recently, when the cage in which they were ascending upset and they were dashed to the bottom of the shaft 400 ft. below. The men were all foreigners. It is believed that the cage struck some obstruction.

Mahanoy City—Masked robbers invaded the workings of the Mahanoy City colliery on the night of Apr. 25, and at the point of pistols robbed a driver boy of his two weeks' pay amounting to $24. The robbers planned to rob the men on the night shift who received their pay on the above date, but the plan miscarried.

Girardville—McTurk Colliery suspended operations on Apr. 25, to remain idle for three months while a new slope is being sunk and old workings are being reopened, throwing 300 employees out of work.

Hazleton—Six hundred union miners recently struck and tied up the Hazle Colielry because 12 men did not pay their back dues for reinstatement into the United Mine Workers. The Lehigh Valley Coal Co., on Apr. 23, closed the operation indefinitely. A "button strike" is also threatened at Beaver Brook.

Harrisburg—Steps are to be taken early in May by the Auditor General's Department to prepare the way for collection of the state tax on anthracite coal in case the constitutionally of the statute of 1913 should be upheld. Practically all of the hard-coal operators in the state have filed reports of their output for 1913 and these will be used as a basis for calculation of the tax, the coal consumed in operation of mines and from washeries being excepted. The de-

partment is estimating the taxes on corporations which failed to file their reports for 1913.

Shenandoah—Fire on Apr. 25 destroyed the Indian Ridge colliery boiler house containing 10 boilers, and for a time threatened an oil house and a powder magazine close by, containing 500 kegs of powder and a large quantity of dynamite.

Bituminous

Pittsburgh—Six suits were entered in the United States District Court, Apr. 24, against the Monogahela River Consolidated Coal & Coke Co., by women whose husbands were killed in an explosion in the Cincinnati mine of the above company on Apr. 23, 1913. In each case damages are asked to the amount of $10,000.

Canonsburgh—The Hazel mine of the Pittsburgh-Buffalo Co. recently resumed operations after being idle since Apr. 1. The miners at first demanded being paid on the run-of-mine basis, but later voted to return to work even though this proposition was refused.

Du Bois—No result followed the joint conference of operators and miners of District No. 2 in Clearfield, on Apr. 25. The miners have, however, decided to submit the question of signing the 1912 scale to a referendum vote of the district. If the scale is accepted work will be resumed at once.

Summerville—It was recently announced that Mines Nos. 5 and 6 of the Pennsylvania Coal Corporation would reduce operations to three days per week until further notice. It is expected that this arrangement will cause a number of men to seek employment in other fields.

MARYLAND

Frostburg—While leaving the Ocean No. 1 mine of the Consolidation Coal Co. on the evening of Apr. 21, four miners were killed by a fall of slate. It is reported that a driver heard the roof breaking and called to the men to get out of the entry. This they were, however, unable to do.

WEST VIRGINIA

Bluefield—The annual meeting of the West Virginia Medical Society will be held in this city May 13-15 inclusive, and will be made the occasion of an exceptional program calculated to attract the population of the Pocahontas coal field and surrounding sections. Contests in first-aid work will be a special feature of the program, and many valuable prizes have already been donated.

Charleston—Because Superintendent Sandberg, of the Dorothy mine of the Four States Coal Co., refused to participate in the joint meeting of the miners and operators recently held in this city, 500 miners laid down their tools.

A deadlock resulting from the attempt to agree upon a wage scale for the coming year, the joint scale committee of miners and operators for District 17 adjourned on Apr. 24. All efforts are being made, however, to reach an amicable settlement shortly without a suspension of work.

TENNESSEE

Whiteside—The New Etna Coal Co. is making plans for improving its transportation facilities so as to shorten its six mile haul from the mines. The company has located Etna blacksmith coal in a tract of 400 acres and is prospecting extensively, at the same time making continued improvements in equipment and operation.

KENTUCKY

Hawesville—Test holes are being drilled by S. H. Allen and D. G. Duncan, who have leased the farm of J. B. Adams and adjoining properties, which are known to lie over veins of good coal. As soon as the operators agree on the best location for the sinking of a shaft work of developing the mine will be pushed forward. It is the plan of Mr. Allen and Mr. Duncan to have operations under way by early fall.

Louisville—Local coal operators and agents are participating in bidding advertised for by the Mississippi River Commission and the United States Engineer's office in St. Louis, the total requirements making some 50,000 tons, for river shipment.

Bridgeport—The power house of the Barton Coal Co. at this place was destroyed a few nights ago by a fire of mysterious origin. The damage was considerable.

OHIO

New Straitsville—Taylor, Williams & Jenkins closed a lease with Henry Watkins and Albert Groff whereby the latter secure a large tract of coal lands in the Whippoorwill Valley. It is the intention to develop the property during the summer.

Columbus—The conference of operators and miners which was in session in Columbus for four days adjourned sine die Friday, Apr. 24, without arranging a wage agreement. In fact the indications for an immediate settlement of the wage scale apparently were rather remote at the time of the adjournment of the conference.

The proposition of the miners, calling for a scale of 49.64c. per ton for machine-mined coal on the mine-run basis was rejected by the operators on the ground that it was entirely too high and they could not afford to pay that scale.

Just before adjourning a resolution was adopted giving the operators and miners in the various subdistricts of the state power to agree upon a scale for the subdistrict if possible. It was stated by several eastern Ohio operators that a settlement of the wage scale in certain subdistricts of that part of the state might be effected on the Pittsburgh basis of 64.64c. for pick mining and 44.76c. for machine mining, mine-run basis.

INDIANA

Indianapolis—According to reports made at the International headquarters, Apr. 25, the action of the Policy Committee of the United Mine Workers of America was upheld in the recent referendum. This means that the bituminous coal miners of the country will continue at work wherever possible pending the negotiations of the new wage contract.

Lafayette—The Public Service Commission of Indiana has lowered the freight rate from the Linton and Brazil coal fields to this city from 70c. to 65c. a ton. It issued an order about a year ago to this effect but the railroads petitioned for a rehearing and they were given a chance to arrange the controversy. They failed and the new tariff goes into effect May 10.

Sullivan—Among suits recently filed here against coal companies is one for $10,000 damages against the Vandalia Coal Co. by Hugh Houston because of injuries received from falling slate in the Superior mine and another against the same company for $5000 by John Dono for loss of a thumb while spragging a loaded car in the same mine. Robert Dixon sues the Gregory Coal & Mining Co. for $10,000 because of injuries received in a gas explosion in the old Shelburn mine.

Petersburg—The Hartwell mine property in Pike County near here has been sold by the receiver to D. J. Mackay & Co., Evansville, Ind., for $198,750. There are three shafts, four miles of railroad and 2438 acres of coal land on which is the town of Hartwell, with 300 inhabitants. The mines are electrically equipped. The new owners will spend $10,000 in getting them ready for operation and employment will be given to 300 miners

ILLINOIS

Johnston City—An extension is being built to the main line of the Illinois Central, south of here, connecting with the mine of the Johnston City Coal Co This will give this mine the Chicago & Eastern Illinois, Missouri Pacific, and Illinois Central R.R. for its outlet.

Springfield—Governor Dunne has appointed as members of the State Mining Investigating Committee: Wm. Hall, Springfield, vice W. E. Walker, Pawnee; R. J. Wilson, Marissa, vice Robert E. Locke, Johnston City, and John Tuttle, Harrisburg, vice Thos. R. Davis, Kewanee.

Royalton—The Franklin Coal & Coke Co. has plans for the erection by July 1 of a rescreening plant at its No. 1 mine.

Chicago—The creditors of the Standard Washed Coal Co. recently filed an involuntary petition in bankruptcy. The petitioners are the McComber-Whyte Co., the Hoplin-Benedict Co., and Logan A. Coleman.

ARKANSAS

Fort Smith—Competitive contests between teams from the various coal-mining camps in District No. 21, embracing Arkansas, Oklahoma and Texas, for proficiency in mine rescue, first aid and other phases of the Safety First movement, will be held during the early part of May, the date being not yet decided upon.

Clarksville—It is reported that the works of the Scranton Anthracite Coal Co., at Montana, will in the future, be operated with non-union labor. It is expected that the mine will be opened about June 1. This is one of the largest operations in this section of the state and employs several hundred men.

OKLAHOMA

Lehigh—During the month of March the mines of the Folsom-Morris Coal Mining Co. produced 53,000 tons of coal. This is the largest amount ever produced in these mines in one month. It is anticipated, however, that within a year these mines will be turning out coal at the rate of a million tons per annum.

PERSONALS

Job Freeman, one of the largest and best known operators in the Indiana bituminous field, has been nominated for treasurer of the state by the Republicans.

John I. Absalom, ex-state mine inspector of Montgomery, W. Va., has been made general superintendent of the Coalbell Coal Co., at Scotford, W. Va. He is a well known and popular mining man.

W. O. Garvin was made president of the Trenton (Mo.) Coal & Mining Co. at the annual election recently. Other officers are H. F. Hoffman, vice-president; G. M. Wolz, secretary, and W. E. Austin, treasurer.

C. H. Nesbitt, of Birmingham, Ala., and K. F. Webb, of Walker County, have just been reappointed chief mine inspector and associate mine inspector, respectively, by Governor O'Neal for a term of three years.

Harry Brown has been appointed mine foreman at the Hazel Mine of the Pittsburgh-Buffalo Co., at Canonsburg, Penn. He was formerly assistant mine foreman at the Francis mine at Burgettstown under the same company.

M. H. Boyer, division sales manager of the McAlester (Okla.) Fuel Co., with offices at Kansas City, has resigned after ten years' service with the company. He has been succeeded by C. H. Hightower, former general sales manager of the company.

John C. C. Mayo, the Kentucky millionaire coal operator who has been seriously ill at the Jewish Hospital in Cincinnati for some weeks, was removed to New York for special treatment recently, the private car of Senator Watson, of West Virginia, specially fitted up for the journey, being used.

C. D. Caldwell, of Cincinnati, Ohio, who recently received a promotion to the position of general manager of the Pittsburg & Buffalo Co., was presented a few days ago with a handsome silver-mounted cane by his associate members of the Coal Table of the Business Men's Club, in honor of his rise.

W. S. Newcomb, secretary of the Southwestern Intertsate Coal Operators' Association, underwent an operation at St. Marys Hospital, Kansas City, on Apr. 25 for hernia. Mr. Newcomb withstood the shock well and was reported resting easily. He has an excellent chance of recovery, though it will be at least six weeks before he is able to resume work.

Edward C. Mahan, of Knoxville, Tenn., vice-president and general manager of the Southern Coal & Coke Co., and president of the Southern Appalachian Coal Operators' Association, is quite ill with typhoid fever. The annual meeting of the association, to have been held Apr. 24, was postponed indefinitely on that account.

CONSTRUCTION NEWS

Clearing, Ill.—The Chicago & Western Indiana R.R. plans to build large coal docks at Clearing. The yards when completed are expected to be the best equipped in the country.

Jellico, Tenn.—Operations are expected to begin this summer on the erection of the new government building here, which, among other uses, is to house the mine-rescue work offices for east Tennessee.

Greensburg, Penn.—The Delmont Gas Coal Co. will shortly begin the development of a tract of land which it controls near here. E. M. Gross is president and James H. Gallagher is secretary and treasurer.

Penny, Ky.—In connection with the opening of new coal-mining operations in Pike County, Ky., John Smith and others have contracted for the building of some 600 houses for the use of miners and their families.

Hazard, Ky.—R. F. Peters and others who recently leased 800 acres of coal land near Mason, in Perry County, expect to begin construction of spur tracks, tipples, etc., immediately, with the hope of beginning operation by the middle of the summer.

McAlester, Okla.—The Rock Island Coal Co. has begun work on two new shafts near McAlester, Okla., and will spend about $1,000,000 during the summer. Steel tipples, the latest screening devices and electrical appliances will be features of the new mines.

Hartley, Ky.—It is expected that the Long Fork Coal Co. will begin a big coal development on Long Fork by June 1. It is the purpose of this firm to spend several million dollars in the work, and the building of a five-mile branch of the Baltimore & Ohio will be necessary.

Viper, Ky.—The Mason's Creek Coal Co. expects to start at once a good-sized coal plant to be reached by a short-line spur from the Lexington & Eastern R.R. The initial work will be started about May 1 and the company proposes having a daily capacity of from 15,000 to 20,000 tons.

Chattanooga, Tenn.—A coking plant to be located at the foot of Walden's Ridge is to be built by a syndicate represented by C. E. James, who is just back from New York, where he is understood to have made arrangements for financing the enterprise. Plans, it is declared ,are being prepared for the plant.

Martins Ferry, Ohio—The Rail & River Co. has been making improvements for the last year, and is now taking advantage of the shutdown in order to hurry these forward. Work has been started on a tipple at the No. 3 mine and steel for this structure has already begun to arrive. An extra force of men has been put on and still others will be set to work in the near future.

Sturgis, Ky.—The West Kentucky Coal Co. is building a large tipple, coal chute and watering station opposite, Granger, west of here, for the accommodation of the Illinois Central trains. The cost of the improvements will be about $15,000. In this connection the West Kentucky Coal Co. has just let contracts for improvements and additions to its office building here involving an expenditure of about $13,000.

Johnstown, Penn.—Contractors Sheesley & Janney, of Johnstown and Baltimore, have started work upon the opening of a big coal operation in East Wheatfield Township, Indian County, for the Conemaugh Smokeless Coal Co. The contract involves the sinking of a 200-ft. shaft and the excavation of a slope 950 ft. in length. It is anticipated that work will be sufficiently advanced by Jan. 1 next to allow the shipping of coal.

Nesquehoning, Penn.—Work has been commenced on a big washery and the huge culm bank between this place and Hauto will be removed by the Lehigh Coal & Navigation Co. This culm bank will be passed through the washery, after which the coal will be run through the breaker and the marketable fuel removed. It will require some years to remove the culm bank, and this operation will somewhat change the topography of the country.

Dunlap, Tenn.—A crew of civil engineers recently began to survey a route for the proposed railway from this point to the coal lands of the Chattanooga Iron & Coal Corporation in Brush Creek Gulch. The construction of this railway has long been contemplated by the Chatanooga firm, the purpose being to augment the company's coal resources by opening the Brush Creek Gulch tract. Construction of this railway will afford employment to a large number of laborers, and may last for more than a year.

Jackson, Ky.—The Wolf Valley Coal Co., of Roosevelt, has awarded a contract to T. J. Turner, manager of the Jackson Plumbing and Machine Supply Co., for all work in his line in the building of a new mining town in Breathitt County, Ky. First of all a sewerage system is being laid out in the city, yet to be christened. The town will contain 40 miners' homes, a clubhouse, a manager's residence and the usual other buildings. An electric plant will furnish power and light and all the coal from the mines to be developed will be handled in a huge modern tipple.

NEW INCORPORATIONS

Terre Haute, Ind—W. L. Bogle & Co., coal operators, have increased their capital stock $40,000.

Peru, Ind.—The Island Creek Coal Co. has filed notice of dissolution with the secretary of state.

Dover, Del.—The International Mines Development Co. has been incorporated with a capital stock of $3,000,000. Joseph W. Curtin, of New York, is one of the principal incorporators.

Fargo, N. D.—The Dakota Lignite Mines Co., of Dickens, has been incorporated with a capital stock of $200,000. The incorporators are W. L. Richards, Hanson E. Smith and Henry Truelsen.

Hamilton, Ala.—The South Brilliant Coal Co. has been organized with a capital stock of $10,000 by A. A. Griffith, George H. Parker and O. S. Goodwyn. Machinery has already been purchased to develop the mine.

Savannah, Ga.—The South Atlantic Coal Co. anticipates raising its capital stock to $100,000. Provision is also made that no stockholder shall dispose of his holdings to an outsider without first offering it for sale to stockholders.

Fairmont, W. Va.—The Miners' Appliances Co. has been organized to manufacture machinery of various kinds. The capital stock is $5000 and the incorporators are George G. Brobet, C. T. Shinn, John J. Wright, J. J. Mulvehill and C. W. Mulle, all of Fairmont.

Huntington, W. Va.—The Ellington Co. has been organized to operate coal mines and kindred business in Illinois. The capital stock is $25,000 and the incorporators are Frank Ellington, G. D. Miller, S. J. Hyman, J. K. Oney and W. H. Cunningham, all of Huntington.

Pittsburgh, Penn.—The Pittsburgh-Henderson-Standard Coal Co. has been organized to operate in western Kentucky. The capital stock is $20,000 and the incorporators are Thomas J. Lattimer, E. McClintock, H. Williams, W. T. Tharp, Jr., and W. C. Smith, all of Pittsburgh.

INDUSTRIAL NEWS

Dixon, Ky.—The Ruckman Coal Co. has recently installed an extensive line of improved haulage equipment, which will result in increasing the output of the mines, near here.

Toronto, Ont.—According to a recent estimate made by John J. Stirling, chief mining inspector for Alberta, the average payroll per day of the Alberta coal-mining industry during 1913 was $28,708, or $8,612,490 for the year.

Middlesboro, Ky.—F. D. Hart, Jr., has purchased of Oaks & Sharp the coal mine they operated near here under the name of the Home Mining Co. He will operate it in connection with the Mingo Coal Yards, which he also purchased from J. D. Yarborough.

Uniontown, Penn.—Following the word that the Carnegie Steel Co. has blown out two stacks in the Pittsburgh district the H. C. Frick Coke Co. put 1200 coke ovens out of blast. The Southern Connellsville Coke Co. is also considering blowing out all of its ovens.

Pittsburgh, Penn.—As a result of the opening of navigation on the Great Lakes there is a somewhat heavier shipment of lake coal over the Cleveland, Lorain & Wheeling Division of the Baltimore & Ohio. Practically all of this fuel is from West Virginia mines.

Salt Lake City, Utah—The 108th meeting of the American Institute of Mining Engineers will be held in Salt Lake City, Utah, Aug. 10-14 inclusive. Twenty-five papers are already in the hands of the secretary, and have been accepted for this meeting, and an interesting program is assured.

Charleston, W. Va.—In the Kanawha County Circuit Court, H. J. Smarr, of Charleston, was recently appointed receiver for the Mecca Colliery Co. holding mines on Morris Creek. No statement of the company's finances was made public but the receiver was appointed upon the petition of creditors.

Rockwood, Penn.—Hitchman Bros., who optioned a 600-acre tract of coal land in Milford Township, have been successful in securing an extension of 60 days on all the leases covering the field. They expect within this time to have made a thorough test and be in a position to commence work should they decide to purchase.

Johnstown, Penn.—The coal under the Singer tract in Conemaugh Township, about two miles east of Johnstown, consisting of 260 acres, was sold recently to a syndicate of local people headed by James Suppes, Jr., for $90,000. This price per acre is believed to be the record for bituminous coal outside the Connellsville field.

Boston, Mass.—Fire, on Apr. 22, destroyed a large empty coal pocket on the Mystic River in East Summerville. This pocket was owned by the Boston & Maine R.R. and leased to Dixon & Eddy, Boston merchants, who do a commission business in coal. Only the direction of the wind prevented drawbridge No. 8 from catching fire. The loss is estimated at $25,000.

Pittsburgh, Penn.—The annual meeting of the Mine Inspectors Institute of the United States of America will convene in Pittsburgh, June 9-12 inclusive, with headquarters at the Seventh Avenue Hotel. All members of the institute and all state mine inspectors of this country and the provincial inspectors of Canada are urgently requested to attend the meeting.

Kingston, Ontario—At the present session of the Canadian Parliament the government was asked why contracts were given last year for American coal for the Intercolonial R.R., which is a government institution, rather than to Canadian firms. The answer was made that the American coal could be procured at a more reasonable figure and with a quicker delivery.

New Orleans, La.—The quartermaster's department in this city, recently received instructions from Washington to secure estimates on the amount of coal in port and the facilities for coaling a fleet of transport ships in case of war. It was found that there was 160,000 tons of Pittsburgh coal on hand in addition to approximately 100,000 tons of Alabama coal at the several yards.

Pocahontas, Alta.—The Jasper Park Colliers, Ltd., of Alberta, which has for some time had a mine in operation at Pocahontas, on the south side of the Athabasca River is making another opening on the north side of the river, close to the main line of the Canadian Northern Ry., and shipments are expected shortly. The coal measure is 8 ft. in thickness of a high-grade bituminous.

Washington, D. C.—The Senate Naval Committee recently ordered a favorable report on Senator Tillman's resolution for an investigation of freight rates on coal shipped to Southern ports for the use of the navy. This action followed charges that the Southern Railway directorate was being used by the so called coal trust in discriminating against South Atlantic states in coal freight rates.

Springfield, Ill.—Sarah E. Finley, recently filed suit as administratrix in the circuit court to recover $10,000 from the Spring Creek Coal Co. for the death on Jan. 29, of Hugh Finley, who was killed by falling down a shaft. It is alleged that the company was careless in allowing a fireboss to run the cage to the bottom as Finley prepared to push a car upon it, supposing that it was where he left it, at the top.

Pittsburgh, Penn.—A statement by the Pennsylvania R.R. of the coal and coke carried over the line east of Pittsburgh and Erie for the month of March, shows an increase in bituminous coal over the corresponding month of last year. The total is 4,740,313 short tons, being an increase of 690,066 tons. The total from Jan. 1 to Mar. 31 is 12,414,492, or an increase of 296,745 tons as compared with the same period of last year. Both coke and anthracite coal show a decrease.

Pittsburgh, Penn.—The Federal Government has inaugurated a "flying squadron" for use in the coal fields for the relief of miners in case of accident. The initial equipment which has been delivered to the Bureau of Mines is a 1½-ton automobile truck, equipped complete with pulmotors, oxygen helmets, medicine, first-aid supplies, etc. It is anticipated that similar vehicles are to be stationed at various points throughout the country as the needs of the service demand.

Charleston, W. Va.—A peremptory writ of mandamus was recently awarded by the Supreme Court against the White Oak Fuel Co., at Scarbro, Fayette County, compelling it to furnish electricity for lighting purposes to all citizens in the town. This decision of the court places all coal companies whose plants furnish electric light to individuals under the definition of public-service corporations compelling the payment of a public-service corporation tax and other legal requirements for such concerns.

Chicago, Ill.—The Williams Patent Crusher & Pulverizer Co. has recently prepared Crusher Book No. 5, which covers every phase of coal crushing, a copy of which may be obtained upon application. This firm reports that many of the orders which it has received during the past few months are repeat orders, and that most of the machines sold are in use in connection with byproduct and beehive ovens preparing the coal to the general specifications of 90 per cent. through a ⅛-in. circular opening. The company reports that present prospects for business are bright, that inquiries are good, and sales exceptionally so.

Edmonton, Alta.—The United Collieries of Canada, Ltd., which controls large quantities of lignite within transmission distance of the city of Edmonton has made a proposition to the city to construct a modern power plant at the mine, transmit power to the city, and sell it to the municipality in bulk to be distributed by the civic distribution plant. As a basis of negotiation the company proposes an agreement to supply all power required at present at a rate not exceeding $12 per horsepower-year of maximum demand, plus a charge of six-tenths of a cent per kilowatt-hour subject to reduction provided enough industries will employ day or off-peak power. This offer is under consideration by the city.

Coal Trade Reviews

General Review

Heavy movement of anthracite but spring opening lacks the customary snap. Bituminous completely flat in all sections. Curtailment in industrial activity, large stocks and indications of an early resumption of mining have brought business to a standstill. Outlook poor.

Although the anthracite trade is experiencing a certain spring activity, it is becoming more apparent all the time that there is an absence of the customary snap and urgency. As usual, all companies will carry some of the April orders over into May, particularly for stove coal, and this paucity of supplies is being accentuated by a recurrence of the incipient "button" strikes, which has threatened to materially restrict production. The trade is most active in the line business; the situation at tidewater is showing a tendency to drag and lake shipping is slow in getting under way. The large output of domestic coal is also threatening to develop a surplus of the steam grades.

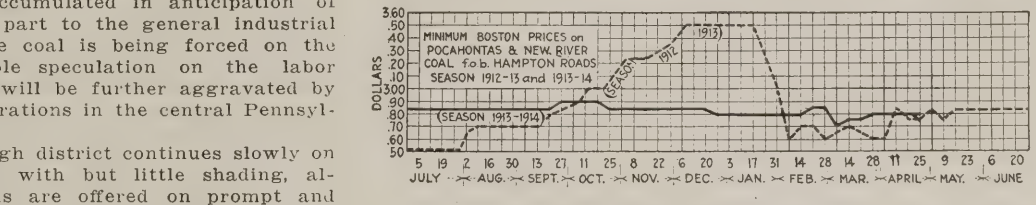
The demand for prompt bituminous has disappeared almost entirely. Prices are weakening, and coal of all kinds continues to pile up. The movement is confined entirely to contracts, requisitions on which are heavily curtailed as a result of the large stocks accumulated in anticipation of labor difficulties, and also in part to the general industrial curtailment. Much demurrage coal is being forced on the market, indicating considerable speculation on the labor agreement, and the situation will be further aggravated by the general resumption of operations in the central Pennsylvania district.

Contracting in the Pittsburgh district continues slowly on the same basis as last year with but little shading, although substantial concessions are offered on prompt and short-term business. A good water stage is permitting full operation at the river mines, while stocks generally are being liquidated, but the lake trade promises to be slow, and more men are returning to work than it will be possible to use. Shipments in Ohio are now reduced to a minimum, but consumers still have plentiful supplies as a result of the restricted operations in general industrial lines, and there is no anxiety felt over the possibility of a shortage. There is some slight demand for steam grades. The lake trade is open, but entirely devoid of any activity.

Business at Hampton Road is confined principally to shipments on contract, and there is rather an accumulation in local yards, although this will probably be moved shortly. The battleships of the American Navy, as well as those of other countries, manouvering in Mexican waters have thrown an unexpected demand upon the Southern ports at New Orleans, Pensacola, and Mobile, depleting stocks and causing a rush of urgent orders.

The Middle Western consumers are still using up stocks accumulated in anticipation of labor trouble, and there is no evidence of any improvement. What few mines have attempted to work, have been forced to close down in most instances as a result of the light demand. Some operators are accepting contracts at last year's figures, which would seem to indicate that an advance in the wage scale is not anticipated.

EASTERN MARKET



BOSTON

Emergency requisitions from Government have small effect. Heavy volume of Pocahontas and New River still at piers, and no relief to general dullness. Georges Creek and Pennsylvania situation unchanged. Stove coal getting into short supply.

Bituminous—The war flurry has had small effect on the market as a whole. A few spot cargoes here have been disposed of to put battleships in readiness for sailing but the demand from that quarter will soon be satisfied. The call for fuel at Hampton Roads is only slightly in excess of normal, the piers there furnishing the bulk of the fleet coal during normal times.

Meanwhile Pocahontas and New River fuels continue to pile up and the agencies have not relaxed any in their efforts to move it. The prospect is now for a long dull summer with a heavy market, the $2.85 price probably being reasonably well maintained for the reason that operators for the most part will not permit sales that net anything lower. Buyers have seen no reason to change their attitude and it is hard to see where any broad market can come from. That there should be so much hopeful talk over the Government's emergency requirements and on such small excuse is only another indication of how dull the coastwise market is.

Contracts are still being closed, but almost entirely on alongside or on car figures so that the base price is not disclosed. Judging from what is known of the minimum water rates, however, there is small reason for doubting that many of the contracts lately closed will net less than $2.85 f.o.b. Hampton Roads. The lowest bidder on a municipal order for about 10,000 tons was $3.47 alongside Boston for Pocahontas or New River for the season which allowing insurance of 2c. and $2.85 for the coal, would leave but 60c. for a season water freight for a relatively shoal place when current rates for the largest transportation are 65@70c. for spot loading.

The Pennsylvania coals show a better situation all-rail than at tidewater, although no stone is left unturned to place coal. The majority of the operations are still under suspension with no near prospect of work being resumed.

Anthracite—May is expected to be a lighter month than April for shipments of hard coal into this territory but the volume received will depend somewhat on the proportion of stove size available. The companies find it difficult to meet the demand for this size and we are almost certain to run into a scarcity of it next fall. Retail trade is sloping off with the approach of warm weather.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.95@1.50	$1.20@1.65	$1.67@1.77	
Philadelphia*.....	2.50@3.05	2.75@3.20	3.22@3.32	
New York*.....	2.20@2.75	2.45@2.90	2.92@3.02	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.80@2.85
Boston†.....	.....	.....	.....	3.60@3.78
Providence†.....	.....	.....	.....	3.55@3.73

* F.o.b. †On cars.

NEW YORK

Prompt bituminous market at a complete standstill and considerable coal reported on demurrage. Movement entirely on contracts. Line business on domestic grades of anthracite about normal but slow at tidewater.

Bituminous—The New York soft-coal market has seldom ever been so completely flat as at present. What little

movement there is, is almost entirely on contracts, and the demand on these is heavily curtailed by reason of the stock accumulated in anticipation of a suspension in mining, and also as a result of the general curtailment in industrial activity. The prompt market is as completely dead as it is

possible to imagine. There is some demand in the line trade, but none whatever at tidewater, and the fact that large tonnages are being forced on the market to avoid demurrage indicates that there was considerable speculation on an adverse turn to the labor situation.

Western Maryland coal has been offered at down to $1.90@$2, f.o.b. It is probable that the situation will be further aggravated by the general resumption of mining in the Central Pennsylvania district, an agreement between the miners and operators having been reached, but subject to a referendum vote May 4. Operators hesitate to predict how much the mines will work, but it is doubtful if more than two or three days a week will be possible.

Unless there is a decided change in conditions, the outlook for the summer is highly unfavorable. The one encouraging feature in the situation is the determined efforts the agencies are making to obtain last year's prices, or better, on contracts, and also the excellent manner in which nominal quotations are being maintained on the better grades in the prompt market. Although substantial concessions are obtainable on odd tonnages of coal, particularly when on demurrage, the nominal circular continues as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The large hard coalers report that they cannot supply current orders, and that much April business was carried over into May. In addition to this the situation is being further strained by a recurrence of "button strikes" which are delaying operations.

In the prepared grades, stove coal is generally the shortest in all departments, and chestnut the easiest, moderate concessions being offered by the individuals for prompt movement. The situation on egg coal is rather mixed, the free burning grades being notably short, while individuals are forced to make cuts in the regular circular in order to move prompt shipments of the off-qualities.

In the steam department the high grades of pea coal are moving off promptly, while the lower qualities are selling off as much as 20c. per ton. The lower grades of No. 1 buckwheat are offered down to $2.35, with premiums of 10c. prevailing on the better qualities. About the same condition applies on Nos. 2 and 3 buckwheat.

It is obvious that heavy operations at the mines, occasioned by the large demand for domestic coal, is developing a surplus of the steam grades. Line business on all the domestic coals is about normal for this period of the year, but there is a heavy falling off in the tidewater trade, particularly locally. We quote the New York anthracite market in which the new May circular has gone into effect, as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.70		$4.65	
Egg	4.95	$4.85@4.95	4.90	$4.80@4.90
Stove	4.95	4.95	4.90	4.90
Chestnut	5.20	5.20	5.15	5.05@5.15
Pea	3.55	3.55	3.45@3.50	3.25@3.50
Buckwheat	2.80	2.80@2.90	2.50@2.75	2.35@2.75
Rice	2.30	2.30@2.40	2.00@2.25	1.80@2.25
Barley	1.80	1.80@1.90	1.70@1.75	1.40@1.75

PHILADELPHIA

Anthracite trade still satisfactory. Domestic sizes in good demand, but steam grades flat. Bituminous market dull, with little improvement in sight, either in the way of prices or demand.

Anthracite—The second month of reduced prices finds the anthracite trade in a satisfactory condition. At this season of the year, however, the market for the small or steam sizes begins to contract, and as a result, individual operators are commencing to cut prices, and the large companies to stock their surplus. The past winter, it is understood, has been a distinct disappointment in the demand for pea, it was only at the end that there was any marked call for this size, and it is understood that quite a tonnage was carried over, when as a rule, the storage places are found bare.

Domestic sizes still continue in good demand. A large number of orders were carried over, and the prospect looks good for at least the month of May. Those conversant with the market, however, are loth to predict what the situation is likely to be after May. While there is a large tonnage moving, at the same time, the trade seems to lack the snap that should characterize it at this period. Egg and stove are the leaders, with the companies drawing on their storage supplies for the former. There are no stocks of the latter, and it is impossible to fill the requisitions made. Chestnut is not moving off as well as desired, although there is no indications of price cutting on this size. Prices at tidewater rule about as follows:

	Circular	Individual
Broken	$4.35	$4.35 @ 4.45
Egg	4.60	4.60
Stove	4.60	4.60 @ 4.70
Chestnut	4.85	4.85
Pea	3.25	

Bituminous—Marked dullness still characterizes the bituminous industry. This is due to the fact that the manufacturers, carry sufficient stocks, and also many industrial establishments are working either on short time, or not at all. The opening up of the Lake trade, is expected to improve conditions somewhat, but the operators are not depending on this to strengthen the market. Good coals can be bought at from $1.35 to $1.50 at the mines, grading down to $1 to 95c. for the cheaper varieties.

BALTIMORE

Remarkably dull situation in the coal business generally. Prices weakening under the light demand. Pennsylvania and Ohio suspensions have not aided the market in any way.

The soft-coal business has been remarkably dull and the past week proved the dullest yet. While there is, of course, a certain call for contract fuel, this is not at all what it should be, and the spot market has disappeared almost entirely. Prices are weakening under the light demand, and the past week witnessed sales of West Virginia gas and steam coals at figures off what had been obtained recently, and while the Pennsylvania situation held somewhat better, it was still wobbly to say the least. With gas coals there was recorded sales of slack on contract as low as 60c.; run-of-mine at times sold down to 70c. and three-quarter at 80c. Maryland and West Virginia steam coals of less desirable variety were quoted around 80c. or a little better. Low grade Pennsylvania fuels were hugging the dollar mark, and best grades holding steady at around $1.30.

The trade had rather expected that the suspension in Pennsylvania and Ohio might have the effect of tightening the market, but such has not been the case. There is more than enough fuel to meet the demand. In regard to the strictly local stiutaion, it about measures up to the general conditions. Cancellation of some shipments to Tampico the early part of the market threw some little coal free at tide, but arrangements were made to take it up.

The anthracite situation remains unchanged. It will be well into the present month before there is any special activity to take advantage of the low schedule of the year, which will last until May 31.

CENTRAL STATES

PITTSBURGH, PENN.

Annual contracts being closed at moderate rate with some concessions and considerable shading on prompt. Pittsburgh district operating at 35 per cent. of capacity. Ample labor supply and very light demand for coal. River mines operating almost full. Connellsville coke stagnant, with a further decline in production and shipments.

Bituminous—Coal contracts which expired Apr. 1 are being renewed at only a moderate rate. The leading interests are holding to the same prices as prevailed a year ago, with a basis of $1.30 for mine-run, but they are all quoting 1¼-in. at $1.50 whereas last year the regular price on domestic was $1.55 while some operators made a differential of five cents on the same coal for steam purposes, quoting it at $1.50. There is occasional shading on contracts, but not a great deal. Spot coal, on the other hand, is offered at various low prices and some short-term contracts are being made at 10@15c. under the regular market. Regular prices are as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

The referendum vote on the adoption of the Cleveland scale unchanged for another two years has been completed, and the official announcement will be made May 1. Immediately thereafter a conference will be arranged to settle various local points with respect to the Pittsburgh district. No trouble is expected on these matters, though there may be considerable discussion.

Lately more men have been willing to work than there is employment for. Mines in the Pittsburgh district are operating this week at an average of not over about 35% of capacity and are finding difficulty in maintaining even this rate. The trade is suffering from three things, the stocks recently accumulated, an industrial depression and failure of the lake trade to open. The stocks are being liquidated and will cut little figure within another fortnight. The lake trade promises to be slow until July, and shipments from mines will be

particularly late in starting in volume because there is much coal loaded in vessels last fall and which will have to move up the lakes first.

The river mines are working practically full, loading coal for shipment down the river as fast as the boats can take it. Nearly all the mines of the leading interest are now able to ship by rail, and it is the desire to take care of the river demand now and then divert the capacity to rail shipment for the lake trade. There has been a good river shipping stage for some time.

Connellsville Coke—The market is stagnant, with prices showing a slight softening tendency. The leading operators are still holding to $2 for contract furnace coke but there is no demand. Prompt coke is a shade easier. We quote: Prompt furnace, $1.85@1.95; contract furnace, $2; prompt foundry, $2.35@2.45; contract foundry, $2.35@2.45, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 18 at 334,655 tons, a decrease of 20,070 tons, and shipments at 325,545 tons, a decrease of 22,866 tons. Production exceeded shipments by 9110 tons.

BUFFALO

Bituminous waiting for stocks to be reduced. Too much nonunion coal coming in. Coke still not moving. Anthracite only fairly active. Market nowhere improving as yet.

Bituminous—There is still too much newly-mined coal in the market for any improvement. The Allegheny Valley, Pittsburgh and Central Pennsylvania field operators are holding together firmly, not operating unless they have customers that have no stocks ahead, but there is a lot of coal coming in from the Panhandle district beyond Pittsburgh, which takes a Pittsburgh rate and this is making trouble. It is mined by nonunion labor, but even then is selling at sacrifice prices as a rule. Jobbers report that they are buying this coal at prices below cost, while at the same time quite a large amount of it pays demurrage before it is finally disposed of. If the whole mining interest could be made to stand together and do little work till the surplus is gone there would then be a chance of re-establishing a paying market.

There is still no general quotation except the former: $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.25 for slack, no part of the trade having any life in it but slack, though most of the operators refuse to sell at a reduction. Pittsburgh has fixed the same Buffalo price as last year and will maintain it as far as possible. The continued strength of slack is on account of the poor lake trade.

Coke—The demand for coke has not improved and is not likely to till there is better movement of iron, which is not looked for right away. It would seem, rather, that the market grows more quiet from week to week. Connellsville prices remain fairly firm at $4.50 for best 72-hr. foundry.

Anthracite—The end of April finds the demand far less active than in recent years. There is a steady call and the rail movement is good, but the sales offices are not getting urgent orders from country consumers and jobbers. There is some scarcity of egg coal in this market, the leading companies not appearing to have taken care of that market very carefully as some ran entirely out of this size. Actual consumption is small now, but there is always some demand.

The lake trade is as dull as other branches. Instead of the winter-loaded cargoes rushing out, so that the vessels can bring down other waiting freight they now appear indifferent to getting away. So far the clearances have amounted to only 115,000 tons, most of it for Lake Superior ports. It is stated that some ports are still very badly blocked with last seasons coal.

TORONTO

Anthracite moving on the Lakes. Demand becoming less.

Trade is steady with diminishing demand as the season advances. The yards are well stocked and supplies of anthracite coming forward freely by water since the opening of navigation. The usual reduction in prices of anthracite will be made about May 1. The figure has not yet been fixed, but it is not likely that the price will be put below $7.50 per ton. There is no change in present quotations.

TOLEDO

Supplies still large and business at a standstill. Mines closed for an indeterminate period. Some movement in the Lake trade.

So far as the retail market in Toledo is concerned business is exceedingly dull and prices are demoralized. There is a light demand for both domestic and steam coal. The factories are well supplied in anticipation of the strike. The warm weather has, of course, made the domestic demand light. Ohio mines are all closed down and there is little prospect of an immediate return to activity but supplies seem to be sufficient to meet all demands.

The opening of navigation has witnessed some improvement and several boats have cleared from this port while others are now loading. There is an immense amount of coal on track in Toledo and the T. & O. C., yards are full of loaded cars. There has been no change in quotations. Coal men here are optimistic as to the future and it is generally believed that so far as lake business at least is concerned Toledo will have a profitable year.

COLUMBUS

Prices show no strength despite the month's suspension. Some West Virginia coal coming in, but stocks are still sufficient to last for 45 to 60 days. Conference of operators and miners adjourned without agreement.

The feature of the Ohio coal trade is the irregular prices which have prevailed despite the fact that all the local mines have been out of commission snce Apr. 1. Apparently there is not much demand and inquiries are not numerous. On the whole the trade is quiet and the prospects for the future are not bright.

Some West Virginia coal is finding its way to Ohio, but prices on the whole have been weak. Mine-run is sold as low as 70c., while ¾-in. is bringing less than $1 with domestic lump almost as cheap. These prices only prevail, however, where West Virginia coal has been shipped in on consignment. Retalers have sufficient stocks to carry them through until the usual stocking-up period. Outside of the demand for fancy grades such as Pocahontas and splints there is not much call for domestic sizes.

Since the conference of operators and miners adjourned without agreeing on a mining scale, the entire situation is unsettled. There is talk of the miners' officials calling a strike and that might complicate matters still further. Miners generally show an anxiety to return to work.

While navigation on the Great Lakes has been formally opened, there is not much stir in the lake trade. It is doubtful if there will be any appreciable tonnage of Ohio coal shipped before June or July, as reports from the Northwest show that there is still a large tonnage on the docks of that section.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.45@$1.35		$1.50@$1.40	$1.40@$1.35
¾-inch	1.30@ 1.25	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.25@ 1.20		1.30@ 1.25	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.15@ 1.10
Nut, pea and slack	0.90@ 0.85		0.90@ 0.85	0.80@ 0.75
Coarse slack	0.80@ 0.75	1.00@ 0.95	0.80@ 0.75	0.70@ 0.65

CLEVELAND

Little coal coming in and the market is only just able to absorb it. Prices continue low. Lake business opening slowly; few requisitions received from upper lake docks. The first coal has been delivered at Lake Superior ports.

All week coal receipts in Cleveland have not exceeded fifty cars in any one day. The average amount of coal on track was hardly more than fifty cars and it was moved at the low prices that have prevailed for a month. Nonunion mines in western Pennsylvania, No. 8 mines in Richland, West Virginia and Fairmount gas operations continue to supply the market.

There has been some inquiry for coal for shipment and an Ohio No. 8 operator quoted seven cars of slack in reserve at the mines at 90c. This sort of inquiry is not extensive and hardly indicates that storage stocks are being exhausted. It comes more from companies that did not store much coal against a suspension. The limited market has tended to make the operators less eager to meet the demands of the miners for increased wages. This and the fact that the suit to test the legality of the screen-coal law will be decided early in the week, were big factors in bringing the joint conference at Columbus to an end.

Lake Trade—Saturday, vessels with coal arrived at Duluth-Superior and at Fort William-Port Arthur, the two largest coal receiving ports on Lake Superior. All of the lake ports were entered by vessels during the week. The coal shippers, however, are very busy getting boats to load before May 1 when car service goes into effect on lake coal on all railroads except the B. & O. and C. H. & D. which began charging car service Apr. 15. There is not a great deal of coal on track or en route, but shipments are so uncertain it would be dangerous to depend upon credits to balance car service charges on coal already on track. After next week shippers will find it comparatively easy to get vessel capacity as the boats will be largely in commission and will need coal.

Anthracite and Pocahontas are selling well. May circular is being asked for both coals shipped now. The advance amounts to about ten cents a ton. Spot coal is selling at $1.70@1.80 for slack of all kinds and lump at $2@2.05. For shipment the following prices are being asked:

	Pocahontas	Youghiogheny	Fairmont
Lump	$3.05	....	$2.05
Lump, 1¼-in.	....	$2.55	....
Lump, ¾-in.	....	2.40	....
Egg	3.05	....	....
Mine-run	2.60	2.30	....
Slack	2.60	1.90	1.80

CINCINNATI

Demand continues slack in all lines, largely on account of the delayed lake movement. Pocahontas the only strong grade on the list. Practically no market on other varieties.

Despite the growing seriousness of the labor situation the local market has shown no signs of strengthening. The usual heavy spring contract demand for Pocahontas is the only cheering feature of the situation; in other respects the market is abnormally quiet.

The steam grades, including nut and slack from the Eastern Kentucky field and some of the same grade from the several West Virginia districts, are in fair demand, as practically all industrial consumers in and around Cincinnati are operating on nearly full time. Buying seems to be very light, however, and only for current consumption. A plentiful car supply in all fields now operating, and the light demand in the Lake trade have contributed to the present slowness.

There is little consignment coal on track in Cincinnati, however, this being a peculiar feature of this market, growing out of the fact that there is no reconsignment privilege, and demurrage charges accumulate too rapidly, without an opportunity to market the coal at outside points. The railroads also refuse to accept coal for shipment on consignment, and this has served to keep Cincinnati free from surplus fuel such as frequently chokes other markets.

Owing to conditions indicated, prices are about what the purchaser cares to make them, although there has been no great concession made in this respect. Most of the selling agencies are holding out for 85c. on contracts for steam coal, for example, but at the moment that price will buy block, as one operator put it.

DETROIT

Consignment coal cleaned up and a more optimistic feeling prevails. Stocks still large, but opening of Lake navigation will stimulate business.

Bituminous—The local agencies have finally succeeded in cleaning up all of the track coal in this vicinity, and are now advising operators that they will accept no further fuel on consignment except at their own risk. Even yet there is a great deal of cheap coal offered, there being plenty of lump available recently at 70c. with no buyers. Manufacturing plants and railroads are reported as well stocked for several weeks to come yet. However, there are some members of the trade who freely predict better conditions shortly, particularly when the lake movement gets under way in full blast. Conditions seem to be improving in general business.

Coke—There has been a slight break in the coke market, as is only to be expected at this time of the year. The Semet-Solvay product has consistently held its own, but gashouse is off 50c. on quotations to the retailer, and 25c. to the consumer.

HAMPTON ROADS

Only fair movement for the week. Principal shipments to New England. Rather excessive accumulation in local railroad yards.

Dumpings at Hampton Roads have been fair. There has been no heavy demand and the greater part of the coal moving has been on contract business or on sales made during the previous week. The coastwise shipments have been principally to the New England ports although some small cargoes have gone South. In addition to Pocahontas and New River run-of-mine there has been several small cargoes of high volatile shipped to the New England market.

Foreign shipments have been made to Rio de Janeiro, Canal Zone, Dakar, Kingston, Leghorn and La Plata. Owing to the light demand for coal, vessel chartering has fallen off and for several days there was considerable tonnage here seeking charters.

The accumulation of cars on the railway terminals is somewhat above normal but vessels about due will considerably reduce this and indications are that some of the suppliers will be loading government colliers which will in all probability cut the accumulation to below the average.

LOUISVILLE

Market continues dull and heavy although there are indications of improvement. Concessions necessary to move coal on consignment.

Local operators and dealers report a slight improvement in the local trade marked by a somewhat increased demand in both the Eastern and Western Kentucky fields. Such stocking as there has been so far this spring is lighter than customary, a condition attributed to a disappointing winter. Operations in Western Kentucky continue practically at a standstill, with only the nonunion mines working, though in the eastern part of the state operations are said to be better than usual.

In spite of a slow domestic market, steam coals are in such poor demand that the dealers having nut and slack on consignment have found it necessary to cut prices sharply in order to dispose of it. One representative of a Western Kentucky operating company in Louisville complained that Eastern Kentucky slack had been offered there at below cost of production.

A feature of the Eastern Kentucky market is that several of the Jellico operators claim to be getting as high as $1.75 to $1.85 f.o.b. mine for block coal, but this is for fancy and highly advertised grades. Elsewhere in the eastern section prices range from $1.30 up for the block coals and on down to from 50 to 60c. for the pea and slack of Western Kentucky.

BIRMINGHAM

Market on both steam and domestic coal far below the average. Furnace and foundry coke quiet. Blacksmith falling off slightly in tonnage. Little doing in the pig-iron market.

The market on domestic lump is quiet. Operators having regular agents at various points are having less trouble to move their product than others. Regular agents are required to take a certain monthly tonnage during the summer, and they are keeping the coal moving fairly well.

The steam market is also quiet, though the bunker business at New Orleans, Mobile and Pensacola is taking quite a good tonnage. The operators state that the usual falling off in blacksmith coal has started, the tonnage during the fall and winter being more than in the summer; however, the prices are being maintained. Both furnace and foundry coke are weak, with few buyers, and quotations are off about 25c. Furnaces report only a small amount of pig iron sold during the past 10 days.

NEW ORLEANS

Coal requirements for American fleet deplete local stocks and increased orders are being sent out. Usual trade continues inactive.

Unexpected activity pervades the coal industry here due to the demand for coal for use by the American fleet in Mexican waters. Fuel is even being shipped by rail from here to Galveston to coal the army transports. One hundred and twenty-five cars have been forwarded this week and dealers instructed that further supplies probably would be needed. In addition to the American war vessels, which will secure a portion of their coal here, ships of other nations, on duty in gulf waters, are putting in for supplies. The "Conde" of the French navy filled every bunker here this week and two of the British vessels will coal here as soon as they can be spared from duty on the Mexican coast.

This has changed the whole outlook here. Stocks that were too heavy for this time of year have dwindled almost overnight. Orders to the mines in Pennsylvania, Kentucky, Indiana and Alabama have been increased. With high water in the rivers, deliveries can be made quickly from the up-river section. There are also plenty of cars available for the movement of coal from Birmingham and efforts are being made to increase the receipts from the Warrior River section of Alabama via the water route.

Other than the movement of coal for the use of the fleet demand is light. Few contracts are being made and retail dealers in this territory are placing no orders in the belief that lower prices will be obtainable. Despite the lowering cost of fuel oil many plants are showing reluctance to reconvert their boilers, fearing another increase in price which will make it necessary to use coal again.

INDIANAPOLIS

Few mines in operation and trade slow as a result of the large purchases in February and March. Contracts and sales in open market being made at old prices. Coal situation influenced more by industrial than mining conditions. Retail prices unchanged from winter schedule. Little or no domestic buying.

Owing to the fact that most large consumers of Indiana coal laid in a 30- to 60-day supply during the efforts of operators and miners to reach a new wage agreement, trade is now slow. Few of the mines are running. It has been difficult to make new contracts because coal buyers are waiting for industrial conditions to improve. It is the general im-

pression that there will be no strike, largely because the miners need money, both individually and for their organization, which has been severely taxed, supporting many strikes. It is said operators have been making new contracts based on the old scale, which is an indication of their opinion of the outcome of the present negotiations.

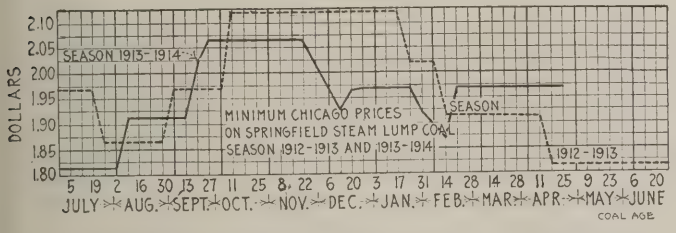
Indianapolis dealers are still selling at winter prices. They say they have not yet been able to make contracts with the mines for next season. It is known, too, that they would like to dispose of present stocks at old prices before making any reduction.

Present prices at Indiana mines run about as follows: No. 4 mine-run, $1.10@1.20; Nos. 5 and 6, five to ten cents lower than No. 4; steam lump and nut, $1.25@1.40; egg, 15c. additional; No. 4 4-in. domestic lump, $1.80@2; No. 5, about 30c. lower; screenings, 80c. to 90c.; Brazil block, $2.25@2.50.

ST. LOUIS

Market unchanged with little business being done. A few mines working, and even some of these are closing down because of poor business. Consumers showing no anxiety at all over the situation.

There is practically no change in the local market; little trading is being done, and there is no great tonnage of coal being offered. The steam market is somewhat irregular. Standard screenings bringing as low as 75c. or 80c. one day, and going to 90c. or higher the next day. Standard 2-in. lump is sold as low as 85c. and as high as $1.05. The nut coal is worth 90c. and egg the same. There is no Big Muddy coal offered and little from the Mount Olive field.



Carterville lump and egg is offered as low as $1.15, the better grades bringing $1.25@1.35; screenings the past week have been as low as 85c., and as high as $1. Nut coal is in good demand at from $1.25 to $1.50, while mine-run can be bought from $1.05 to $1.15.

The coöperative mines in the Standard field are working, and here and there a commercial mine, with a few railroad operations. During the past week, two or three mines found it more economical to suspend operations than to work. There is no dealer demand, and little anxiety during the past week on the part of the manufacturing plants. Anthracite is moving in good volume, coke and smokeless dragging.

CHICAGO

Dull and heavy despite the general suspension. Consumers are using up stocks and still have considerable on hand. Some coal on demurrage.

There has been no relief from the dullness in the Chicago market since the mines suspended and the demand is no better. The only active department is screenings on which prices are slightly higher. But there would not be a strong demand for a large production.

Dull conditions prevail in the anthracite market, although the buying has been a little stronger because retailers wish to get the April prices. The smokeless spot market has been comparatively good, although there is not a strong demand for prompt coal. A good deal of the spot coal is being shipped on new contracts and all that comes can be taken care of. Demurrage coal has been sold at an average of $1.10, although the larger companies are holding to circular prices. Splint coal has been only fairly active and there has been little demand for Illinois and Indiana fuels with the top figure of $1.25 for domestic lump as compared with the circular price of $1.35. Considerable activity is evident in the coke market, this being the contracting period for by-product coke. Some of the consumers are buying for storage and thereby aiding the present market.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.30@2.40	$2.12	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.65
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.90@2.05	1.95@2.05	1.67@1.87	

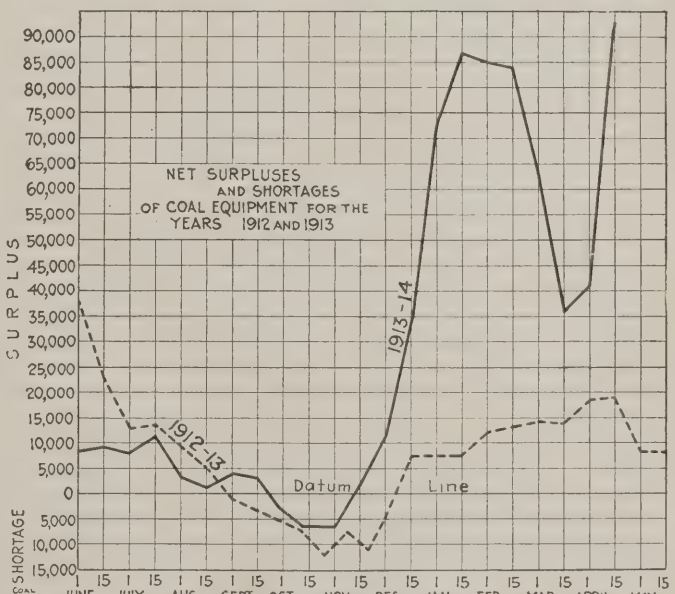
Coke—Connellsville and Wise County, $5@5.25; byproduct egg, stove and nut, $4.45; gas house, $4.25.

KANSAS CITY

Improved business outlook has created a better feeling in the coal trade. Operations on about a half-time basis.

Though little change was in evidence during the past week, the volume of future bookings was materially increased, due largely to more favorable crop conditions. With wheat in splendid shape in the Southwest, there seems to be little cause for concern on the score of crops and general business has thrown off its conservatism somewhat. The coal trade is among these and a much more optimistic feeling prevails than for some time. Demand is quiet for immediate needs, and about half-time operations is the rule in most parts of the Southwest. A feeling of unrest is noticeable among the miners and no increase of working hours or output is likely in the immediate future.

PRODUCTION AND TRANSPORTATION STATISTICS



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended Apr. 15, as follows:

	Surplus	Shortage	Net*
New England Lines	738	0	**738**

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for October and the first ten months of the years 1912 and 1913:

State	October 1912	October 1913	Nine Months 1912	Nine Months 1913
Missouri	315,419	317,466	2,438,163	2,367,435
Kansas	524,315	609,827	4,152,505	4,676,157
Arkansas	205,031	209,693	1,579,505	1,616,480
Oklahoma	319,717	340,915	2,384,278	2,864,050
Totals	1,364,482	1,477,901	10,554,451	11,518,12

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire tonnage produced in the four states.

Financial Department

Lehigh Coal & Navigation Co.

President S. D. Warriner, of this company, reports for the year ended Dec. 31, 1913, as follows:

Income Account—For purposes of comparison the income account of the previous year has been restated to conform to the revised plan of accounting. Gross revenue for the year was $15,294,687, an increase of $1,486,037, due to (a) increases in coal revenue of $1,028,573, in canal revenue of $2,507, and in miscellaneous revenue of $464,114; and (b) decrease in railroad revenue of $9157. The net revenue of the several departments was $3,735,828, an increase of $100,101, and the net income was $2,372,511, an increase of $84,255.

The net miscellaneous revenues for the year was $833,646, an increase of $411,383, as compared with the net revenue for the year 1912, based upon the same method of accounting. This increase is mainly accounted for by an initial dividend of 4% on stock of the Lehigh & New England R.R. Co. and by profit from the sale of surface lands in the mining region.

Bonds and Notes—In order to provide for general corporate purposes, the company issued on July 1, 1913, $1,500,000 one-year 5% secured gold notes, secured by deposit of $1,250,000 general mortgage 4½% bonds, due May 1, 1912, and $1,000,000 funding and improvement 4% bonds, due July 1, 1948. Of these notes, $220,000 were subsequently retired by issue of treasury 4½% bonds.

To provide for the bonds and one-year notes maturing in 1914 [aggregating $10,054,519 in hands of public] and for general purposes, present and future, the board has authorized a consolidated sinking fund mortgage dated Jan. 1, 1914, securing an authorized issue of $40,000,000 gold bonds, maturing Jan. 1, 1954, and containing provisions for the retirement of prior liens. The initial issue of these new bonds, "Series A," will be for a total of $18,000,000, bearing 4½% interest. Of this series $14,000,000 has been sold.

Taxes—Our taxes continued to show an increase, the total amount of taxes in 1913 being $540,720, as compared with $450,567 in 1912, due principally to the imposition of a tax of 2½% on the value of anthracite coal as prepared for market, in accordance with an act of the Pennsylvania legislature, effective June 28, 1913. In 1908, our taxes were $288,483; in 1913, $540,720, an increase in five years of about 87%.

During 1913 state taxes in dispute accruing for 1910, 1911 and 1912 were settled adversely to this company, and payments amounting to $213,021 were made and charged against profit and loss.

Coal-Mining Department—Coal tonnage from lands owned and controlled:

	1913	1912
Mined by company	3,612,711	3,241,388
Mined by company lessees	209,018	183,892
Recovered from culm banks by company and its lessees	724,524	455,902
Less consumed as fuel by company and its lessees	551,486	424,093
Net commercial coal produced by company and its lessees	3,994,767	3,457,089
Net by Alliance Mining Co. and its lessees	147,144	159,843

Two new shafts, one at Rahm Colliery and one at Coaldale Colliery, are being sunk to develop the low levels.

During the year the company expended for permanent additions and betterments $816,450, charged to capital, and in addition $398,977 was charged against operation on account of underground developments and improvements, new stripping operations, and extraordinary repairs and renewals. There has been charged for depreciation and other reserves $476,777, and to cover obsolescence, $242,976.

On May 1 the claim of employees for additional wages under the sliding-scale percentage, in effect since 1902, was decided in favor of the men. Under this award your company paid during 1913, $25,771.

The sales of coal during the year 1913 amounted to 3,529,094 tons, a decrease of 117,337 tons, as compared with 1912. Market conditions late in 1913 were unsatisfactory. The shipments of anthracite coal by the producing companies have exceeded market requirements, this condition being caused by the mild weather of two successive winters, which unsettled the trade and decreased consumption. The net revenue received from coal for the year was $464,746, a decrease of $200,430 from 1912, based on the same method of accounting.

Note—For previous annual report of this company see "Coal Age," Vol. 3, page 552.

GENERAL BALANCE SHEET, DEC. 31, 1913

Assets ($62,513,921)—	
Coal lands, mining and marketing property, $17,456,799; canal property, $3,414,857; real estate, $1,018,753; total	$21,890,409
Railroads and other property owned or controlled: Physical property, $16,847,132; securities pledged, $7,988,311; securities unpledged, $6,286,786; total	31,122,229
Securities of uncontrolled companies pledged, $432,750; company's securities pledged, $3,399,000; total	3,831,750
Cash	984,444
Company's stock in treasury, $29,700; bonds, $393,813; securities of uncontrolled companies, $638,066; total	1,061,579
Customers' acounts, $1,231,307; sundry debtors, $512,958; total	1,744,265
Coal stock, $1,188,296; materials and supplies, $383,976; total	1,572,272
Accrued interest and dividends receivable, $16,719; sundry accrued rentals receivable, $9094; total	25,813
Suspended debit accounts	281,161
Liabilities ($62,513,921)—	
Capital stock, $26,587,650; funded debt, $26,515,333; total	$53,102,983
Loans and notes payable, $978.975; audited vouchers and payrolls, $909,550; total	1,888,525
Sundry creditors, $884,059; accrued taxes, $378,155; total	1,262,214
Matured interest on bonds, $177,301; accrued interest on bonds, $69,895; total	237,196
Matured and accrued rents, $2802; dividends unclaimed, $6991; total	9,793
Suspended credit acounts	63,466
Depreciation and other reserves, $4,055,359; profit and loss, surplus, *$1,884,384; total	6,003,209

*After adding sundry accounts adjusted, $194,064, and deducting adjustment of state taxes for years 1910, 1911 and 1912, $213,021.

COAL SECURITIES

AS THE MULE SEES IT

BY BERTON BRALEY

I once was thin and bony as a mule could ever be,
You'd almost cut your fingers if you laid a hand on me;
I had an evil temper and a mighty evil eye
And I tried to kick the daylights out of everybody nigh,
My head was full of anger and my legs were full of scars
Where I tumbled in my struggles with the stiff old-fashioned cars,
But now I'm plump and cheerful as a pampered pussy cat,
For Hyatt Roller Bearings make a Mule
Grow
Fat!

But though I'm bright and happy with a temper that is cool
And though I'm roly-poly as you seldom see a mule,
And though my work is easy as it never was of yore,
I'm pulling twice the string of cars I ever did before!
So the mine is running smoother than it ever used to do
And the skinner is so pleasant that I can't believe it true,
While I'm so calm and placid that we never have a spat,
Since Hyatt Roller Bearings make a Mule
Grow
Fat!

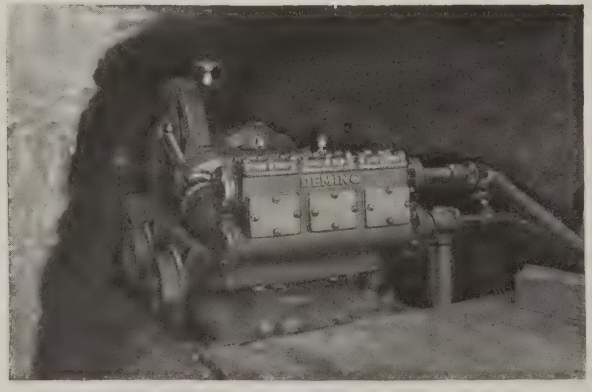
There's nobility in labor, we should honor it a lot,
But unnecessary labor is a thing that makes me hot,
And a simple beast of burden like my modest little self,
Could observe that Hyatt Bearings save both energy and pelf,
For they double up the tonnage I can haul along the track,
Yet they almost last forever—and they never strain my back,
And the owner's purse and happiness won't lose a bit by that,
While Hyatt Roller Bearings make a Mule
Grow
Fat!

Westinghouse Electric Direct-Current Motor and Pump mounted on a skid for lowering down inclines.

Westinghouse Electric Self-Starting Direct-Current Motors for Mine Pumps

These motors form the most satisfactory drive for small pumps in coal mines equipped with direct current.

They are similar to standard motors except that they can be connected directly to the line and require no starting box.



In starting these motors it is only necessary to close a circuit breaker in the power house or at some other convenient location; there is no need of visiting each pump and starting each by hand.

Another advantage lies in the fact that these motors start automatically on the return of power after a temporary failure of voltage, thus insuring operation at all times without individual attention.

Since there is no starting box and resistance, the connections are of the simplest possible character, a switch being all that is required.

These motors have been in successful operation in coal mines for several years and many re-orders from users prove their satisfactoriness in service. They are built in sizes up to 20 h.p. for all commercial direct-current voltages.

Full information sent on request.

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 755

A suggestion that coöperation between the sales department and the operating department of any coal-mining corporation will bring about more satisfactory and permanent results.

IDEAS AND SUGGESTIONS: *Pages* 756-757

Weak Links in Coal Mining — The Other Fellow's Troubles.

*A TYPICAL WELSH COLLIERY: *Pages* 758-760

The operations described have been entirely overhauled and brought up to date, as is necessary if economy of operation is to be secured. The coal is carefully sized and cleaned both by hand and in a washery. The fine coal goes to byproduct ovens. COAL AGE, Vol. 5.

A NEW ERA: *Page* 760

*THE POCKET-COAL FIELD OF LEE COUNTY, VA.: *Pages* 761-763

The name refers not to the condition of the coal, but to the mountain-girt character of the district. The central-power station and central washery exhibit uptodate developments in the mining industry. W. R. Peck. COAL AGE, Vol. 5.

*INTERPOLE MOTORS FOR MINE LOCOMOTIVES: *Pages* 764-767

The demand for interpole motors on mining locomotives appears to have been built up by the manufacturers. Their use complicates the wiring and necessitates the carrying of an extra set of spare parts, while the results secured are not appreciably better than those afforded by a properly designed noninterpole machine. A. R. Anderson. COAL AGE, Vol. 5.

MINERS' ELECTRIC LAMPS: *Page* 767

SNAPSHOTS IN COAL MINING: *Pages* 768-769

Views of surface and underground equipment and of the Eccles explosion.

Competition Is The Life Of Trade

The Weekly Ad-Talk Page

And advertising is the life of competition.

There can be no real competition between manufacturers of competing machines, unless each knows fully what the other is doing—unless they compete squarely out in the open.

Advertising not only informs prospective buyers fully of detailed points of superiority of a machine, but also informs the makers of competing machines in the same way.

This brings about a sharper competition—a competition that results in better machines on both sides, in a better business for both manufacturers, and a better machine and greater satisfaction for the user.

Advertising, in short, has been the one big factor that has brought the manufacturer and his product squarely out into the light where both were prone, before the days of real technical journal advertising, to hide in the dark and, fearfully, avoid the benefits of real competition.

Advertising has paid and still pays—pays big—in the very broadest sense.

COAL AGE

Vol. 5 NEW YORK, MAY 9, 1914 No. 19

As a rule there is "no love lost" between the sales department and the operating department of any coal-mining corporation.

To the operating officials it always appears as if the sales department takes sides with the coal users, as against the company, and to the sales department officials, it seems that the only dependable thing about the operating officials is that they can get out a specified tonnage.

Operators like to believe that the right kind of a salesman ought to be able to sell anything that can be loaded aboard railroad cars, and salesmen seem to believe that operators ought to be able to produce lump, nut and slack in any desired proportion and quality, as the demands of a constantly fluctuating market require.

The superintendent keeps harping on the fact that if he were allowed to get out a larger output, he could make a better cost. The sales manager talks about the thousands of tons of coal he could sell, if they would only give him a particular grade.

Periods of dullness, such as the coal trade has experienced pretty generally during the past few months, often lead to a better understanding between the two departments. It is during such periods that mines which have continually produced dirty coal are almost eliminated from sales records, while the ones with good reputations seem to continue working in the same old way.

When the sales manager is approached, he calls attention to the fact that at the Big—— mine, the coal is all being disposed of by Jim Baldwin; "Yes, the same Jim Baldwin that we fired six years ago."

The manager quietly starts a little investigation of his own and learns that at the Big ——mine, the superintendent has succeeded in educating his miners up to a realization of the fact, that unless they load clean coal the mine will have to cut down to quarter time. When the manager gets his sales force and his superintendents together the following day, he does most of the talking and he does it in a way that convinces Mr. Sales Manager and Mr. Division Superintendent that "a house divided against itself can not stand."

Credit for many of the innovations leading to better preparation of coals must be credited to men in sales departments, not by right of invention, but because grim necessity drove them to outwit their competitors, and, working hand in hand with some progressive superintendent, they succeeded.

In some of these battles for market supremacy, you'll find evidence of co-operation leading all the way from miner to sales manager, and it occurs to us that such team work, once inspired, will be far reaching and permanent.

Ideas and Suggestions

Weak Links in Coal Mining

SYNOPSIS—A record-breaking run for one day. Reasons why the same record cannot be made every day. The need for careful and close investigation to discover the weak links in the operation of a mine. Many suggested weak links.

A weighmaster at a mine, stepped into the coal office one evening, and, all smiles, remarked: "Broke the record today." His smiles were reflected on the faces of all present, except one official of the company, who asked, "Why can't we break the record every day? Why can't we load as much coal tomorrow, and the next day, as we did today?" The mine foreman, who was present, explained that conditions were just right for a good run that day; all the men were in; all had plenty of coal; the machinemen had all places cut; the water was well pumped out; the equipment was all in good order; and, owing to having run out of flats the day before, there were plenty of loaded cars on the dump and on the bottom, which gave the boys a good start.

These were evident and sufficient reasons, and the superintendent was satisfied. If he had carried his inquiries further, however, he might have learned the one important reason why this record could not be equaled every day. A mine may not be expected to produce the maximum tonnage every day, but when the average daily production falls below the normal capacity, there is a reason for it. We were often told at school that "a chain is no stronger than its weakest link"; but, often, it is harder to find that weakest link than it is to repair the same when discovered.

A Weak Link in Haulage

In the mining of coal, the weak link may be found in the relation of the working places to each other. If two drivers can haul the coal mined by 40 men and ten of the men are widely separated from the other thirty, one of these drivers will generally be found hauling the coal from the ten men and loafing half the time, while the other driver is working the full day and only hauls two-thirds of the coal mined by the thirty men in his territory, which makes the total production of the forty men only 75 per cent. of capacity. If the conditions of the mine will not permit a more proportionate division of the men, it's time to figure on another mule or to let the other driver work half time in each section. Mules cost money but the price of a mule and its upkeep might easily be produced from the proceeds of the coal mined by ten men.

We often hear a miner say, "I didn't get much done today. I had one car to clean up, and then I had to wait for the machine till two o'clock." And another will say, "I didn't get started till the middle of the afternoon, and they kept me on the jump from that on till quitting time." It is easy for the boss to claim "They're always kickin'"; but he might better study the situation carefully and install a new machine, or put on a night shift to clean up and insure a good run the next day, by which a weak link would be strengthened.

The lack of a sufficient number of tracklayers or timbermen may be a weak link. Two or three places thrown idle every day on account of no track or need of timbering will seriously affect the tonnage. And if conditions are such that the production of these idle places could be handled if they are working, the necessary outlay for more track and timbermen would be justified, even though there will be days when they will have to be put on other work. There is almost always extra work to keep such men employed to advantage, such as cleaning up tracks, opening waterways, etc.

A weak link is sometimes discovered in the drainage of the mine. The pumping system should be adequate to meet all demands. A motor, trying to start a trip on a slippery rail, results in loss of time and equipment. Mud and water in entries and on roads where work must be done, is sure to cause a loss of efficiency in men, mules and equipment.

The timbering of a mine may prove a weak link. Aside from considerations of safety and the conservation of material, systematic and efficient timbering is good policy, from the standpoint of dollars and cents. Not only are falls of roof expensive, in the wages paid to day hands, for the labor necessary to clean the tracks, rehang trolley and signal wires, relay track and repair broken ties, but the delay and loss in time in haulage, occasioned by such falls, will be plainly apparent on the weigh sheet.

The Need of Good Track

Far too often we find poor track one of the weak links in mining. The need of good track is so obvious that it should not be necessary to call attention to it. But we often observe the results of poor track in spite of the fact that it is one of the most important items in the production of coal. It costs practically the same and more for the maintenance of poor track as it does to make good roads; and the delays occasioned by wrecked motor trips and cars off the track, perhaps in a part of the mine that will throw a half-dozen drivers idle, leave no valid excuse for poor roads in the mine.

Inefficient or insufficient equipment may cause a large reduction in tonnage, and must, therefore, be regarded as a weak link. It may be that an insufficient number of mine cars are in operation. During the short periods of temporary delay, the miners should have enough empty cars given them to keep on loading the coal mined. It is somewhat difficult to figure on the exact number of cars needed, in any case, for it is possible to have an oversupply as well as an undersupply. But if a larger supply of mine cars will result in an increased production of coal, it is probable that the expense of the new cars and the necessary storage room, both inside and outside of the mine, will be justified.

From the time the mine car is loaded and started on its journey to the tipple, it must be kept moving. The mine locomotives and loading machinery should never be

permitted to permanently curtail production; but should be kept to such a high standard that they will not be overloaded by the maximum capacity of the mine.

The installation of the power plant and the construction of the tipple and other permanent structures, being the most expensive items in the opening of a mine and having received careful consideration, will generally determine the limit of production. As the initial cost is so great, it is not often advisable to make many important changes in such equipment. But such minor changes may be made and equipment added as conditions warrant.

In the purchase and distribution of supplies, we may discover another weak link. All supplies that are ordinarily needed about a mine, should be kept constantly on hand. This includes lumber for track, timbering, car repairing, etc.; steel rails, nails and bolts, wires and insulators, iron and steel bars, oil, waste, pipe fittings and tools, small machinery parts, small tools; in fact, all mine supplies should be kept in sufficient quantities to meet every need. The purchase and distribution of supplies should be in charge of a competent man, who will see to it that all material is provided where needed, in quantities to meet the demand and, at the same time, prevent waste, which is as inexcusable as a lack of supply.

A system should be in force, checking all tools against the employee who takes them out, such tools to be charged to him if not returned. The prompt return of tools and an ever-ready supply of small repair materials, will insure prompt and permanent repairs, avoiding the delays caused by hunting material and tools, and preventing "patched-up" jobs.

A Possible Weak Link in Management

Even the management of the mine may be a weak link. So much depends on the mine superintendents and foremen that they are deserving of an article themselves. Much responsibility rests upon these often overworked and underpaid officials. But only brief mention will be made of some of the requirements and qualifications of the successful mine manager. To secure and maintain an increased production, he must use care in laying out the mine, and in the hiring and placing of men. He must be a man of forethought, looking to the future as well as the present requirements of the mine. His judgment must be sound in regard to the construction and improvement of the various departments, so that each department may bear its proper relation to the whole, resulting in greater safety, greater efficiency and a larger tonnage. On the superintendent devolves the duty of finding weak spots in daily operation of mine.

Then in his personal relation to the miners, by tact and good judgment, the mine foreman can do much to eliminate friction. Men will clean coal better for a foreman who treats them well, thus avoiding part of the delay in operation, which would be caused by having to clean the coal at the tipple. The foreman must treat his miners and their officers with fairness. Sometimes it is possible for the turn keeper or the mine committee to curtail the production of a mine to a greater or less degree. They will probably not do this if they receive the proper treatment from the management.

It is easy to run in a rut, and sometimes hard to convince those in authority of needed improvements on account of the extra cost entailed. It is true that improvements mean added expense and are sometimes not justified, on that account. But a considerable outlay is warranted by any improvement that will result in an increased tonnage, day after day, year after year. A chain is no stronger than its weakest link; and the capacity of a mine cannot go above the capacity of its weakest unit.

One hundred per cent. efficiency is hard to secure, perhaps impossible. But we certainly rise no higher than our ambition; and we will never reach 100 per cent. efficiency, unless that is our aim.

The Other Fellow's Troubles

By Southern Superintendent

If you think that you have more to contend with than any other class of men, possibly there's something wrong with your thinker. We had this brought home to us rather forcibly, only recently, while riding in a crowded Pullman smoking compartment. Here were a number of men, each one of whom was an entire stranger to all of the others, and, as it happened, each engaged in a different occupation. As is usually the case, under similar circumstances, the talk soon became rather personal and every fellow volunteered snatches of personal history and narrative that bordered almost on inside information, about his respective business. We recall that in the group was a chewing-gum manufacturer; a proprietor of a mineral-water bottling establishment; an adjuster for an automobile-insurance company; an owner of a powder mill; a manager of a large hotel company; and a former coal-mine superintendent.

The fun started when the ex-mine superintendent suggested that no one, unacquainted with the coal-mining business, could realize the full and terrible meaning of such words as strikes; explosions; inflamed public opinion; open winter; etc., etc. We won't attempt to repeat all of the conversation that followed, interesting though it was, but we feel called upon to affirm that we are now convinced that the man at the head of a powder mill can speak feelingly about explosions; he also knows a thing or two about liability insurance. An automobile-insurance adjuster knows a few things about unreasonable human beings. The chewing-gum manufacturer with a factory full of girls, knows just what a strike may mean, public sympathy, boycott and all, and the hotel man acquires a hide that can resist the word "robber," expressed in eighteen languages.

The words robber and baron are not necessarily always associated, popular opinion to the contrary notwithstanding; the average hotel man looks like a baron naturally, while the coal-mine owner is gifted only with such dignity in the eyes of the cartoonist.

We were about to slight the mineral water man: He's the fellow who studies weather conditions in earnest, if keeping a thermometer and a barometer in one's bedroom is any criterion. When the natural gases in his waters refuse to follow the accepted analyses, he has no stock-pile to fall back on and he can't even leave them in the ground.

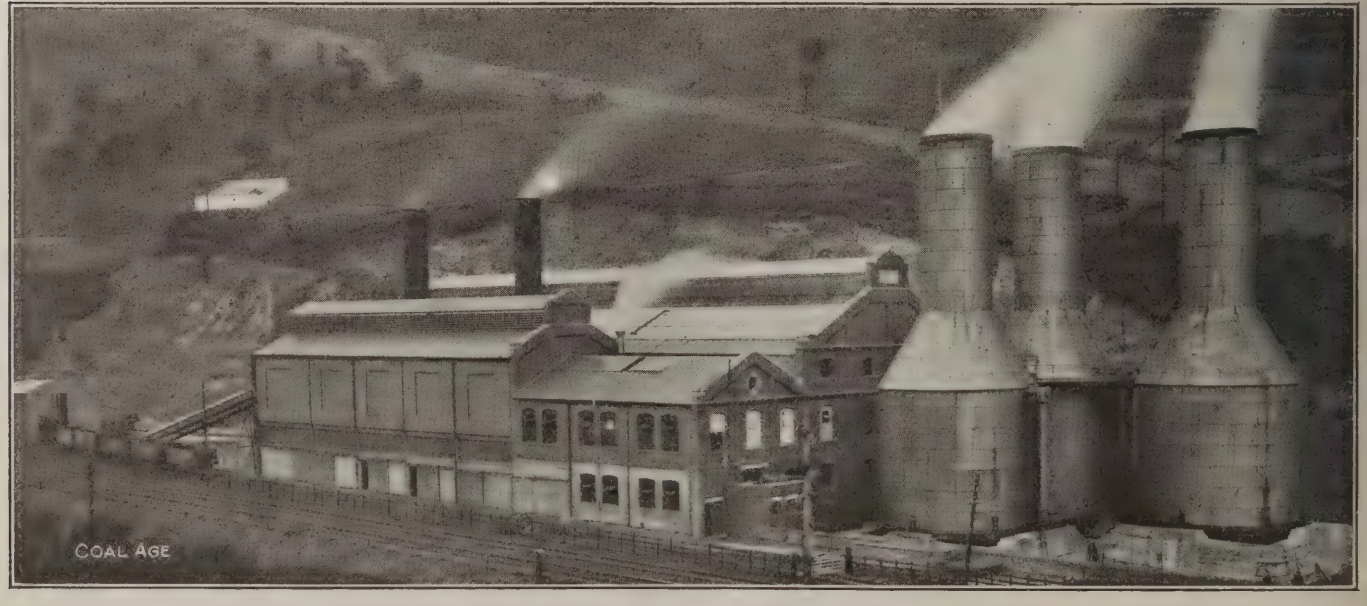
There's a French saying that sounds something like this: "Company in distress makes trouble less." Perhaps that is the secret of the crowded condition so characteristic of smoking compartments on trains and steamers.

Try it out, the next time you think you're in trouble.

A Typical Welsh Colliery

SYNOPSIS—The operations described have been entirely overhauled and brought up to date as is necessary if economy of operation is to be secured. The coal is carefully sized and cleaned both by hand and in a washery. The fine coal goes to byproduct ovens.

D. Davis & Sons, Ltd., operating the Ferndale, Coedely and Griffin-Nantyglo collieries of South Wales, is one of the most famous firms in the Welsh coal-mining industry. The company now sells 3,500,000 tons of coal per year. The Ferndale mineral property embraces all the coal seams underlying an area of between 6 and 7 sq.mi., in the heart of the South Wales steam-coal district. This forms a continuous coal field reaching from the valley of the Rhondda Fach to that of the Rhondda Fawr and comprising no less than 6 workable coal beds. These are known as the 2-ft., 4-ft., 6-ft., 9-ft., the second 4-ft. or Bute seam and the 5-ft. seam.



SURFACE WORKS, INCLUDING COKE-OVEN AND BYPRODUCT PLANT AT COEDELY COLLIERY

VENTILATING EQUIPMENT

These various coal measures are intersected by nine hoisting shafts and numerous ventilating pits ranging in depth from 720 to 1680 ft. The colliery is noted for its uptodate equipment and methods. Its electrically operated turbo-compressors and its fine ventilating plants are considered typical of the best in colliery engineering, while large sums have been spent in improvement.

It would be difficult to depict more graphically the size of the ventilating equipment than by stating that something over 17½ million tons of air are driven through

ELECTRIC POWER STATION AT FERNDALE

the workings per year. In other words, it may be roughly stated that for every ton of coal hoisted, ten tons of air have entered and left the underground galleries.

Sprinkling Lines

The workings are traversed by miles of iron pipe through which water is forced under pressure for sprinkling the floors, walls and roofs of the entries. At intervals there are valves, to which hose is attached by a special force of men retained for the sole purpose of keeping the coal dust wetted down in order to eliminate risk of explosions. Where electricity cannot be safely employed for operating machinery underground, another and larger system of piping 33 miles long is installed to carry the compressed air.

Picking Coal at Ferndale Colliery

The power house is of modern and economic type. It contains four boilers, each of 2000 hp., equipped with mechanical stokers; one stoker and one ash man are employed upon each shift, the fuel never being moved by manual labor from the time it leaves the hoisting shaft until the ashes are withdrawn from the ashpit.

In the central Power House there are installed three horizontal cross-compound engines of 2400 hp. each, with an equal number of Lahmeyer electric generators of the most modern type.

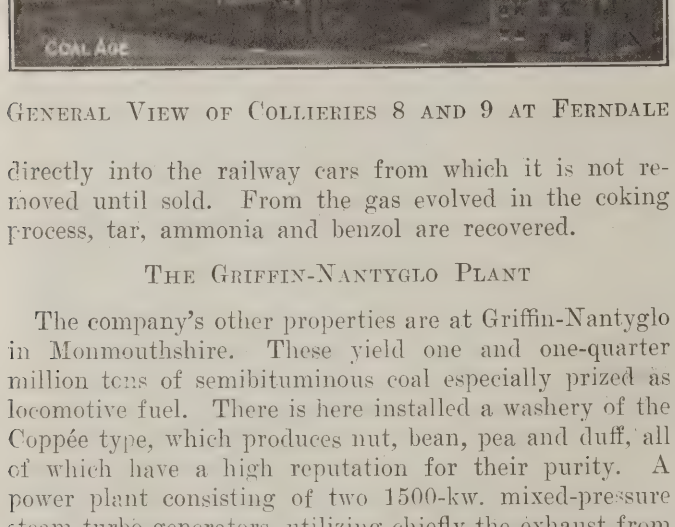
Plant Has Been Made Over

The whole power plant has been practically replaced during the last five years, the latest improved electrical equipment being installed. The electrically operated hoisting engines are each capable of raising 200 tons gross weight per hour, each wind being accomplished to a depth of over 1500 ft. in about 40 seconds.

The company's other large coal property at Coedely, now known as the Welsh Navigation Steam Coal Co.'s mine, was acquired in 1911. The seams now being developed contain the best quality of coking coal, steam and locomotive fuel. The output, which at present does not exceed 500,000 tons per year, is expected ultimately to reach 1,250,000 tons per annum.

Dumping and Coal Preparation

The cars, leaving the mine cage, run by gravity to revolving dumps which discharge the coal upon shaking screens. These separate the coal into sizes discharging the fine coal into bunkers beneath and depositing the larger grades upon picking belts in slow motion. Here the coal is picked and sorted, and the dirt removed. Washed coal from this plant is carefully lowered into railway cars by spirals to avoid breakage, and under the designation of pea, bean, or nut, according to its size, finds a ready market.



In the washery, the coal is classified into various trade sizes, nut, pea, bean and duff, each size being separately prepared and delivered into bunkers conveniently situated for loading into cars. Of the total washed coal delivered from the washery, some 75 per cent. amounting

to about 420 tons per day or 150,000 tons per annum will be duff or slack which will be delivered to a 1000-ton reinforced concrete bunker suitably arranged for feeding into the compressor boxes of the two oven-charging machines.

Coking Plant

In accordance with the general policy of this company some of the chief officials engaged at Coedely visited Belgium, Germany and other places to study and receive special training in the operation of byproduct coke ovens. A plant will soon be completed with the most modern devices for the reclaiming of byproducts.

The coking plant comprises two batteries each containing 30 ovens Coppée regenerative type; each oven will coke about seven tons of coal per day, producing about five tons of product. When the coking process is complete, the coke is pushed from the oven through a quenching machine at a rate of about 6 ft. per minute and is delivered

General View of Collieries 8 and 9 at Ferndale

directly into the railway cars from which it is not removed until sold. From the gas evolved in the coking process, tar, ammonia and benzol are recovered.

The Griffin-Nantyglo Plant

The company's other properties are at Griffin-Nantyglo in Monmouthshire. These yield one and one-quarter million tons of semibituminous coal especially prized as locomotive fuel. There is here installed a washery of the Coppée type, which produces nut, bean, pea and duff, all of which have a high reputation for their purity. A power plant consisting of two 1500-kw. mixed-pressure steam turbo-generators, utilizing chiefly the exhaust from the hoisting engines, fans and air compressor, is under process of construction. Electricity will be generated at 3000 volts and transmitted at 10,000 volts, being stepped down again for utilization at the first named potential. The motors at present aggregate upwards of 3000 hp. and include hoists, pumps, fans and the usual auxiliary motors for use on the surface in workshops, sawmills and coal washery.

Meeting of A. I. M. E.

A meeting of the American Institute of Mining Engineers, under the joint auspices of the Iron and Steel Committee, the Committee on Petroleum and Gas and the Committee on Coal and Coke, will be held at Pittsburgh, Penn., Oct. 8 to 10 inclusive.

A New Era

By Carson W. Smith*

There is much talk, at the present time, in regard to efficiency; we hear a great deal said about efficiency standards, efficiency engineering, scientific management and other words and phrases of like suggestion. Though the study of industrial efficiency, in the modern scientific manner, is of comparatively recent date, the underlying principles have been already discovered. The aim and purpose of this study are good; the tendency is good.

The elimination of waste, the utilization of products; the increase in capacity of units; these are all worth while. The growth of science and the knowledge of its principles and, especially, their application to industrial plants all over the country, are giving to this nation and to the world a foundation for the learning of a Greater Science, which is slowly but surely evolving from the heterogeneous chaos of the present inefficient industrialism. One hundred or two hundred years hence, the present period will be spoken of as the "Renaissance" or awakening of industrial development.

The tendency of the present time points emphatically to a new era in the entire industrial world. Business, efficiency and scientific management are important features of this development. The present labor unrest and socialistic tendencies point in the same direction. There is a leavening that is working profoundly in and through all classes; but the future will prove that these tendencies are for the development of a broad socialism that will give every man a "square deal." The time will come when the only man who is hungry will be the man who will not work.

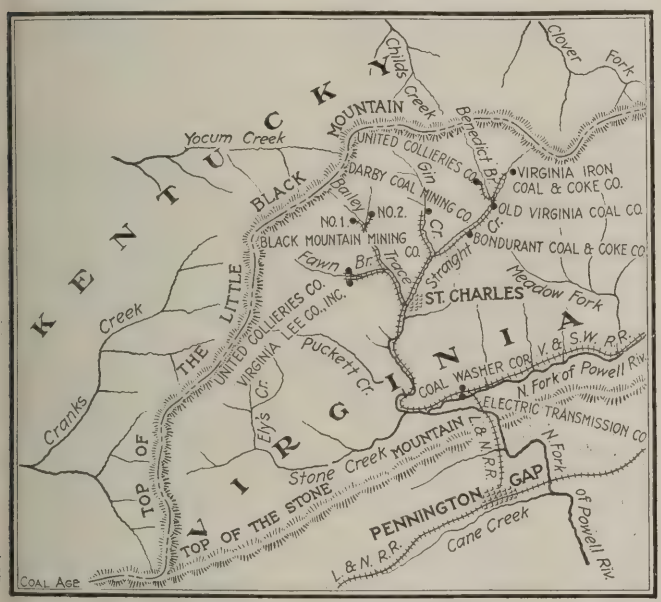
We hail in the coming of this era a new conception of justice and equity. There will be no red-flag socialism; and friction between labor and employers of labor will ultimately be eliminated, as productive only of waste and inefficiency. That this is not altogether a dream, many incidents of daily occurrence are proving.

Coal and Coke Exhibits at Panama-Pacific Exposition

The United States Steel Corporation, and its subsidiary companies, propose to have a comprehensive exhibit of its operations at the Panama-Pacific Exposition, in San Francisco, 1915. In addition to the material exhibits, the Corporation expects to show, by moving pictures, its coal and coke operations throughout all departments, and all the ramifications of the processes used at its different plants. It will also set forth the work which it has done toward the social welfare of its employees and those depending on them, and will exhibit many forms of safety devices which have been conceived by its officials and employees. Aid and care for the injured, and the voice given to its employees through their committees, will also be demonstrated.

The cost of concrete overcasts can be greatly reduced by the use of reinforcement. Well screened tough coal can be economically used in place of crushed stone in massive stoppings, where the pressure or the danger from fire is not very great. If not well screened, too much coal dust is apt to be present, necessitating the use of a large amount of cement without corresponding improvement in the strength of the concrete.

*Superintendent, the Consolidated Coal & Coke Co., Dacono, Colo.



The Pocket Coal Field of Lee County, Va.

By W. R. Peck*

SYNOPSIS—The name refers not to the condition of the coal but to the mountain-girt character of the district. The central-power station and central washery exhibit uptodate developments in the mining industry.

In the extreme western part of Virginia, on the Kentucky state line, is a coal field of some 40 square miles in extent, which has come into prominence within the last ten years. Locally, this is the Pocket or Little Black Mountain coal field of Lee County.

Geographically, it is in southwestern Virginia, bordering Kentucky, in the heart of the Appalachian Mountains. Little Black Mountain, the summit of which forms the state line, bounds two sides of this coal field, while Stone

The Virginia Pocket

Mountain cuts it off from the world on the other sides, nature providing only one natural outlet, a water gap for the north fork of Powell River through Stone Mountain, known as Pennington Gap. Thus, this region, entirely surrounded by mountain ranges, became known to the earliest settlers of southwestern Virginia as "The Pocket."

"The Pocket"

Topographically, the field is one of many small streams, with narrow, winding valleys, each stream heading in the main mountain ridges and being divided from its tributaries by spurs having steep slopes and sharp summits. The main spurs, as they leave the mountain, are lofty, in many cases rising 200 to 300 ft. above the mountain, and maintaining this height until, with an abrupt break, they slope down to the stream at their foot. After the upturned strata of Stone Mountain have reached their natural horizon, as they do a short distance from the foot of the mountain, they become regular, and have a general northwestwardly dip with moderate grades.

Though this field, at the present time, produces only from 600,000 to 700,000 tons annually, it is, nevertheless, of great interest to the domestic coal trade, as the principal seam mined is one of the best domestic coals on the market. Eight mines, owned by six companies, are in operation; a large central power station has recently been completed, and a washer, large enough to handle the entire output of the smaller sizes of coal in the field, will be completed in the early spring of 1914.

History of Field

This field was not opened when the first rush was made into southwestern Virginia in the latter part of the eighties, due, perhaps, to the fact that there the famous Imboden seam of Wise County has deteriorated and is practically worthless. "The Pocket" was undeveloped and unprospected until the year 1903, when the Darby Coal & Coke Co. began prospecting and purchased about 1500 acres on Gin and Straight Creeks. About the same time, the principal land-owning company of this section, now known as the Black Mountain Corporation, entered the field, purchasing practically the entire region, with the exception of the 1500 acres mentioned above. The first company to open mines on the properties of the Black Mountain Corporation was the St. Charles Coal & Coke Co., which operated a mine on Seam No. 3, and later on Seam No. 5 also; this company, after passing through many and varied troubles, is known today as the Virginia-Lee Co., Inc., Norfolk, Va.

The Darby Coal & Coke Co., working Seam No. 5, or the Darby Seam, had an output of from 200 to 300 tons a day when the exceptional high prices of 1905 and 1906 prevailed in this field. Due to the superior qualities of the coal, and the small supply, it demanded and obtained an extremely high price, a price that would be fabulous there today. The profits made caused several new companies to enter the field, leases being obtained from the Black Mountain Corporation. The Virginia & Southwestern R.R. at once began to build several miles of additional tracks; and in the spring of 1907 there were seven mines in operation on the Darby Seam.

Would-Be Coal Men Forced Out by Competition

With the exception of the Darby Coal & Coke Co. and the Bondurant Coal & Coke Co., the history of the various corporations has been one of trouble, due to poor managers and limited capital, and all but the two mentioned above have changed hands in different ways: two through the bankruptcy courts, others by reorganization or the sale of stock. But the impression must not be drawn from the statement that investments in this field are not advisable, for they are. The first companies rushed into the field with limited capital, opening their mines and beginning to ship coal just when the prices, which were so high, began to drop, and the money they expected to make, to pay their debts, vanished. As this was a new

*Engineer with Fox & Peck, consulting engineers, Big Stone Gap, Va.

coal and a new field, it did not have an established market, and prices remained low for some time, thereby forcing many of the companies and their stockholders to get out as best they could. These conditions naturally brought into the field experienced mine managers and real coal men, and the field now has established markets in the south, north and west.

The Darby Coal & Coke Co. leased its plant and lands to the Darby Coal Mining Co. in 1909; and in 1911 the Virginia Iron, Coal & Coke Co., Imperial plant, began shipping coal from their mines on No. 6 Seam.

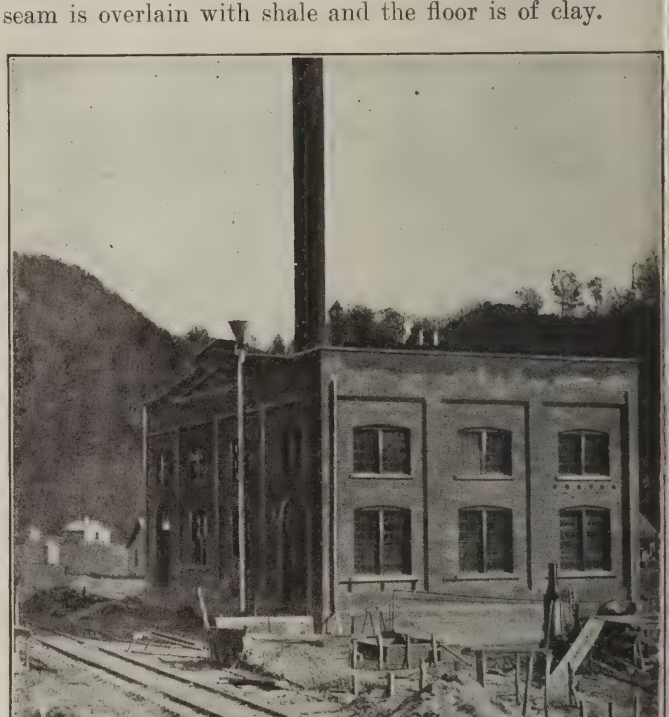
Description of Seams

Twelve workable seams of commercial value are found in this field, occurring in the upper part of the Pottsville group. Below Seam No. 1, according to report, are four or five coal seams in the lower part of the Pottsville group, and in the Lee Conglomerate, but they are thin, varying from a few inches to 2 or 3 ft. in thickness and are at the present time of no commercial value.

Following will be found the different seams, with their thickness and the interval between them, beginning with the highest and descending:

CROSS SECTION OF POCKET FIELD

Harlan sandstone, exposed in cliffs near the mountain tops, 40 ft. in thickness.
No. 12 seam, from 48 to 60 in. in thickness; interval, average, 60 ft.
No. 11 seam, average, 36 in. in thickness; interval, 300 ft.
No. 10 seam, average, 72 in. in thickness; interval, average, 40 ft.
No. 9 seam, average, 55 in. in thickness; interval, average, 100 ft.
No. 8 seam, average, 48 in. in thickness; interval, average, 205 ft.
No. 7 seam, average, 42 in. in thickness; interval, average, 325 ft.
No. 6 seam, average, 52 in. in thickness; interval, average, 275 ft.
No. 5 seam, from 36 to 48 in. in thickness; interval, average, 180 ft.
No. 4 seam, average, 30 in. in thickness; interval, average, 180 ft.
No. 3 seam, average, 40 in. in thickness; interval, average, 85 ft.
No. 2 seam, average, 36 in. in thickness; interval, average, 300 ft.
No. 1 seam, from 36 to 72 in. in thickness.



ANALYSES OF THE SEAMS

No. of Seam	Moisture	Vol. Mat.	Fixed Carbon	Ash	Sulphur	B.t.u.
12.....	5.49	41.20	52.75	6.05	1.36	13,109

1.....	1.92	38.78	56.26	3.04	0.65	.....

At present, only two seams are mined, Nos. 5 and 6; however, No. 10 seam on the head of Fawn Branch, was worked for two or three years by the former Dominion Coal Co., but, due to the improper construction of the incline and financial troubles, it was abandoned. The United Collieries Co., now operating the Dominion plant on No. 5 seam, and opening a new mine on seam No. 6, on Benedict Branch, will, in the near future, build a new incline and open up this No. 10 Seam.

The Darby, or No. 5, seam of coal is the most important in the field at the present time, and it is the same as the Roda or Taggart coal of Wise County, Va., and the Kellioka, of Harlan County, Ky. This seam in the area mentioned varies from 26 to 50 in. It is practically a clean coal, free from partings; it has a luster, is hard, and, when cut, breaks into splinters as well as blocks; it stands handling and the weather well, ignites quickly, burns splendidly in grate, stove or furnace, and leaves only a small quantity of a light reddish ash when complete combustion is obtained. This coal also makes a good coke, although, at the present time, it is not used for coking, as the price of nut and slack for steam purposes is usually good. The seam is overlain with a heavy sandstone top, but the sandstone is sometimes cut out by a heavy draw slate. The bottom is a clay.

Seam No. 6, lying about 275 ft. above No. 5, averages about 50 in. in thickness, and has a parting varying from ½ to 1 in. thick, usually occurring from 12 to 14 in. from the bottom. This coal, when cut, breaks into cubes, from the nut to block size; the blocks seldom exceed 12 in. in any dimension. The coal is hard, with a dull luster; it ignites with difficulty, burns slowly and leaves little ash. The top, in the mines of the Virginia Iron, Coal & Coke Co. on the head of Straight Creek, is exceptionally good, for after the drift mouth is passed, no cross-timbers and but few props are needed anywhere in the mine. This seam is overlain with shale and the floor is of clay.

Central Station of Electric Transmission Co., Pocket, Va.

Seam No. 10 has an average thickness of 6 ft. It contains a clay parting in the upper half and a thin shaly coal parting in the lower, and, usually, is overlain with sandstone and rests on shale. This coal blocks well, stands handling and weather, and is a good average domestic coal.

Operating Companies

The Black Mountain Mining Co., Big Stone Gap, Va., Dr. J. W. Kelly, president and general manager, leases from the Black Mountain Corporation. This company operates two mines on Seam No. 5, on Bailey Trace Branch, and has an output of 350 tons per day, shipping three grades of coal from Mine No. 1 and two grades from Mine No. 2. The power house consists of one 100-kw., belt-connected unit, 250 volts, direct current; additional power will be obtained from the central-power station. Mine No. 1 has four chain machines, two haulage motors, one electric pump and one electric rock drill. Mules are still used in parts of the mine for gathering. Mining is done by the room-and-pillar method; rooms 40 ft. wide and gob entries. Mine No. 2 has two chain machines, two haulage motors, one fan motor and one electric rock drill.

Mules are still used in parts of the mine. System of mining is the room-and-pillar method. The rooms are 40 ft. wide; and the entries are gobbed.

The Bondurant Coal & Coke Co., St. Charles, Va., C. W. Bondurant, president and general manager, leases from the Black Mountain Corporation. This company is mining No. 5 seam on Straight Creek. The output is 30 tons per day, and three grades of coal are shipped. Coal is shot off the solid. The coal is hauled by mules with a gravity incline to tipple. The system of mining is the room-and-pillar method. Rooms are from 20 to 30 ft. wide and gob entries are driven when necessary.

The Darby Coal Mining Co., Darbyville, Va., C. H. Thompson, president and general manager, leases from the Darby Coal & Coke Co. This company is mining Seam No. 5 on Gin Creek. The output is 360 tons per day, and three grades of coal are shipped. The two smaller grades are washed. The power house has one 150-kw. direct-connected generator developing direct current at 250 volts. There are four chain cutters, one Hess bar machine and three six-ton crab motors. The system of mining is the room-and-pillar method. The rooms are 40 ft. wide and are turned both ways from the cross-entries.

The Old Virginia Coal Co., Darbyville, Va., C. H. Thompson, president and general manager, leases from the Black Mountain Corporation. This company is mining Seam No. 5 on Straight Creek. The output is 450 tons per day, and three grades of coal are shipped. The power house has one 200-kw. belt-connected, 250-volt direct-current generator three-chain machines; one Hess bar machine and three 6-ton motors. Mules are used in some parts of the mine. The system of mining is the room-and-pillar method with rooms 40 ft. wide.

The United Collieries Co., Bristol, Tenn., C. W. Bondurant, general manager. The plant is known as the Dominion colliery and is leased from the Black Mountain corporation. This company is mining Seam No. 5 on Fawn Branch. The output is 250 tons per day, and three grades of coal are shipped. The power house contains one 150-kw. unit, belt-connected, delivering direct current at 250 volts. A substation is already installed to obtain power from the central-power station. Five chain machines and four motors are in use. Mules are still used in parts of the mines. The system of mining is the room-and-pillar method with rooms 30 to 40 ft. wide and the cross-entries are gobbed.

This company also operates the Benedict Plant, leasing from the Black Mountain Corporation. This operation will mine Seams Nos. 6 and 10 on Benedict Branch of Straight Creek. The output will be 1000 tons per day and power will be obtained from the central-power station of the Electric Transmission Co. Modern machinery will be installed throughout the mine.

The Virginia Iron, Coal & Coke Co.—Henry K. McHarg, Jr., vice-president and general manager, Roanoke, Va. The Imperial plant of this company, R. R. Williams, superintendent, leases from the Black Mountain Corporation. This operation is mining Seam No. 6 on the head of Straight Creek. The output is 500 tons per day, and three grades of coal are shipped. The power house has one 250-kw. direct-connected unit delivering direct current at 550 volts. There are three chain machines, five motors and a gravity incline to the tipple. Coal is mined by the room-and-pillar method with rooms from 25 to 30 ft. wide.

The Virginia-Lee Co., Inc., Norfolk, Va., W. A. Wagner, vice-president and general manager, leases from the Black Mountain Corporation. This company is mining Seam No. 5 on Fawn Branch. The output is 400 tons per day and three grades of coal are shipped. The power house is equipped with one 150-kw. belt-connected unit delivering current at 250 volts. There are seven machines and five electric locomotives. The coal is mined by a method giving a short-wall face of 120 ft. Where this method cannot be used on account of heavy draw slate, the room-and-pillar method replaces it with rooms 30 ft. wide.

Central-Power Plant

The general manager of the Electric Transmission Co. is Harry B. Reed, of Lexington, Ky. The central-power station of this company is located at the Pocket. The building measures 90x50 ft., and is constructed of brick and concrete. It has steel roof trusses and a concrete floor. A General Electric turbo-generator delivers 1000 kw., with power factor of 80 per cent. at 2300 volts, the current being three-phase, 60 cycles. There are two exciters each generating 25 kw.; one is motor-driven and the other actuated by a steam turbine. There is a five-panel black slate switchboard with lightning arrester and aluminum cell. The line voltage is 33,000 volts.

The transmission line is carried on wooden poles with Byllesby wishbone cross-arms, 35,000-volt insulators being provided. Steam is raised in a battery of two 350-hp. boilers, the pressure being 200 lb. per square inch. The draft is secured by a steel stack, 5 ft. in diameter by 140 ft. high. The vacuum of the turbine is provided by a Wheeler jet condenser. The piping is extra-heavy and was installed by B. F. Shaw & Co., Wilmington, Del. Water for the condenser and boilers is taken from the North Fork of the Powell River through 12-in. pipe, a concrete dam being built across the river.

The intake is constructed of concrete and the water is double-screened before it is admitted to the pipe line. After being used in the condenser the water is pumped to a hot well, where the makeup pumps deliver it to a 1000-hp. Blake-Knowles feed-water heater. Worthington outside-packed piston pumps are used for boiler feed. The rear of the building is of temporary construction, so that it can be extended for future installments.

Five houses for employees have been erected. An 8-in well 341 ft. deep to supply water for domestic use has been drilled, and the water will be pumped to a 20,000 gal. tank on the hillside. Another 2500-kw. unit, with the necessary boilers, will be installed later, and the transmission line will be extended to Harlan County, Ky., and to Wise County, Va. This plant was erected under the supervision of S. E. Puckette, with B. F. Shaw & Co. acting as consulting engineers.

A Community Coal Washery

The Coal Washer Corporation, N. D. Bachman, Jr., general manager, Bristol, Tenn. The present capacity of the washer constructed by this corporation is 750 tons every 10 hours. The constructors are the Montgomery Coal Washing & Manufacturing Co., Birmingham, Ala., who also are the manufacturers and designers of the jigs.

The present installation includes two jigs with foundations and a settling tank for these and for two more. The elevators will lift 1500 tons in 10 hours. There is one bin of 75 tons capacity for unwashed coal, and three bins of 100 tons capacity and one of 75 tons, for storing washed coal.

Coal is delivered in railroad cars from the various adjacent mines and dumped below the tracks and elevated to unwashed-coal bins. Then it passes through the jigs and settling tank and is elevated to the top of the washed-coal bins, where it is screened into ¾x2-in. nut, and ⅛- to ¾-in. pea and slack, being sprayed in the revolving screen. The slack goes to another settling tank and is elevated by a slow-speed elevator. The coal above 2 in. is sold unwashed. The washed coal can be mixed in any way desired. Water will be pumped from the hot well of the power house of the Electric Transmission Co. and delivered to a 30,000 gal. tank on the hillside.

This coal field is served by two railroads, the Virginia & Southwestern, a branch of the Southern R.R. and the Louisville & Nashville R.R. These two railroads use the same tracks in the field from their junction at the Pocket.

Acknowledgment is made to S. E. Puckette, engineer of the Black Mountain Corporation and to others in the field, for assistance in preparing this article.

Interpole Motors for Mine Locomotives

By A. R. Anderson, M. S.*

SYNOPSIS—The demand for interpole motors on mining locomotives appears to have been built up by the manufacturers. Their use complicates the wiring and necessitates the carrying of an extra set of spare parts, while the results secured are not appreciably better than those afforded by a properly designed noninterpole machine.

Most practices have their legitimate field of usefulness, and there are but few that cannot be overdone. So it is with interpole motors. The merit of interpole construction for certain classes of service is beyond dispute, but it seems that the recognition of its good features has so urged the extension of its application that the legitimate limit of its usefulness along certain lines has been overstepped. Particularly is this true in its adaptation to railway motors for electric mine locomotives.

The engineer, in common with all his fellow beings whose efforts are of any avail, is continually working in the spirit of compromise, and the advantages of a certain practice should not be permitted to become assertive to the point of barring the spirit of compromise from the engineer's considerations.

In recent years there has been a strong tendency to urge upon the mine operator the use of locomotives equipped with interpole motors, and many have taken up this agitation and established a demand for interpole motor equipment without, perhaps, definitely knowing whether the basis on which this demand is made is reasonable or not. It is hoped that the facts set forth in the following discussion from which conclusions of some value may be drawn, will assist the practical mine man in deciding upon the value of interpole equipment from the standpoint of satisfactory and economical operation.

Interpoles Are Not New

Interpole-motor construction is by no means a new idea; it dates back at least to 1884. On Oct. 23 of that year, an application for patent on this principle was filed in the U. S. Patent Office by R. H. Mather, and on Aug. 25 of the following year a patent (No. 324,862) was granted under the title of "Regulator for Dynamo Electric Machines and Motors."

The application of auxiliary poles midway between the main ones was exactly the same in principle as the present-day interpole practice, and the object as stated in the above mentioned patent was "to render dynamo electric machines of the specified classes self-regulating in such a sense that with constant speed of driving and with a constant position of the brushes, any such machine will maintain a constant potential regardless of variations of resistance in the working circuit—in other words, it is the object of my invention to prevent the occurrence of sparking at the commutator without any change in the position of the brushes, and at the same time to produce a constant electromotive force regardless of variations of resistance in the main circuit, a result which is particularly desirable in incandescent lighting and in the electric deposition of metals."

At that time the laws of commutation were perhaps not so well understood as they are today, and the above wording, therefore, sounds a little ambiguous, but the object of preventing the occurrence of sparking at the commutator without any change in the position of the brushes, is clearly enough put.

In 1885 and 1886 interpoles were used by F. L. Sprague in some experiments he was conducting on the Manhattan Elevated R.R. Commercial requirements, however, in regard to sparkless commutation, overload capacity and cost were not as exacting in those days as they are at present, and the principle was abandoned to be revived in more recent years.

The question naturally is asked, "Why were interpoles abandoned and then revived?" The answer has been hinted at above, but will be developed more fully later.

Sparkless Commutation Is Possible without Interpoles

As a starting point then, the statement is made that where no restrictions are placed on the dimensions of the machine, it is possible to design a motor that will have practically sparkless commutation from no load to full load in both directions of rotation. By "practically sparkless commutation" is meant that any sparking which may occur is so slight that it cannot in any way be considered injurious. As the load is increased above full load, however, the distorting effect of armature reactance upon field flux becomes more and more pronounced and objectionable and destructive sparking sets in.

In the early days when knowledge of these matters was more or less vague, everybody from the designer and manufacturer to the ultimate purchaser played safe. Commercial competition was less keen than it is today; designs were of liberal proportions, both in regard to dimensions and amount of material, and in the specification of apparatus for a given duty, a generous factor of safety was allowed. Electrical apparatus was passing rapidly through successive stages of development, and to err on the side of "too much" rather than "too little" was the watchful care of every engineer.

Eventually designs became more standardized; competing companies manufactured similar lines of apparatus, and business was obtained largely on price. The electrical industry took its place among well founded commercial enterprises of the day, and the inventive engineer with original ideas gave way to the cold, calculating scrutinizer of detail, whose sole business it was to reduce the cost of production of existing designs.

A similar revolution took place in the specification of machines, and the tendency toward investigating the average rather than the maximum duty in determining upon the capacity of the machine required became more marked.

Some significance then accrued to the term "overload capacity," and in the design of motors the long neglected

*Electrical Engineer, Jeffrey Mfg. Co., Columbus, Ohio.

interpole was soon revived. The association of interpoles with overload should be borne in mind. Thus may be explained the reason why the interpole with its added complications of mechanical construction and electrical connections lay for so long a time dormant, to be revived later in the strife for economic production and efficient operation under conditions in respect to heating, etc., where the variation in load is such as to permit of intermittent *overloads*.

With Limited Dimensions Use Interpoles

Another legitimate application of interpoles is found in motors where the dimensions for a given horsepower and speed are limited by the machine of which the motor is a part. By virtue of the increased number of ampere conductors on the armature, made possible by the use of interpoles, the torque developed by the armature is increased by this construction so that for a given speed a greater horsepower with good commutation may be obtained from a frame of given dimensions.

In general, interpoles are desirable and properly applied in cases where the motor is subjected to overloads, or where a large horsepower at a low speed is cramped into small dimensions.

But, thousands of interpole motors are designed for and put into service under conditions that do not fall under either one of these cases; conditions where the motor cannot be overloaded and where dimensions do not necessitate the use of interpoles to obtain the required horsepower. Then why are interpole motors built for these conditions, where dimensions are not limited and where the motor cannot be overloaded? The initiative in this matter is taken by the manufacturer; therefore, his side of the question will be considered first.

As pointed out above, the efforts of the manufacturer's engineers are directed toward decreasing the cost of production. Without going into detail, it is generally possible, because of the increased ampere conductors permissible on an armature of a given diameter when employing interpoles, to effect, in stationary motors of any considerable size, with continuous rating, a sufficient saving in material to more than offset the additional labor required by the interpole construction.

The size of motor in which the interpole design effects a saving in the cost of production, varies considerably with the design and methods of fabrication, but in general the interpole construction will not prove economical from a manufacturing standpoint on motors below 20 or 25 hp. And so although commutation is but little, if at all, improved under working conditions, the cost of production may be reduced.

The argument of good commutation under overload, however valueless in the particular application under question, still affords a talking point, and the interpole motor is urged on the trade by the manufacturer.

The customer, under the impression that "overload capacity" means an increased factor of safety, overlooks the fact that in accepting an interpole motor, he accepts just as much more apparatus on which he must take a chance of break-down and for the upkeep of which he must keep added stock on hand as the interpoles represent; and so, although the overload capacity may not be needed, the purchaser is easily won over to the attitude of the manufacturer in regard to interpole motors, and thus the demand is established.

In many cases where the motor is reasonably well looked after and cared for, and where the usage of the machine does not severely expose it to liability to damage, this point of upkeep on additional apparatus may not carry much weight, but there are places where this point is significant enough to demand deliberation, and of these, the electric locomotive for mine haulage is cited as perhaps the most conspicuous.

A Locomotive Can Only Exert a Certain Pull

Consider the conditions under which the electric motor is applied to a mine locomotive. A locomotive of given weight hauling a trailing load, is capable of exerting a maximum effort at a speed depending upon the speed of the motor, the gear reduction and the diameter of the wheels. This maximum tractive effort which the locomotive will exert depends upon the coefficient of adhesion between the locomotive wheels and the rail, and for general conditions may be taken as 20 per cent. for chilled cast-iron wheels or 25 per cent. for steel-tired wheels.

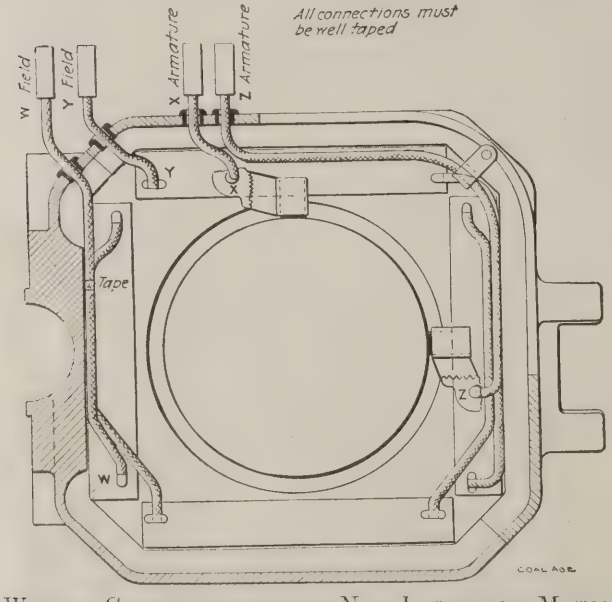
In other words, the maximum tractive effort of a locomotive with steel-tired wheels and driving on all wheels is 25 per cent. of the weight of the locomotive, which maximum tractive effort is developed at a certain definite speed depending upon the motor equipment, gear reduction and diameter of drivers and, therefore, represents a certain maximum horsepower.

Allowing for the mechanical efficiency of the locomotive, the maximum horsepower developed by the motor is, therefore, determined. Since there is nothing to prevent the motor from being operated continuously at this maximum horsepower while the locomotive is in operation, the motor equipment should be at least large enough to meet this condition, no matter what the purchaser may specify in regard to the average duty of the locomotive.

For example, the purchaser may outline a schedule of duty in which the locomotive is required to develop the maximum draw-bar pull only occasionally, and for very short intervals, as will be the case if his haulage route contains a short, steep grade. The rest of the haul is comparatively easy, and the average horsepower required of the motor may be less than one-half of the maximum.

Under this condition the locomotive might operate satisfactorily with a motor equipment having a normal rating of one-half the required maximum capacity, and an overload rating obtained by the application of interpoles equal to the maximum capacity for short intervals. It is repeated that a locomotive with such a motor equipment might operate satisfactorily *so long as the route remains unchanged,* but this is an item over which the manufacturer has no control.

The locomotive may be operated over the specified route for only a short time and be then placed on a haul that is practically level, as many cars as the weight of the locomotive will permit being hauled are coupled to it, and the maximum draw-bar pull developed almost continually; the motor operates at double its normal rating almost all the time, and trouble follows.



The correct motor equipment for industrial haulage and especially mine haulage must have a normal capacity at least equal to and preferably 10 to 15 per cent. greater than the maximum tractive effort which the locomotive can develop regardless of any outlined schedule of duty. Then the motor cannot be overloaded, and troubles arising from excessive overload are eliminated.

The above has been well enough known for several years, but seems to be lost sight of in urging the overload performance of interpole motors for mine locomotives. It is merely desired to emphasize this point; the overmotored locomotive is the only successful locomotive for mine service, as the motors in such a machine cannot be overloaded. This eliminates the necessity for interpoles so far as overload is concerned.

Sufficient Space Is Usually Available

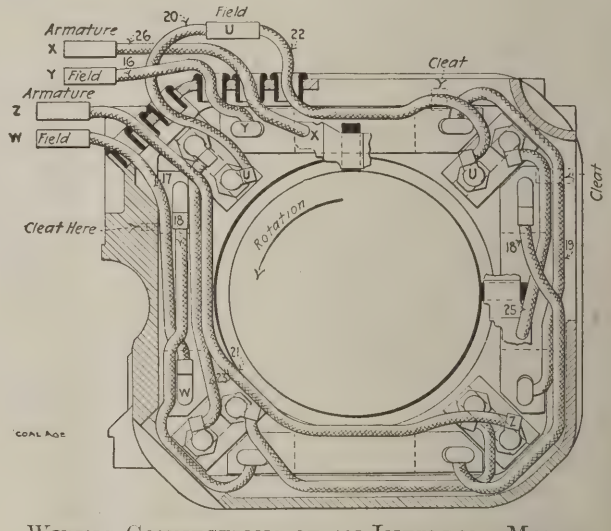
The next point, then, concerns available space. Without going into the question of design, it is a fact that for practically all combinations of locomotive weight and track gage, the dimensions available for the motor will permit of the design of a good noninterpole machine, or one that gives sparkless commutation up to its full rated load, and whose speed is low enough for a single gear reduction.

Special cases arise occasionally, as, for example, where an exceptionally heavy locomotive or an unusually high-

Wiring Connections of a Non-Interpole Motor

speed machine is desired on narrow gage. These conditions, however, can generally be met by a special mounting of the motor. There are extremely few cases that can be met with an interpole motor that cannot be met equally well by a noninterpole motor.

Motors of the railway type are totally inclosed; they are rated on the one-hour basis, and since there is practically no difference in efficiency between interpole and noninterpole motors, the amount of heat to be radiated for a given horsepower is practically the same in both cases and the dissipation of this heat within a given temperature rise requires a machine of practically the same size in both cases. Therefore, entirely aside from the question of satisfactory commutation, the opportunity for reducing cost of production and over-all dimensions of motors for this class of service by the use of interpoles, is practically nil.



The limited space available for the application of interpoles to motors of this type oftentimes prohibits the design of an economically produced interpole machine capable of carrying overload with sparkless commutation.

A detailed discussion of design does not fall within the scope of this paper; suffice it to say that to take advantage of the interpole construction in the way of increased ampere conductors on the armature will generally necessitate excessive flux density in the interpole core, with consequent faulty commutation at overloads. Experience in the design of interpole motors of this type has pointed to the fact that the only correct way is to design a noninterpole motor as good as possible, and then if anything better is desired in the way of overload capacity, to add the interpoles.

Commutation Is Not Always to Blame

It has been said that the majority of locomotive troubles arise from faulty commutation, and that with the use of interpoles these troubles are eliminated. That the majority of locomotive motor troubles arise in this way is not strictly true with a properly designed equipment, in spite of the fact that the commutator, brushes and brush-holders often show the greatest signs of abuse when the machine is examined after the trouble has occurred.

The seat of trouble will more generally be found in worn armature bearings which permit of considerable

Wiring Connections of an Interpole Motor

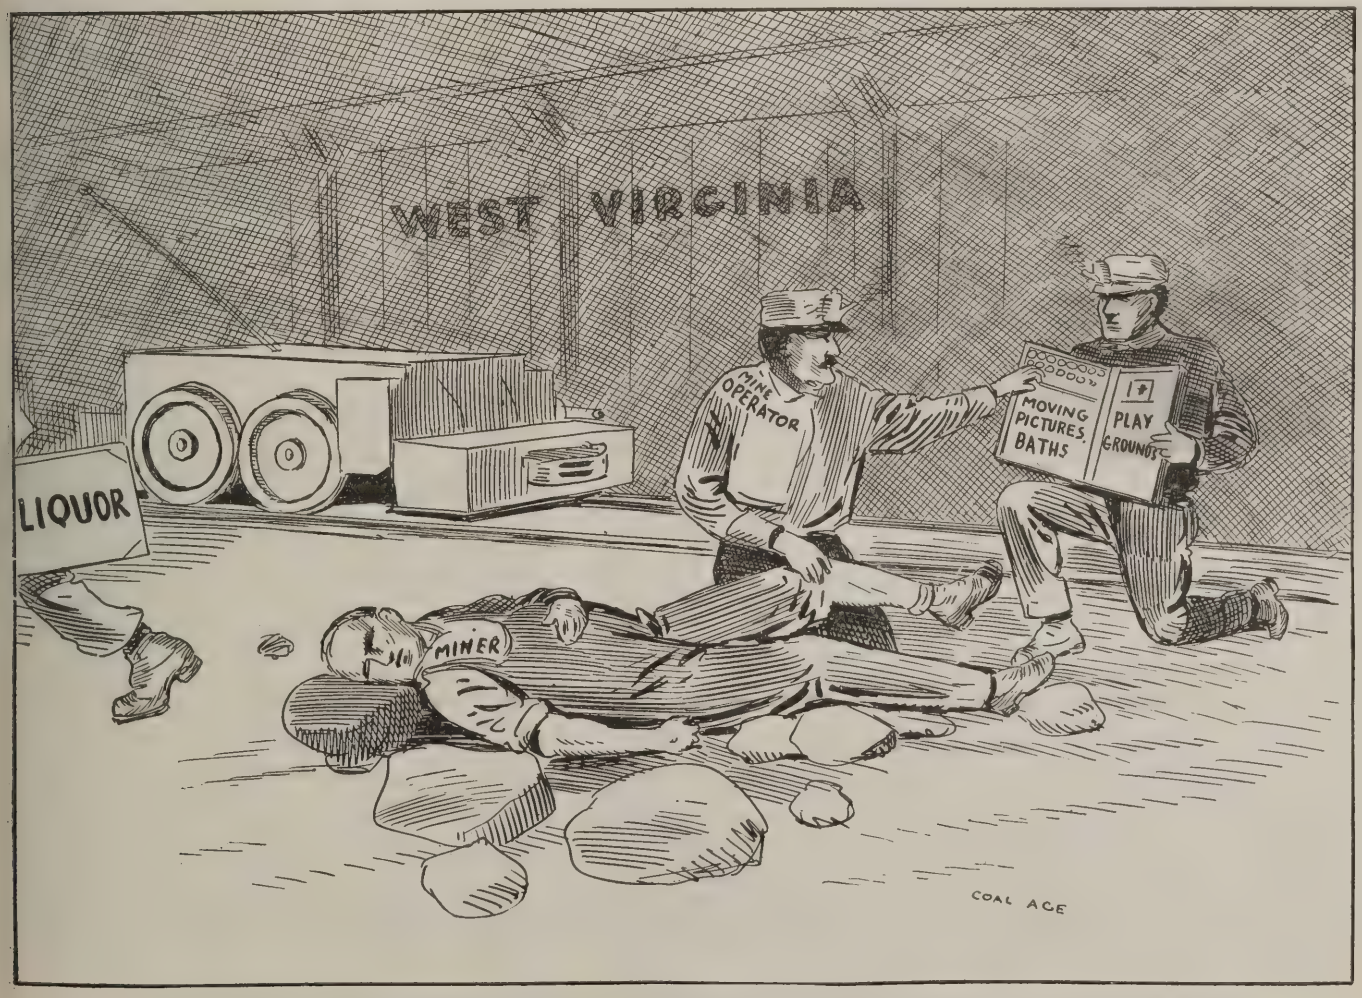
jarring, pounding and vibration with consequent chattering of the brushes, small "make and break" arcs between commutator and brushes causing pitted and blackened commutator surface, high mica, excessive wear and disintegration of brushes and severe sparking which may eventually result in a flash-over or burn-out. All this is the result of badly worn armature bearings rather than faulty commutation, and is found in interpole as well as in noninterpole motors.

Furthermore, worn armature bearings permit grease, oil and dirt, a mixture whose electrical conductivity renders it a formidable promotor of trouble to enter the motor and accumulate on the commutator, brushes or brush-holders. The recognition of this has led the leading manufacturers of mine locomotives to embrace ball bearings as an effective remedy for these troubles, but the further step of adding interpoles is not necessary.

If nothing advantageous is gained, is there possibly anything disadvantageous about an interpole equipment on a mine locomotive? Only this, as stated above: That the installing on a mine locomotive of interpole motors, is equivalent to installing as much additional and un-

necessary apparatus from which there is liability of breakdown, and for which repairs must be carried in stock, as the auxiliary poles and their windings represent. The already small space inside of the motor is further filled by the auxiliary poles and coils, and more leads are packed into the motor, reducing accessibility and decreasing the ease of repair.

The acompanying illustration represents wiring diagrams drawn to scale of similar motors, one without, and one with interpoles, and illustrates what the addition of interpoles means in this respect. The connections shown might, of course, be somewhat simplified and leads shortened by making two kinds of field coils, one open end and the other closed, but there is the obvious objection of having to provide two different kinds of coils with the possibility of getting them wrongly placed.



The complication of connections by the addition of the auxiliary windings is not altogether a trivial consideration from the standpoint of the mine electrician and the carrying of an unnecessary stock for repairs is not attractive.

There is no lengthy or involved moral to the above. The conclusion is simply this: Overload capacity is not needed on properly designed mine locomotives; no appreciable saving in the cost of production of motors of this type is effected by the use of interpoles, and where good noninterpole motors with satisfactory commutation can be obtained, the installation of unnecessary equipment is not to be recommended.

Miners' Electric Lamps

In a paper on the "Design and Maintenance of Miners' Electric Lamps," before the London branch of the Association of Mining Electrical Engineers, F. J. Turquand says the design of miners' electric lamps may be divided into three subsections: (1) The shell, or case, including the lantern or light-emitting portion; (2) the battery or source of electrical energy; (3) the methods of mechanically and electrically connecting the lamp case containing the electric bulb with the battery, including locking devices.

The main points in erecting a miner's electric lamp charging and repair installation are: (a) An electric supply at constant voltage supplied through a circuit, the installation resistance of which is high and without liability to leaks; (b) absolutely accurate circuit and testing voltmeters and ammeters, including a main-circuit recording-volt- and ampere-meter, which should be recalibrated periodically and have frequent sub-section fuses with the minimum of margin; (c) strong benches and charging racks completely covered with stout lead or glass sheet; (4) facility for washing down with a hose, and quick drainage.

The Colorado Strike

SYNOPSIS—Peace and disarmament have followed the entrance of the U. S. troops into Colorado. The militia under arms now numbers 30 men.

Last week we gave a history of the strike from the burning of the Ludlow camp to the dispatch of United States troops to the scene of action. The account this week is of a continuous pacification which bids fair to last at least as long as the troops remain. The President telegraphed to Governor E. M. Ammons that he should call the attention of the legislature to the need for immediate consideration of the whole situation as soon as that body would convene, namely, on May 4, and added:

"The manifest disadvantages of having two military forces under separate control operating within the same locality leads me to request you to withdraw your militia so soon as the troops of the United States have reached the scene and are ready to take over the necessary control.

COLORADO MINE WAR ARBITRATION COMMISSION

From left to right they are: William Fairley, of the U. M. W. of A.; Secretary of Labor Wilson, and Hywel Davies, president of Kentucky Coal Operators' Association.

SHOULD THE MILITIA WITHDRAW?

Governor Ammons very properly replied that he understood this part of the President's message to mean that the militia should not be kept in arms in parts of the state where United States troops were stationed. Cañon City and Trinidad, at which towns the two United States forces are stationed, are 137 miles apart by railroad. The former town is 192 miles from Boulder by the Atchison, Topeka & Santa Fé and the Colorado and Southern Rys. Near this latter town much of the violence of which we have been reading has been committed. It is not easy to see how the executive of the state of Colorado could be justified in removing the militia and leaving so large an area open to the armed forces of strikers, so long as the distribution of forces remained unaltered and the army of occupation was not augmented.

THE FIGHT AT FORBES

On Apr. 29 the fighting still continued. A conflict at Forbes, 10 miles north of Trinidad, which is near the New Mexico line, resulted in the death of nine men, there being six wounded. Forbes was attacked by some 150 or 200 strikers and was defended by Superintendent Nichols and 40 mine guards and strike breakers. The strikers had approached the camp at night and attacked the mine at 5 o'clock in the morning, the defense being aided by a machine gun mounted above the superintendent's office.

This gun became "leaded" in half an hour, but for three hours more the men in the camp withstood the fire until every building had been riddled. They then withdrew, leaving six of their number dead. Three strikers were killed, one of the bodies being pulled down from a tree, the man having ascended to pick off the defenders with a high-powered rifle. As a result of the fighting the Forbes camp of the Rocky Mountain Fuel Co. is burned to the ground.

The mine owners here threatened arrest of J. P. White, J. R. Lewson, J. McLennan, E. Doyle, F. Hayes and other union members on a charge of murder or conspiracy to murder in connection with the Forbes attack.

Major Patrick Hamrock stated to the Women's Peace Association that he heard the shots at Forbes and telephoned to Governor Ammons repeatedly for permission to move his 150 militiamen from Ludlow to the defense, but could not get his consent. The governor declares he did not receive any such request.

WALSENBURG AND LOUISVILLE

There was conflict in the Walsenburg region, about 30 miles further north, in which 200 militiamen, under Col. Edward Verderberg, participated. As a result five men were slain and three wounded, the former including Maj. P. C. Lester, of the hospital corps, who was attending a private, Miller, 150 yd. from the strikers' position. He was shot twice after he was dead, his Red Cross badges and revolver removed and his military overcoat was torn from his body.

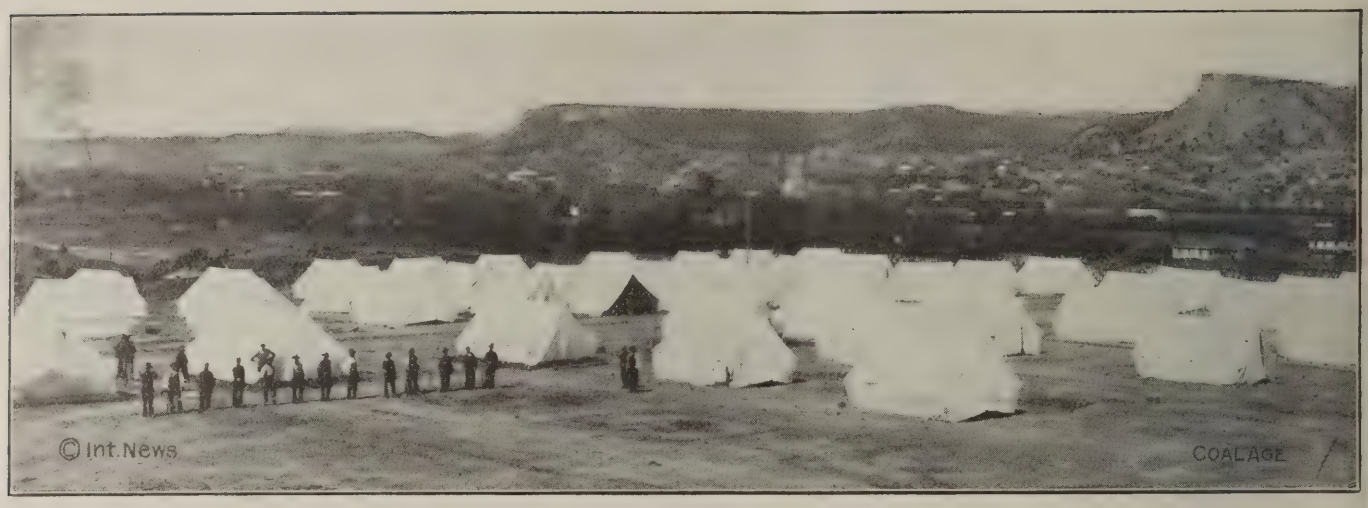
On the preceding night in Louisville, 187 miles away by rail, a fierce fight had ensued. The militia succeeded in overpowering the opposition, and entered Hecla to find it deserted by the miners, their women and children having been sent to Boulder and Denver.

LUDLOW INQUEST

On Apr. 29 an inquest was held of the victims of the Ludlow battle. Dr. Asa Harvey, of Aguilar, physician of

STRIKERS' TENT COLONY AT LUDLOW, COLO.

the union at that place testified that after the fire in the tent colony had practically died down and while the women and children lay in the "safety pit" the militiamen applied torches to the inflammable canvas and that he with a ranch man had witnessed the deed. He also declared that the militia violated the white flag and fired on him while he was tending a patient.



From evidence given on May 2, it seems increasingly difficult to exonerate the militia, even if we grant that the citizen force had every reason to attack and remove the tent colony as being an encampment of armed forces occupying a strategic position and constantly used as a vantage point in lawless attacks on the militia and strike breakers.

DEATH OF LOUIS TIKAS

Evidence as to the death of Louis Tikas seem to show that it took place in a most barbarous manner and even in violation of the rules of martial law which, however, was not in operation at that time. R. J. MacDonald, ex-stenographer of the Colorado Military Commission, declared that he heard Lieut. E. K. Linderfelt say, "I have ordered them not to hang him, but I have spoiled a good rifle."

RUINS OF LUDLOW TENT COLONY WHERE TWO WOMEN AND ELEVEN CHILDREN PERISHED

MILITARY HEADQUARTERS OF U. M. W. OF A., AT TRINIDAD, COLO.

Mr. MacDonald declared he had been told that Tikas was arrested and would be hanged. He met Linderfelt carrying his rifle over his shoulder with the stock to the rear. Previous testimony had declared that Tikas had been shot twice in the back and that his head had been crushed by a blunt instrument. The events recorded are a further indictment of the usefulness of the militia in times of civil strife. It is not trained and drilled like an army or a constabulary force and not being steadily under arms, the undesirable personel is not thoroughly weeded out as in the regular forces nor is the espirit de corps so strongly developed.

MILITIA HAS SUBJECTED ITSELF TO SUSPICION

It must be remembered that the militia has suffered a great deal of maltreatment from its oponents, many of its members had been killed and we can only condemn it because we expect a higher sense of duty from soldiers who are officers of the law and from citizens than we do from civilians and foreigners. As the Military Commission has declared the militia guilty of the murder of Tikas, the evidence seems strongly against them. Eighty-six members of Company B, Second Regiment, are to be courtmartialed, but probably only a few are guilty, perhaps only Lieutenant Linderfelt. This one evidence of savagery, however, makes it difficult for the public to give the military a blanket exoneration on all the other charges which have been brought against it.

THE IMPORTANCE OF LUDLOW

Henry A. Atkinson, secretary of the Social Service Commission of Congregational Churches, an advocate of the miners' cause, says of the Ludlow camps, the words being taken from a briefed account in the "New York Survey:"

This colony was a strategic position for the miners as it enabled them to keep watch on the station of the Colorado & Southern R.R. at Ludlow where strike breakers would detrain for several important mines. The land on which the colony was located was leased by the United Mine Workers of America, who furnished the tents and have supported the colony. There were 178 tents housing 900 people, of whom 271 were children, 25 babies having been born there since October.

Evidently, as the colonists were armed, there were only two courses to pursue: either to close the mines or to attack the camp. The militia was clearly checkmated by the strikers if the camp was to be kept inviolate.

THE INTERVIEW WITH ROCKEFELLER

Apparently the unrest has spread to New York City. Displeased with the somewhat general complaint that he had rebuffed Congressman Foster, J. D. Rockefeller, Jr., on Apr. 28 made a statement that Mr. Foster was unable to make any suggestion which did not involve the unionizing of the mines or the submission of this question to arbitration. He added that the Colorado Fuel & Iron Co. did not deny the right of any men to enter a union or to assert themselves freely in union for the furtherance of their common and legitimate interests, but it did assert the equal right of an individual to work independently of a union, if he so elected.

As a result of the interview with Mr. Foster, J. D. Rockefeller, Sr., who has always been regarded as an exemplary employer even by those who have denounced his other business methods, has been subjected to fierce criticism in the Federal House of Representatives. Men and women in mourning have picketed his offices at 26 Broadway and his house

A COMPANY OF ARMED STRIKERS AT THE TRINIDAD MILITARY CAMP

ARMED MINERS AT FIRING LINE IN ALL-NIGHT BATTLE, LOUISVILLE, COLO., APRIL 27

STRIKER FIRING FROM AMBUSH IN ONE OF THE BATTLES NEAR LUDLOW, COLO.

at West 54th St. and have been arrested for blocking the sidewalk. Some paid fines and were released; others refused and took part in a short and ineffectual "hunger strike."

ROCKEFELLER'S REPLY

Mr. Rockefeller, Jr., made a detailed reply, under the following heads, to those who declared that the Colorado Fuel & Iron Co. did not use its employees rightly:

1. **The Eight-Hour Day.** This was established by the fuel company for all its coal miners some time ago.

2. **Semi-Monthly Pay.** When this question was raised by one or two miners in one of the camps of the company, the officers at once studied the question and without delay decided to pay not only the miners in that particular camp twice a month but all the miners employed by the company.

3. **Checkweighmen.** For several years the fuel company has raised no objection to the employment by the miners of their own checkweighmen, as is done in Eastern mines where union labor is employed. In order that new men might understand their right in this matter, the officers of the company gave instructions that circulars should be posted in all the mines, stating that the company had always encouraged its miners to employ their own checkweighmen.

4. **Company Stores.** It has been charged that the employees of the fuel company are obliged to buy at the company's stores. The storekeepers are under strict instructions to say to all that they are at liberty to trade where they please, that the company is glad of their patronage but that their standing will not be affected one way or the other by their action in the matter. As a result of a study made in one of the mining camps of the company, it was found that only 22 per cent. of the wages of the men were spent in the company's stores.

5. **Wages.** In spite of the fact that no dividends have been paid on the common stock of the company since our connection with it, a matter of at least 10 or 12 years, and only $780,000 has been paid on the preferred stock, of which the greater part represented payment on account of an accrued dividend which had accumulated during many years, the company voluntarily increased the wages of its miners last year by a total amount of $300,000 a year and of its steel employees by a total of $350,000 a year. The wage scale compares favorably with that of any similar mines, whether union or nonunion, in any part of the country.

J R. LAWSON ANSWERS ROCKEFELLER'S STATEMENT

The reply of John R. Lawson, member of the International Executive Board of the United Mine Workers, recorded by Helen R. Robinson, is probably fair but puerile. He says that the eight-hour law was passed in 1905 and broadened in 1313 and could not be withstood, owing to the care in its framing. The semi-monthly pay law was established by law in 1901 and was not observed till March, 1912, when a strike was threatened. The law permitting the men to elect checkweighmen was passed in 1897. Lawson claims, 'With no union back of him, what would be the use of miners paying a checkweighman?", which is a check on the operators' statement that the union was weak at the time of the breaking out of the strike. There was a law passed in 1899 forbidding companies to compel their men to trade at the store. "May be," Lawson said, "the Colorado Fuel & Iron Co. people are observing that law just now, but they were not doing it when the strike was called."

But if these things are true, arbitration is still not necessary and a strike might well be declared off. A conference is not needed; the companies declare they have and will keep the law; the law is there to compel them. What need is there for controversy or arbitration? In a way everything Lawson is recorded to have said, leads one to the conclusion that the fight is for a closed shop.

ARBITRATION

The President still hopes to arrange for arbitration, however, and has sent for Hywel Davies, president of the Kentucky Coal Operators' Association, and William Fairley, a member of the Mine Workers Association in Alabama. He expects to ask them to appoint a third man.

On page 775 of this issue will be found the correspondence between Martin S. Foster, John D. Rockefeller, Jr., and the coal-company officials in Colorado relative to arbitration.

THESE FOUR STRIKE-BREAKERS WERE KILLED THE DAY AFTER PICTURE WAS TAKEN

The Italian and Austro-Hungarian governments are interesting themselves in their citizens who have been killed in the recent fights. The Italian consul at Denver has gone to Trinidad to obtain a complete account of the deaths of such men.

GENERAL STRIKE

The miners throughout the country have condemned the action of the Colorado authorities. At Pittsburg, Kan., the United Mine Workers threatened a general strike unless President Wilson took immediate steps to investigate the strike situation. The same district convention voted that the entire defense fund of the district, to wit, $200,000, be placed in the hands of John P. White to use in furtherance of the Colorado strike. The action of the 25 members of the executive board of the United Mine Workers now meeting at Indianapolis, Ind., is awaited with interest. It assembled May 4 and may possibly call a general strike, but is more likely, it is thought, to sustain the Federal Government in its action. At Peoria, Ill., and Du Bois, Penn., the United Mine Workers suggested such a strike as a protest.

SUCCESS OF U. S. TROOPS

The troops from Forts D. A. Russell and Leavenworth, Kan., arrived on Apr. 30 at Cañon City and Trinidad respectively. Mayor Holbrook is in charge. Guns were surrendered by 650 strikers at Walsenburg. Major-General Chase withdrew his militia from the district.

But the troops appeared to be insufficient for the pacification of so large an area and consequently on the request of Governor Ammons and Congressman Edward Keating, President Wilson sent the Eleventh Calvary from Fort Oglethrope, Ga., comprising 860 men, and two troops of the Twelfth Calvary from Fort Robinson, Neb., comprising 140 men. The first mentioned force will go to the southern part of the southern field, which includes Trinidad, Walsenburg, Forbes, Aguilar and Delagua. The other force will be the first sent to the northern field—Boulder and Louisville. Col. James Lockett, of the Eleventh Calvary, will be in supreme command. On May 2 the last militiamen left the southern district, one troop of U. S. soldiers being sent to Ludlow, relieving 200 men of the militia from duty.

DISARMAMENT

Also, on May 2 the Secretary of War, L. M. Garrison, issued a proclamation calling upon individuals, firms, associations and corporations in the Colorado strike districts to give up their arms. The secretary stated privately that the intention was to disarm first the rioters, then the sellers of arms and lastly the citizens. Receipts are being given those who surrender their arms, but no promise has been made to return them. Whether the United States troops have the right to disarm the militia and the mine guards who have been duly sworn to maintain the peace of the state is a question, and Major Holbrook showed no disposition to attempt such a disarmament. Even after the proclamation it seemed likely that only those volunteering such surrender or opposing the military forces of the United States would be disarmed by force.

Orders have been issued forbidding railroads and express companies from shipping weapons into Colorado except for the use of Federal troops.

THE COLORADO LEGISLATURE

On May 4 the legislature of the State of Colorado met in special session at the call of Governor Ammons. The immediate outcome was less eventful than was expected, the chief executive being greeted with applause. It has been stated that Governor Ammons will introduce an arbitration bill which will, however, not have compulsatory features.

It is also likely that a bill creating a constabulary will be introduced. The legislature has to provide $1,000,000 to meet the state military indebtedness. Impeachment of the governor appears to be unlikely, as the vote for the speaker showed that 23 were in his favor and only 17 opposed. Furthermore, five of his supporters were not present at the vote.

The latest report shows that the militia is completely disbanded, except in Routt County at the Oak Creek mine. This detachment of 30 men is located 224 miles distant from the nearest United States force which is detailed for service in maintaining peace.

Recent experiments in byproduct ovens in Great Britain showed that out of every ton of coal charged, there was obtained from twelve to fifteen c.w.t. of excellent coke, which sold in the market for $7.50 per ton. This same ton of coal also gave 30 lb. of ammonia, which sells for $63 per ton; 100 lb. of tar, at $8.50 per ton; 2½ gal. of benzol worth 60c.; and 5000 cu.ft. of gas.

University of Tennessee Offers a Course in Coal Mining

The Mining Department of the University of Tennessee, at Knoxville, will offer a two-weeks' course in practical coal-mining subjects to candidates who are qualifying themselves for the State Mine Foremen's Examination, and to others who are interested in the work. The course will begin on May 18, and continue until May 30. It will be under the direction of Dr. Jarvis, of the mining department, assisted by Geo. E. Sylvester, Chief Mine Inspector of Tennessee and his deputies, together with other practical mining men of the state.

The work has been arranged on the basis of particular topics and days, so that those who find themselves unable to attend the entire session may select the subjects that are of chief interest to them and be present on those days only.

The schedule of subjects and time devoted to them is as follows:

Mine gases, their chemical and physical properties; testing mine gases; effect on the human system; handling mine gases and the management of gaseous mines. May 18.

The theory and practice of mine ventilation; distribution of air currents. May 19 and 20.

Methods of mining; mine timbering and support; mine development; tunneling and shaft sinking. May 21, 22 and 23.

The use of electricity in mines; haulage; lighting; signaling; dangers. May 25.

Explosives used in mines; the handling, use, storage and the theory of explosives; testing. May 26.

Mine drainage and haulage; haulage systems; laying out tracks; transportation of men, coal and explosives. May 27 and 28.

Inspection, discipline and sanitation in and around mines; mining law; duties of mine foremen and miners. May 29.

Mine accidents; first-aid and rescue work. May 30.

The Certificate Law

In a recent decision of the examining board of the Province of Alberta, Canada, refusing the application of a former certified resident of Scotland, for a certificate of competency making him eligible to hold the position of mine manager in the province, the reason given for not issuing such certificate under the new law was that, in the opinion of the board, the standard of examination in Great Britain in 1909 (the date of the candidate's British certificate) was not equivalent to the present standard of examination in Alberta Province. The board further stated that the percentage of marks necessary to obtain a first-class certificate in Great Britain is not so high as the percentage required in Alberta.

CERTIFICATES FROM OTHER COUNTRIES ARE HONORED BY THE CANADIAN AUTHORITIES

The new law authorizes an examining board to grant certificates, without examination, to the holders of certificates from any other country, providing that the board considers that the standard of training and examination required in the other country was equivalent to that required in the province. In making their decision in this case, we believe the examining board acted conscientiously, only desiring to maintain the standard of efficiency required of all certified mine managers, for whose ability to assume such duties they are responsible. The law is the safeguard of all mine workers, and its representatives only perform their duty in striving to maintain the standard required.

Statement of Colorado Operators

SYNOPSIS—The following is the statement of Martin D. Foster, chairman of the House Mines and Mining Committee, relative to arbitration and the reply of the operators to his proposal:

FOSTER'S STATEMENT

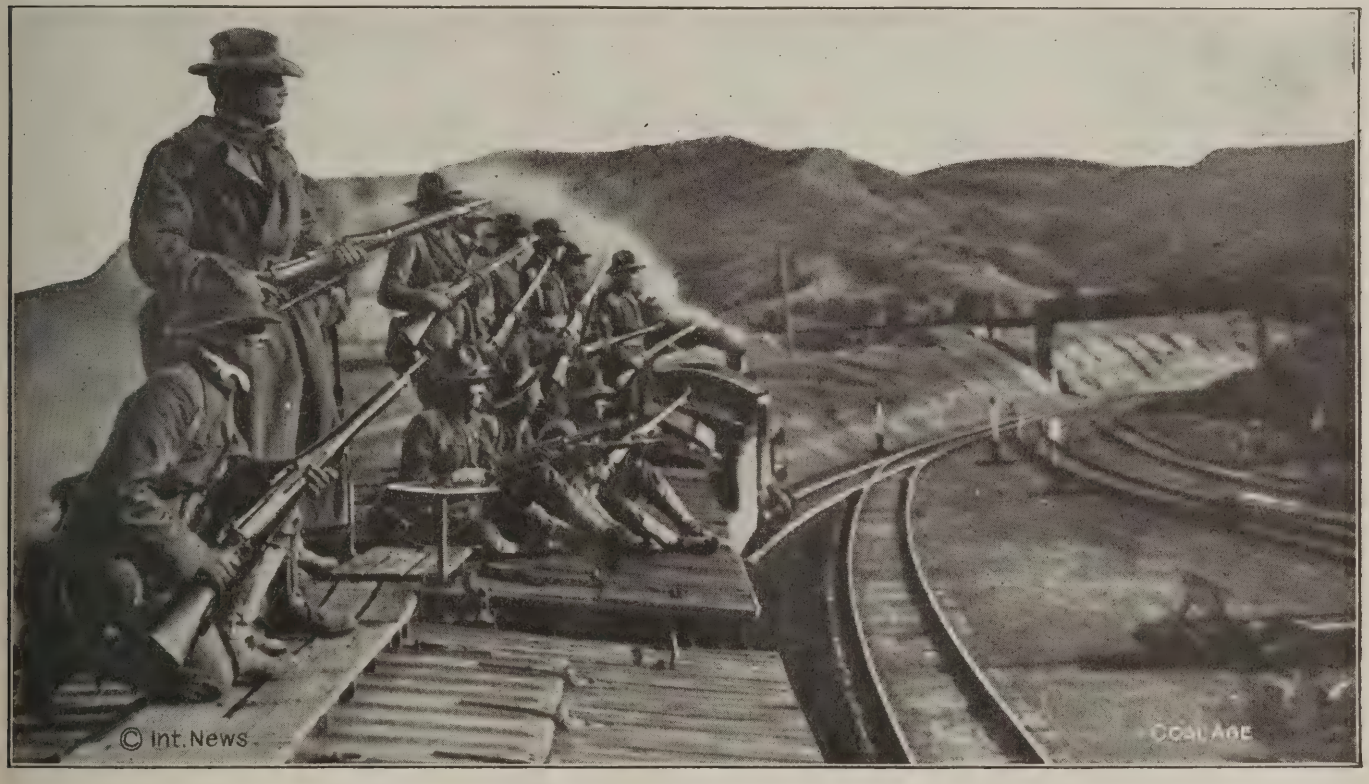
In my conference with Mr. Rockefeller at his office in New York I urged on him the importance of submitting the differences existing between the striking miners and the operators, to a fair and neutral board of arbitration, believing that troubles existing in the state of Colorado could be peacefully settled.

I spent the month of February in Colorado at the direction of the House of Representatives, investigating conditions. Mr. Rockefeller has not been there in ten years. I have been over the property and have conferred with and examined men on both sides of the controversy. I understand the issues on both sides.

There is nothing in the differences which cannot be settled by arbitration. The demand that the union be recognized union and all the other differences can be amicably settled. In my judgment, it is your duty to do so.

ROCKEFELLER TO FOSTER

Your telegram last night received. I am forwarding it to the officers of the Colorado Fuel & Iron Co. in Denver, who, with officials of other mining companies in Colorado, are the only ones competent to deal with the question therein referred to.



REPLY OF FOSTER

Your telegram somewhat a disappointment. We were in hopes that you would deem the situation so grave and serious that you would give your personal effort to prevent the further killing of men, women and children, and we renew the hope that you will reconsider and resolve to use your personal influence and authority to this humane end.

REPLY OF EIGHTEEN COAL COMPANIES

Reply of the Colorado Fuel & Iron Co. and other coal-operating companies to Dr. Foster.

Answering your telegram of last night addressed to John D. Rockefeller, Jr., and referred to Colorado coal-mine own-

MILITIA ATOP BOX CARS APPROACHING LUDLOW, COLO.

has now been withdrawn. The great question now confronting the strikers and owners is, "Will you agree to submit the matter to adjustment by arbitration?"

Mr. Rockefeller cannot evade his responsibility; he cannot set forth the excuse that he will not arbitrate the recognition of the union. He can prevent loss of life and property by yielding to arbitration.

The great Pennsylvania strike and also the recent West Virginia strike were settled by men on both sides agreeing to abide by the decision of umpires.

National sentiment and every instinct of humanity demand the prompt settlement of the Colorado strike. Nothing should prevent both strikers and Mr. Rockefeller from placing the case before a neutral board.

TELEGRAM OF FOSTER TO ROCKEFELLER

William Green, secretary-treasurer of the International Mine Workers' Union, makes public statement that mine workers will waive any recognition of union or unionizing camps. Are you willing to enter into negotiations for settlement of strike on that basis and stop the killing of men, women and children? I strongly urge you to do so, and believe the strike can be ended without recognition of the

ers for reply: When, on Apr. 16, the governor withdrew all except a small detachment of militia from the field, order and quiet prevailed in this state. There were employed by operators of Colorado coal mines more than 10,000 apparently contented men. On the morning of Apr. 20 the strikers in the Ludlow tent colony, two miles from the nearest coal mine, placed their women and children in what they considered places of safety, and made an armed attack upon the militia, encamped nearby.

LUDLOW

The fight continued throughout the day and several men were killed. During the battle the tent colony was destroyed by fire. The next day the bodies of two women and eleven children were discovered in a hole under a tent where the strikers had placed them when the attack upon the soldiers was begun. They had all been suffocated. None of these children and no woman was killed by rifle fire nor did the soldiers know of, or have reason to suspect, the presence of non-combatants where the strikers had concealed them.

On Apr. 23, Lawson, international board member United Mine Workers of America, and the leader of the strikers, in an interview published throughout the state, asserted that a

war of extermination would thenceforth be conducted by the strikers, and Doyle, secretary of the United Mine Workers of America, by wire instructed the officials of local unions to watch for the approach of the militia, which had been ordered back into the field. The meaning and purpose of such language was obvious.

MURDER AND INCENDIARISM

Since that time the strikers, in armed bodies varying in number from 50 to 400, have attacked the town of Delagua from the hills and killed three men. They have dynamited and burned the buildings and equipment of the Empire, Southwestern and Green Cañon mines at Aguilar. They have driven men, women and children into the Empire mine and sealed the entrance with explosives. After the declaration of truce agreed to between the Governor and Hawkins, attorney for the mine workers, they drove the postmaster and others away from the Sunnyside mine and took possession of it, as well as the Pictou mine.

They dynamited the tipple at the McLaughlin mine and fired many shots into the buildings at Maitland. They forcibly entered the store building at Rockvale and carried away guns and ammunition. They attacked the building and dwelling houses at the Chandler mine and kept up a merciless fire from the hills for nearly 40 hours, killing one man, and finally took possession of the camp by slipping in a number of men under a white flag.

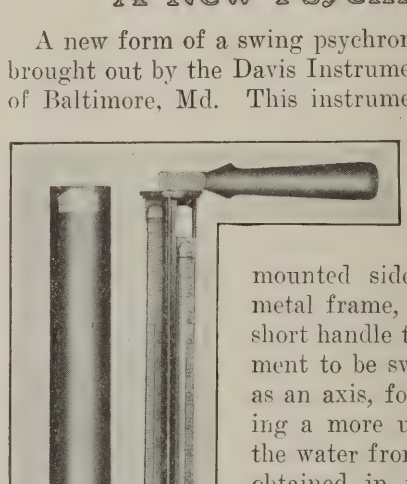
They have burned, dynamited and completely destroyed the McNally mine in Huerfano County, kept up an almost continuous fire from entrenchments for fifty hours upon the Walsen mine, wounded one woman, killed and wounded four men and killed a surgeon wearing the Red Cross insignia while attending a wounded soldier on the field.

They viciously attacked the Hecla mine in Boulder County, killed one and wounded three men, and drove all employees and their families to cover for many hours. They attacked the Forbes mine in Las Animas County with a force of 400 armed men, killed seven miners, including four Japanese, and burned everything in sight, including a stable and thirty-three mules.

THE UNION, A PARTY TO VIOLENCE

In the prosecution of the campaign of extermination, the foregoing are some of the things those men have done during the past few days, with the tacit consent, active coöperation, and under the personal direction and control of officers and paid agents of the United Mine Workers of America.

As stated before, the coal mine operators of this state now have in their employ about 10,000 men, who are satisfied with the conditions of their employment. We promised these men protection from personal violence when the strike was called, and they have stood loyally by their employers under most trying circumstances, disregarding the dangers and privations incident to the recent armed attacks of strikers upon them and their homes. With these men we will always treat concerning matters of their welfare.



But we cannot enter into negotiations of any character with the officers and agents of the United Mine Workers of America, who alone are responsible for the terrible reign of disorder and bloodshed which has disgraced the state. Instead of it being our duty to do so, we conceive it rather the duty of the officials of the United Mine Workers of America, who called the strike, now to call it off. They can do so if they see fit, and by so doing they will within an hour in a great measure restore industrial peace and prosperity to this state.

In no event will the American people, when fully advised, permit 1200 or 1500 armed strikers to continue their unlawful efforts to prevent 10,000 law-abiding and industrious men from working for whom, when, and upon such terms as they see fit.

A New Psychrometer

A new form of a swing psychrometer has recently been brought out by the Davis Instrument Manufacturing Co., of Baltimore, Md. This instrument, which is shown in the accompanying illustration, is 8 in. in length. The two graduated, standard thermometers are mounted side by side on a light metal frame, to which is attached a short handle that permits the instrument to be swung about this handle as an axis, for the purpose of securing a more uniform evaporation of the water from the wet bulb, than is obtained in the other type of instrument, which is stationary.

A CONVENIENT PSYCHROMETER

Two of the features in which this instrument is superior to other forms of swing psychrometers are the lightness of its mounting and its compactness. As shown in the illustration, the frame of the instrument consists of a central light rod that terminates in a screw point, which secures the instrument in its case by screwing into a hole in the bottom of the tube or case shown on the left. The case is 1 in. in diameter and provides a convenient and safe means of protecting the instrument from harm, in transportation or when being carried from place to place. The wet tube, shown on the right, is mounted at a slightly lower level than the dry tube on the left. The bulb of the former is covered with a small silken sack, which can be readily immersed in a vial of water, without wetting the dry tube, when the instrument is to be used. Accurate and rapid readings are obtained with this instrument, which is the most convenient form of psychrometer that we have seen.

It requires great skill and a lot of experience to enable a fireboss to judge by means of the ordinary safety lamp when he has a gas cap. He is often troubled in estimating small percentages. Indeed it is possible that the number of firebosses who can accurately test a percentage of 2½, on examination would be found to be in a minority. The eye is given to playing tricks, often regulated by the health of the individual—good today but indifferent tomorrow.

Editorials

The Colorado Strike

In the conflict of testimony regarding the conditions in Colorado, we are chary of accepting any statements but those we know are unbiased—to wit, those made by one party in favor of the other in an unguarded moment.

The socialists at Colorado Springs give testimony of that kind to the excellence of the management of the coal corporations in that vicinity by a statement drawn up and adopted by them at a meeting held Apr. 19, 1914. They state first of all that socialism does not mean national ownership and that the nationalization of mines is not a socialistic measure. We differ with them, of course. Socialism is a somewhat indeterminate creed, but this particular faith is a tenet of binding force. They have always demanded either that or nothing. They then go on to state in discussing federalized coal mines:

> What difference can it make to the workers what group of capitalists own the industries, whether they are owned by one individual, by a "soulless corporation" or by a "soulless state," so long as the laws are made, interpreted and enforced by the capitalists through their "soulless" government?

This doctrine is not new. It is the creed of the Industrial Workers of the World. In that it states that government employees are not likely to be more fairly treated than the workmen engaged by private corporations, it expresses our own sentiments exactly. We do not observe that the federal services are marked by consideration for the rights to combine, by the provision of pensions, by advanced notions as to safety in operation or by any interest in the welfare of the employee. We are in accord in this view with the "socialists" of Colorado Springs. Pensions and some welfare work in the army and navy should, however, be specifically excepted.

Moreover, we are quite ready to *believe* the testimony of those socialists that conditions of labor would not be improved if the operation of the Colorado mines were to be handed over to the state or federal authorities. We readily grant that the socialists of Colorado have every reason to know whether labor is abused as has been declared, or on their shoulders would all such tyrannies fall, and being not operators but operatives, they are not likely to be protagonists for the coal-mine owners. They are therefore good enough witnesses when they declare that the individual Colorado operators are no more to be suspected than their fellow countrymen would be if, as a body, they took control of the mines.

But Edward Keating, who represents Colorado in the Federal House, also replies unexpectedly to those who argue against the coal operators. In a speech denouncing John D. Rockefeller, made Apr. 29, 1914, in the House of Representatives, he stated, "The Colorado laws were enforced throughout the state, except in the counties of Huerfano and Las Animas, the counties where Mr. Rockefeller and his associates dominate the situation."

Mr. Keating would have us believe that the strike is for the purpose of securing the enforcement of state laws. Why, therefore, is it to be found active in other counties than those mentioned by him? Why has Fremont County been the seat of so much trouble that it has been chosen as headquarters for one detachment of the Federal army? Why has there been a continuous rattle of musketry in Boulder County? For this reason only that the point at issue is not one relating to the enforcement of state law, as Mr. Keating declares, but is for the purpose of introducing the closed shop. A law which, apparently, is being obeyed in central and northern Colorado, is one which requires that no discrimination shall be shown against Union men. In these sections the miners cannot be seeking merely the right to combine. What they really desire to secure is the exclusion of the nonunion workman.

But there are more friends of the strikers to hear. William Diamond, an organizer of United Mine Workers of America, in charge of the Trinidad district, is said to have stated, Apr. 30:

"The strikers will comply with every command of the Federal authorities, provided we are assured that the mines are to be closed and that Federal troops are to remain in the field until this difficulty is settled."

All of which means that the United States govenment is asked to close down the mines till the men have every demand satisfied. The nation is not to permit any man to work unless the men who have engaged in lawless rebellion are willing. We can easily see why the militia, though directed by a pliant governor, failed to satisfy the strikers.

The Panama Canal and the Coal Trade

There has been much written about the advantage of the Panama Canal to the coal trade, and there is little question but that it will profoundly modify conditions and in some ways redound to the benefit of the nation as a whole. It should cheapen coal on our western coasts and provide a better fuel than that which they are now using and it should help us to gain some of the coal trade of South America.

But when it interferes with transcontinental travel it reduces the aggregate amount of coal used and it tends to isolate sections of the country which are now on important interoceanic routes. The United States is now divided into two parts; one is a peninsula, embracing the West, including Mexico, the South American Republics and Panama; the other an island, including all the Eastern states. It has been our constant endeavor to build up means of communication around and outside this island and around this peninsula, regardless of the inevitable effect on the interior regions and the disturbing action on the vested rights of those people, who do not and cannot have water frontage.

As to the deterrent effect of water transport on internal development, we might instance Newfoundland. It has always been a difficult matter to maintain a railroad in

that island. Subsidies had to be provided prior to its construction, and they say that some few years ago one passenger train only was run every other day. Even today there are but six trains a week in any one direction, which cover the full length of the line. The water freighters are such powerful competitors that the railroad can not be made a profitable business without a mail subsidy. Somewhat similarly, the Panama Canal will serve to remove much of the transportation activities from the heart of the country to the big rivers, the ocean front and tide water, and consequently certain parts of the coal trade may be expected to suffer acutely.

However, the loss to the country will not be so much by reason of this changed market as by the fact that deprived of profitable transportation business between certain points, the railroads will be obliged as always to make up their profits by increased charges on noncompetitive business. This will raise coal freights everywhere except where there is competition with water service. The public in the small towns who have helped pay for the canal will not only have to continue to pay the interest on its construction, but pay again and dearly for the business it displaces.

We do not much sympathize with inland towns in their predicament if the traffic on the canal, on the rivers and the lakes is economic and can be, and is, made to stand the charges of the services rendered to it. The welfare of the country must be considered paramount, even if the interior does suffer decline. But we have sought to build up water transportation by wholly artificial means, making our canals, our harbors and our lockage almost free to coastwise travel. Perhaps most of this traffic is economic; we have no way of telling. The most natural way to find out would be to load it with all the charges incident to creating, maintaining and lighting the waterways.

We have no conceivable right to subsidize any form of business as against any other in order to lower the rates another business is charging. To do so is tantamount to acknowledging that the business against which the discrimination is set in force is not charging too high a rate or why should the public have to aid the new competing party by presenting it with the facilities with which the original carrier was not similarly provided.

The influence of Big Cities is more powerful than that of Big Business, and is just as much the proper subject of suspicion. Equally liberal are the appropriations of both to the congressional lobbies. These cities are mostly along the coast and rivers, and they seek to aid their transportation problems at the expense of the whole country.

Had there been a Panama Canal when gold was discovered in California, many a goodly city in the Rockies and many a coal mine might never have been opened. Without transcontinental roads, the West would have remained an undeveloped wilderness. As it was, railroads had to be constructed for military as well as for economical reasons. Subsidies were given to a few of these so as to induce them to take risks such as the nation itself faces in the construction of the Panama Canal, the inevitable loss of money in the lean years before commerce is established.

Competition by the Tehuantepec R.R. has reduced the inter-oceanic rates and by reducing earnings has increased the charges on purely internal travel. Such charges as these, the Canal, especially if freed, will tend to increase and the part of the coal business which cannot easily ship by the coast is sure to suffer not only in increased freight charges, but in the decreased prosperity of the towns it supplies.

Surely it is not a proper duty of Congress to redistribute the energies of the nation partly at the expense of those sections of a common country, which lose and not gain by the distribution. Is it too much to hope that Uncle Sam may in a few years assimilate a part of the lesson he has repeatedly taught the railroads—that a common carrier must not make discriminations, least of all an organization whose patrons are all stockholders in the carrying company.

Arbitration

The proposal made by Martin D. Foster, Chairman of the House Committee on Mines and Mining, strikes a responsive chord in every one's heart. It seems, at first sight, that the coal companies are all wrong in refusing arbitration. The inquiry is heard everywhere, "What is Rockfeller going to do about it?"

But it must be remembered that we might also ask with reason: What are the armed bands of foreign gunmen, who have slaughtered dozens of our citizens, who have burned villages and mines, going to do to end such a state of insurrection?

The operators are not any too favorably disposed toward arbitration, for somehow our arbitral bodies are unlike our law courts. They are animated rather by sympathy than by justice. So strong is this sentiment of surrender to clamor that we could hardly rely on John D. Rockefeller, Jr., J. F. Welborn and D. W. Brown themselves to arbitrate this matter without making a concession in wages.

The outcome is wholly different in international affairs. Arbitration between nations means a decision in favor of one or the other on certain counts, but arbitration between workingmen and operators always means concession to the party of the first part. If it does not, then the arbitral award is not worth the paper on which it is written and the war it is intended to quench, flames up with renewed ardor.

When men have attempted to subvert order, have armed themselves and attempted to dictate who shall, and who shall not, work, surely we should call on them to quiet the tempest they themselves have raised. Failing obedience, the forces of the law should make continued disturbance impossible.

We trust that a wholesale deportation will follow of all those foreigners who having taken advantage of a friendly power have dared to take up arms against its authority. Where the militia has wreaked vengeance on those who opposed its action, let the state take the proper measures.

Let us, however, not condemn the militia for the deaths it may not have intended to cause. The murder of Louis Tikas, a prisoner in the hands of the militia, if substantiated as appears probable, is to our mind a far greater crime than the burning of a camp which had been armed and hostile and which the militia might well have considered empty. Most of the women and children appear to have left the camp. Possibly the militia did not know that 14 still remained or could not escape.

Legal Department

Amount Recoverable for Personal Injury or Death

By A. L. H. Street*

SYNOPSIS—A recent verdict for $50,000 for personal injuries to a coal miner suggests a review of previous decisions bearing on the excessiveness of awards for personal injury or death, and a statement of general rules governing such allowances.

Fifty thousand dollars was allowed by a jury in the United States District Court, sitting in Brooklyn the other day, for injuries sustained by Matt Yarkanis, a miner, while working in a mine owned by the Delaware, Lackawanna & Western R.R. Co., at Luzerne, Penn.

If this verdict is finally sustained by the courts, it will probably be the largest recovery that was ever upheld in this kind of a case, and one of the largest awards that was ever made in a personal injury case. The largest previous recovery awarded in a coal-mine case seems to have been for $37,000, the judgment having been awarded by the same court against the Lehigh Valley R.R. Co.

The Yarkanis suit was based on claimed negligence of the company in failing to provide sufficient ventilation in the mine. Gases issuing from fissures resulted in a primary explosion, which accident caused the explosion of dynamite which Yarkanis was handling. His injury consisted in loss of eyesight, fracture of skull and leg, and internal injuries.

Theoretically, the measure of damages recoverable at law for a personal injury is the amount which will afford fair compensation therefor, including allowance for physical and mental suffering endured and to be endured, loss of time, expense reasonably incurred on account of the accident, impairment of earning capacity, disfigurement of the person, etc.

Test of Reasonableness

Since no arbitrary money value can be placed upon physical or mental suffering, the courts allow juries much latitude in assessing damages therefor, if the award is within the proof. Ordinarily, a verdict will not be disturbed as being excessive unless it is so large as to indicate that the jurors were governed by passion, prejudice or a misconception of the law or evidence of the particular case. If the amount of interest which the amount of the verdict could earn, at a reasonable rate, grossly exceeds the amount of wages which plaintiff would probably have earned annually, and the balance of the recovery is excessively disproportionate to the suffering he has endured and will endure in the future, the award will be deemed improper. (Idaho Supreme Court, 125 Pacific Reporter 341.)

Probably the largest recovery ever sustained by the courts of this country for a personal injury was the judgment for $70,000, awarded by the California Supreme Court in 1911 against the Southern Pacific Co., in favor of Willard R. Zibbell. (116 Pacific Reporter 513.) He had earned about $2500 a year, had a life expectancy of 38 years, and his injuries consisted in loss of both arms and a leg. The jury returned a verdict for $100,000, but the trial judge ordered reduction on this amount to $70,000. In upholding this judgment, the Supreme Court said:

What Courts Have Held

"While the damages awarded in this case are very great, the shocking character of the injuries, the loss of both arms and one leg, the permanent loss of earning capacity, the inevitable disabilities and the suffering endured, and necessarily to be endured for more than 38 years, present a case where the injuries are as grave as the damages are great, or, at least, a case where there is no such marked disproportion between the character of the injuries and the award made for them as to suggest at once that the award was influenced by prejudice, passion or corruption."

But $50,000 was held by the Arkansas Supreme Court to have been excessive recovery for injury to an employee, although he was hopelessly incapacitated for work, was paralyzed below the point where his back was broken, had previously earned $100 and incurred $1000 expense for medical treatment, etc. (140 Southwestern Reporter 279.) The court ordered the recovery reduced to $25,000. On the other hand, the same court sustained a recovery of $35,000 for permanent disability accompanied by curvature of the spine. (137 Southwestern Reporter 1103.)

The following awards have, also, been upheld: $20,000 for death of an employee who left a dependent family (California, 136 Pacific Reporter 303); a similar verdict in Mississippi (63 Southern Reporter 336); $25,000 for loss of arm, leg and teeth (Minnesota, 145 Northwestern Reporter 40); $20,700 for loss of an arm, the other arm having been previously amputated (Ohio, 103 Northeastern Reporter 761); $18,000 by a miner who was severely crushed (Washington, 137 Pacific Reporter 1019); $17,000 for impairment of employee's health, with probable loss of leg (Virginia, 80 Southeastern Reporter 568); $27,000 for loss of leg and most of other foot (Alabama, 62 Southern Reporter 679); $25,000 for loss of leg, broken shoulder and permanent incapacity for chosen vocation (Arkansas, 151 Southwestern Reporter 699); $20,000 for loss of sight (Washington, 132 Pacific Reporter 241.)

The following awards have been held to be excessive: $35,000 for permanent injury (Idaho, 125 Pacific Reporter 331); $30,000 for mother's loss of son (Florida, 62 Southern Reporter 210); $30,000 for permanent injury (Washington, 132 Pacific Reporter 39); $20,000 for death (Louisiana, 63 Southern Reporter 888); $18,300 for partial disability (Wisconsin, 143 Northwestern Reporter 1027); and $17,500 where there was no total disability (Missouri, 161 Southwestern Reporter 726).

Instruction Work in Illinois

It will be generally conceded that the most effective work that is being done, at the present time, in connection with the Safety-First campaign, is the instruction of industrial workers. Particularly is this true in regard to coal mining. The work of giving practical instruction to miners has received special impetus in Illinois. During the last few months, the work has been organized in different centers.

The Illinois Miners' and Mechanics' Institutes

This organization was established by act of the state legislature, Senate Bill No. 259, approved May 25, 1911, but only made effective by the appropriation of $15,000 per annum by the last legislature. The work of the institutes is under the general direction of R. Y. Williams, formerly of the Federal Bureau of Mines; and schools have since been organized in two mining districts, in the southern part of the state. The administration of these institutes is, by act of the legislature, placed in the hands of the trustees of the University of Illinois at Urbana. The Department of Mining Engineering of the University, in this connection, has planned a two years' course covering the practical subjects of coal mining.

The Peoria District Organization

With the same general objects in view, and for the purpose of bringing th practical instruction of miners nearer home, the coal-mine operators of the Peoria district united in an organization known as the Safety-First Inspection Bureau. This organization was formed during the month of January, 1914, and has for its purpose the prevention of accidents in coal mines and the education of employees of the mines in that district. The plan of instruction covers both the science of mining and first aid to the injured, together with the personal inspection of the mines of the district, for the purpose of reaching the entire community of miners and all classes of mine workers and giving them such helpful suggestions and instruction as may be practicable.

The following companies are included in the organization: The Clark Coal & Coke Co., Logan Coal Co., Crescent Coal Co., Groveland Coal Co., Brewster & Evans Coal Co., Warsaw Coal Co., Newsam Bros. Coal Co. and Tazewell Coal Co. The organization has made a wise choice in the selection of John Dunlop, former state mine inspector, Peoria, who is in direct charge of the instruction work.

Coal Age has no hesitancy in saying that Mr. Dunlop is thoroughly competent and fully qualified, by education and experience, to assume the important duties that devolve upon him by reason of this work. He is an indefatigable worker and an experienced mine inspector. Under the direction of Mr. Dunlop, classes have been organized at different points in the district, and the superintendents and other mine officials, by their liberal support and presence at the classes, show that they are deeply interested in the success of the undertaking and the welfare of their employees.

In Peoria, the Proctor Recreation Center have tendered to the organization the free use of their rooms, for class purposes. The Peoria Institution occupies a building recently erected and devoted entirely to the recreation of the citizens of that place. In this building are provided rooms for bowling alleys, basket ball, pool tables, social parties and club rooms, besides shower baths for male and female, and a large swimming pool. The building is a handsome edifice provided and maintained by the Proctor Endowment Fund.

The classes held for the instruction of miners are the only educational meetings conducted in the building. The attendance on these classes predicts with certainty the success of the undertaking. Many of the students, at present, are preparing to take the coming state examinations for mine manager, mine examiner and hoisting engineer, to be held this month. Mr. Dunlop's long experience in the mine inspection work in Illinois and the preparation of candidates for examination makes him eminently fitted for the work in hand. Mr. Dunlop is vice-president of the National Association of Mine Inspectors, known as the Mine Inspectors' Institute of the United States of America, which will hold its seventh annual meeting at Pittsburgh, Penn., in June.

The Mining Scale

Latest advices seem to show that there is a deadlock in the scale situation. The abundance of coal and the indifference of many of the men as to whether they work or not, are factors in the situation. The latter condition cannot long continue and it is probable that, in a short time, the miners will accept the old scale or the mines will work without an agreement.

At a well attended open-air meeting, near DuBois, in central Pennsylvania, on Apr. 28, the speakers, all but J. E. Brown, advised that the men work till after a referendum has been taken to decide whether the old scale unmodified should be accepted in that district. The men almost unanimously decided to violate the orders of the national officers. They voted to remove their tools and stop the boiler and repair men from working. The Nanty Glo miners have declared for a closed shop.

The miners in the Kanawha coal field quit work on May 1. Thomas Cairnes, president of District No. 17, urged them to remain at work, but without avail. The miners during the negotiations had made 24 demands. These were later reduced to three. Though the agreement in the Cabin and Paint Creek district does not expire till next March, many of the men quit work on May 1.

Miners' Examinations in Illinois

Announcement is made that the Miners' Examining Board of the State of Illinois will hold meetings, during the month of May, according to the following schedule:

Peoria, May 5; Spring Valley, May 6; Braceville, May 7; Danville, May 12; Pana, May 13; Springfield, May 14-15; Willisville, May 19; Belleville, May 20; Staunton, May 22; Eldorado, May 26; Benton, May 27; Herrin, May 28-29.

The members of the examining board are Edward Maher, president; John Knies and Nicholas Cowell, secretary.

Shot-firing accidents due to the shot going off after the battery has been disconnected from the cable are fortunately very rare indeed. They may easily be counted on the fingers of one hand, and a good explanation of the cause has perhaps never been given. The idea generally favored seems to be that the detonating substance becomes slightly damp and then needs a certain amount of energy to make it detonate.

Discussion By Readers

Indications of Gas on the Carbide Lamp

Referring to the interesting letter of William Kellum, COAL AGE, Mar. 28, p. 536, the following may be of interest to those using the carbide lamp.

As has been previously explained, COAL AGE, Vol. 1, p. 1136, calcium carbide in contact with water produces acetylene gas and calcium hydroxide is thrown down, according to the equation

$$CaC_2 + 2\ H_2O = Ca(OH)_2 + C_2H_2$$

The reaction that takes place when this gas burns in air, disregarding the inert nitrogen of the air, is

$$2\ C_2H_2 + 5\ O_2 = 4\ CO_2 + 2\ H_2O$$

It is important to remember that the flame of a carbide lamp is a gas-fed flame, the gas being generated in the lamp chamber and burned at the nozzle, in contact with air. As is well known, all wick-fed flames require first, a distillation of the gas from the oil drawn up through the wick, which distillation absorbs a certain portion of the heat of the flame. This absorption of heat in wick-fed flames, together with the high calorific power of the gas generated in a carbide lamp, are sufficient to account for the greater tenacity of the carbide flame. The extinction of all flame is due to one or both of two causes; namely, the lack of sufficient oxygen to support combustion; and the absorption of heat from the flame, causing its temperature to fall below the temperature of ignition of the gas or vapor.

I was much interested in Mr. Kellum's narration of the effect observed by him of carbon dioxide or blackdamp on the flame of a carbide lamp. My experience differs from that of Mr. Kellum's in one respect; namely, I have been able to observe no vertical tendency in the tip of the carbide flame, in the presence of carbon dioxide, as he has described. In my opinion, the failure of the carbide flame to maintain a horizontal position throughout, was due to the fact that the lamp had not been freshly charged; or, possibly, the nozzle was partly choked by water that prevented the free flow of the gas feeding the flame.

Once, when examining an entry that had caved, my carbide lamp, which was freshly charged, did not show any change to warn me of the presence of blackdamp; but, after going about 400 ft. in this entry, I felt, first, a choking sensation and experienced some difficulty in breathing. Taking the lamp from my cap, I set it on the bottom to observe more closely its action. My casual observation, at first, did not detect anything peculiar. Soon, however, I noted that the flame of the lamp became more extended and had a reddish tint. The flame, however, remained horizontal throughout.

I now endeavored to light a "sunshine" lamp that I always carried with me, to use in case of emergency. The matches simply flashed and went out. Then I tried to light the wick by the flame of the carbide lamp, which, by this time had elongated to about 1½ or, perhaps, 2½ in. and had a distinct reddish tint, while the top of the flame became smoky; but the flame itself remained horizontal, as I said before. I spent about five minutes trying to light the "sunshine" lamp with the carbide flame; but it would only burn a moment after taking it from the carbide flame. On removing it therefrom, the oil-fed flame diminished and went out gradually, with little smoke, unlike its extinction in fresh air owing to lack of oil or a heavy draft.

By this time, the carbide flame was more extended and redder than ever, and, becoming dizzy, I thought it wise to retreat at once. The carbide lamp was not extinguished and its flame remained horizontal, as at first. In my opinion, the horizontality of the flame depends on the pressure of the gas within the lamp, in the same manner as the horizontal throw of water from a nozzle depends on the pressure in the pipe. I cannot understand how any outside cause affecting the combustion of the gas, would act to turn the tip of the flame upward or, in other words, give it a vertical direction.

In regard to the enlargement of the carbide flame and its extension, I believe this is simply due to the effort of the flame to reach a sufficient supply of oxygen for its combustion. The reddish tint I consider is due to a partial or incomplete combustion in the flame. It is a well known fact that, while from 13 to 16 per cent. of carbon dioxide, in an atmosphere of otherwise pure air, is sufficient for the extinction of a wick-fed flame, gas-fed flames require all the way from 10 to 58 per cent. of that gas for their extinction. I believe that this fact is due to the higher calorific power of the gas fed to the flame, by which a higher temperature of the flame is maintained. As previously stated, the extinction of a wick-fed flame is hastened also by the absorption of the heat, in the distillation of the oil in the wick.

The cap formed above a lamp flame, in presence of inflammable gas, as is well known, is caused by the burning of the gas in the air surrounding and in contact with the flame. The sensitiveness of a flame to produce such a gas cap depends, primarily, on two factors: 1. The free access of the air to the flame. 2. The temperature of the flame, which directly affects the combustion of the gas and enlarges the cap formed thereby. Owing to this fact, a flame fed by a gas, such as hydrogen, is much more sensitive to the formation of a cap than a wick-fed flame, even when the latter is consuming a volatile oil as alcohol, naphtha or benzine, which are, in turn, more sensitive than the flames of sperm or cotton-seed oil. It must be remembered that the calorific power of hydrogen gas is from five to ten times higher than that of other gases and vapors, which fact makes it the most sensitive to the formation of a gas cap. For similar reasons, the flame of the carbide lamp is peculiarly sensitive to gas.

In reference to the suggestion of introducing a carbide burner into the combustion chamber of a safety lamp for the purpose of testing for gas, I want to say

that I consider such an attempt unsafe, for the reason that the carbide flame cannot be easily reduced and regulated; but, in the presence of gas, sufficient heat would be generated within the chimney to destroy the cooling effect of the gauze.

In closing, I want to draw attention to the fact that a carbide flame indicates the presence of dust more clearly than any other open lamp in use. The intense heat of the flame causes the particles of dust to burn more brightly, often producing minute sparks about the flame, besides elongating and changing its size and color.

Scalp Level, Penn.

Examining for Gas with an Open Light

In reading the article entitled "An Extraordinary Experience," COAL AGE, Apr. 25, p. 682, what surprised me most was the fact that a man having charge of a mine and with six years' experience as fireboss, should look for gas with a naked light. He and the other men present can congratulate each other that they escaped without harm or injury. The only time a person should experiment with gas in a mine is when obliged to remove it; and only safety lamps should then be used.

The incident narrated would not be so bad had the man making the examination quit after the first manifestation of the curious phenomenon. Instead of this, he seems to have tried the experiment several times, inviting others to witness the spectacle.

In my experience, I have only known of one man who thought he could examine a place for gas successfully with an open light and he would have discharged any man for attempting the same trick. Many who have tried to do this have been burned severely and have caused injury to others, while some have lost their lives in the attempt. In my opinion, the mining law should empower the mine inspector to lay off anyone who would be so thoughtless of danger to himself and others as to make such a foolhardy attempt. It reminds one of the man who toyed with a loaded gun and afterward said "I did not know it was loaded."

A MINER.

Scranton, Penn.

The Mine Foreman

Letter No. 3—I want to endorse the statements of Mr. Srodes, COAL AGE, Mar. 14, p. 458; as well as those in the letter of Mine Foreman, Apr. 18, p. 658.

As mine foreman, myself, I have long felt that men holding this position in West Virginia have too much for which they are responsible. There are few plants where the mine foreman has not more than he can do to look after the inside of the mine. In most cases, it is no small matter to maintain the circulation required by law and ventilate the working face in such a manner as to make the mine safe and healthful. This work alone requires constant and watchful care; but, in addition, the foreman must give most of his attention to the output of coal and to keeping the roads in good condition.

Besides the inside duties, the foreman must look after work on the surface, in the blacksmith shop and on the tipple, in the boiler house and engine room, fan house and elsewhere. These buildings, and the equipment requiring his daily attention, are often widely separated. When a breakdown occurs, he may have to spend half a day at a single point, endeavoring to overcome the trouble and maintain his output. On going to the office in the evening, after such a day, he must account to the superintendent for the short tonnage.

In nine cases out of ten, the superintendent of the mine does not fully appreciate the difficulties against which the mine foreman must strive. While holding his foreman responsible for maintaining the daily output and keeping the mine in safe condition, he too often refuses to give him the needed support and necessary equipment to perform his duties successfully. Under these conditions, it is difficult for a mine foreman to comply with many requirements of the state law.

I have in mind one instance, in this state, where the company is operating four mines, and where the superintendent changes the mine foreman at each mine about three times a year. A close observer can see readily that the real reason for this condition of affairs is a lack of coöperation between the superintendent in charge and his foremen, many of whom are practical and competent men. In such cases, the foreman suffers from the incompetency of the superintendent.

The suggestion has been made that, owing to these conditions, it would only be just and right that the state law should require certificates of competency of mine superintendents; because, as cannot be denied, he is the one in power to say what shall or shall not be done. It is true in many cases that if a mine foreman suggests that the mine is not complying with the mining law of the state, he is in danger of losing his place. I am glad to see this question discussed and hope to hear from others.

ANOTHER FOREMAN.

———, W. Va.

Starting Longwall in Room-and-Pillar Work

Letter No. 4—Referring to the inquiry, COAL AGE Apr. 4, p. 587, asking if the common longwall system can be successfully applied in a coal mine already fully developed on the room-and-pillar system. The data given in this inquiry—the thickness of the coal, nature of the underlying and overlying strata and the fact that the coal lies in a basin, are all strong points in favor of the adoption of the longwall system and warrant an affirmative answer to the above question.

However, before one decides to change the system already in use in a mine, he must carefully study the question of obtaining efficient labor under the new system. Longwall work is a different class of work from room-and-pillar operations. It may be difficult to get a class of miners sufficiently acquainted with the system. The adoption of the new system will require changes in respect to yardage, tonnage, undercutting the coal, timbering and other details, all of which must be carefully considered beforehand.

The advantages derived by the proposed change will be an increased output of coal, increased percentage of lump coal, increased safety, better ventilation, less coal dust, less shotfiring, less expense for brattice boards and

cloth, rails and timber. There is less timber lost in longwall work than in room-and-pillar operations. The posts are used over and over again, and when broken can be sent out of the mine and worked up into cap-pieces. In some instances, steel props have been used to advantage in longwall work. In adopting the longwall system, I would endeavor to drive the main haulage roads "on face" and the main gateways and stallgates "on end" or "on the butts." This will insure the maximum amount of lump coal. In the present case, I would use longwall mining machines and undercut in the nine inches of soft slate. The waste of the seam should be used for building packs. The nine inches of bottom coal could probably be taken up with the pick as the face advances and loaded out with the coal mined.

In starting the longwall work, I would begin at the face of the main haulage road and undercut the coal, gradually working the face into a half circle. Wooden cribs should be built at the entrance of the main gateways, which, of course, are at right angles to the main haulage roads. In the case under consideration, the main gates should be set off 1800 ft. apart, to allow for four stalls on each side of each main gate, each stall having a 200-ft. face, equally divided on each side of the gateway.

When the main gateway has advanced a distance of from 200 to 250 ft., a crossgate should be set off, by building substantial packwalls at that point. This crossgate should run at such an angle as to cut the intermediate stallgates successively as they advance 250 ft. As these stallgates are cut off by the crossgate, new stallgates are started from the cross-gate, in the usual manner of longwall. The blue slate rock should be taken down over the main haulage roads, main gateways and main returns, up to the sandrock. It will probably prove of advantage to use the large pieces of rock for building packwalls, while the smaller pieces are used to make a good floor over which the track is laid, which will prevent, to some extent, the heaving of the soft bottom. This work is usually done in steps and kept at a distance of 200 or 300 ft. back from the working face.

At the coal face, two rows of props are kept, the posts being set at regular distances apart. Roadpacks are usually built 6 ft. apart, as the face advances; and 9-ft. packs are built every 24 ft. along the face. Where there is not sufficient waste for building these packs, timber cogs are used. These are withdrawn and carried forward, as the face advances. The longwall system is fast gaining favor and undoubtedly will predominate in all coal fields when the shallower seams have been worked out.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Summation of Potentials—The circulation of air in two or more splits or currents, in a mine, differs from a tandem circulation in the fact that the same unit pressure circulates the air in each and all the splits, which are thus separate currents moved by one pressure; while in a tandem circulation one continuous current passes in succession through different airways or sections of the mine.

While in a tandem circulation the mine pressure is equal to the sum of the pressures for the several sections through which the current passes; and, likewise, the total power for the mine is equal to the sum of the powers absorbed in the sections; in a split circulation, the total power for the mine is equal to the sum of the powers absorbed in the splits, but there is but one pressure, which is the same for all the splits starting from the same point in the mine.

As before, indicate the several split pressure potentials by X_{p_1}, X_{p_2}, X_{p_3}, etc.; the corresponding powers on the air by u_1, u_2, u_3, etc.; and the total power on the air by u_o, remembering that it is necessary, in all splitting calculations, to use the pressure potential, which has the value

$$X_p = a\sqrt{\frac{a}{k\,l\,o}}$$

The work is simplified by using the part potential value, as previously stated, omitting k when finding the potential values and multiplying the final result by that coefficient.

The following shows the development of the formulas for the summation of the potentials in split circulations where the splits all start from one point in the mine:

$$u_o = u_1 + u_2 + etc. \qquad (1)$$

But,
$$u_1 = \frac{q_1^3}{X_{p_1}^2};\quad u_2 = \frac{q_2^3}{X_{p_2}^2};\ etc. \qquad (2)$$

By the principle of splitting air currents,

$$q_1 = \frac{X_{p_1}}{\Sigma\, X_p}Q;\quad q_2 = \frac{X_{p_2}}{\Sigma\, X_p}Q;\ etc. \qquad (3)$$

Combining equations 2 and 3 and simplifying,

$$u_1 = \left(\frac{Q}{\Sigma\, X_p}\right)^3 X_{p_1};\quad u_2 = \left(\frac{Q}{\Sigma\, X_p}\right)^3 X_{p_2};\ etc. \qquad (4)$$

Finally, substituting these values (4) in equation 1, and factoring,

$$u_o = \left(\frac{Q}{\Sigma\, X_p}\right)^3 (X_{p_1} + X_{p_2} + etc.) \qquad (5)$$

Simplifying equation 5, gives the formulas for calculating the horsepower on the air at the point of split, by the summation of the part pressure split potentials:

Horsepower on the air,
$$H = \frac{k\,Q^3}{33{,}000\ (\Sigma\, X_p)^2} \qquad (6)$$

The formula for calculating the water gage, in like manner, is

Water gage,
$$w.g. = \frac{k\,Q^2}{5.2\ (\Sigma\, X_p)^2} \qquad (7)$$

The Coal Age Pocket Book

As an illustration of the usefulness of the summation of potential values, we give below the calculation of the horsepower on the air, unit pressure and water gage developed in the circulation of 100,000 cu.ft. of air per minute, in four splits, calculated by the usual method on a preceding page, where it was necessary, first, to find the natural division of the air.

Example—An air current of 100,000 cu.ft. per min. is divided, at the foot of the downcast shaft, between the following four splits:

Split A, 8x12 ft., 6,000 ft. long; a = 96 sq.ft.; s = 240,000 sq.ft.
Split B, 6x20 ft., 12,000 ft. long; a = 120 sq.ft.; s = 624,000 sq.ft.
Split C, 6x12 ft., 8,000 ft. long; a = 72 sq.ft.; s = 288,000 sq.ft.
Split D, 4x 6 ft., 1,000 ft. long; a = 24 sq.ft.; s = 20,000 sq.ft.

Calculate the horsepower on the air, unit pressure and water gage concerned in producing this circulation, using the part potential values and employing the method by summation of potentials; no regulators being used in the mine, but the division of air being natural.

Solution—The part potential values for the several splits are as follows:

Split A, $X_{p_1} = a\sqrt{\frac{a}{s}} = 96\sqrt{\frac{96}{240{,}000}} = 1.920$

Split B, $X_{p_2} = 120\sqrt{\frac{120}{624{,}000}} = 1.664$

Split C, $X_{p_3} = 72\sqrt{\frac{72}{288{,}000}} = 1.138$

Split D, $X_{p_4} = 24\sqrt{\frac{24}{20{,}000}} = 0.831$

Sum of part pressure potentials ($\Sigma\, X_p$) 5.553

Substituting this value for $\Sigma\, X_p$ in the formulas for finding the horsepower on the air and water gage, in natural splitting,

Horsepower on air. $H = \frac{0.00000002 \times 100{,}000^3}{33{,}000 \times 5.553^2} = 19.6\ hp.$

Unit pressure. $p = \frac{0.00000002 \times 100{,}000^2}{5.553^2} = 6.48\ lb.\ per\ sq.ft.$

Water gage, $w.g. = \frac{0.00000002 \times 100.000^2}{5.2 \times 5.553^2} = 1.24\ in.$

In natural splitting or when no regulators are employed, the general mine potential is always equal to the sum of the several split potentials, which is true for either power or pressure.

In a tandem circulation, however, the general mine potentials for power (X_{uo}) and for pressure (X_{po}) are given by the formulas

$$X_{uo} = \frac{1}{\sqrt[3]{\Sigma\,(1/X^3_u)}};\quad \text{and}\quad X_{po} = \frac{1}{\sqrt{\Sigma\,(1/X^2_p)}}$$

Inquiries of General Interest

Extinction of Lamp on Falls

I was much interested in the answer given to an examination question, COAL AGE, Mar. 28, p. 540, which reads as follows:

If, while examining a fall in one of the entries in a mine, your safety lamp became suddenly extinguished, what gas or mixture of gases would you say was present?

I would like to ask, would it be possible, in a portion of a mine that is not ventilated, to find the air depleted in oxygen to such an extent that a light would be extinguished, assuming there was no marsh gas or carbon dioxide present? Or, would it not be possible to find a sufficient quantity of nitrogen given off, in such an unventilated portion of a mine, as to render the atmosphere incapable of supporting combustion? Or, again, is it not possible for the coal to absorb the oxygen from the air to such an extent that the air in that portion of the mine will not support combustion?

Also, would a lamp be extinguished in an atmosphere containing 19 per cent. of oxygen, no foreign gases being present?

I would like to hear from someone who has made analyses of mine air, under different conditions, when the lamp was extinguished. I have seen safety lamps extinguished at different times on falls when no explosive gas was present.

I remember an instance where a fall had occurred in one of the room pillars, during the night, and the fireboss when making his examination the following morning found a mixture of gas, on the fall, that extinguished the flame of his lamp. Gas had never been seen in that section of the mine before. When the gas, in this case, had been removed, the place showed no indication of the presence of explosive gas coming from the cave.

READER.

Punxsutawney, Penn.

In the absence of any analysis of the mine air taken at the point where the lamp was extinguished, we can give no better explanation of the cause of the extinction of the flame than that given in answer to the examination question to which correspondent has referred. As there stated, it is possible for the extinction of a lamp to be caused by "sharp" marsh gas—gas undiluted with air; or a mixture of marsh gas and carbon dioxide.

Under certain conditions, where these gases diffuse into each other in the absence of air, they form a mixture lighter than air. It is also possible for carbon dioxide to issue from the roof strata, in such quantities as to extinguish a lamp on top of a fall. It is possible, also, that temperature may play an important part in holding an extinctive mixture of gas at the roof, while a cooler undercurrent keeps the air clear at or near the floor. These conditions are so numerous that it is impossible to more than suggest certain possibilities that may exist, any of which may or may not be true in this case.

In regard to the strata giving off a sufficient quantity of nitrogen to render the air extinctive, we do not think such a condition is within the range of ordinary possibilities, in coal mining. Even assuming that the place is not ventilated, there would have to be an addition of 27.4 volumes of nitrogen to each 100 volumes of free air, to produce an extinctive atmosphere containing 16.4 per cent. oxygen and 83.6 per cent. nitrogen.

Neither do we consider it probable, although we admit it may be possible, that the coal might absorb sufficient oxygen from the air in an unventilated place to render the atmosphere extinctive. This condition could only exist, however, in a very close place, hardly in mine workings, even though unventilated.

Referring to the incident of the extinction of the fireboss' lamp on a fall of the night before, in pillar workings, it is possible for a close atmosphere to have formed in a space above the roof slate before it fell; and we may suppose that the oxygen in that atmosphere would, in time, be depleted by absorption to such an extent as to render it extinctive. Such a condition may have existed in the incident cited by correspondent, and would explain the fact that when the gas had been removed, there was no further indication of trouble.

In the absence of foreign gases, a wick-fed flame will not ordinarily be extinguished until the oxygen has been depleted to, say 16.4 per cent., although an alcohol flame is extinguished at 17.2 per cent. Gas-fed flames are more tenacious, the hydrogen flame not being extinguished until the oxygen has been depleted to 6.3 per cent., in the absence of other gases.

Engineer of Mines Degree

My profession is geology and, for many years, I have been engaged in making investigations of coal properties and rendering reports upon coal and mineral lands, in 13 different states. I have been in the habit of affixing the letters M. E. to my name when signing these reports. I have observed that some engineers write the letters E. M. after their name when signing such reports. I shall much appreciate having COAL AGE express an opinion as to which of these, if either, is the proper form to use.

MINING ENGINEER.

————, Penn.

The letters E. M. written after a name indicate that the person is a graduate engineer, holding the degree "Engineer of Mines." The letters M. E., written after a name, indicate that the person is a graduate mechanical engineer, holding that degree.

While there are many mining engineers of unquestioned ability who have gained their knowledge by an extended experience and practice, only the graduate engineer can properly write the letters referred to above after his name. The practical engineer who holds no degree, but has gained his knowledge and experience in practice, is entitled to write "Mining Engineer," or "Mechanical Engineer," following his name; but he should not use the letters mentioned above, which refer to a degree conferred by a college or school, authorized to give such degrees.

Examination Questions

Springfield, Illinois, April 20, 1914

(*Selected Questions*)

Ques.—Explain how you would determine the safe working load for a seasoned hemlock, mine prop, 10 in. square and 7 ft. long, assuming the crushing load is 5300 lb. per sq.in., for hemlock timber.

Ans.—The length of the post in feet, being less than its diameter in inches, there is no danger of the post failing by bending. The safe working load, in this case, can, therefore, be calculated from the crushing strength, which is given as 5300 lb. per sq.in. The post being 10 in. square, its sectional area is 10x10 = 100 sq.in., and the total crushing load is, therefore, $100 \times 5300 \div 2000 = 265$ tons. It is customary, in mine timbering, to allow a factor of safety of 3, which makes the safe working load, in this case, $265 \div 3 = 88+$ tons.

Ques.—A current of 9000 cu.ft. of air is passing per minute through a regulator. If the difference in pressure on the two sides of the regulator is equal to 0.7 in. of water gage, calculate how far the regulator shutter is open, assuming the height of the opening is one foot.

Ans.—For the given quantity of air and water gage, the area of the opening is calculated by the formula

$$A = \frac{0.0004\,q}{\sqrt{w.g.}} = \frac{0.0004 \times 9000}{\sqrt{0.7}} = 4.3\ sq.ft.$$

The height of the opening being 1 ft., its width is 4.3 ft.

Ques.—In a mine ventilated by a fan, which is circulating 120,000 cu.ft. of air per minute, at a speed of 70 r.p.m. and a water gage of 2.5 in.; at what speed would this fan have to run to circulate 150,000 cu.ft. per min.; and what water gage would be produced by such circulation?

Ans.—Commonly, the speed of the fan is assumed to be proportional to the quantity of air circulated; or, in other words, the speed ratio is equal to the quantity ratio. By this rule, calling the required speed of the fan x,

$$\frac{x}{70} = \frac{150{,}000}{120{,}000} = \frac{5}{4} = 1.25$$

and $$x = 70 \times 1.25 = 87.5\ r.p.m.$$

More accurately, however, the fourth power of the speed ratio is equal to the fifth power of the quantity ratio, which gives

$$\left(\frac{x}{70}\right)^4 = 1.25^5 = 3.05$$

and

$$x = 70 \times \sqrt[4]{3.05} = 70 \times 1.32 = 92.4\ r.p.m.$$

Since the water gage varies as the square of the quantity of air in circulation, the water-gage ratio is equal to the square of the quantity ratio, which gives

$$\frac{w.g.}{2.5} = 1.25^2 = 1.56+$$

$$w.g. = 2.5 \times 1.56 = 3.9\ in.$$

Ques.—If the ventilating machine was permanently disabled by an explosion of firedamp, what temporary means would you employ to restore ventilation in the mine?

Ans.—Assuming that the ventilating machinery is permanently disabled so that it cannot be repaired in a reasonable time, steps should at once be taken to secure and set up, temporarily, another fan. Such a fan may often be obtained from an adjoining colliery or sent on a rush order from the nearest machine shop.

In a gaseous mine, as in this case, no attempt should be made to start circulation by a fire basket lowered in the shaft, or other similar means. Following an explosion, there will often be a manifest tendency in the mine that will make one of the shaft openings the upcast. Advantage should be taken of this tendency to increase the natural circulation by any means possible; such as lowering a steam jet into the upcast or the diversion of surface winds into the downcast opening.

There should always be kept on hand, especially at mines subject to explosion, emergency equipment that will be available for use on such occasions. This equipment should include a duplicate fan, a small disk fan or blower that can be quickly set up when and where needed. There should also be an abundance of brattice material at hand ready for use if conditions permit.

Ques.—What percentage of firedamp (marsh gas mixed with air) is necessary (a) to show a faint cap; (b) to readily explode; (c) to be at its most explosive point?

Ans.—(a) Assuming the firedamp in question is pure marsh gas diluted with air, no dust or foreign gases being present, it is possible for an experienced observer to detect the first appearance of a flame cap in an unbonneted Davy lamp burning sperm or cotton-seed oil, when the marsh gas forms from 2 to 2½ per cent. of the mixture. Much depends on the style of lamp used, the oil burned, the velocity of the air current and the experience of the observer. Under these varying conditions, a flame cap will often not be detected when fully 3 per cent. of gas is present; and, at other times, the effect of the gas on the lamp flame will be first observed when somewhat less than 2 per cent of gas is present.

(b) A firedamp mixture, consisting of pure marsh gas and air only, first begins to explode when the proportion of gas to air is 1:13; or the mixture contains, say 7.14 per cent. of gas. It should be remembered, however, that firedamp is inflammable and dangerous, before this point is reached; namely, when the proportion of gas to air is 1:17; or, say 5.5 per cent. of gas is present in the mixture.

(c) A mixture of pure marsh gas and air reaches its maximum explosive point when 9.46 per cent. of gas is present in the mixture; this point being determined by the quantity of oxygen necessary for the complete combustion of the marsh gas, the volume of oxygen required for this purpose being twice that of the marsh gas consumed.

Coal and Coke News

Pennsylvania

HARRISBURG

The belief held here that the personal power long wielded by the late George F. Baer, as head of the Reading system and of its many subsidiary and associated companies will be largely divided, received confirmation in a considerable degree, when the directors of the Central R.R. of New Jersey, on May 1, elected William G. Besler as president of that company.

While Mr. Besler is recognized as an able railroad man, it is not thought that there is any likelihood that he may be chosen to head the Reading company, the holding corporation of the system, where legal and financial training are requisite, or of the Philadelphia & Reading Coal & Iron Co., where familiarity with the commercial side of the anthracite coal business is needed. For these reasons the opinion is expressed that the election of Besler made it nearly a certainty that some other man would be chosen as the president of the Philadelphia & Reading Coal & Iron Co.

The Possible Successors of the Late George F. Baer

The most generally accepted view is that the next president of the Philadelphia & Reading Ry. Co. will be either Theodore Voorhees, the veteran vice-president in charge of operation, or A. T. Dice, vice-president and general manager. W. J. Richards, vice-president of the Philadelphia & Reading Coal & Iron Co. stands next in line of promotion for the presidency of that corporation.

Incidentally it was recalled that the directors of the Philadelphia & Reading Ry. Co. have always recognized the principle that under its charter, the president must be a legal resident of the state of Pennsylvania. The principle does not necessarily apply to the Reading Co., the holding corporation, or to the Philadelphia & Reading Coal & Iron Co., which owns and operates the Reading coal mining and marketing industry.

A new president was also selected on May 1, for the Lehigh & Wilkes-Barre Coal Co., another of the many subsidiaries of the Reading system. The new president chosen by the directors, is Charles F. Huber, hitherto vice-president and general manager. His former position is abolished.

The developments of the meetings held on the above date, accentuated the opinion held in many quarters that not only will there be a great subdivision of the late Mr. Baer's authority, but that separate presidents will be selected for every one of the nine different corporations embraced in the Reading system.

Temple Iron Co.

The Temple Iron Co. directors, on May 1, elected E. T. Stotesbury, of Philadelphia as president pro tempore, to succeed Mr. Baer, and Robert W. De Forts was selected to take Mr. Baer's place as a director.

The directors of the Temple Iron Co. on the above date, also announced that the company's assets had been sold to the highest of six bidders. This concern was the storm center of the suit several years ago by the Government against the leading anthracite coal-carrying roads, which resulted in a decision by the U. S. Supreme Court that the company must be dissolved. The Temple Iron Co. held the stock of eight important coal-mining concerns in the Wyoming region, and its shares were held by the railroads until the court ordered that this control should cease.

The buyer was the firm of Thorne, Neale & Co. The chief assets comprise eight collieries and a cash payment will be made for them. The new owners of the Temple Iron Co. operate other large properties in the Schuylkill and Wyoming regions.

The Lehigh Valley R.R. and the Coal Sales Co.

The Lehigh Valley R.R. Co. and other defendants on Apr. 30, filed their answer to the government's suit for the dissolution of the existing relations between the railroad company and various coal-producing companies. The answer is a general denial to the allegations of a combination in restraint of trade or any infringement of the provisions of the Sherman anti-trust law.

The Lehigh Valley Coal Sales Co. specifically denies that it receives favors of any kind from the railroad company that might be called discriminatory against other shippers. The company further says it has nothing to do with interstate trade.

The Lehigh Valley Coal Sales Co., in its answer stated that the sole purpose of the organization of the company was to separate and disassociate absolutely the Lehigh Valley Coal Co. from any interest or participation in the anthracite coal business other than the mining and production of anthracite coal and its sale at the mines.

The answer adds that not a single share of the Lehigh Valley Coal Sales Co. stock was subscribed for at the time of its organization or at any subsequent time by either the Lehigh Valley R.R. or the Lehigh Valley Coal Co., but admits "that the large majority of the Lehigh Valley R.R. stockholders as of February, 1912, availed themselves of the privilege offered to subscribe to its stock at organization," and that "its first officers were chosen largely from the officers of the Lehigh Valley Coal Co.'s sales agency force." It denies however, "that any of its incorporators or any other board of directors were the nominees, representatives or instruments or under the control of the defendant Lehigh Valley R.R.," or "that its shares were intended for distribution among stockholders of the railroad company pro rata or otherwise."

As to coal it purchased from the Lehigh Valley Coal Co., the Lehigh Valley Coal Sales Co. asserts that the fixing of price was a matter of bargaining, involving several legitimate business considerations, and the answer declares that the Lehigh Valley R.R. Co. has never used or attempted to use, and never has had and does not now have the power to use it as an instrument for any purpose.

Additional Rescue Stations

In the effort to have the government add 10 additional rescue stations and 15 additional rescue cars to the government service throughout the country, President Van Bittner, of District No. 5, of Pittsburgh, and Andrew Matti vice-president of District No. 9, of Hazleton, United Mine Workers of America appeared before the Mines and Mining Committee, Apr. 29, and urged the passage of such a law.

Vice-President Matti delved extensively into the affairs of the anthracite coal district of the state, and when asked the reasons for the many accidents occurring in the hard-coal fields he declared that some of them could be avoided if the number of mine inspectors were increased. He stated that the number now employed is entirely inadequate to meet the wants at the various mines.

He added that the miners seldom see the inspectors. He did not believe these officers were remiss in their duties, but the amount of labor needed for complete inspection is now excessive, due to the increased number of mines, to the depth of the shafts, and the distance from the chambers to the surface. "It would take" he said, "the inspector nowadays about a month, to examine the average mine, and when he completed his labors it would be necessary, in order to keep the workings of the mine under the closest observation, to start back and do the mine over again." In other words, Mr. Matti believes that there should be an inspector for almost every colliery.

He also favored the establishment of additional rescue stations, and cars. It was his belief that at least three more of these cars should be located in the anthracite fields, one at Hazleton, the other at Scranton, and the third at Shamokin or in that vicinity. It was contended by the miners' representatives that more cars are needed in the anthracite region, because of the greater danger in anthracite mines than in the bituminous regions where there is little gas where the roof is low, and where there is little danger of caving.

Anthracite

Jeddo—The Casino, the new Jeddo club house, erected by G. B. Markle Coal Co., is now completed and was thrown open on May 2; General Manager A. B. Jessup delivered the address of welcome. The building is one of the most modern club houses in the anthracite region and is a valuable addition to that little mining town.

Drifton, Penn.—Ground was broken on Apr. 29 for an addition to the Mining & Mechanical Institute. The new ad-

dition will be of the same style of architecture as the present building and it is the intention of the contractor to have rooms ready for occupancy in September. A manual-training and chemical department will be maintained in the new structure.

Wilkes-Barre—Locals of the United Mine Workers at the several collieries of the Lehigh Valley Coal Co. for the past week have been discussing what is called the "prop question" and the grievance committee of the Dorrance colliery called on the officials and made a request that the men be paid for the placing of props. The request was refused and it was explained to the committee that according to the scale now in effect, the miners agree to place props in the workings without extra charge. It is thought that other locals beside the Dorrance have discussed the question and requests from other committees are expected to be made to the officials.

Centralia—The strike of mine workers at Packer Collieries Nos. 1, 2, 3, 4 and 5, operated by the Lehigh Valley Coal Co., which went into effect Apr. 27, throwing 4000 men and boys out of employment, was amicably settled on May 2, and the collieries will resume full operation at once, causing much rejoicing.

Pittston—One miner was instantly killed and another perhaps fatally injured in the Hoyt shaft of the Pennsylvania Coal Co., on May 2, when these men were run down by runaway cars. The men had started up the slope behind some loaded cars, when the rope broke and the cars started down. Before they could reach a place of safety they were caught under the wagons, which left the track and buried them in the débris.

Taylor—Attorney William Brewster, of Wilkes-Barre, on Apr. 30, bid in the property of the defunct Marion Coal Co. for $531 at a trustees' sale, conducted by Attorney William A. Titsworth, who was appointed referee in bankruptcy. It is said that Brewster represented W. P. Boland, president and organizer of the company. The sale closes a long legal battle.

Bituminous

Lilly—The independent miners' union at this place is finding the cost of maintaining its large membership now out of work a heavy burden. The union pays to every member out of work $2 a week; $1.50 to his wife and 50c. to each child under age. Since the slackening of work at the mines, the special reserve fund of $17,000 has been dwindling at a rapid rate.

Connellsville—Several hundred miners and coke workers at the Herbert plant of the Connellsville Central Coke Co. struck on May 2, when notices were posted announcing a reduction of 25c. a day for drivers and coke workers and 10 per cent. for miners.

Washington—The number of violent deaths in Washington County in April due to alcoholic drink was just twice the deaths in the coal mines. According to the monthly report of the coroner, James Heffran, four persons died as a result of using liquor, while the mines only took two lives.

WEST VIRGINIA

Charleston—Against the instructions of their leaders, 10,000 miners in the Kanawha Valley have laid down their tools and refused to work, having voted almost unanimously to remain idle pending an adjustment of the wage controversy, which has been the subject of a prolonged conference between the operators and union officials. Failure to arrive at an agreement on various disputed points caused this action on the part of the miners, who became impatient at the delay. President Thomas Cairns, of District No. 17, which is involved in the controversy, is endeavoring to persuade the men to return to work until the negotiations are concluded, but without much prospect of success.

It is feared by many that scenes rivaling those of the strike in Paint and Cabin Creek districts will take place during the present strike of the miners in the Kanawha coal district. There are 10,000 miners out, and the situation is ominous.

Unlike conditions following previous mine explosions in the state of West Virginia, the widows, children and other dependents will be taken care of by a fund created by the employers and employees, made possible under the Workmen's Compensation Act, which went into effect last October.

Wellsburg—The Rex Carbon Coal Mine, about five miles east of here, on the Wabash R.R., is being put in condition for operating, and it is expected to have the mines in working order within a few weeks.

KENTUCKY

Middlesboro—The Hazard Coal Land Co., which holds 3200 acres, has just leased about half of these holdings to the Ashless Coal Corp., of Roanoke, Va. The Ashless Company will install an electrically equipped plant with 1000 tons daily capacity and the operation will be under way as soon as possible. The Hazard company is now negotiating for the lease of the remainder of its land.

Pineville—Mine operators and miners are much elated over what Congressman Caleb Powers reports that there is an excellent prospect that either Pineville or Harlan, in the Eastern Kentucky coal field, will get one of the mine rescue stations to be established by the Federal government. Mr. Powers some time ago introduced a bill in the house calling for the appropriation for two stations of $26,500 each, one to be located here and the other at Harlan. Local interests are not disappointed especially in the recommendations from the Department of the Interior that Kentucky be allowed but one station.

OHIO

Massillon—Fire starting in the boiler room of mine No. 21 of the Massillon Coal Mining Co., located at Dalton, nine miles north of Massillon, destroyed the outside equipment of the company, entailing a loss of approximately $50,000. It is announced that the plant will not be rebuilt.

Columbus—It is announced that the newly created United States Commission on Industrial Relations will likely take a hand in the Ohio wage controversy. It is understood that a representative of the commission, Alexander M. Dailey, has been in the Buckeye State investigating conditions relative to the coal-mining industry and that his report will soon be filed with the commission. It is believed that public hearings may be fixed at which both operators and miners will be called to testify.

Fort Smith—Negotiations to arbitrate the strike between the miners and the Bache-Denman Coal Co. terminated when the company refused to be a party to the proposal of State Labor Commissioner J. C. Clary, which was to have the Governor appoint a committee to settle the matter.

INDIANA

Sullivan—The drilling outfit now sinking test holes at Caledonia for the Monon Coal Co. will be removed to Shelburn, to drill test holes to the No. 5 vein at the Steel Tipple and Mammouth mines. These have been shut down because of exhaustion of the vein they were working.

Jasonville—The Latta's Creek mine, closed for a month, has been reopened. The Island Valley mine has been closed.

Terre Haute—The settlement of the wage and working conditions in Indiana for the next two years is put in the hands of a subscale committee of the operators' and miners' associations. This committee has begun its meetings, using as headquarters the office of Phil H. Penna, secretary of the operators' association.

ILLINOIS

Springfield—The Illinois Mining Investigation Commission recently appointed by Gov. Dunne, has been recently organized, electing Thomas Jeremiah, a coal operator of Williamsville, as president and R. J. Wilson, of Marissa, a miner, as secretary. The commission will investigate mining conditions in the state and will draw up such amendments to Illinois Mining Laws as they think desirable, and report them to the General Assembly when it meets next winter.

Edwardsville—Mine No. 3, which has been operated for 35 years, it is said, will be soon abandoned. The City Coal Co. has given up its lease to the Edwardsville Coal Co., the owners, and it is reported that the property will be converted into a large coal yard.

ARKANSAS

Fort Smith—The first investigation ever undertaken under the auspices of this state in a labor dispute has been recently started, when J. J. Clary, state commissioner of labor, began inquiry into the difficulties between the United Mine Workers of America and the Bache-Denman Coal Company. The trouble between the mine workers and the company resulted in the company's breaking its contract with the union and substituting the "open shop" policy.

CANADA

Victoria, B. C.—The Canadian Collieries, Ltd., operating mines on Vancouver Island, B. C., has asked holders of the company's bonds to consider a proposal that the company be allowed to postpone sinking fund payments for five years. Labor troubles during the past 18 months have caused serious loss of profit, necessitating the fixed charges for the past year being met to a considerable extent out of working capital. They have also delayed the carrying out of the scheme of new construction and development entered upon soon after the company was organized, so that the sum of approximately $3,000,000 provided to pay for the extension and im-

provement plan and for additional working capital, has proved to be inadequate. About $1,500,000 more will probably be required to complete the necessary work. This sum certain holders of the stock are willing to find when required, provided that the holders of the first mortgage bonds agree to the postponement until Mar. 21, 1919, of the sinking fund payments, the first of which fell due on Mar. 31, last. Power will be reserved by the company, however, should circumstances make it desirable to commence payment of the sinking fund at an earlier date than that specified. The resolution for the postponement of sinking fund payment also provides that no dividend shall be paid on any share of capital stock until after commencement is made on the payment of the sinking fund.

PERSONALS

John E. Finney has been appointed receiver for the Poteau Coal & Mercantile Co., Poteau, Okla.

The Hazard Mfg. Co., formerly of 50 Dey St., has removed its office and warehouse to 533-541 Canal St., New York.

R. C. Cole has joined the staff of the Pneumatic Tool Department of the Ingersoll-Rand Co., and has been stationed at the Chicago Office.

C. L. Purcell has been made assistant to sales manager J. A. Rundio, of the New Pittsburg Coal Co. at Columbus, Ohio, to take the place of Ray Davis, who resigned.

George H. Garrey has recently severed his connection with the American Smelting & Refining Co. and allied companies, as their chief geologist, and has opened an office as consulting mining geologist and engineer at 115 Broadway, New York.

CONSTRUCTION NEWS

Scranton, Penn.—Penn Forest Coal Co. is building a breaker between Beaver Meadow and Weatherly to prepare the fuel to be mixed from the recently tapped veins on the Penrose tract.

Connellsville, Penn.—It is reported that within a short time, the Republic Iron & Steel Co., expects to begin operating the 80 by-product ovens now nearing completion. About 200 additional men will be given work.

Pineville, Ky.—The Pioneer Coal Co. has announced plans for the erection of a new building for the commissary department which will be enlarged. The company has ordered also the construction of a number of new homes for its miners.

Falmouth, Ky.—Surveyors are at work on the survey of a rojected railroad line to run from Newport, Ky., along the ast bank of the Licking River, to be called the Virginia & icking River R.R. The operations are being made to enable n estimate of the cost of the railroad to be reached. The romoters would open up some 80,000 acres of coal lands in his vicinity and propose to handle their product through lewport and Cincinnati.

Jackson, Ky.—The Kentucky interests of the Lete-Maupin Engineering Co. have been purchased by W. S. Canning, f this city. In the new Kelly Kash building, now in course f construction here, Mr. Canning will install a coal-testing aboratory and a completely equipped engineering office by he first of June.

NEW INCORPORATIONS

Edmonton, Ky.—The Premier Products Co. has been organized with a capital stock of $300,000, to mine coal and on.

Harlan, Ky.—The Harlan Coal Co. has been incorporated with a capital stock of $10,000. The incorporators are J. L. Smith, A. M. Gregory and John Reese.

Stillwater, Ohio—The Stillwater Coal Mining Co., of Stillwater, O., has filed amended articles of incorporation increasing its capital stock from $350,000 to $600,000.

Dewar, Okla.—The Electric Coal Co. has been organized with a capital stock of $5000. The incorporators are J. T. Buckner, Ora Buckner and E. A. Jennings, all of Dewar.

Columbus, Ohio—The Wm. J. Hamilton Co., coal and kindred products, has been incorporated with a capital stock of $10,000. The incorporators are Wm. J. Hamilton, L. E. Ridgway, A. Morse and D. M. Hamilton, all of Columbus.

INDUSTRIAL NEWS

Wilkes-Barre—The Lehigh & Wilkes-Barre Coal Co. has decided to substitute horses for mules in hauling coal and supplies about the collieries and in the city. The company has found that horses are better suited for the outside work than mules.

Massillon, Ohio—General Manager John Whalen, of the Massillon Coal Co., has announced the opening of three new mines west of Massillon upon which work will be started immediately. These will furnish employment to between 400 and 500 men.

Springfield, Ill.—The Montour Coal Co. recently resumed activities. Its mines are the Empire, located near the state fair grounds, and those at Virden, Auburn and Girard. The Pittsburgh Coal Co., of Illinois, with branch offices in the Reisch Building, will handle the output of these mines.

Whitesburg, Ky.—A good-sized coal operation on the Sandy Valley & Elkhorn R.R. is to be begun shortly east of here in coal lands lying on the border of Letcher and Pike Counties. The operation will be by the Bucalo Creek Coal Co., organized and recently incorporated with a $50,000 capital.

Uniontown, Penn.—At a meeting of bituminous-mine inspectors held recently, preliminary arrangements were completed for the annual meeting of the Mine Inspectors' Institute of America, which will be held in Pittsburgh commencing June 9. The technical program is being worked out by a committee and will be announced probably early in May.

Hazard, Ky.—The opening up of two large tracts of coal properties, one on the Racoon Branch and the other on Davidson Creek, in Perry County, has been begun by W. E. Davis, formerly interested in the Jellico district. In the operation of the latter property it will be necessary to build a bridge in order to convey the coal from the mines across the river to the railroad line.

Washington, D. C.—Increased rates on coal from grouped mines in southern Indiana and Illinois to points on the Mason City and Clear Lake and the interurban railways in Iowa, proposed by the Rock Island and other railroads, have been approved by the Interstate Commerce Commission, and the order of suspension lodged against the advances withdrawn. The increased rates are to take effect May 8.

Louisville, Ky.—The Harlan Coal Mining Co., of Louisville, which recently disposed of two large operations near Coxton, Ky., by lease, owns another large tract in Harlan County upon which the company is considering the establishing of an operation. The plans in this direction, however, are indefinite, and if the opening up of the mine should be decided upon it would take place late this year at the earliest.

Turley, Tenn.—Messrs. Seabrook & Howard, and other parties of Atlanta, have purchased the old Rock Springs Coal Co. on the Southern R.R. at Turley, Tenn., and have organized the Turley Coal Co. The present plant will be entirely overhauled and machinery installed under the direction of A. H. Wood, an experienced mining engineer of Petros, Tenn. The new company intends to handle a large tonnage.

Pittsburg, Kan.—The Pratt-Durkee Coal Co., of Cherokee County, Kan., recently filed a petition in voluntary bankruptcy and Edward I. Martin, of Columbus, Kan., was appointed receiver. It was reported that the company's assets were slightly more than its liabilities. The cause as given for the condition is that the price of coal is too low to make a profit for the operator, and that labor conditions make it impossible to operate economically. This is the first strippit company to go into the hands of a receiver.

St. Louis, Mo.—The Coal Operators' Traffic Bureau of St. Louis has been organized, consisting of about 30 operators of mines in the Inner District, producing commercial coal. The Inner District mines are that group of mines taking the 32c. freight rate to East St. Louis. R. W. Ropiequet has been retained as traffic manager, under contract. The purpose of the organization is to take action against the railroads entering East St. Louis that own coal minees, and which roads are operated exclusively for the purpose of hauling this coal to the St. Louis market.

Coal Trade Reviews

General Review

Heavy movement of anthracite with demand centering particularly on stove coal. Bituminous down to the bottom, but has failed to round the corner yet. Surplus stocks being cleaned up.

The cool April weather, together with the heavy demand for storage purposes, resulted in a large movement of anthracite last month. Many orders were carried over into the current month and an active situation prevails among the large companies. The demand is centering particularly on stove coal, while the steam grades are now showing a tendency to ease off under the heavily increased production, and some companies are reported as putting these back into storage. In the dealer trade, the situation is by no means so favorable. Some of the prepared grades are still offering, at certain points, down to the April circular, with no buyers. The Lake business in anthracite is opening up slowly, and indications point to a light movement for the season.

The most encouraging feature in the bituminous situation is the general belief that the trade is down to an irreducable minimum and that any change must be for the better. Large tonnages are still reported at the Atlantic Coast loading ports, with considerable on demurrage, while cancellations on contracts are becoming more frequent. There is less shipping on consignment, however, and there are reports that the surpluses accumulated prior to Apr. 1 are now nearly cleaned up.

Production in the Pitsburgh district is slightly increased, but there is no movement whatever in the Lake trade, due to the absence of demand and the light iron-ore tonnage; the iron industry is again down to approximately the low level of last December. The trade generally is not anticipating better prices any time this summer.

Nothing is being done toward effecting a settlement of the wage scale in Ohio, but considering the prices the West Virginia product is bringing, the local operators feel they have little cause to worry. Some Lake vessels have cleared from Ohio ports for the Northwest, but the opening is slow and this business will not get actively under way before June 1. The surplus coal at Hampton Roads has been greatly reduced and is now about normal. Some sales involving small tonnages are reported at practically the circular, with others of considerable size being negotiated, but generally speaking, the trade continues dull and flat.

The situation in the Middle Western market is still rather mixed, there being absolutely no demand at some points, with operators showing a complete indifference as to when work is to be resumed. The Indiana mines, on the other hand, are gradually resuming operations and are making preparations for a heavy production in the event of a deadlock in the adjoining states. Although the market continues rather heavy generally, there is a widespread feeling that the consumers are now reaching the end of their storage supply, and will soon be forced into the market again.

EASTERN MARKET

BOSTON

Dull market continues and general curtailment still in force. Pocahontas and New River reasonably firm at $2.85 f.o.b. Hampton Roads. Other grades also dull. Anthracite companies well supplied with orders for May.

Bituminous—The demand for spot coal is practically nil and shipments even on contract are in light volume. Water power in Maine and New Hampshire is the heaviest for several years and is another factor accentuating the stagnant situation. The tonnage of Pocahontas and New River standing at the loading piers is still large and this in face of a general curtailment in the mining districts. For inland distribution there is practically nothing doing, the shipment of coal on the market having largely ceased on account of the poor success shippers have lately met in that respect.

Prices, however, are rather well maintained and operators are apparently adhering to the policy of netting $2.85 f.o.b. Hampton Roads or keeping the coal in the ground. Less is now heard of new business on contract; the buyers who have stayed out of the market so far are disposed to be consistent in their attitude. June and July, they figure, will be a more favorable time for them than May.

Georges Creek and the Pennsylvania grades are also dull and aside from special orders there is only a small tonnage coming forward. The Central Pennsylvania labor troubles seem to be no nearer settlement, although in some quarters the mine-workers show an accommodating spirit and allow their employers to fill some of the more urgent orders that happen to come in.

Anthracite—April shipments were hardly as heavy as tidewater New England expected, and there is still a good volume of orders being carried over into May. With the larger shippers it will be well into June before spring orders are filled. The shortage of stove is steadily becoming a greater cause for worry on the part of dealers everywhere. In some cities this year the retail price of stove has been placed on a parity with chestnut, in the hope of diverting some of the popular demand for the former size.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.95@1.50	$1.20@1.65	$1.67@1.77	
Philadelphia*	2.20@2.75	2.45@2.90	2.92@3.02	
New York*	2.50@3.05	2.75@3.20	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.80@2.85
Boston†	.....	.....	.....	3.65@3.78
Providence†	.....	.....	.....	3.58@3.73

* F.o.b. †On cars.

NEW YORK

Surplus stocks of bituminous dwindling but the market continues heavy. Production still much curtailed. Anthracite at wholesale remains active but the dealer trade is slowing down with concessions on the circular obtainable on odd lots.

Bituminous—There is some indication that the large stocks accumulated in anticipation of curtailed mining are beginning to be exhausted, but no material benefits to the trade have been experienced yet. As a matter of fact, the situation is steadily becoming more flat. There is no business whatever being done in the prompt market, while cancellations or orders for restricted shipments on contracts, are still coming in. It is thought by some that the middle of the current month will see surplus stocks generally depleted to a point where more buyers will be forced into the market. A great deal of coal is still reported on demurrage, much of which is selling at sacrifice prices.

As a result of petty strikes, the absence of orders and the refusal of some of the miners to resume work, production is down to something less than half capacity. Negotiations on contracts for the new coal year have practically ceased for the time being. The nominal market continues on the following basis, with scarcely any business being done: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The customary spring activity prevails with the large hard-coal companies. Full time operations are the rule, while orders for April and May coal are in excess of the supply.

But in retail circles there is a different situation. The rail business continues moderately good, but the trade at tide is quiet, a distinct falling off being noticeable during the past week. Odd lots of domestic coal are selling at 10c. off the circular, with chestnut particularly hard to move. Dealers state that they cannot continue filling the bins of customers who already owe them money. Pea coal is offered at 25 to 30c. off the circular, with no demand even at these figures. There is no activity in the May buying, and the coal is going out very slowly, even April prices failing to stimulate business. The New York hard-coal market is quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.70		$4.65	
Egg	4.95	$4.85@4.95	4.90	$4.80@4.90
Stove	4.95	4.95	4.90	4.80@4.90
Chestnut	5.20	5.20	5.15	5.05@5.15
Pea	3.55	3.55@3.50	3.45@3.50	3.20@3.45
Buckwheat	2.80	2.75@2.80	2.50@2.75	2.30@2.75
Rice	2.30	2.30	2.00@2.25	1.75@2.25
Barley	1.80	1.75@1.80	1.70@1.75	1.30@1.70

PHILADELPHIA

Anthracite situation still favorable, with prospects good. Past month showed a better tonnage than corresponding period of last year. Steam sizes dull. No improvement in bituminous trade.

Anthracite—The tonnage moved the past month has been as large, if no larger, than any corresponding period. This is due to the fact that the cool weather has delayed the drawing of fires, and supplies were being laid in against the coming fall and winter. Orders for the domestic sizes still continue plentiful, and renewal of orders not shipped during April has been most satisfactory. The trade looks for a prosperous May, but are not inclined to be optimistic about the summer months.

The only noticeable falling off is in the steam sizes and pea coal. The latter is essentially a domestic article in this locality, and the demand up to the present time has about absorbed the production, owing to the cool weather, but inasmuch as higher temperatures will prevail from now on until fall, concessions—and liberal ones at that—will doubtless be made in order to create a market. It is understood that the large companies are beginning to stock all of the junior grades. In the large sizes, the demand seems to be centered on egg and stove. Stocks of the former are still being depleted to meet the market requisitions, but chestnut is inclined to drag. Large quantities of this size are now being sent to the Great Lakes terminals, for transshipment to the Northwest.

Prices at tidewater rule as follows:

	Circular	Individual
Broken	$4.35	$4.35 @ 4.45
Egg	4.60	4.60
Stove	4.60	4.70
Chestnut	4.85	4.85
Pea	3.25	

Bituminous—No improvement is noted in the soft-coal situation, but it is now so bad, that the turning point must be an improvement. Coal is being used, and as the stocks dwindle, buyers may be disposed to purchase at better figures, but the present situation does not seem to hold much hope in the immediate future. Many operators seem to be of the opinion that the central Pennsylvania district miners will finally compromise with a renewal of the wage scale of 1912, but there is nothing definite as yet. In the meantime, demand continues light, and prices on about a parity with the week previous.

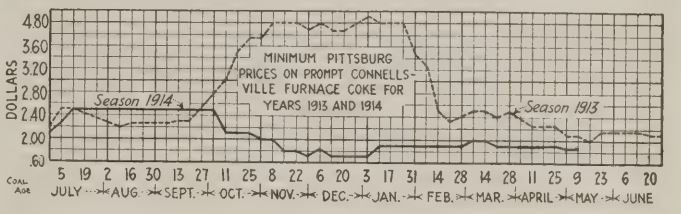
BALTIMORE

A dull, featureless week in the bituminous business, with prices shading off still farther. Late call for anthracite, due to the continued cool weather. Export figures show an increase.

The spot trade in bituminous has apparently disappeared for the time being, and curtailment on contracts continues to worry the trade. Despite the fact that the week saw the opening of shipments to the Lake ports, prices fell a little lower in some cases as a result of the poor demand. In West Virginia slack was a particularly weak feature, some forced sales being recorded at 50c., while three-quarter was bringing around 75 and 80c. In Pennsylvania, while the tendency was to hold the market at least to the dollar mark, some sales of low-grade fuels were made around 90c. Better coals commanded from $1.20 to $1.35.

A belated call for anthracite coal is taking place and is a somewhat confusing element, as this is the period usually devoted to buying for next season. Dealers report that more inquiries are now coming in for May and June delivery, and that the business as a whole looks healthy.

Export figures for April show a total of nearly 75,000 tons, a gain of about 10,000 tons over the month previous. It was a loss over April of 1913, due to abnormal shipments to take the place of English coals stopped by labor troubles in Great Britain.



CENTRAL STATES

PITTSBURGH

Coal production slightly increased, at about 40% of capacity for Pittsburgh district. Stocks not all liquidated and consumption low. Regular prices cut for prompt lots. Coke stagnant with prices weak, and production and shipments decreasing.

Bituminous—There has been a slight improvement in mining operations, and the Pittsburgh district as a whole is probably operating at 40% of its full normal capacity. The domestic demand is almost entirely absent. Manufacturing demand is light as there are still some stocks in the hands of consumers, while manufacturing activity is at a low ebb. In some well informed quarters it is estimated that the steel industry is not operating at over 50% of capacity, whereas early in March it was operating at about 75%. Conditions in the steel trade, in other words, are approximately as bad as they were last December before the short-lived revival took place.

There is little movement of lake coal, and it is hardly expected now that there will be much movement before July 1, as it is restricted both by the absence of demand and the small iron-ore movement. Little ore is likely to be bought for awhile and the ore movement is expected to be light for the first half of the season at least. Regular prices on coal are as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh. These prices are frequently shaded on prompt lots.

Connellsville Coke—Thus far there has been scarcely any demand for furnace coke for May, there being merely small purchases of prompt lots. The large operators are still quoting $2 on furnace-coke contracts, but it is recognized that there is hardly any chance of effecting sales at this figure, the small uncovered requirements being easily met by purchases of odd lots. We quote: Prompt furnace, $1.85@1.95; contract furnace, $2; prompt foundry, $2.35@2.50; contract foundry, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Apr. 25 at 313,757 tons, a decrease of 20,898 tons, and shipments at 310,209 tons, a decrease of 15,236 tons. Production exceeded shipments by 3548 tons.

BUFFALO

Trade still waiting for a reduction in the surplus accumulations; also the fixing of an agreement with the bituminous miners. Anthracite about as dull as bituminous and coke the same.

Bituminous—The supply in consumers' hands is still large and some selling interests are urging sales instead of waiting till the consumer begins to ask for more. There is not much coal being mined in the districts tributary to this market, some large operations being entirely idle and most others not working more than half time.

The consumers are naturally indifferent to the situation and all purchases are at reduced prices as a rule and not then till much of the coal has paid demurrage. The operating interest is quite aware of the chance it is taking in putting coal on the market under such conditions, but in many cases this is done on account of a desire to keep the miners together against any improvement that may develop. As a rule the trade does not look for any better prices but conditions may occur as was the case last summer.

As a rule the operators are looking after contracts and regular orders believing any attempt to urge new sales would prolong the congestion and keep prices down perhaps all summer. In fact many are of the opinion that there will be no stir in either consumption or price before fall, if then. There is still some coal sold at close to circular prices and sellers refuse to admit a further reduction in quotations which are as follows: Pittsburg lump, $2.80; three-quarter, $2.70; mine-run, $2.55; slack (still much stronger than sizes), $2.25. Allegheny Valley sizes are about 15 to 25c. lower, slack not reduced.

Coke—The demand for all grades of coke is as light as ever, but prices are regarded as at the bottom, for the ovens will as a rule close down on any further reduction. Quotations remain on the basis of $4.50 for best 72-hr. Connellsville foundry.

Anthracite—The continued scarcity of egg coal is the feature of this trade. Consumers are afraid that the mines are deliberately cutting down the production of this size, on account of the lower price. Never has April closed with so little clamor for coal but shipping agents generally appear to regard the situation with satisfaction as they have never been reconciled to the selling of the bulk of the coal in April and November.

Most of the larger companies have resumed loading into lake vessels, some of them having made considerable sales, as shipments to minor ports indicate. The indication, however, is that the season's movement will be much smaller than last year. The winter-loaded coal is now about all out of port, but the amount reported is not large, being only 76,000 tons for the week.

TOLEDO

Situation continues dull and quiet. Some vessels have cleared with coal for the Northwest, but even this trade is slow.

Market conditions have changed little, if any, during the past week, and there is small movement of coal. The railroads are showing some little uneasiness and indicating by inquiries that they may be in the market for coal at an early date but have as yet placed no orders.

There is considerable coal at the various docks held over because of the open winter, but the lake movement has begun. A number of vessels have cleared from Toledo and others are now loading. There is an immense amount of coal in the railroad yards in this city, and it is also stated that there was a great deal held over at the mines which is now making its appearance.

COLUMBUS

No progress in the wage agreement. Conferences in the various sub-districts will probably be arranged soon. Little demand for coal and loss due to suspension will be negligible.

The wage scale has not yet been settled and there are no immediate prospects for its adjustment. At the time of the adjournment a week ago, provisions were made for conferences in the sub-districts of the state but so far none of these have been held. Some preliminary steps were taken but the miners made such unreasonable demands that negotiations were discontinued. In the meantime all of the Ohio mines are closed and it will probably be another month before work will be resumed.

But Ohio operators are not losing a great deal of business because of the shut-down. In fact there is very little demand for either steam or domestic sizes and stocks in the hands of consumers are apparently sufficient for several months. There have been a few inquiries received which indicates a change, but these are not sufficient to cause any uneasiness. Some West Virginia coal is coming into the state but this is usually sold at low prices. In fact prices are too low to cause Ohio operators any apprehension over the business they are losing.

Steam business is slow and most of the steam users have ample stocks for some time to come. Railroads are not requiring any great amount of fuel since the freight movement is lax and many of the passenger trains have been taken off. Domestic trade is about over for the season and there will not be much doing in that department until after the stocking up period arrives. There is, however, some demand for the fancy grades of domestic lump such as Pocahontas and splints which are selling at fair prices. Not much is doing in lake trade although some West Virginia operators are going after the business and some coal has been loaded on boats for shipment to the Northwest.

Word has been received that all of the miners in the Kanawha district of West Virginia went on a strike May 1. Steps are also being taken by the Ohio miners to call a strike soon. This will not change the status of the miners so far as the negotiations with operators are concerned but will enable them to secure strike benefits which are impossible under a suspension.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.45@$1.35		$1.50@$1.40	$1.40@$1.35
¾-inch	1.30@ 1.25	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.25@ 1.20		1.30@ 1.25	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.15@ 1.10
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.75@ 0.70
Coarse slack	0.75@ 0.70	0.95@ 0.80	0.75@ 0.70	0.65@ 0.60

CINCINNATI

Local market still dull despite the labor situation in West Virginia and Ohio. The lake movement hampered by unusual transportation conditions. Smokeless market is sold up for some weeks ahead, but other lines are lifeless.

The rather remarkable state of the coal market can be attributed to a general continuation of slack business conditions. In view of the serious labor situation in West Virginia and Ohio, this has produced a condition full of complications and serious possibilities. The quietness in manufacturing lines has made the demand for steam coal extremely slow, so that even the present light production of screenings is more than required.

The same quiet has resulted in such a surplus of rolling stock on the railroads that many operators find they are unable to get cars moved on account of the sidings being choked with empties. This is especially true on the lines between West Virginia and the lake ports, due to the idleness in Ohio. The lake situation is especially irritating at this time, inasmuch as the shipping season should be in full swing; there are few bottoms available, and many of these cannot be loaded because the operators cannot get coal through.

If the strike in the Kanawha district gets much beyond the incipient stage things should improve materially, as this will undoubtedly cause a decided shortage. The general opinion seems to be, however, that the trouble will be settled, in which case the market may have to await better business among the manufacturers before it experiences any improvement. Contracts for steam fuel are well closed up at the usual figures, 85 to 90c., but orders to cease shipments are now the rule.

DETROIT

Market generally dull, but surplus tonnages are being cleaned up. Some improvement anticipated soon. Anthracite moving freely.

Bituminous—No change is noticeable in the local situation and coal on track seems to be reduced if anything. Contracting for the new year continues on the same basis as last season. The steam market is generally dull just now, but the outlook is more promising. There is no demand whatever for domestic fuel except Pocahontas, egg and lump, which are moving rather freely at the circular. It is thought that the next week will see the surplus fuel well cleaned up, and with a better demand, prices will firm up at the fall circular.

Anthracite—Unusually heavy shipments are the rule in anthracite, but orders are not coming in as freely as expected. However, a better movement is anticipated.

Coke—The outlook in coke continues discouraging, the past week having been one of the dullest of late. Connellsville coke is selling at $2.55 with Semet Solvay at $2 and Gas House at $2.75, f.o.b. ovens.

HAMPTON ROADS

Large shipments both foreign and coastwise. Several inquiries in the market, but no large amount of spot coal reported sold. Good dumpings during the week.

The movement from Hampton Roads for the week has been good, leaving only an average number of cars in the local yards. Several inquiries for large quantities have been made, but no extra large amount of coal is reported sold. Some small cargoes of spot coal have been moved at practically circular prices.

Foreign shipments for the week have been to Dakar, Havana, Venice, Naples, Geona, Para, Kingston and Canal Zone. In addition to coastwise and foreign shipment the government has taken some coal for Key West.

The total dumpings of the three railways at Hampton Roads during the month of April amounted to 1,063,719 tons, of which the Norfolk & Western dumped 535,032 tons, the Chesapeake & Ohio Ry. 267,269 and the Virginian Ry. 261,418. It will be seen from these figures that the dumpings of the Norfolk & Western amounted to over 6000 tons more than those of the other two roads combined. Although there was a general complaint during April of poor movement, these figures indicate good shipments.

LOUISVILLE

Southeastern Kentucky mines working exceptionally well, but situation generally, dull and quiet. Some contracting at less than last year's figures.

Few changes in the local market, prices remaining about at the same level, except that there has been a drop of 25c. in retail quotations on domestic sizes, usual, however, at this time of year. Business generally is slow to poor with the manufacturers and the railroads taking little coal of any kind. There has been no change in the labor situation, another futile conference between the operators and the miners' representatives of the western Kentucky field having been held in Louisville.

Nut and slack and the various steam sizes are plentiful in spite of the lack of stocks of domestic sizes. This is more true in the Eastern field than in the Western. In the former contracts are being renewed at an average reduction of from 5 to 10c. a ton. In western Kentucky nut and slack, and pea and slack are scarcer, but there are no orders. These mines are being worked on short time, some only one day a week and others as much as three.

Prices at the mines range from 45 to 65c for pea and slack or nut and slack in western Kentucky, to 60 to 75c. for the best grades of these sizes in eastern Kentucky, with the poor qualities priced at 40 to 50c. Eastern Kentucky block coal ranges from $1.30 to $1.80 with the average around $1.50 a ton.

SOUTHERN AND MIDDLE-WESTERN

INDIANAPOLIS

More mines open, due to storage stocks being exhausted. Railroads still have coal and until they resume buying, screenings will continue scarce. Higher-priced Indiana grades likely to benefit from the more disturbed condition in adjoining states.

The large consumers who stocked up for thirty days are in the market again for coal and mines are gradually resuming operations. The railroads are apparently within two weeks of exhaustion of surplus supplies and are beginning to make inquiries and contracts so that about half the Indiana mines have opened again. All grades of coal are in ample supply except slack, for which premiums of 20 to 30c. a ton are obtainable. At the present rate of improvement in demand, all the state mines should be again in operation by June 1.

Retail dealers unexpectedly put their summer schedule into effect May 1. Perhaps the fact that Indiana miners decided not to strike has had something to do with the dealers' changed attitude. They say that the lower prices now in effect are good only for sixty days, instead of until fall, as is customary. Indiana operators and selling agents of Eastern bituminous mines say a long list of mines could be named that would be glad to have some spring orders.

If Illinois miners decide to strike and the conditions continue in Ohio as they are, Indiana mines see busy times ahead in about two weeks. The new retail prices in Indianapolis are:

Anthracite, chestnut	$7.75	Hocking Valley lump	$4.00
Anthracite, stove and egg	7.50	Luhrig lump	4.00
Anthracite, grate	7.25	Luhrig washed egg	4.25
Pocahontas, forked lump	5.50	Cannel	6.00
Pocahontas, shoveled lump	5.00	Linton No. 4 lump	3.00
Pocahontas, mine run	4.00	Linton No. 4 egg	3.00
Pocahontas, nut and slack	3.50	Indiana washed egg	3.25
Blossburg	5.50	Brazil block	4.00
Jackson (Ohio)	4.75	Indianapolis lump coke	6.50
Kanawha lump	4.00	Indianapolis crushed coke	6.50
Kanawha, egg and nut	4.00	Connellsville lump	6.00
Pittsburgh lump	4.00	Citizens egg coke	5.50
Raymond lump	4.00	Citizens nut coke	5.50
Winifred lump	4.00		

CHICAGO

Railroads reported down to near the end of their storage supplies. Some inquiries already noted and more anticipated shortly if the labor situation does not clear up. Prompt market still comparatively dull.

The Chicago market is decidedly unsettled. The large consumers are down to about the last of their storage coal and the demand for new stock is expected shortly. Queries for coal from large consumers have been very few.

It is expected that many steam coal buyers who stocked up extensively for April will have sufficient to run well into the present month, the consumption being smaller than was anticipated but a number of railroads will be obliged to come into the market shortly. The purchase by the Wabash railroad of 25,000 tons of coal for early delivery has stimulated the spot market. The Wabash did not buy very extensively in March. The Pennsylvania and the New York Central roads are expected to need a large supply, while other Illinois roads are facing the exhaustion of their storage piles at no far distant date.

Screenings have eased off to $1 as compared with $1.10 to $1.15 a week ago. It is expected that the price will recede to about 85 or 90c. when the mines resume operations again. Conditions in the anthracite market have been dull. The retailers are buying slowly as the result of a money shortage, it is believed. There have been few purchases for storage for next winter and the current demand is small.

A few Pocahontas coal contracts have been closed up at prices arranged some time ago, and conditions in this coal are generally dull. There are few contract shipments and spot buying has practically stopped, with consignment coal selling as low as $1 a ton in order to move it. With little coke being consumed the market is very quiet.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.30@2.40	$2.12	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.65
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.65@1.87	1.95@2.05	1.67@1.87	

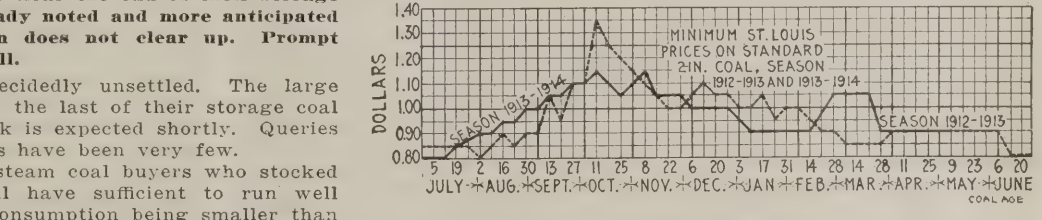
Coke—Connellsville and Wise County, $5 and $5.25; by-product egg, stove and nut, $4.45; gas house, $4.25.

ST. LOUIS

An agreement nearly reached in some fields but operators as a rule are showing no anxiety to resume operations. Long idleness beginning to tell on the miners.

A little more anxiety as to the future has developed during the past week. The early part of the week conditions at Peoria looked favorable for a settlement between the Illinois operators and the miners, regarding their wage scale. The insistence on the part of the miners that the differential of 4c. a ton between the Standard and the Carterville field be equalized was apparently the only point at issue. The Carterville and southern Illinois producers refuse to concede this and as there is no demand for coal the operators of both fields are indifferent about working.

On the other hand, the miners for the most part are getting to that point where hunger is not far distant. At several mines in the 5th and 9th District, the miners' locals voted not to continue work any further during the past week, believing that as long as coal is mined the operators will hold out in the Peoria Conference. A few mines continue to work a couple of days a week in the Carterville field, but there is no demand for coal, with the exception of the finer sizes for steam purposes and possibly Nos. 1 and 2 nut for domestic.



The end of the month saw a good volume of anthracite move in at the April figure, but deliveries seem slow and not much is expected until the latter part of this month or the early part of June.

The St. Louis circular is as follows:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	.....	$1.20	$0.90 @ 1.00	$1.15
3-in. lump	.....	.....	1.25	.....	.....
6-in. lump	$1.25 @ 1.40	.....	1.35	1.20 @ 1.80	1.35
Lump and egg	1.85 @ 2.15	$2.25	.....	.....	1.15
No. 1 nut	1.35 @ 1.50	.....	.....	.....	.....
Screenings	0.85 @ 1.00	.....	.....	0.65 @ 0.70	0.75 @ 0.80
Mine-run	1.10 @ 1.20	.....	.....	0.80 @ 0.85	.....
No. 1 washed nut	1.50 @ 1.60	2.25	1.50	.....	.....
No. 2 washed nut	1.25 @ 1.35	.....	1.25	.....	.....
No. 3 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 4 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 5 washed nut	0.80 @ 0.85	.....	.....	.....	.....

Anthracite—The wholesale May circular on hard coal is: Chestnut, $7.15 egg and stove, $6.90; grate, $6.65. The May retail circular is: Chestnut, $8.10; egg and stove, $7.85; grate, $7.60.

Coke—Coke is quoted at $4@4.25 at wholesale and $5.25@5.50 retail.

KANSAS CITY

Steam grades fair, but domestics weak. Some concessions offered, but the market is fairly steady as a whole.

Demand for coal in the Southwest is quiet with the attention of operators concentrated on labor conditions rather than movement of coal. Steam lines are moving well, but are not unusually good. On the other hand, lump is slow and is causing operators much anxiety. The market has been generally steady at summer quotations. It is reported in some quarters that prices are being cut in order to secure business, but the trade is at its normal strength, considering the season.

PORTLAND, ORE.

Summer prices go into effect, making a reduction of 50c. per ton in lots above five tons. Bunker rates still up for consideration with the railroads.

It was announced here this week that summer rates on coal will be in effect at once, meaning a reduction of 50c. per ton. Some of the dealers are beginning to take business in bulk instead of in sacks, giving the consumer a concession of $1 per ton. It is believed that this method of delivery will be regarded as the most satisfactory.

The mine strike in Colorado has not affected conditions here and it is thought no effect will be felt as this district buys no coal from Colorado at present. But should other districts which depend upon the Colorado product for their supplies, start using the Montana, Wyoming and Utah coals, it may create a scarcity of these.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is statement of coal and coke tonnage moved over this system and affiliated lines during March and the first three months of this year and last year:

	March		Three Months	
	1914	1913	1914	1913
Coal	3,173,972	2,538,039	8,477,049	8,091,860
Coke	356,164	405,220	896,499	1,215,751
Total	3,530,136	2,943,259	9,373,548	9,307,611

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for March and the three months of 1913 and 1914, in short tons:

	March		Three Months	
	1914	1913	1914	1913
Anthracite	1,086,344	741,209	2,706,391	2,743,504
Bituminous	4,740,313	4,050,247	12,414,492	12,117,747
Coke	1,027,339	1,247,451	2,700,237	3,756,325
Total	6,853,996	6,038,907	17,821,120	18,617,576

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for February, 1913-14, and for the eight months ending February, 1912-13-14, in long tons:

	8 Months		February	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	5,861	7,355	8,460	137	3,547
Canada	625,238	954,363	654,641	110,401	75,570
Japan	7,307	42,217	81,476	12,213	7,170
Australia and Tasmania	149,396	107,917	172,127	8,709	30,843
Other countries	1,444	3,257	2,010	2,809	43

Bunker coal	4,453,131	4,794,941	5,110,588	564,252	535,529

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for February and the eight months ending Feb. 28, 1912 and 13, in short tons:

	February				Eight Months			
Destination	1914	%	1913	%	1914	%	1913	%
Tidewater	240,689	21	323,469	24	2,264,182	19	2,391,580	22
East	190,530	16	220,991	17	1,745,564	15	1,739,698	16
West	663,868	58	671,742	51	7,232,229	60	6,109,197	57
Total	1,095,082		1,216,202		11,241,975		10,240,466	
From Connections								
Bituminous	55,494	5	88,546	7	727,218	6	423,111	4
Anthracite	1,063		1,480	1	10,476		8,829	1
Total	1,151,639	100	1,306,228	100	11,979,669	100	10,672,406	100
Coke	34,194		29,643		251,447		195,343	

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for November and the first eleven months of the years 1912 and 1913:

State	November		Eleven Months	
	1912	1913	1912	1913
Missouri	293,360	290,958	2,731,523	2,658,393
Kansas	489,387	571,165	4,641,892	5,241,322
Arkansas	203,295	187,703	1,782,800	1,804,183
Oklahoma	334,818	346,064	2,719,096	3,210,114
Totals	1,320,860	1,395,890	11,875,311	12,914,012

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

COAL FREIGHT DECISIONS

I. C. C. No. 4894—Rogers & Prinkey vs. Baltimore & Ohio R.R.

Basis proposed by Baltimore & Ohio Railroad for construction of joint through rates on coal from mines on the line of the Indian Creek Valley Railway Co., which basis makes rates 10c. per ton higher from these mines than from mines in the Meyersdale group on the Baltimore & Ohio Railroad, not found to be unreasonable or unjustly discriminatory.

FOREIGN MARKETS

GREAT BRITAIN

Apr. 24—The market is firm for prompt deliveries. Buyers are holding back forward orders in the hope of obtaining reductions. Quotations are approximately as follows:

Best Welsh steam	$4.56	Best Monmouthshires	$4.11
Best seconds	4.38	Seconds	3.96
Seconds	4.20	Best Cardiff smalls	2.82
Best dry coals	4.20	Seconds	2.64

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry, $5.28@5.52; furnace, $4.08@4.56.

British Exports—The following is a comparative statement of British exports for March and the three months of the last three years, in long tons:

	March		3 Months		
	1913	1914	1912	1913	1914
Anthracite	216,151	201,899	558,004	701,516	721,987
Steam	4,144,761	4,294,733	9,046,223	12,609,068	12,712,882
Gas	833,547	1,002,414	1,938,998	2,610,246	2,771,197
Household	141,867	119,887	299,234	435,454	377,249
Other sorts	262,448	290,789	630,613	882,725	847,054
Total	5,598,774	5,909,722	12,473,072	17,239,009	17,430,369
Coke	76,340	82,898	277,123	282,180	301,749
Manufactured fuel	156,210	178,100	373,332	507,202	502,181
Grand total	5,831,324	6,170,720	13,123,527	18,028,401	18,234,299
Bunker coal	1,654,142	1,689,304		4,951,231	5,035,448

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending May 2:

	Week's Range			Year's Range

A Barsteel Gathering Locomotive
That Will Operate in a 29-Inch Clearance

Here is an illustration of a Baldwin-Westinghouse Barsteel electric gathering locomotive that operates successfully in a clearance of twenty-nine inches—36 inches was heretofore considered about the limit for locomotives.

Great care has been exercised in keeping the overall height to a minimum, as is shown in the general construction of the locomotive and the location of the reel.

There is not a projection above the top of the frame anywhere and ample room has been provided to permit the operator to crouch upon his seat.

The reel is driven by an independent motor contained inside the reel drum. This motor is in effect an electrical spring. It tends to wind the cable up and its turning force acts as a brake and keeps the cable taut when the locomotive enters the room and promptly takes up all slack when the locomotive returns.

With this type of reel there is easy access to the locomotive motors, because of its being located out of the way on the rear of the frame. The armature of the reel motor can be readily removed for inspection and overhauling.

Locomotives of this type have successfully solved the problem of gathering in very low rooms. Our specialists in mine haulage, who make a careful study of various mining problems will be glad to assist you in selecting the proper equipment for your mines.

Get in touch with them by writing to either company.

The Measure of Success

The Weekly Ad-Talk Page

"THE SUCCESS of any technical paper" said a man, who knew what he was talking about, the other day, "depends upon the *intelligence* put into its advertising pages."

Do you "get" that, Mr. Reader? "The *intelligence* put into the advertising pages."

"Intelligence" does not mean trickery and "hot air" in inducing manufacturers to spend money in the advertising pages.

It means a complete comprehension of the needs and opportunities of the paper's field, persistence and commonsense in inducing the advertiser to fill his advertisement with real information, to leave exaggeration alone, to make it possible for the reader actually to believe what he reads in the advertisements.

This is the "intelligence" that spells the success or failure of a technical paper. That is the intelligence you are getting, week by week, in COAL AGE.

It should interest the reader to know that while there are just four men soliciting "space" for COAL AGE there are 16 men who devote their time to helping the advertiser put this "*intelligence*" into the advertising.

The ads in COAL AGE ***are*** *worth reading*!

The Two Spirits

By Berton Braley

Written expressly for Coal Age

Two spirits waited at Heaven's gate
And one was confident, smug, sedate,
The other was weary and labor-bowed,
Mighty shouldered and blackly browed,
And the cultured spirit drew away
With a glance at the other's rough array.

"Speak up, you spirits," St. Peter cried,
"And tell me why you would step inside."
"Sire," said the polished one, "Let me in,
A golden crown I am fit to win,
For the world has always known of me
As a splendid giver to charity,
A leader of uplift, near and far,
So let me in where the good souls are."

"I'm wise," said Peter, "You got your rents
From rotten houses and tenements,
Then thought to cheat your God, good lack!
By giving some of the money back.
You gave your gold—on a wholesale plan,
But did you ever, your whole life's span,
Help some poor devil—as man to man?
Did you ever toil, did you ever learn
What a dollar means that you have to *earn*?"

The head of the cultured soul hung low,
And meekly and faintly he answered, "No."

"You're sort of a useless thing, my lad,
But I reckon your bringing up was bad,
So I'll send you back to the earth once more
Don't putter around as you did before,
But get in the rough world's work and strife
And learn the joy and the pain of life,
And play and work with your fellow men
—And after awhile you can call again!"

To the other spirit St. Peter said,
"What did you do in the life you led?"

"Just dug the coal," was the soul's reply,
St. Peter viewed him with kindling eye,
"What else?"—
"Why nothing," returned the soul,
"Nothing important—just digging coal."

"Nothing important, just digging coal!"
St. Peter laughed at the puzzled soul,
"Just digging coal—to make the steam
Which makes a fact of the dreamer's dream,
Just digging coal—whose power has hurled
Man's mightiest engines round the world,
Just digging coal, whose white hot glare
Beats back the winter's bitter air,
Just digging coal!—oh friend of Man,
Come in and join the Heavenly clan,
You did your work nor shirked nor swerved,
And Heaven is made—*for those who served*!

Remodeling an Old Mine

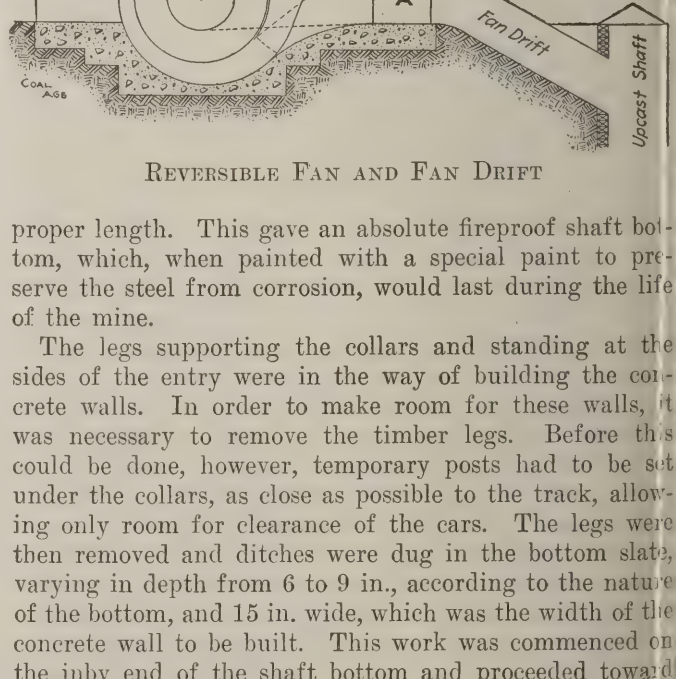
By John E. Ambrose

SYNOPSIS—The need of both increased capacity of the ventilator and the ability to reverse the current. Description of method used to replace old timbers with steel I-beams without interruption of the operation of the mine.

Some time ago, it was my fortune to have charge of the work of remodeling a shaft sunk to the Pittsburgh seam, for the Federal Coal & Coke Co. This shaft is located at Grant Town, on a branch line of the Baltimore & Ohio R.R., about 11 miles from Fairmont, W. Va. Upon a change of management, it was decided to make a number of improvements, both in the equipment of the mine and the arrangement of the underground workings.

The Ventilating System

The ventilation of the mine, up to that time, had been produced by an exhaust fan located at the mouth of the airshaft but set a short distance back from the top of the shaft, with which it was connected by a fan drift constructed of sheet steel. This ventilator produced good results, but the later development of the mine would require a larger quantity of air in circulation, which would be beyond the capacity of the fan to produce. Moreover, since the mine generated gas, it was decided that a reversible fan was needed that would throw a larger quantity of air under a low water gage. The fan chosen for this purpose was a Robinson fan of the reversible type.



The general arrangement of the fan drift and its connection with the upcast shaft is shown in the accompanying figure. The air current coming up the shaft and entering the fan drift is divided by the doors *A A*, so that half the current enters each side of the fan. These doors can be swung into the position indicated by the dotted lines *B B* when it is desired to operate the fan on the blowing system. It is then also necessary to open other doors in the side of the fan drift, to admit the free outside air to the fan, and to close the door that permits the fan to discharge the air into the chimney, instead of which the air passes from the fan into the fan drift and thence into the mine. By this means, the fan can be converted at once from an exhaust fan into a blower. The last doors mentioned are not shown in the figure.

The walls and floor of the fan drift were constructed of concrete; and, as shown in the figure, this drift was carried down on an angle of about 30 deg. and intersected the shaft 10 ft. below the surface. The foundation of the concrete walls were 18 in. thick, but these were carried up with a thickness of 12 in. above the ground line. The roof was constructed of 30-lb. steel rails laid across the top of the sidewalls and covered with concrete reinforced with ¾-in. round iron and steel wire netting. The fan drift was 10x10 ft., giving a sectional area of 100 sq.ft.

Plan of Conducting the Work

It is not intended, here, to give a full description of the details of this work. Before remodeling, the shaft bottom was timbered with 12x14-in. oak timbers, 25 ft. long, the collars being supported on legs, on each side of the entry, at a height of 5½ to 6 ft. above the rail. The timber sets were generally put in on 3-ft. centers, but close to the shaft the frames were set "skin to skin." It became necessary to remodel the shaft bottom, because many of the timbers contained dry rot that caused them to break in the middle. More room was also required for the handling of the necessary supplies.

It was decided to replace the oak timbers with 12-in. I-beams, having 8-in. flange faces, the thickness of the central web being 0.35 in. These beams were to be set on sidewalls of concrete at such height as to give 7 ft. headroom or clearance above the rail. A short distance from the shaft, the roof slanted upward until it attained a height of 13 ft., at the shaft. The purpose of this was to expedite the handling of the heavy 40-lb. rails used on the haulage roads and to enable these to be loaded on trucks directly from the shaft. The I-beams supporting the roof were to be lagged with 20-lb. steel rails cut to the proper length. This gave an absolute fireproof shaft bottom, which, when painted with a special paint to preserve the steel from corrosion, would last during the life of the mine.

Reversible Fan and Fan Drift

The legs supporting the collars and standing at the sides of the entry were in the way of building the concrete walls. In order to make room for these walls, it was necessary to remove the timber legs. Before this could be done, however, temporary posts had to be set under the collars, as close as possible to the track, allowing only room for clearance of the cars. The legs were then removed and ditches were dug in the bottom slate, varying in depth from 6 to 9 in., according to the nature of the bottom, and 15 in. wide, which was the width of the concrete wall to be built. This work was commenced on the inby end of the shaft bottom and proceeded toward the shaft. As quickly as a few legs were removed, the ditches were dug on both sides, the necessary forms constructed and concreting commenced.

Two gangs of men were kept busy, one standing the temporary posts and removing the old legs from the side of the entry, and the other digging the ditches, building the forms and filling them with concrete. While the work was in progress, about one-third of the length of the shaft

bottom was thus supported on temporary posts and the hoisting of coal was not interrupted. When the timber gang had reached a point close to the shaft, they were brought back and began the work of removing the old collars and replacing them with the steel I-beams. This work was difficult, as anyone experienced in retimbering mine passageways will realize. Great caution was necessary in order to prevent a fall of roof that would block the entries and delay the hoisting of coal.

At a point about halfway from the shaft, it became necessary to saw off the ends of the collars, in order to provide the necessary height of the sidewall to give 7 ft. of headroom above the rails in the completed entry. Again, at a point about 15 ft. from the shaft, the walls had to be run up on an angle of about 28 deg., to make the 13 ft. of headroom at the shaft, as previously mentioned. To do this, it was necessary to take down 6 ft. of toprock, which proved a tedious operation, inasmuch as some of the roof was loose and it was impossible to set posts to secure it properly, as the concrete walls had to be built before the steel I-beams could be put in place. It was also necessary to keep all the tracks clear.

Electricity in Coal Mining

By David R. Shearer*

SYNOPSIS—This is the first article of the series and deals with the calculations employed in direct-current work. The formula used is explained by examples.

It is presumed that the reader is acquainted with the fundamentals of direct or continuous current, but a brief outline of the characteristic features will be here given.

A direct current of electricity may be compared to the steady flow of a stream of water in a pipeline and in the same manner, electrical action may be compared, for clearness of conception, to hydraulic phenomena as follows:

The pressure of the supply of electricity is measured in volts and can be compared to the pressure in pounds per square inch in a water or steam pipe. Thus, we say a generator works at a pressure of 250 volts just as we would speak of a boiler working at 80 lb. As an example, the electrical pressure or voltage of an ordinary dry cell is 1.5 volts, of a storage cell 2 volts, of the standard lighting circuit 110 volts and of the usual mine supply system 250 volts, although in some of the older installations a pressure of 500 volts is still used.

The flow of an electrical current or quantity per unit of time is measured in amperes and may be compared to the flow of a stream of water in gallons per minute.

Resistance is measured in ohms and may be compared to the friction of the waterpipe restricting flow.

Certain dependent relations may also be compared hydraulically, for instance, the higher the voltage, the greater will be the flow of current through a given wire, just as more water will flow through a given pipe, if the pressure is raised; also, just as the friction on a pipe increases in proportion to the length and varies in inverse proportion to the cross section, so the resistance of a wire increases directly with the length and inversely with its cross-sectional area.

The Law of the Electric Circuit

The fundamental law of the electric circuit known as Ohms law is: $I = \frac{E}{R}$. Where I = current in amperes, E = electrical pressure or voltage and R = resistance measured in ohms. This formula or law may be transposed to other forms, viz.: $IR = E$, $R = \frac{E}{I}$.

The power of the circuit is IE in watts and as the watt or $^1/_{746}$ horsepower (hp.) is an extremely small unit, the kilowatt (kw.) or 1000 watts is more generally used in rating power installations. Now, as 746 watts = 1 hp. and 1000 watts = 1 kw., then 1 kw. = 1.34 hp. nearly. As an example, what is the theoretical horsepower of a motor requiring 14 amperes at 110 volts?

Solution: $hp. = \frac{I \times E}{746} = \frac{14 \times 110}{746} = 2.06$

A definite amount of power is always lost in forcing the current through any conductor, this loss, of course, being proportional to the resistance of the circuit. This is usually known as voltage drop or lost volts and the actual power or wattage thus dissipated is easily computed. Example: The resistance of a line of wire is 2 ohms, the voltage at the sending end is 110 and the current forced through the wire is 5 amperes. What is the voltage drop at the receiving end and the power lost in the line?

Solution:

$I = \frac{E}{R}$ or $E = IR$ $\qquad E = 5 \times 2 = 10$ *volts lost*

$110 - 10 = 100 =$ *voltage at receiving end.*

Power lost $= I \times E = 5 \times 10 = 50$ *watts* $= {}^1/_{14}$ *hp.*

By substitution in watts lost

$I \times I \times R =$ *watts lost or* I^2R

In calculating actual mechanical power produced by an electric current of given voltage, we must further consider another factor, the efficiency of the generator or motor. This means that there is some loss in converting mechanical energy into electricity and *vice versa*. The efficiency is usually written as a decimal or in percentage. Example: The efficiency of the generator is 80% or 0.8, how much current will be produced at 110 volts by a 10-hp. engine driving the generator?

Solution:

10 *hp.* = 7460 *watts theoretical hp. produced*

$7460 \times 0.8 =$ *actual electrical hp. produced*

$= 5968$ *watts*

*Knoxville, Tenn.

[Note—Many good engineering handbooks are to be found dealing with the details of electrical construction; however, there is a considerable demand for information concerning the application of electricity to coal-mining work. With the idea of somewhat filling this want, Mr. Shearer has compiled some valuable data on electrical engineering as applied to coal mining, and a large part of this material will be published in succeeding issues of "Coal Age." Later, the complete text of the articles will be issued in book form by the McGraw-Hill Book Co., of New York.—Editor.]

The Friedrich Heinrich Colliery at Lintfort, Germany

By P. Büssing

SYNOPSIS—A recent German development, embodying many features not found in American plants.

The very recent opening of this German mine, 1913, makes the particulars of its development of unusual interest. The property covers about 11,000 acres and is situated in the northern extremity of the Rhine Province, not far from the well known Krupp Works, at Essen. As the mine is unusually wet, the two shafts, 20 ft. in diameter each, were sunk by the freezing process. Operations were begun in July, 1907, and the mine was ready to be worked in February, 1913.

At present, the drainage water is removed by an electrically operated unit, consisting of two centrifugal pumps of five stages each, directly driven by an intermediate motor and designed to handle 1000 gal. per min. over a 1900-ft. lift. The motor develops 900 hp. at 1480 revolutions. The low-pressure pump rings are of cast iron, the high-pressure ones, of steel. Each ring is cast in one piece with inlet and outlet.

The Surface Plant Is Particularly Interesting

The plant above ground is of especial interest, embodying the latest German engineering practice for the comfort and convenience of the workmen, as well as for the most economical operation, due regard being had for the future and for general appearance as well. Care was taken to design all the buildings in one style, so that each forms a harmonious unit of the whole plan. The Administration Building and the homes of the manager and his staff are on the west side of Friedrich Heinrich Ave. The mining plant and all its buildings are on the opposite eastern side (see Fig. 1).

The offices for the foremen and timekeepers are in the same building as the baths, the former being arranged around three sides of an open light court (see Fig. 2);

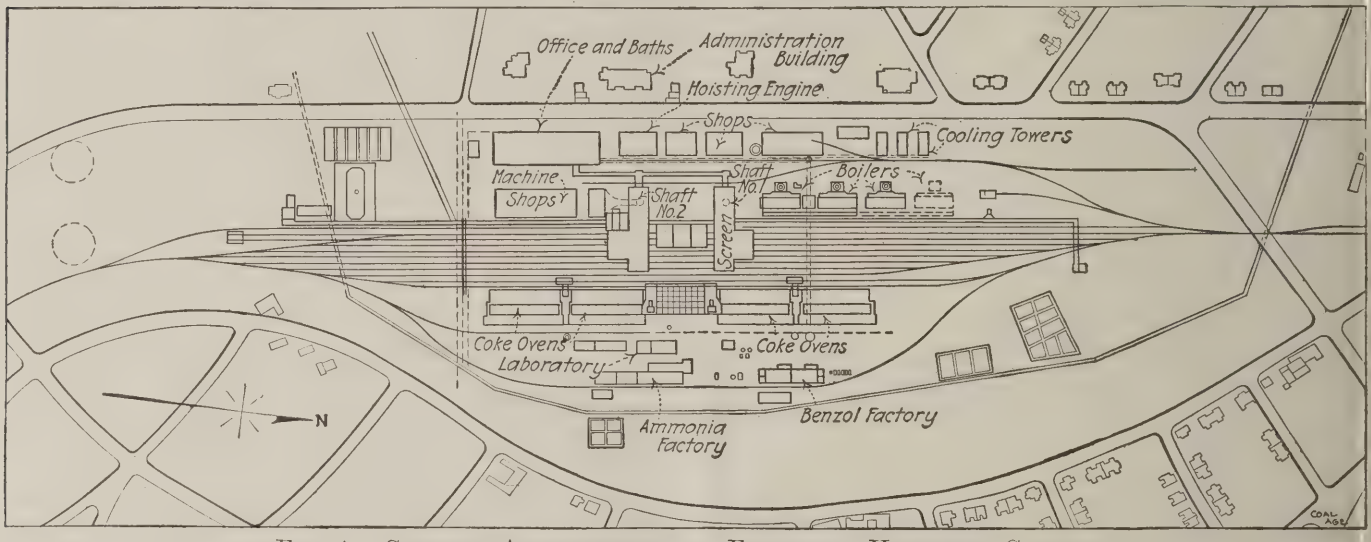


Fig. 1. Surface Arrangement at Friedrich Heinrich Colliery

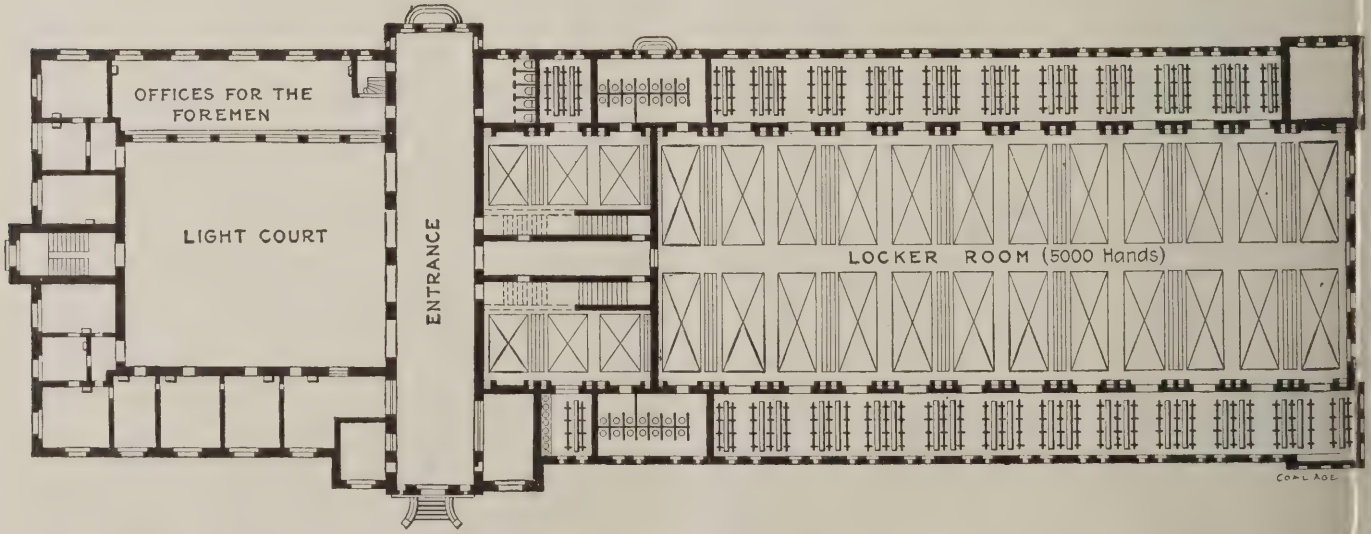

Fig. 2. Ground Plan of Offices and Baths

Note—Translated and abstracted from series of articles appearing in the Feb. 7, 14 and 21 issues of "Glückauf."

the bathing arrangements taking the rest of the floor. The baths for the management are on the upper story. The locker room is large enough for a payroll of 5000 men and occupies the center, while the showers and toilet rooms are on both sides. The men in charge of the baths are stationed on a platform, from which all the rooms can be overseen and on which the valves for the heating system, as well as for the hot and cold water, are located.

The entire building is heated by a hot-water exhaust-steam system.

In Fig. 3 is shown, on a larger scale, the arrangement of the shafts, hoisting engines, store house, power house, etc. In the store house, in addition to the oils, supplies and machine repair parts, is a garage for an electric ambulance, a doctor's office and an emergency room. The location of the shops is clearly shown in Fig. 1.

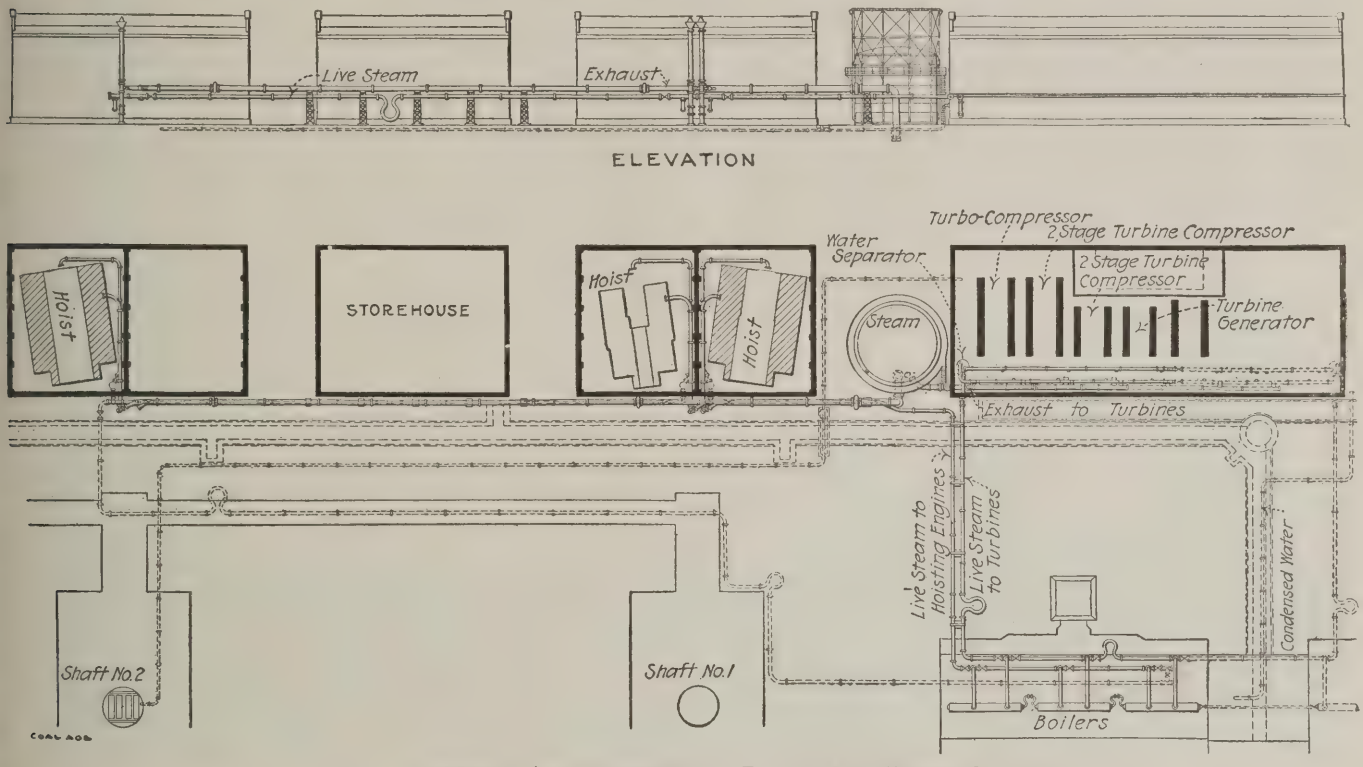

FIG. 3. GENERAL ARRANGEMENT OF PLANT AND STEAM PIPING

Above the baths is the lamp room, from which covered bridgeways lead to the shafts. The entrance to and exit from the shafts are separated completely, so that the workmen never interfere with each other on going to and from the mine.

Under the offices, in the basement, is a steam laundry, an eating room for the miners and day laborers, a bar for the sale of milk and nonalcoholic drinks, a bicycle room and a room for instruction in life-saving work.

THE POWER SYSTEM IS INTERESTING

The power system is as follows: There are three hoisting engines, two for shaft I and one for shaft II, all alike in design (see Fig. 4), using superheated steam at 572 deg. to 662 deg. F. and 190 to 200 lb. pressure. They have a capacity for handling 11,000 lb. at a depth of 1500 to 2400 ft., at the rate of 65 ft. per second. The steam from the hoisting engines exhausts into a receiver

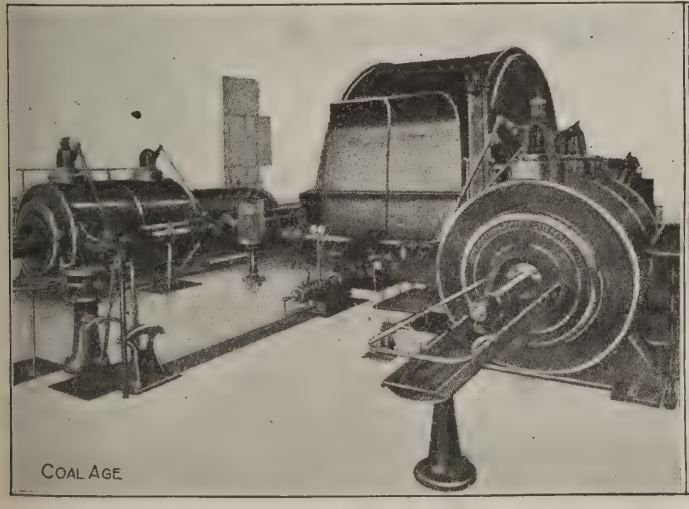

FIG. 4. HOISTING ENGINE FOR SHAFTS

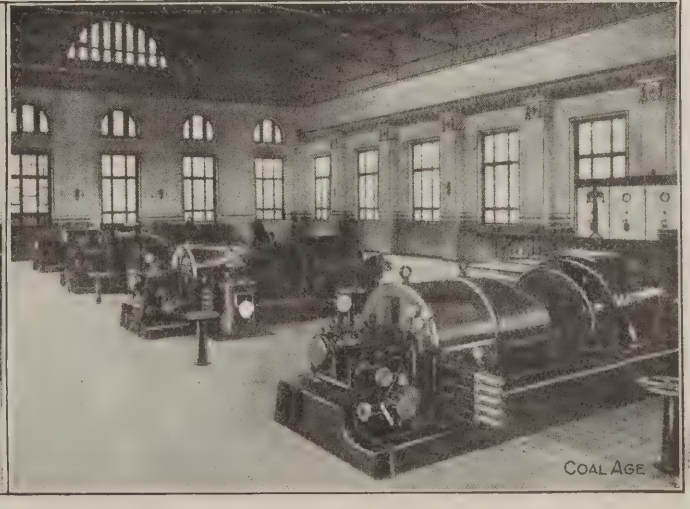

FIG. 5. INTERIOR OF CENTRAL POWER HOUSE

(see plan and elevation, Fig. 3), which resembles and operates like a gas holder.

In the central power house (see Fig. 5), direct-drive turbines are used exclusively, for both the electrical and the compressed-air systems. The cut shows two turbine compressors and two turbine generators. Each machine has a surface condenser directly under it, in the basement, and each condenser has its own pumping system. The two units in the foreground of Fig. 5 are turbine generators, the other pair are the air compressors.

The turbine for the two-stage centrifugal compressor, under normal conditions, takes steam from the receiver at a pressure of about 15 lb., absolute. The generator turbine is of the same general design. Each turbine consists of a high-pressure part, which acts as a velocity wheel, and a low-pressure end operating by reaction, the thrust being equalized by a piston.

FIG. 6. SHAFT TRESTLES, WASHING AND SCREEN PLANTS

FIG. 7. VIEW OF COKING PLANT, SHOWING OVENS AND COKE YARD

The other two turbines are for reserve and are designed for superheated steam at 140 lb. pressure and 572 deg. F. Should the steam supply in the low-pressure holder run short, so that there is danger of the receiver being connected with the condensing apparatus and collapsing, live steam is admitted automatically. Moreover, the turbines can be driven by a mixture of live and exhaust steam. The rating of the turbo-generators is 1000 kw. each, and they operate at 3000 r.p.m. The duty of the turbine air compressor is 675 cu.ft. per min. to 90 lb. pressure.

In Fig. 6 we have a view of the trestle work of the two shafts, washery and screen. The daily output is 5000 tons, of which 4000 tons pass through a 3-in. mesh and are sent to the washery.

There are in operation 180 coke ovens with 60 more under construction (see Fig. 7). The chief byproducts are tar, ammonia and benzol. The total outlay of the company to date has been about $9,000,000.

Portable Electric Lamps

The Bureau of Mines has just issued Schedule 6, "Procedure for Establishing a List of Permissible Portable Electric Mine Lamps." This schedule sets forth the character of the tests and the conditions under which they will be made, together with the fees that will be charged for testing the lamps. It is the purpose of these tests to establish a list of portable electric lamps that are suitable in all respects for the unusual requirements of mine service. All lamps that pass these tests will be specificially approved by the bureau, and all the mine inspectors will be notified of the bureau's action.

Accidents in Anthracite Mines

A statement issued by the State Department of Mines shows that the fatal accidents in and about the anthracite coal mines for the three months ended Mar. 31, 1914, numbered 123, as against 146 for the same period in 1913. The inside accidents numbered 100, as against 128, and the accidents on the surface 23 as against 18.

Of the 100 killed inside during 1914, 41 were killed by falls, 16 by mine cars, 9 by explosions of gas, 5 by suffocation from gas, 4 by explosives, 12 by premature blasts, 6 by falling into shafts and slopes and 7 by miscellaneous causes.

In 1913, 68 were killed by falls, 27 by cars, 7 by explosions of gas, 1 by suffocation by gas, 5 by explosives, 14 by blasts, 7 by falling into shafts and slopes and 17 by miscellaneous causes.

During 1914 the inside fatal accidents were 28 less than in 1913. The accidents on the surface were 5 more in number.

By the Way

No man's religion ever survived his morals.

He who is not ready today will be less so tomorrow.

A man's character reaches town before his person.

The remedy of tomorrow is too late for the evil of today.

A prompt refusal has in part the grace of a favor granted.

It generally costs more to revenge injuries than to bear them.

Most men reason from their heads but act from their hearts.

The worst punishment of all is that in the court of his own conscience, no guilty man is acquitted.

Lessons of the Vancouver Strike

By Special Correspondence

SYNOPSIS—A brief review of the strike in Vancouver Island. A strange condition presented by the mines of Vancouver, which are working regularly and producing all the coal the market demands, while a waiting list of 100 names of miners for whom no places can be found, shows plainly that there is, in fact, no strike. A comparison of conditions and wages in Vancouver with those of miners in the States is invited. The lesson of the strike.

The mining situation on Vancouver Island has now reached a most curious stage. In a previous article, I dealt with the origin, causes and history of the Vancouver strike, which was engineered by paid officers of the United Mine Workers of America. The strike began in September, 1912, at the Cumberland and Ladysmith mines of the Canadian Collieries Co. For a couple of months, the production of these mines was badly crippled. The company, however, began to get command of the situation again, in May, 1913, whereupon, the U. M. W. of A. officers called out the men of Nanaimo and South Wellington. Again, the Island output of coal was seriously curtailed, until September of the same year, when the companies resumed mining operations. Progress at first was slow, but gradually quickened until today it can be said that, while the trouble on the Island still continues, the strike is over.

A Strange Spectacle Presented

This is the curious feature of the present situation. If by a strike is meant the stopping of any industry, then most emphatically there is no strike at the coal mines of Vancouver Island. It is an easy matter to establish this assertion, as the following facts will prove. In the first place, the operators are unable to give employment to all the men seeking work. In Nanaimo, for example, there are 100 names on the waiting list at the mines—100 men waiting their turn for work, as places are found for them. In the second place, in addition to this surplus of labor, more coal is being produced than can be marketed. The Jingle Pot mine is working little better than half time, while the Cumberland mines are working less than full time. The Nanaimo mine, alone, is working every day. At this time, the mines on the island are producing more coal than can be sold. In the third place, there are the figures for the total output of coal that demonstrate the same truth. In the boom year of 1911, the aggregate daily output of all the Island mines was about 5250 tons. Today, the total daily output of all the mines in operation is 4800 tons, which shows a difference between the production in the record year 1911 and the present of only 450 tons.

No further evidence is necessary to prove conclusively that there is no longer a strike on the Island. It is true that the U. M. W. of A. trouble still continues, inasmuch as a large number of its members are yet idle. The officers of this organization, the leaders and makers of all the trouble, still tell their followers that they will win the strike, notwithstanding the real facts of the situation which have just been related. The U. M. W. of A. may continue the trouble as long as it chooses; but the strike itself is absolutely all over as far as the mines are concerned. The U. M. W. of A. as an organization does not in any way affect the operations of the mines; and the situation on the Island, which the miners in the United States are blindly contributing to maintain, is an anomaly.

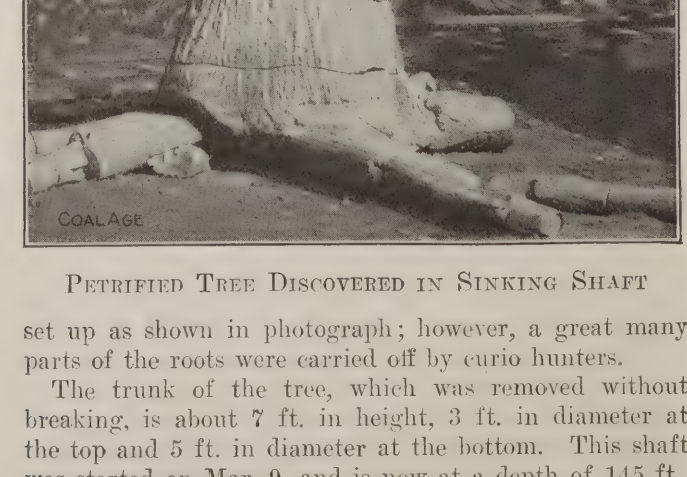
Comparison of Working Conditions in Vancouver Island

Compare, for a moment, the working conditions and wages of the miners on Vancouver Island with those of the American miners, who are financing this strike and who have been given to understand that its object is to secure better conditions and higher wages for the men here. As a matter of fact, it is extremely doubtful if the miners in the United States are as well off in this respect as the men on Vancouver Island. In the first place, the miners here have an 8-hr. day, from bank to bank. In Nanaimo, this means that the men, on an average, work less than 6½ hr. a day, at the face. For this working day, the datal wage is $3.46; firebosses, $4.01; shotlighters, $3.78; face men, $3.56; drivers (single) $3.15½, (double) $3.30; pushers, $3.02 and brattice-men, $3.46.

The above are all scale wages and it is unnecessary to quote the list further. Diggers and loaders (the latter following machines) are employed by contract. For the higher seam, the price is 74.8c. a ton; and, for the lower seam, 80c. a ton, with scale allowances for rock. The average daily earnings of diggers, for months past, as before the strike began, have been over $5; while loaders, during the same period, averaged $4.35 a day. These are the wages made by the miners of Nanaimo, and the mines are operated with every care for safety. The Western Fuel Co. was the first, in the province, to install a Draeger rescue station; and is admitted to have lived up to its avowed policy of "Safety First" at any cost. With these facts before them, American miners can make the comparison for themselves, and then ask why they should be taxed to support a strike that, as a fact, no longer exists.

The Lessons Taught by the Strike

The lesson taught by the whole trouble is that no industry is secure against the machinations of the paid agitator. The miners on the Island did not want a strike. Had they been left to themselves, there never would have been a strike. In the case of Nanaimo, the miners were never even consulted. They were called out and were refused the ballot that they demanded. At Cumberland, the strike was begun under false pretenses. There were no grievances that could not have been adjusted in half an hour's conference. In Nanaimo, there were no complaints at all and, moreover, the men were working under a regular agreement with the operators. Yet with no grievances at hand and with the mining industry itself more prosperous than ever before in its history, a couple of paid agitators were able to stop the whole machine of production. They cajoled or forced the miners into a strike, for no reason that the men themselves knew, and imposed the burden of supporting it upon the miners of the United States, who knew nothing about the true situation. It was as unfair to the miners here as it was unjust to the miners in the States.



Viewed from any angle, the attempt to force this strike

upon contented miners must stand as a severe blow to organized labor and a disgrace to trade unionism. It cannot be freed from the suspicion of ulterior motives. The only persons who have benefited from it are the two or three men who engineered it and who fell into well paid billets as a reward for their work. They have drawn their salaries all through the strike; and it is even charged that some of these men have drawn strike pay as well. These charges are being investigated in the local union now. They are the men who tried to tie up the mines on the Island and who have kept hundreds of men from their work, for over a year, and imposed a heavy burden upon the miners of the United States. In the last analysis, with the laws of the country as they are, no industry is secure against the schemes and plots of one or two professional agitators. This is the great lesson of the strike on Vancouver Island.

An Interesting Fossil

The accompanying photograph shows a fossil petrified tree, which was discovered at a depth of 35 ft. from the surface at the new No. 9 shaft, which is being sunk by the Rock Island Coal Mining Co., at Alderson, Okla.

The strata in the immediate neighborhood of the tree were of a very soft nature, the rest of strata being a hard sand rock; in digging around the tree it was pried off in layers, as shown in photograph. The roots were quite extensive and well preserved, but, of course, broken by shots. After being removed to the surface the tree was

Petrified Tree Discovered in Sinking Shaft

set up as shown in photograph; however, a great many parts of the roots were carried off by curio hunters.

The trunk of the tree, which was removed without breaking, is about 7 ft. in height, 3 ft. in diameter at the top and 5 ft. in diameter at the bottom. This shaft was started on Mar. 9, and is now at a depth of 145 ft., 115 ft. of which has been in solid sand rock. At a depth of about 118 ft. the shaft went through what looked to be a creek bed, which was full of fossil shells, and stems of different descriptions; this character of strata continued for a depth of about 18 ft. After going through this soft strata, the shaft again struck sand rock and is still in same.

This shaft will be in the neighborhood of 804 ft. in depth, and will be the deepest pit in the southwest. It will be equipped with the latest improved machinery.

The Consumer and Higher Anthracite

An official of one of the railroad anthracite companies says: "Apparently the last thing a public service commissioner, or interstate commerce commission, or department of justice representative thinks about, if he considers it at all, is public service or cost to the public. Increase railroad costs and reduce efficiency seem to be the watchwords.

"Look, for instance, at the suits to separate the railroads from their anthracite holdings. Suppose the Government wins! In that event there will be more independents in the field, and there will be absolutely no bar to higher prices for anthracite. It is well known that the anthracite railroad companies keep the price of anthracite within moderate levels. Whenever severe weather brings about a squeeze, the independent demands a premium of $1 or $1.50 a ton, and gets the largest premium possible.

"In the case of any commodity, where the demand at times far exceeds the supply, a high price is bound to come in an unrestrained market. It needs no deep study of statistics to show that the demand for anthracite is increasing with the growth of population, and, with the greater use of this coal in the West, to a larger extent than the supply. If unrestrained competition is permitted to rule, a higher cost to the anthracite consumer is inevitable.

"To mine anthracite, companies of the largest financial strength are necessary. Look at Reading's experience back in the late 90's. With all its wealth of unmined coal the road became bankrupt. Look at the Philadelphia Coal & Iron Co.'s income account, and see how small the margin of profit, and at times the losses from mining coal. The withdrawal of the railroad companies from extending their financial support to the mining of anthracite which will be a result if the Government wins, will increase the cost of anthracite to the consumer.

"The Interstate Commerce Commission has increased our switching expenses and delayed our service to the consumer, and has really benefited no one by breaking up this practice. Formerly, all our coal gathered at New York tidewater was considered as merely so much coal. From the general supply orders were filled or the company got its fuel as needed. Now no car is loaded at the mines without a definite consignment, and when the cars reach tidewater an infinite amount of switching has to be done."

"The sacrifice of efficiency and the increase of cost to the consumer, of course, are minor matters when theories make principles for the operation of railroads and the course of prices. The Standard Oil trust was dissolved, and everyone agreed that unrestrained competition came to prevail, but the increased cost to the consumer of gasoline and oil was noteworthy. Eventual higher cost to the consumer of anthracite is no rash prediction."—*Wall Street Journal.*

Self-Contained Portable Electric Mine Lamps

By H. O. Swoboda*

SYNOPSIS—The frequent occurrence of mine explosions caused by defects of oil safety lamps has encouraged the development of electric lamps. Satisfactory results, however, have been obtained only since the invention of the tungsten filament, permitting the use of smaller storage batteries. The general requirements for electric lamps are: Absolute safety, uninterrupted production of light for at least one shift, and a foolproof design.

It is a well known fact that many mine explosions with enormous losses of life and property, have been caused by defects and improper handling of the so called miners' safety lamps, built on the Davy principle. The Bureau of Mines, for instance, mentions in one of its reports that at least two disasters in this country in 1912 were caused in this manner, killing more than a dozen men, and the Prussian Government states that during the decade from 1902 to 1911 at least 27 per cent. of all explosions in the coal mines of that country were to be blamed on these lamps. Therefore, it is only natural that attempts to develop a portable *electric* safety lamp were made many years ago. Satisfactory results, however, have only been obtained since the carbon filaments were superseded by tungsten. Due to their high economy in current consumption they permit the reduction of the battery to such an extent that the weight and size of the portable lamps no longer prevent the miner from moving around freely in performing his duties.

General Requirements

Electric safety lamps must fill the following requirements: Absolute safety against ignition of mine gases, uninterrupted production of a steady and sufficient amount of light for at least one shift, and absolutely foolproof design.

Besides this, it is essential: That they have a simple and durable construction, that their weight is kept at a minimum, and that the charging and inspecting of the batteries is made easy.

Careful experiments, conducted by the Bureau of Mines in Pittsburgh, and also at Gelsenkirchen, Germany, have shown that the only source of danger in a portable electric lamp is the glowing filament of the bulb.

As long as the maximum short-circuiting current of these batteries does not exceed

100 amperes for batteries with not more than 2.5 volts
85 amperes for batteries with not more than 4.0 volts
65 amperes for batteries with not more than 5.0 volts
45 amperes for batteries with not more than 6.0 volts

sparks obtained by the breaking and establishing of the electric circuit are not of sufficient strength to ignite mine gases, due to the low voltage and amperage of the batteries used. Therefore, it is not necessary to provide special protection against sparking on the switch and on the connections between battery and lamp.

As the filament under normal conditions is operated in a vacuum and enclosed in a glass bulb, the danger of igniting mine gases exists only in case this bulb is smashed without the filament being broken at the same time, so that the latter continues to glow until it burns out. Several absolutely safe methods can be employed to prevent the filament from glowing after the bulb has been broken, and one method which has been in actual use for a number of years will be described in the course of the paper.

Steady and Sufficient Light

The miners' *old* safety lamps furnish a flickering light of about 0.8-c.p. capacity, which rapidly decreases during the shift to about one-half. This is not sufficient light for the miner to perform his work satisfactorily, and, according to the investigations made by Dr. T. Lister Llewellyn, England, is the principal cause of the special eyesickness (miner's nystagmus) with which miners become affected. For this reason it was considered advisable to equip the *electric* mine lamps with incandescent lamps of at least 1.5 c.p.

The only source of electrical energy which will produce this amount of light satisfactorily for at least one shift or approximately ten to twelve hours is the storage battery, primary batteries for such an output being entirely too large for use in portable equipments. Years of development have resulted in fairly satisfactory batteries and it seems, in the present state of the art, that the lead cell, regardless of its weight, on account of its comparatively high voltage and the steadiness with which that voltage is maintained, while discharging, is the most suitable type.

Foolproof Design

Miners' lamps are exposed to extremely rough handling by inexperienced hands and the least mechanical or electrical weaknesses are liable to result in a failure to supply light. The following are about the most important points which must be observed in a successful lamp: The lamp must be locked so that the miner absolutely cannot get at any part of the mechanism. It must burn in any position, even under water, and if dropped on solid material, such as rock, iron or cement from a height of several feet must continue to burn. The incandescent lamp bulb must be thoroughly protected so that it is almost imposible to break it. The electrolyte of the battery must not leak out. Construction of this character is possible, and that lamps satisfying such conditions are in actual use, will be shown later on.

Lamp Designs

During the year 1912 prizes were offered by the British Government for the best portable electric mine lamp and 197 applicants entered into competition and submitted samples. After careful tests extending over several months, the first prize of $3000 was awarded to the makers of the "Ceag" lamp, described in this paper. Since this lamp has also been accepted by practically all other

*Consulting electrical and mechanical engineer, Pittsburgh, Penn.

Note—Article read Apr. 9 at the 293d meeting of the American Institute of Electrical Engineers, Pittsburgh, Penn. This meeting was held under the auspices of the committee on the use of electricity in mines.

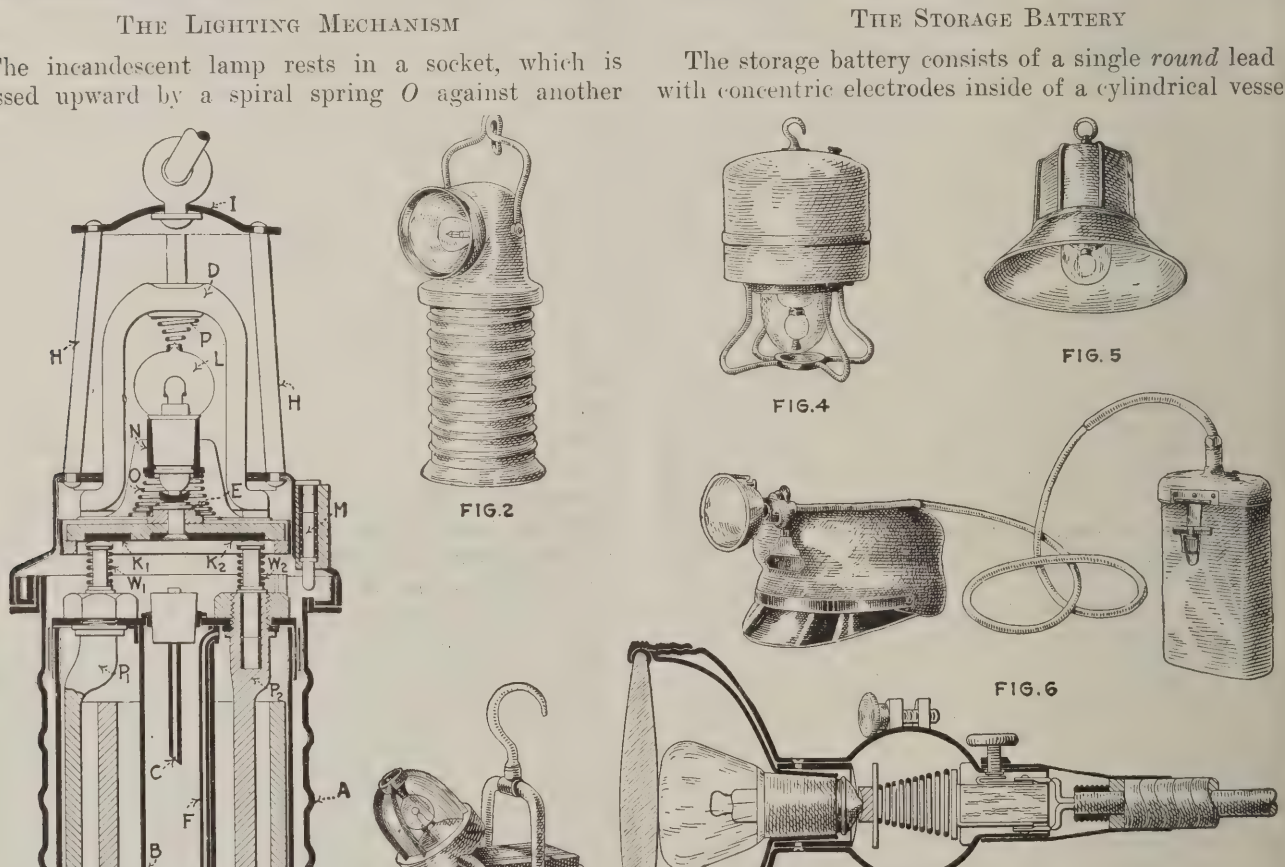
European governments and was the first lamp approved by the Bureau of Mines as answering all safety requirements, and still remains today the only approved *hand* lamp, it might be well to study its construction carefully.

The bulb is covered by a heavy glass dome *D*, which is protected by four heavy steel rods *H* held together by a sheet-steel roof *I*. A substantial hook is attached to this roof; thus, the miner can either stand the lamp on the ground or hang it to a post in the immediate neighborhood of his working place. The bottom part, made of heavy corrugated galvanized sheet steel, contains the storage battery. By turning the upper part on the lower, the miner can turn the light on and off.

The construction of the lamp is easily understood from a section shown in Fig. 1.

The Lighting Mechanism

The incandescent lamp rests in a socket, which is pressed upward by a spiral spring *O* against another spring *P* between the bulb and glass dome *D*, providing a complete spring support and preventing breakage even with the most severe shocks. Electric connection is established for one pole through the socket spring *O*, and for the other pole by another smaller spring *E* inside the socket spring, and insulated from it. In case the bulb breaks, the socket spring pushes the socket upwards, and as the inner spring does not expand as much as the socket spring, the circuit is interrupted.



Lately, another safety device has been added, but it is not shown in this illustration. It consists of a fuse, which blows the moment the bulb of the incandescent lamp is broken. This eliminates the possibility of obtaining sparks or getting the filament to glow in case the miner should attempt to push the bulb back into its normal position; it also protects the battery from being short-circuited for any length of time, in case the leads to the bulb have become short-circuited during the accident.

As stated before, the upper part of the lamp turns on the lower part, opening and closing the switch. This rotating movement is limited by a soft iron pin *M*, which acts as a magnetic lock. This pin can be withdrawn in the charging room by a strong electromagnet, and when this is done, the upper and lower parts of the housing separate, and the battery can be removed for charging.

The Storage Battery

The storage battery consists of a single *round* lead cell with concentric electrodes inside of a cylindrical vessel *A* covered with a waterproof lid of the same material. Cylindrical electrodes are preferable to flat ones, as they are stronger and therefore stand rougher handling. They also warp less, so that in charging, the current density can be increased and the length of time correspondingly decreased.

The holes in the terminal sockets contain bushings made of acid-proof metal, into which removable terminals P_1 and P_2 are fitted. These terminals are pressed upward by the terminal springs W_1 and W_2 against the

Various Forms of Electric Mine Safety Lamps

ontact segments K_1 and K_2 of the switch, carrying in his manner the current to the incandescent lamp. Terminals and springs can easily be taken out and cleaned by washing in warm water, an important point. The use of nonremovable springs has been found impractical, as they are difficult to clean and consequently are liable to corrode and break easily. First-class contact springs, however, are imperative for an uninterrupted light service.

In charging storage batteries, gases develop, which must have an opportunity to escape. It is, therefore, impossible to make the cells airtight. An ordinary opening, on the other hand, would have the disadvantage that the acid would run out, in case a cell were upset, and this would destroy the housing of the lamp. In order to overcome this difficulty, the center of the cell is equipped with a celluloid tubing B, which communicates by means of a small side tubing F, with the upper part of the cell, where all gases collect. The gases therefore can pass from the cell through the side tubing F and finally through center tubing C into the open, whereas

Fig. 8. Magnet for Opening Lamps

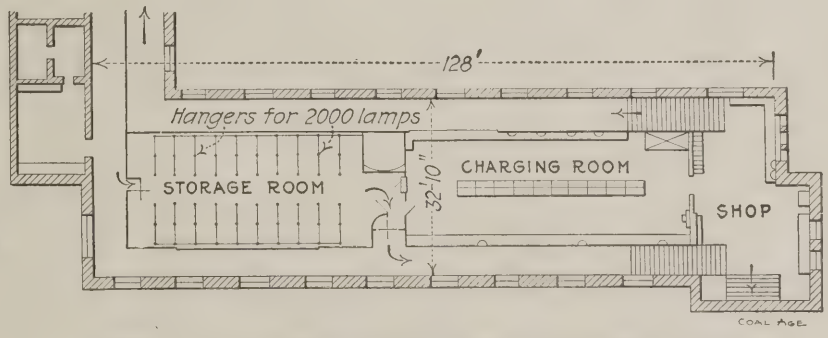


Fig. 9. A Large Electric-Lamp Charging Station

ny particles of acid carried along by the gases, will be eposited in cylinder B. Even if the cell is turned upside own, no acid which may be in the cylinder or any other cid, can escape. In other words, the lamps will burn n any position, without the acid being able to leak out.

The principal dimensions of this lamp are as follows: he weight of the lamp complete is about 5 lb. (2¼ kg.); s height, not including hanger, is 10¼ in. (26 cm.); s largest diameter is 3¾ in. (9.5 cm.) The incandesnt lamp consumes 0.85 amp. at 2 volts. The battery as a capacity of 16 amp.-hr., and the maximum charging urrent should not exceed 2 amperes.

To meet various requirements this standard design is ot only made in four different sizes, ranging in weight om 1½ to 5 lb. (⅝ to 2¼ kg.), but it is also made ith two storage-battery cells connected in series, resultng for the entire line in capacities ranging from four to xteen hours of life for one discharge and producing ght from 0.75 to 3 c.p.

Lamps for Special Purposes

Beside this, a number of other modifications have en developed, so that mines can be completely equipped day with electric safety lamps, wherever a permanent iring in connection with the lighting plant is impossible. Lamps are made for rescue parties, cages, powder agazines, shaft lighting, shaft inspection, loading places, asting, cars and locomotives (head and tail lamps), etc. A few of these modifications are shown in the illustrations.

The standard lamp, being of the "lighthouse" type, distributes its light uniformly over the entire surroundings. The modification shown in Fig. 2, known as the "trip" lamp, has the incandescent lamp mounted on one side combined with a deflector concentrating the light rays in one direction. This design is mostly used for inspection trips and head and tail lamps for cars and locomotives. It is made in the same capacities as the standard lamp.

The "shaft" lamp, illustrated in Fig. 3, is arranged with an adjustable arm, on which the incandescent lamp is mounted, so that the light can be sent in any desired direction. It is made to furnish from 8 to 24 c.p. and to burn from 7 to 12 hours with one charge.

Fig. 4 represents another type of "shaft" lamp, without an adjustable arm. It is made for 8 and 12 c.p. and for 15 and 10 hours of life for one charge.

The lamp illustrated in Fig. 5 is especially suitable for places in which ordinary illumination is not sufficient. It is made for 8 to 32 c.p. and for a life of 7 to 15 hours for one charge.

Cap Lamps

The lamps so far described were designed to take the place of the Davy safety lamp, which is in use in gaseous mines all over the world. In this country, however, the designer of electric safety lamps is confronted with yet another problem. In many of the mines the men have and still use "naked" lamps fastened to their caps. On account of the strict enforcement of the mining regulations in recent years, many of these mines have been and will be compelled to substitute safety lamps.

It is only logical that the men in these mines clamor for a type of electric lamp which is as nearly identical as possible with the present form of naked lamp. To meet this demand, electric cap lamps have been developed, the batteries of which are carried by the miner on his belt and are connected to the lamp by a well protected special flexible cord. This lamp is shown in Fig. 6.

The principles of construction of the cap lamp (see Fig. 7) are identical with those of the hand lamp. But several new features have been added. One is the mounting of the incandescent lamp inside a parabolic reflector, the opening of which is closed by a lens, instead of being covered with a glass dome; another is a ball joint, permitting the miner to direct the light rays wherever they are needed.

A third feature is embodied in the flexible conductors connecting battery and lamp. In case of an accident, there is a possibility that the two conductors may become short-circuited and therefore red hot, eventually setting the insulation afire, if they are made of copper or similar material. To prevent this a special alloy has been prepared, the melting point of which is considerably below the temperature which is required to ignite insulation or mine gas. Consequently, if a short-circuit should take place, the conductors would melt and interrupt the circuit, before there could be a possibility of danger.

From the foregoing description, it can be seen that portable self-contained electric mine lamps of this type have passed the first stage of development, and if one considers that more than one hundred thousand are in daily use in Europe, apparently producing excellent results, there is no reason why the adoption of electric mine lamps in this country should not make rapid progress in the immediate future. The question whether hand lamps or cap lamps, or both, should be used, is a mere matter of detail, which will adjust itself. European practice has adopted the hand lamp exclusively; the sentiment in this country, however, seems to be in favor of the cap lamp. Men who continually change their location in performing their duties will prefer such a lamp, which leaves both hands free for action; men who stay at work in the same place most of the time will favor the hand lamp, which can be set aside or hung up in the neighborhood, relieving them from carrying unecessary weight.

Lamp Service

When the shift leaves the mine, the lamps have to be delivered to the lamp room for recharging and cleaning. For this purpose the magnetic lock has to be opened, so that the battery can be removed from the housing and placed on the charging rack. The unlocking is accomplished by pushing the lamp lock against the pole pieces of an electromagnet (shown in Fig. 8), which lifts the soft iron pin holding the upper and lower parts of the housing together.

Special charging racks have been designed to receive the batteries. Racks are used holding 80 cells connected in two series of 40 each. Each circuit is equipped with a switch, ammeter and rheostat, so that the operator can determine the status of the charge at any time. The rheostats are provided with a surplus of resistance, so that less than 40 cells in a series can be charged, if necessary. A portable voltmeter with a capacity of about three volts is provided to take the voltage readings on the individual cells. Cells are charged, ready for service, when their voltage reaches a value of 2.6. When more than 80 cells are to be charged, two, three or more racks can be combined, and all the cells can be charged at one time.

After the batteries are charged and the contacts and housings have been carefully cleaned, the lamps are reassembled and hung up on special racks, from which the miners remove the lamps, when they begin a new shift.

Lamp Houses

For mines using a large number of lamps, it is essential that charging, cleaning and repairing be handled systematically. For this reason special lamp houses are being erected on the same general principles as those for the Davy safety lamps, but simpler and cheaper, because the lamps need no benzine or oil for the safe storage of which special provision must be made. The ground plan shown in Fig. 9 represents a lamp house erected for 4000 lamps. It consists of a building about 128x33 ft. (39x10 m.), containing a charging room with 20 racks, six opening magnets, three small motors for buffing and cleaning and a small distribution board with a watt-hour meter. To the left of the charging room is the storeroom for receiving the lamps when they are ready for service, and to the right is a small shop for making repairs. Besides this a small room has been provided for a number of benzine lamps, which are used by the firebosses, and on another floor a washroom for the shift.

Importance of Care in Maintenance

Proper care of the lamps has considerable effect on the reliability of the service. One of the large German mines, having several thousand electric lamps in daily use, reports that at first about 5 per cent. of all lamps taken into the mine at the beginning of the shift were returned at the end of the same shift, either burning poorly or not at all. By a careful study of all details in the lamp house and by putting a skilled man in charge of the lamp-house work, this percentage has been reduced to less than 1.5, with the expectation that it will soon drop below 1 per cent.

That this last named figure is not an exception, is verified by the Bullcroft Main Colliery Co., Ltd., Doncaster, England. This company has more than 10,000 lamps in daily use and reports the number of defective lamps per shift to be less than 1 per cent.

The investigation of these defects, when they amounted to 1.5 per cent., showed the following causes:

CAUSES OF FAILURE

	Per Cent.	Per Cent.
Defects due to other causes		0.1
Defects caused by the incandescent lamps:		
Lamps, burning dark	0.6	
Lamps, with broken filaments	0.2	
Lamps, with broken bulbs	0.2	
Total incandescent lamp defects		1.0
Defects caused by the batteries:		
Batteries, leaking	0.1	
Batteries discharged ahead of time	0.3	
Total battery defects		0.4
Total number of defective lamps		1.5

Records covering cost of installing and operating electric mine lamps in this country are not available to any extent, because the number of lamps installed is so far not large and the time during which they have been in operation is comparatively short. However, it should be possible to form some idea of what can be expected, from the experience in Europe.

Cost of Operation 10 to 15 per Cent. Lower Than with Benzine Lamps

While the first cost of electric lamps is undoubtedly higher than that of those burning benzine, the cost of operation, including maintenance, is claimed to average from 10 to 15 per cent. less. Whether the same results can be obtained in this country, the future will have to decide. It may be added that the cost of the electrical energy is small and that the cost of maintenance consists about one-third of labor and two-thirds of renewals of parts, and depreciation.

Of especial importance is the cost of renewing the electrodes of the storage batteries, replacement of complete lamps, which are broken on account of rough hand

ling and accidents, and renewing the incandescent bulbs.

The life of the electrodes for lead cells ranges from about 100 to 400 shifts, depending entirely upon the treatment which they receive. At the present time large claims are being made for the alkaline cell, which is supposed to last as long as 2000 shifts. This, however, requires verification by actual tests.

Besides this, it must be borne in mind that the higher cost of the alkaline cell, the necessity of using two cells, in series, instead of only one as in the lead battery, and the increase in the renewal of the incandescent lamps, due to the large variation in the voltage, will fully wipe out this apparent advantage. However, the weightiest argument against this claim is the fact that the physical life of mining lamps cannot reach 2000 shifts, as shown below, and that the natural deterioration of all parts is considerably below this limit.

The replacement of complete lamps which are broken on account of rough handling and accidents undoubtedly varies more or less in accordance with the character of the work performed in the mine. European practice shows that about 0.1 per cent. of all lamps per shift are lost in this manner.

The incandescent-lamp renewal already has been expressed in figures, in connection with the reliability of service. Excellent results have been obtained, the average life of the lamps being approximately 1000 hours.

The Electric Lamp Has Yet to Cause a Mine Explosion

From the lamp designs and the lamp service as described above, it can be seen that the development of the portable electric mine lamp has made rapid progress during the last few years, and since, up to this writing, no explosions have occurred wherever installations have been made, it can be said without exaggeration that the electric mine lamp is a success and that it is bound to be adopted more and more.

Of course, as is the case with any new appliance, objections have been raised against the electric mine lamp, and especially for the reason that it does not detect inflammable gases as does the Davy lamp. There is no doubt that this detail will be overcome in the near future, as there are several principles which can be used for the construction of mine-gas detectors. In fact, the German government only lately has ordered several hundred of these devices, constructed in accordance with the directions of Dr. F. Haber, on the acoustic principle and known as "mine-gas whistles." These will be distributed to the various mines for a thorough trial.

Wilkes-Barre District Mining Institute

The seventh annual banquet of the Wilkes-Barre District Mining Institute was held at Irem Temple, Wilkes-Barre, Penn., Wednesday night, May 6, and more than 1100 men who are interested in the mining industry and the production of coal were present. The banquet was one of the most successful the Institute has ever conducted and it brought the various members together in a spirit of friendliness that will have a great effect in keeping the ranks solidly built.

The members and guests assembled at the Y. M. C. A. auditorium in the evening and at 7 o'clock they formed a line and marched to the magnificent home of the Masons and Shriners, where a dinner was served. The catering was splendid when it is taken into consideration that the crowd was so large.

The dinner over, Thomas H. Williams, general manager of the Kingston Coal Co., called the banqueters to order and Dr. Charles E. Guthrie, pastor of the First Methodist Church, delivered the invocation. President Williams, in opening the after-dinner speaking, gave a short history of the Institute and the things it has accomplished. He urged upon all those who are interested in mining to avail themselves of the opportunities of the Institute and better prepare themselves for a study of underground conditions and for a practical, systematic manner of dealing with mine problems.

After-Dinner Speeches

Judge J. Butler Woodward, of the Luzerne County courts, was toastmaster, and he opened his remarks with an interesting comparison of the science of engineering and that of law and medicine. He called upon Judge P. A. O'Boyle, also of Luzerne, as the first speaker of the evening. Judge O'Boyle paid a splendid tribute to the anthracite miner and then drifted off into a patriotic address in which he declared that he hoped the American flag would wave from the capitol of Mexico and that it would remain there.

Former Judge Benjamin R. Jones, of Wilkes-Barre, was the next speaker, and he paid a fine tribute to the mining institute as the means of promoting harmonious relations between officials of the coal companies and their employees. He urged men to become members of the Institute and better conditions for themselves and their employers by taking up the splendid course in mining.

Fourteen Men Graduate

President Williams then called 14 young men to the speakers' table and presented them with certificates showing that they had successfully passed a three-years' course in mining at the Institute. He also presented each young man a check for $24, which represented the amount of money he had paid as tuition. The following received certificates: Thomas E. Jones, Llewelyn Jones, William L. Davis, John L. Picton and Patrick Mangan, all of Plymouth; Edward P. Davis and William D. Thomas, of Edwardsville; Michael Boland, of Swoyersville; Isaiah Kershaw, of Larksville; Richard Bowena and Jacob Urban, of Plains; Frank J. Carter, of Forty Fort, and Richard Lewis and Edward Roberts, of Wilkes-Barre.

During the evening solos were rendered by Prof. E. E. Griffith, Roger Howell, Prof. D. H. Lewis. The Institute quartette, composed of John W. Griffith, Thomas W. Morgan, Richard Morgan and John Mason, also rendered several selections. The benediction was pronounced by Dr. T. C. Edwards.

The officers of the Institute are: President, Thomas H. Williams; first vice-president, H. G. Davis; second vice-president, James J. McCarthy; secretary-treasurer, F. M. Devendorf. The board of directors follows: Thomas Thomas, Samuel R. Morgan, Charles Enzian, Benjamin D. Amos, P. H. Devers, Thomas H. Price, M. J. Flaherty, Thomas Martin, G. William Edwards, J. S. Hammonds, E. J. Newbaker, Lewis J. Davis, Gilbert S. Jones, Thomas J. Williams, A. L. Williams and Thomas A. Evans.

Safety Precautions in Mines

The Colorado Strike

SYNOPSIS—The interest in the situation shifts from the battlefield to the state capitol. Peace continues, but what will happen if the regulars are removed seems uncertain. The action of the United States Government is simply to restore the conditions of affairs prior to the Ludlow battle. Mines then working are allowed to work, miners then in the district are permitted to remain, but the mines must continue at rest and all new arrivals must leave and none enter the strike zone.

The issue of last week passed rapidly over the Ludlow battle, omitting many important details which have since come to hand It is, therefore, desirable in the interest of truth to supplement the account then made. The military board, comprising Judge Advocate Major E. J. Boughton, Captains W. C. Danks and Philip S. Van Cise, of the Colorado National Guard, makes a long report of the occurrence. It declares that they examined under oath as many as possible of the soldiers, deputies, mine guards and townspeople of Ludlow and nearby coal camps. They made a personal request for testimony of J. R. Lawson and J. McLennan, of the United Mine Workers of America, but they, in the presence of their attorney, H. N. Hawkins, refused to give evidence on the ground that the inquiry was not publicly conducted.

GROUP OF ARMED STRIKERS AT TRINIDAD, COLO.

GREEKS USED PRESENCE OF WOMEN AS DEFENSE BUT KEPT THEM OUT OF DANGER

The military board condemned the operators for having introduced lawlessness in the persons of "ignorant, lawless and savage Southern Europeans." They declare that the Greeks deliberately prepared for battle, and from the report it may be gathered that the Greeks desired to fire on the militia from the camp, hoping that the fire would not be returned because there were women and children living there. To protect these noncombatants, however, they constructed shelters or pits for some of them and removed others before opening fire on the militia.

The board declared that the Greeks intended on the Greek Easter to open fire on the militia, but they were too drunk at that time to prosecute their scheme. The attack was then to be made on Tuesday, but the moving of the militia from Cedar Hill to Water Tank Hill made the strikers believe that an attempt would be made by the militia to attack the camp and secure the person of Carindo Tuttoilmando, a nonunion miner who was held prisoner in Ludlow camp. Corporal Patton, in fact, according to the official report of Major Hamrock, was sent to make the demand of Louis Tikas.

Hamrock's report to General John Chase says in part:

He refused to see me under any circumstances. I phoned Lieutenant Lawrence to bring the Cedar Hill detachment to drill. Louis must have tapped the wire for he telephoned he would meet me at the railway station. Lieutenant Lawrence reported with detachment and machine gun. On the way I ordered him to assemble and drill in the vicinity. Then Louis arrived, and I saw 300 armed men leaving the colony and going south, while the women and children took cover in an arroyo to the north. I told Louis to get control of his men, and he agreed and went back to the colony. I ordered Lieutenant Lawrence to take a position on Water Tank Hill on the southeast, and then saw Louis with a field glass and gun in hand signal the men in the colony to take cover in the northern arroyo.

PUT LINE OF RIFLE PITS AROUND CAMP

The commission says:

We find that in apparent anticipation of the battle of Ludlow, rifle pits were prepared by the Greeks on the south and west side of their colony, along the country roads and close to the tents. These rifle pits show conclusively the careful and deliberate preparation of the strikers for the battle; and the location of these pits along the front and side of the colony nearest to the militia camp was such that when used they could not be defended without firing into the colony. Such care had the strikers themselves for their women and children that these pits were located where any return of the fire from them would be drawn directly into the colony itself.

Major Hamrock tested his range with the machine gun and sent them directly into the first tents of the colony. It could not be supposed that any women, children, or other noncombatants remained in the camp itself. They had been seen departing early in the morning, and it was impossible to believe that the strikers would draw the fire of the opponents from all sides into the colony if any women and children remained there.

THE RESCUE OF THE WOMEN FROM THE BURNING TENTS

As one tent caught fire after another, some of the men having nearly reached the tent colony heard the screams of the women and called to the men whom they saw firing from the tents to get their women out. The only answer was the words: "You go to ——," spoken with a foreign accent and accompanied by a rain of shots.

The men in the colony being driven back and the presence of women thus being known, Captain Carson, Lieutenant Linderfelt and other officers and men made a dash in among the burning tents for the purpose of rescuing the women. At first they took several women from the tents, some of which were burning and some not. They then dis-

covered subterranean pits beneath many of the tents, and some of them were stored with human occupants.

When the pits were discovered, the difficulty of getting out the women and children increased. Lieutenant Linderfelt took a woman from one tent who could not speak English. She made him understand he must return. She went back with him and indicated one of the holes in the ground, from which the lieutenant took two little children in the nick of time. Captain Carson related that when he was in an apparently open-floored tent he heard the crying or whining of something living beneath. He had to chop away the floor, which was nailed down upon these people, to get them out.

BRAVERY OF MILITIA

During the whole time that this rescue work was going on the colony was under fire, and by taking the greatest risk of destruction by making targets of themselves in the light of the burning tents, the uniformed militia did its noteworthy work.

We find that the work of rescuing some 25 or 30 women and children by Lieutenant Linderfelt, Captain Carson, and the squads under their command, was under all the circumstances truly heroic and must stand out boldly in contradistinction to the abandonment of the helpless women and children by their own people, and the subsequent efforts to kill their rescuers regardless of the safety of the rescued.

DOUBTFUL IF WOMEN AND CHILDREN WERE SUFFOCATED BY FIRE

It was supposed by the officers after a thorough search of the colony that all the remaining women and children had been taken out. The event proved that one of the pits had been missed in the search. In this pit was discovered two women and eleven children, all dead. This chamber of death measured in feet, 8x6x4½. When found it was almost closed. If these women and children were placed in this pit at any time during the morning, it is our belief that they died of suffocation hours before the pit caught fire.

We find that the tents were not all destroyed by accidental fire. Men and soldiers swarmed into the colony and deliberately assisted the conflagration by spreading the fire from tent to tent. Beyond a doubt it was seen that the fire would destroy the whole colony. This was accompanied by the usual loot. So deliberate was this burning and looting that we found that cans of oil found in the tents were poured about them and the tents lighted with matches.

GREEK ACTIVITY RESENTED BY TENT COLONY

We find that the dominant feeling among the refugee colonists on Monday night, and before the second thought came to them or was suggested to them, was resentment toward the Greeks for starting the battle. This resentment prevailed even over their animosity against the soldiers, but the incident was later made a candle to inflame the minds of these deluded men to the acts of slaughter and rapine that followed throughout the state.

It was made the excuse of many bold and defiant utterances and acts of treason against the state by certain union leaders, who had the opportunity by their influence and authority to prove themselves really great and good men, and worthy citizens. Instead, by all means of exaggeration, incendiarism, and treasonable practices, they made of the battle of Ludlow a means of organizing a real rebellion with its attendant awful consequences.

COMMISSION NONCOMMITTAL AS TO CAUSES OF TROUBLE

We do not presume even to hint where the ultimate responsibility lies in the present strike. It may be that the coal operators or the union are wholly to blame for the conditions that have made such results possible. It may be that both sides are partly at fault. But the conditions have been brought about and being actually existent, whatever may be the cause, we feel that for their treason and rebellion against organized society, with the horrible consequences of anarchy that followed, certain union leaders must take the responsibility before God and man.

MILITIAMEN READY TO OPERATE MACHINE GUN, LUDLOW, COLO.

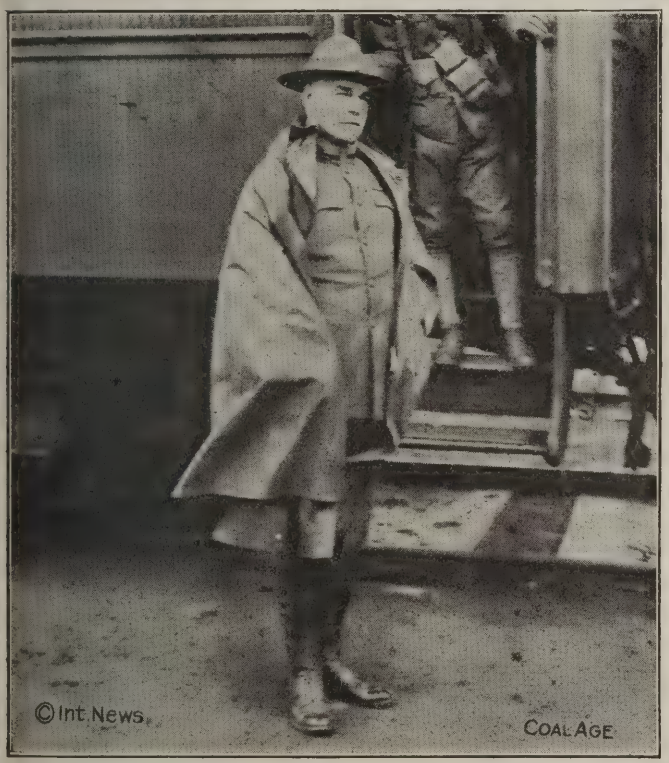
DEATH OF THREE PRISONERS

The report also says that during the evening, Louis Tikas, James Filer and an unknown striker were taken prisoners. Lieutenant K. E. Linderfelt swung his Springfield rifle, breaking the stock over the head of Tikas. This incident followed a heated controversy between the lieutenant and the Greek. The report continues:

An attempt to hang Tikas went so far that a rope was produced and held over a telegraph pole. This lynching was prevented by Lieutenant K. E. Linderfelt, who turned Tikas over to a noncommissioned officer, whom he directed to be responsible for his life. Shortly after, all three prisoners were killed by gunshot wounds. The only bullet found in Tikas' body was of a kind not used by the soldiers, although two other wounds may have been made by Springfield rifle

bullets of the uniformed men. When the colony was looted by participants and spectators in the battle, it was found that 15,000 rounds of ammunition were stored in a tent marked "Headquarters of John Lawson."

SNYDER, THE NONCOMBATANT, SLAIN BY STRIKERS ACCIDENTALLY



Only one person was killed or wounded in the colony by gunshot; Frank Snyder, a 12-year boy, was shot in the head. His father stated that he thinks that his boy had gone outside the fence and was shot in the forehead while facing the arroyo from which the strikers' fire came.

The colony was not swept by machine guns. This is proven by the fact that the chicken houses, outhouses, tent frames and posts still standing in the colony exhibit no bullet holes; while the buildings and fences along the railroad tracks were riddled by the machine guns.

The report also makes the statement that the militia was frenzied as the result of the discovery of Private Martin's body severely mutilated, and that this discovery may have accounted for some of the things which took place later near the tent colony itself. Hockersmith and Chavez, both privates, were also horribly mutilated.

THE LEGISLATURE

The meeting of the Colorado Legislature on May 4 was addressed by Governor Ammons. He stated that he had been obliged to borrow money at 4 per cent. to pay the militia.

MAJOR HOLBROOK, COMMANDING THE U. S. REGULARS IN COLORADO'S STRIKE ZONE

This had to be done at a time when neither the country nor the state was in good financial condition. So the clearing houses at Colorado Springs and Pueblo were asked to supply the money, and thereby exhibit their sense of good citizenship. But before the clearing houses could consider the matter, the auditor sent word that he would not agree to pay the certificates.

The militia, however, was ordered to take the field, and when it came to the payment of the first certificates, they were not issued; the governor was, therefore, compelled to go into the Supreme Court and ask that body to order the auditing of the bills and the issuance of the certificates, which was done. The banks of three cities are carrying $250,000. The railroad agreed to carry theirs until the legislature provided for payment, and some patriotic citizens also agreed to wait.

The governor urged the passage of an arbitration bill and of one establishing a constabulary like those already in existence in Nevada and Pennsylvania. The governor states that the militia has been unable to do effective work because it cannot legally stop the importation of arms, or disarm the gunmen of the strikers and others or close the saloons. There seems some degree of disingenuity about this statement. Surely when a governor declares martial law the authorities in control can regulate such matters without circumventing recognized military practice.

AMMONS WINS IN ALL CONTESTS IN LEGISLATURE

On May 7, the progressive democrats and progressives in the Senate placed on record a resolution condemning the Ammons' administration for failure to control the situation, and the House failed to pass a resolution asking the governor to extend his call for a special session, so as to permit legislation on the entire strike situation. On May 8 a resolution was introduced by Representative Bliss in the State House, providing for an investigation by five members of that body, having power to subpoena and compel the attendance of witnesses.

MONEY VOTED BUT CONSTABULARY BILL NOT PASSED

A bill was passed empowering the governor to close saloons in the strike zone. This was opposed by the progressives, merely for the purpose of determining the strength of the contending parties in the legislature. The constabulary bill was killed by common consent, it being realized that it would imperil the Democratic party to pass it. The Senate also turned down a resolution appealing for Federal arbitration of the strike war. The House on May 11 passed the third reading of the bill, providing a $1,000,000 bond issue to pay for past, present and future expenses of the state militia in the strike field.

WOMEN HAVE DECIDED THE ISSUE AND WILL SEE THAT GOVERNOR OBEYS THEM

The Colorado Women's Peace Association, led by Mrs. Alma V. Lafferty, threatens with 5000 women to camp on the capitol grounds if the militia is called out again. We sincerely hope with them that he will not do so as long as the United States troops can be induced to remain. However, the hysterical plans of these women enable us to size up the whole Colorado situation, which is not marked by reason, but by sentimentalism.

The miners are somewhat slowly giving up their guns. They have been made to believe that as soon as they surrender them the mine guards will attack them savagely. Hoping that the coal companies may soon be short of men and that miners may leave, some of the leaders are doubtless not overkeen in their favor of disarmament. When guns are available for picketing purposes, it will be hard to bring new men into the district to replace those who may leave.

MARTIAL LAW RULING

The operators are slowly surrendering their arms, though their position is precarious. Should the troops leave before the strikers are disarmed, the loyal men and the companies would be apt to lose both life and property. With the present administration, nothing can be foretold.

In fact, the present rulings of Secretary of War Garrison are most unfair. He forbids the opening of any mines which were idle before the Ludlow affair and forbids the companies to take on any new men. We are trying to encourage trade in Vera Cruz, Mex., and suppressing it in Trinidad, Colo. On the other hand, the government is endeavoring to drive out all those armed men who came into Colorado after the Ludlow battle to terrorize the country. Every man has to give the name of his former working place, and if on inspection of the pay-roll his name is not to be found, he is to be summarily removed from the state. It is obvious that this latter provision will not be enforced against the law-abiding.

It is also difficult to determine why the Federal troops are going to permit the rebuilding of the Ludlow camp. This camp should be removed to some place where violence is less likely to be attempted. Even though as reported, the colony will have its membership restricted, there will always be a danger that it will be put to the use for which its location fits it and will be converted into an armed camp.

Itinerary of Federal Rescue Cars

Car No. 1

1914 Arrive	Leave	Address
May 16	May 24	Seattle, Washington
May 24	June 4	Roslyn, Washington

Billings Car No.5

1914 Arrive	Leave	Company	Address
May 18	May 23	Car Repairs	Spokane, Wash.
May 25	May 30	Bear Creek Coal Co. Montana Coal and Iron Co. International Coal Co.	Bear Creek, Mont.
June 1	June 6	Anaconda Copper Mining Co. Smokeless and Sootless Coal Co.	Washoe, Mont.
June 8	June 13	Northwestern Improvement Co.	Red Lodge, Mont.

Editorials

A Special Anthracite Number

The June 6 issue of Coal Age will be devoted entirely to anthracite mining. Much of the information in this particular number will be applicable to soft-coal operations, and therefore will be of interest to bituminous men. We especially request that our readers in the anthracite field submit articles describing mining methods, ventilation, pumping, haulage, etc., in the hard-coal mines.

All such articles as are accepted will be handled promptly and paid for at a liberal rate. Join in and help us make the June 6 issue of Coal Age the most interesting compilation of anthracite information ever published in a single copy of any paper.

The One Thing Needful

It has been said that the model mines are those which most frequently blow up. The most notable of our mines are approached by shafts. Only a strong operating concern can afford to sink a deep pit and equip it with machinery, and such a company is likely to plan the colliery in the most expensive scale.

It is also true that shaft mines have a record for explosions, which is out of all proportion to their numbers. Because, therefore, shaft mines are at once best equipped and most dangerous, the dictum as to the danger of model mines has almost been regarded as an adage. As a rule, gas is generated in their workings and they are usually somewhat warmer and therefore drier than drift mines. But the presence of gas is the important characteristic which makes shafts dangerous. Model mines are not as dangerous in the anthracite region as are others, because nearly all are shaft mines and contain gas. The best mines and the worst in that district are subject to the same class of risks and accordingly the better mines have the clearer record for safety.

It was almost certainly the presence of gas in Eccles No. 5, which caused the violent explosion at that colliery. The mine was really model—in its discipline, its equipment and its morale. But there were a few things needed and all the multiplicity of precautions failed for want of these few things.

Every department of industry relies on all the elements of success, or it will be a failure. It is useless to build a railroad and equip it splendidly, leaving, however, one broken rail. And it is a mistake to provide elaborate ventilating equipment, fans, stoppings, overcasts and canvas more than ordinarily complete, and then to use open lights, electric haulage, and let the miners fire their own shots.

The mine safety in that event depends as at Eccles, wholly on the ventilation. The operators at that mine staked everything on that thin line of defense. They saw to it as far as they could that that one line was perfect, unbreakable, but apparently it broke and the flame was there to blow the mine up. They had provided that flame, trusting it would have no gas to ignite. But they could not assure the absence of the gas should the ventilation for one moment fail.

This is a time when drastic measures are sure to be put in force. By compensation laws such losses as that at Eccles will be distributed among the operators and these men will combine to enforce greater safety on every one. In a short time it will not be possible to work a gaseous mine with an explosive dust like that at Eccles without safety lamps. In the report of 1912, the inspector says: "This mine liberates gas in all working places." The other operators in West Virginia cannot continue to let mines so gaseous as this be operated with open lights, if they are going to be partners with such mines in providing compensation.

No. 5 Eccles was an admirably managed mine. Read what the Department of Mines has to say: "Posting in rooms is done by timbermen; shot-firers are employed; Monobel powder is used exclusively. The mine is damp throughout. All stoppings are of brick or cement." All these statements are true except that the shot-firers only fired the shots for machine-mined coal, which least needs such care. In fact, the report understates rather than overstates the care shown by the management in the operation of the mine.

The men working were satisfied and so were the managers. Even the vice-president and general manager, F. Guiterman himself, was willing to make a monthly trip into the workings. He was ready to expose himself to equal risk with his men. But the few things needed were not done, and it is a folly to say that we are surprised at the result.

We ask those who fear to admit, by introducing safety lamps, that their mines are dangerous, to think carefully. If their mines blow up, there will be more than their admission to advance the notion that the mine is a dangerous operation. They will have to fight thereafter not only the fear and dislike of safety lamps, but the dread inspired by the history of a mine which, in its time, has slain its hundreds.

Proposed Oriental Legislation in Colorado

The Colorado Progressives have a remarkable program of reform which proceeds on the basis of oriental law, that anyone guilty of the slightest infraction of a statute should be adjudged as worthy of total deprivation of property.

They also would provide that the right of determining guilt should be placed entirely in the hands of one person for determination, who was not at the time he prepared the decision cognizant of the importance of the issues he was determining. This program is a conclusive proof that if Governor Ammons and his followers are to be reprobated, his opponents in the legislature are also to be regarded as men of neither judgment nor principle.

In fact, the legislature of Colorado is conspicuously unworthy of public esteem.

The Progressives demand changes in the state laws governing the leasing of coal properties, so that the state may compel lessees, under pain of forfeiture of leases, to comply with all safety regulations to save lives in mines; that the state shall say who shall be employed in mines, that forfeiture of leases shall include forfeiture of improvements; that all present lessees who are proved guilty of violating state statutes for safety in mines shall be deprived of their rights, the report of the state inspector in the last two years to decide this point; that the state shall reserve the right to fix the price of coal to consumers making the price to cover the cost of mining, transportation and sale, with a small profit to the operators. The Progressives also declare that the present royalty of 10c. per ton for coal mined on state lands is not enough.

In such ridiculous propositions the legislators waste their time while foreigners in hordes overrun their state with arms, tying men down to the floors of houses and setting fire to them, hitching mules to the number of 28 in a barn and firing the building, taking prisoners, clubbing, shooting and murdering better men. The Progressives have nothing more valuable to say than that if any operator has let a portion of his mine get dry during the last two years, or has failed to put a shelter hole at a certain definite distance from its neighbor, his property shall be confiscated by the state. We do not wonder with men like this to misrepresent the people that feeling runs high in Colorado.

Government Mine at Williston, N. D.

We are by no means ardent friends of such capitalism as does not serve the interest of the public. Conversion of most of us to all forms of state socialism would be comparatively easy could we be convinced that government ownership was economically sound and would give a higher return for the labor rendered, that it would promote safety in operation and be anything else than an unstimulating system under which all would live on a lower plane.

In a quiet way the reclamation service has opened a mine at Williston, N. D. This department of the United States Government, like all the others, is free from graft and has had a reputation of being free from sterility and sluggishness. Many works it has accomplished have added to the wealth and been creditable to the enterprise of the nation. So we do not single out a discredited graft-ridden organization in order to condemn state ownership when we discuss the achievements of the reclamation service in coal mining.

The mine which the service is working is small; in fact, in ordinary parlance, it would not be called a mine, but a "country bank." There are only 12 or 15 men employed, but six to ten tons are mined by each miner. So the coal must be thick and conditions favorable.

The rate of pay is reasonable and runs, we are told, from 60 to 80c. per ton, according to the location. The pay per working day on the surface is $1.75, and underground $3. All these figures are like those paid in the coal regions throughout the United States, though probably the miners in central Pennsylvania, where they have been trying to increase the pay of outside workers, would strongly object to such differences existing between daylight and dark.

Now with a small mine, with favorable conditions, with a wage scale not high but about that obtaining in Pennsylvania, Illinois and Ohio, the reclamation service produces coal for $1.78 per ton, "including all maintenance charges."

The average price of bituminous coal at the mines throughout the United States was $1.15 in 1912. So, if the reclamation service had to go out and do business in the markets under the average conditions, it would lose 63c. on every ton of coal mined, or 35 per cent. on each sale.

The writer, Raymond W. Pullman, on whose report we rely, states: "Of course, Uncle Sam can't do anything, and when he does, he always makes a failure of it. This coal mine and the reclamation service are proofs of things, don't you know." Indeed they are, Mr. Pullman, indeed they are.

The Court of Public Opinion

We are approaching a crisis in the industrial conditions of America, and the coal industry has apparently been selected as one of the principal battlegrounds on which the conflict is to be waged.

We have had actual civil war in both West Virginia and Colorado, and the contending factions have resorted to a show of force rather than an appeal to reason.

We doubt if violence is a good substitute for logic, and we are sure that if the same amount of money and effort, now being expended by organized labor in Colorado, was to be used in a broad campaign of public education, whatever wrongs exist would soon be righted.

Have we reached a point in our business life where each man who is not satisfied will exert physical force to correct the ills that beset him? Are we coming to a state where we must smash something every time we want a raise in wages?

Capital and labor must soon learn that the one court of last resort is public opinion, and they must know that no unjust condition can withstand for long this force of public thought.

Every social movement based on intimidation and violence has been doomed to failure before it was well started. The "Molly Maguires" tried physical force 40 years ago and failed, and every campaign of lawlessness and bloodshed since then, including that of the suffragettes in England, has been equally unsuccessful.

We hold no brief for the mine owners. Some of them are as unjust and selfish as employers can be. May speedy retribution come to them and may they and the rotten conditions they stand for be banished forever.

The coal industry is filled with enough earnest, honest, Christian men to conduct its affairs on a plan of social justice to the employee, and equal fairness to the capital employed.

The time has arrived when employer and agitator alike must stop exploiting the decent workingman, who is aiming to get a fair wage for an honest effort. Most of our social ills could be avoided by submitting all differences to "public opinion.," the one and only court that can be depended on certainly and finally to exercise justice to all.

Saline County Mine Safety Association Meet

Saline County, Illinois, held its first annual first-aid contest at Harrisburg, Ill., on Saturday, May 2, under the auspices of the Saline County Mine Safety Association. Every effort was made by the officials in charge to make the event a success. How well they succeeded could be easily told from the satisfied expression worn by both members and visitors when the event closed. As the weather was most favorable and the contest well managed, fully six thousand spectators attended and all remained till the proceedings ended.

At ten o'clock in the morning, the officers of the Saline County Mine Safety Association, followed by the first-aid teams which were to take part in the contest, and the members of the association, formed in line on South Main Street and marched around the square to the Interurban line, where cars were ready to take them to the White City.

After a selection by the Harrisburg Union Band, M. S. Whitley, master of ceremonies, introduced O. M. Karraker, mayor of Harrisburg, who in an interesting and appropriate address welcomed the crowd to the city. H. H. Stock, dean of the department of mining engineering of the University of Illinois, was next introduced, and in a brief address told of the origin of first-aid work and the benefit derived from its introduction.

An Exhibit of Safety Work

A most interesting and well-planned exhibition of mine rescue work was then performed. A mine entry had been constructed opposite the grand stand, representing four rooms and an entry which was several feet in advance of the inner room. The spectators were informed as to the movements of the men in the mine by George W. Riggs, of the U. S. Bureau of Mines, who acted as announcer during the day. First the examiner, equipped with testing rod, safety lamp and anemometer, entered the mine, marking the dangerous roof, testing the rooms for gas, and measuring the air current with the anemometer, and making his report of the condition of the mine to the manager, who arrived just as the examination was completed.

Next the miners appeared ready for work, reporting to the mine boss, and being checked in by him. The miner in Room 4 was cautioned not to enter his place until an accumulation of gas found in it by the examiner had been removed and the place made safe. After considerable discussion, the machine men succeeded in getting the bit boy to bring in the bits for the machine, and they began work cutting the face of Room 1. In the meantime, the timberman had received his orders from the examiner, and had gone about his work, supporting the roof where necessary, and taking down such material as was dangerous.

View of First-Aid Field and of Imitation Mine for Exemplification of Rescue Work

Exhibit of Carelessness

The tracklayer, after a more or less social visit with the miners in each chamber, finally reached Room 4, where he and the miner in charge of the place were soon engaged in a heated discussion as to the relative position of the track and the face, the miner claiming that he was unable to load his coal because the track was too far back, and the tracklayer asserting that he had laid track in that room just the day before. The discussion finally became too hot, and, forgetting all about the danger sign across the entrance to the room, the two men started up to the face to prove who was right.

A moment later, an explosion was heard, and dense smoke began to pour out along the entry. The miners working outby from Room 4, hearing the explosion,

First-Aid Contestants and Helmet Men at Harrisburg, Saline County, Illinois

rushed in to give assistance, and were themselves overcome by the smoke. Some of them were rescued by their comrades, for those who were uninjured, finding the smoke and afterdamp too bad, sent in a call for the rescue team. Two automobiles soon arrived, bearing the rescue men and their equipment, and after testing the apparatus in the smoke room on the surface, the rescue crew entered the mine, carrying a life line, stretcher, and electric lamps.

The two men who were overcome by the explosion and afterdamp were soon discovered, and on being brought to the surface, were turned over to hastily organized first-aid teams, which administered to them until the arrival of the ambulances. The entire demonstration was realistic, and received such enthusiastic applause that the officials decided to repeat the performance in the afternoon, so that all might have an opportunity to see a mine-rescue team at work. Following the exhibition, an adjournment was made for dinner, and at half-past one in the afternoon, the first-aid contests were called.

First-Aid Work

The first event was the single-man contest, and believing that this is by all odds the most important event, the Judge-in-Chief, Dr. A. F. Knoefel, made the problem for this event a rather hard one. When a man is injured, there is often but one man in the neighborhood who is capable of administering first aid to him, and as a consequence, it was thought that the best measure of a man's ability is his work in the single event. There were 26 men entered for this contest, and the problem given them was as follows:

While two miners are engaged in mining with the machine, the coal falls from the face upon one who is shoveling slack, he being caught under the fall. The following injuries are sustained: Severe lacerated wound back of left knee with profuse hemorrhage; fracture of tibia and fibula of left leg in its upper third; cut of forehead; fracture of right arm. Time limit, 35 minutes.

The following men were entered in the event, and finished in the order given:

1. John Krainock, with Charles Elliott as subject. Bunsen Coal Co., 93 per cent.

2. John Griffiths, with Matthew Dewar as subject; Big Creek Coal Co., and James Struthers, with Dan McLaughlin as subject; Superior Coal Co., tied with a percentage of 92. To decide this event, a final test was given to these two men, the second and third prize depending on the result of the final. The problem given was to "put on a skull-cap dressing of the head," and in this John Griffiths made a mark of 95 per cent. and James Struthers made 94 per cent., giving them second and third place, respectively in the single event.

4. James Weir with Robert Weir as subject; Superior Coal Co., 91 per cent.

5. Three men were tied for this position: Steve Gosnell, with Michael McTaggart as subject; O'Gara Coal Co.; T. B.

First Five Contestants in the One-Man Event. Third Man from Left Is John Krainock, Winner of First Prize

Trigg with James Ford as subject; Big Creek Coal Co.; and William B. Griffiths, with A. Robasse, subject; Big Creek Coal Co., 90 per cent.

8. Two men were tied for eighth place: Bertram Peak with Frank Futrell as subject; Saline County Coal Co.; J. Estwanik, with Fred Creswell as subject; Big Creek Coal Co., 88 per cent.

10. Two men were tied for tenth place: John Lyons, with Peter Boland as subject; Madison Coal Corporation; No. 8 mine; and Charles Miller, with Sam Anderson as subject; Superior Coal Co., 86 per cent.

12. Three men were tied for 12th place: Oscar Horn, with Thomas Thornton as subject; Chicago & Carterville Coal Co.; John Cowden, with Wm. B. Orr as subject; Superior Coal Co.; and James Law, with Paul Henderson as subject; Saline County Coal Co., 82 per cent.

15. Two men were tied for 15th place: Steve Shaeffer with Jos. De Barba as subject; Bunsen Coal Co.; George Tincey, with George MacNab as subject; Saline County Coal Co., 81 per cent.

17. Two men were tied for 17th place: Earl Mitchell, with Carl Heine as subject; O'Gara Coal Co.; and Stephen Tovey, with C. E. Noonan as subject; Bunsen Coal Co., 80 per cent.

Bunsen Coal Co., U. S. Steel Corporation Subsidiary, Won Second Prize

19. Wm. G. Taylor, with Joe Goff, Jr., as subject; O'Gara Coal Co., 79 per cent.

20. Two men were tied for 20th place: E. Parkins with Robt. Lanton as subject; Big Creek Coal Co.; and James Pepper, with William McNab as subject; Saline County Coal Co., 78 per cent.

22. Charles Cathcart, with John Cathcart as subject; Saline County Coal Co.; 72 per cent.

23. Robert Henderson, with James Long as subject; Saline County Coal Co., 71 per cent.

24. Two men were tied: T. F. Bailey, with D. H. Wilson as subject; Chicago & Carterville Coal Co.; and William S. Lang, with Daniel Simms as subject; Saline County Coal Co., 70 per cent.

26. Guy Biggs, with Oscar Peak as subject; Saline County Coal Co., 54 per cent.

Following the single-man event, the full-team event was called. The problem presented was:

Following a gas explosion, a miner who is in the entry sustains the following injuries: Second degree burns of the face, neck and forearm; fracture of the sixth, seventh and eighth ribs on the right side; fracture of the left thigh; also a fracture of the right patella. Perform artificial respiration, load patient on stretcher, carry and load in ambulance. Time limit, 30 minutes.

The teams and the order in which they finished were:

1. Superior Coal Co. Team No. 1, Gillespie, Ill. James Weir, captain; James Struthers, John Cowden, Charles Miller, Robert Weir. Field No. 2. 95 per cent.

2. Bunsen Coal Co., Westville, Ill. John Krainock, captain, Chas. Elliott, Steve Shaeffer, Joseph De Barba, C. E. Noonan. Field No. 5. 90 per cent.

3. Two teams were tied for third place, and the following problem was given to decide to whom the third prize was to be awarded: "In removing a prop, the miner was caught by a fall of slate, and sustained a fracture of the right clavicle, a dislocation of the right shoulder, and his right ear was torn off." The two teams tied were the Chicago & Carterville Coal Co., Herrin, Ill., and the Cuba first-aid team, Big Creek Coal Co., Mine No. 3, Cuba, Ill., with a percentage of 89. In the final the Chicago & Carterville team won third place, with a percentage of 98, the Cuba team scoring 82 in the final, and receiving fourth place. Chicago & Carterville team, Oscar Horn, captain, Harrison Wilson, Thomas Thornton, T. F. Bailey, Clark Miller. Field No. 8.

4. Cuba first-aid team, T. B. Trigg, captain, D. B. Griffiths, John Griffiths, Joe Estwanik, E. Parkins. Field No. 6.

5. O'Gara Coal Co., Eldorado first-aid team, Eldorado, Ill. Steve Gosnell, captain, Michael McTaggart, Joe Goff, Jr., Wm. Taylor, Robt. Taylor. Field No. 4. 88 per cent.

6. O'Gara Coal Co. No. 9 Mine, Harrisburg, Ill. A. Goodman, captain, C. Sprague, James Ford, E. Mitchell, Carl Heine. Field No. 9. 86 per cent.

7. Saline County Coal Co. Independents, Harrisburg, Ill. Geo. Tincey, captain, James Lang, William S. Lang, Robert Henderson, James Pepper. Field No. 1.; and Saline County

Chicago & Carterville Coal Co. Team, Which Secured Third Place

Coal Co. Mine No. 3, Harrisburg, Ill. Charles Cathcart, captain, Bertram Peak, James Law, Guy Biggs, Frank Futrell. Field No. 3. 85 per cent.

9. O'Gara Coal Co. Mine No. 4, Harrisburg, Ill. Thomas Eddy, captain, Sherman Walters, Arthur Love, V. E. Pry, John Mead. Field No. 7. 84 per cent.

Officials and Prizes

The officials of the contest were:

Judge-in-chief, Dr. August F. Knoefel, Terre Haute, Ind.; assisted by Dr. H. M. Orr, La Salle, Ill., and Dr. Frank Deason, Bush, Ill. Timer, D. B. McGehee, O'Gara Coal Co. Clerk of contest, J. R. Henderson, Saline County Coal Co. Scorers, Oscar Cartlidge, Illinois Mine Rescue Commission, and E. C. Lee, Illinois Miners' & Mechanics' Institutes. Announcer, George W. Riggs, U. S. Bureau of Mines. Marshall of the day, C. A. Horning, O'Gara Coal Co.

Following the announcement of the results, the prizes were presented as follows:

First prize in full team event, silver loving cup; presentation made by Hon. J. J. Parish. Each member of the winning team was given a gold medal, each member of the second team a gold medal, and each member of the third team a silver medal, the presentation being made by H. H. Stoek. Professor Stoek also presented the medal for the winners in the one-man event, gold medals being given for first and second place, and a silver medal for third place. In addition to the prizes given by the local association, American Mine Safety medals were awarded to each member of the winning team.

Rules of Contest

The following rules governed the contests.

1. A team is composed of five men. Upon demand the members must certify that they are not doctors or trained nurses.

2. Each team must select its own patient from among the five members.

3. In team events the captain will control his team in its field work by giving audible commands.

4. No coaching or prompting will be allowed from the visitors or the patient.

5. Anyone desiring to participate in the event must file entry before noon of the day of the contest.

6. At the conclusion of any event the captain will raise his hand and announce his team number. The team will remain at its post until relieved by the judges.

7. Teams will bring their own first-aid materials, including bandages, splints, blankets, etc., and will not be allowed to leave the patient in order to secure materials.

8. The triangular bandages will be the standard used in the contest, but roller bandages may be used and equal credit will be given for their proper use as with the triangular bandage.

9. All splints must be prepared on the field for each event requiring their use. Specially designed splints may be used but they must be assembled during the time of each event requiring their use.

10. No practicing will be allowed on the field preceding the contest.

Treating Patient for Traumatic Shock in One-Man Event

Dr. Knoefel Examining John Lyons in Same Event

11. The teams will be numbered consecutively, beginning at No. 1, and they will occupy their respective positions on the field.

12. Notice will be given before the beginning of the contest as to the number of teams assigned to each judge.

13. In all events requiring resuscitation, rescue of the patient and stretcher drill, the judge may require the teams to perform separately.

14. Each judge will mark the team number, event, and discounts for each team judged, sign his name and deliver his report to the recorder.

15. The recorders will foot up discounts and announce the scores to the judges. In case of a tie, the teams with the same scores will be compelled to participate in another event, those receiving the highest score in this event being accorded first, second and third places, respectively.

16. Time will not be an element, unless the team or men performing run over the allotted time, or fail to give proper treatment. All events shall commence and be finished at proper signal.

Evening Session

At 7 p.m., a moving-picture exhibition was given in the Orpheum Theatre. Four reels from the Bureau of Mines were used, and after the first performance, W. D. Ryan, of the Bureau of Mines, was introduced by President Johnson of the local association, and gave a talk on mine safety. He was followed by H. H. Stoek, who gave a talk along similar lines, and then several slides showing accident prevention were explained by E. C. Lee. The program lasted until about 11 p.m..

Other guests at the exhibition were: Thomas Devlin and John Jeremiah, of the Illinois Mine Rescue Commission; Martin Bolt, James Forrester and John Bohlander, of the State Mining Board; R. Y. Williams and Clarence Bonnell, of the Illinois Miners' and Mechanics' Institutes; the entire force of state mine inspectors, and G. L. Morgan, T. P. Back, D. Z. Thrush, P. Hogan, J. Kaney, J. Garrity, J. McClintock, B. Roberts, W. Hartman, A. Frew and J. Starks. Dr. J. A. Holmes and J. T. Ryan, of the U. S. Bureau of Mines, were expected to be in attendance, but were called to West Virginia to assist in the rescue work at the Eccles explosion.

The officers of the Saline County Mine Safety Association responsible for the excellent showing made during the day are William Johnson, president; T. W. Johnson, vice-president; Bert Tavender, secretary; and Wm. R. Taylor, secretary.

The Rocky Mountain Coal Mining Institute

Owing to the continued unsettled conditions in the Colorado coal-mining industry, the executive board of the institute, by an almost unanimous vote, has also decided to postpone the next meeting of The Rocky Mountain Coal Mining Institute.

It was thought with an Institute such as ours that beneficial results could be obtained only by the hearty interest and coöperation of all the members belonging. Such interest and coöperation is hardly possible at the present time.

It is to be hoped that when the time rolls around for the November meeting, we will all be enjoying such a period of peace and prosperity that every member will find it possible to be in attendance.

E. H. WEITZEL,
President.

F. W. WHITESIDE,
Secretary-Treasurer.

Coming Meetings

The New York section of the **American Institute of Mining Engineers** will hold its final meeting for the year on May 21 at 7 p.m., at Brown's Chop House, 1424 Broadway. Following the brief annual meeting, a beefsteak supper will be served; price, $1 per plate.

The summer meeting of the **West Virginia Coal Mining Institute** will be held in Cumberland, Md., June 2, 3 and 4.

The annual meeting of the **Mine Inspectors' Institute of the U. S. A.** will be held in Pittsburgh, Penn., June 9, 10, 11 and 12, with headquarters at the Seventh Avenue Hotel.

The annual meeting of the **International Railway Fuel Association** will be held in Chicago, Ill., June 18, 19, 20 and 21, with headquarters at the Hotel La Salle, La Salle and Madison Sts.

Discussion By Readers

Overcasts and Stoppings in Mines

Referring to my article on Overcasts and Stoppings in Mines, COAL AGE, May 2, p. 718, I desire to state that when the walls of overcasts are more than 10 ft. 6 in. apart, it is well that the rails resting on the tops of the walls should be hitched into the coal ribs, to aid in resisting the thrust due to the weight of the roof of the overcast. The same result may be obtained by bracing the tops of the walls for 20 or 30 days.

A. W. HESSE, Asst. Chief Engineer,
The Consolidation Coal Co.

Fairmont, W. Va.

The Certificate Law

Letter No. 28—Referring to the interesting discussion on The Certificate Law, permit me to ask: Why not adopt the German system of education for mine officials, under which any mine worker between the ages of 16 and 35 years can go to the mine schools or "*Bergschulen*" and, after two years of study, if he passes successfully the third and last examination, he is given a graded certificate, which is good all over the Empire and in all countries on the Continent. Men who have passed the examination secure positions readily, as the demand and supply of certificated men are properly regulated. The men have the opportunity to show their ability; they are first placed among tried officials and thus given an opportunity to gain more knowledge; and as soon as they show themselves qualified they are given districts in the large mines.

The mines in the German Empire are divided into districts underground. Some have four while others have forty, while every "*steiger*" or deputy takes care of from forty to eighty miners and workers. He is with them for six hours every work day, giving instructions and taking observations with lamps and otherwise to see that the timbering, trackwork and excavations are properly performed in accordance with the law and regulations. This system is very satisfactory. The miner and the foreman have a fraternal feeling, one toward another, as the work is classed as craft or trade. The result is a system and it is profitable to the operator and the miner alike; and considering the size of the underground workings, they are as safe as human ingenuity and science can make them.

Compare this with what we have in the United States? From my observations in Pennsylvania, the Southwest, and in Colorado, for over 30 years, I find that every state has separate mining laws and regulations. In some states the candidate for the position of mine inspector must submit to an election at the polls; while, in other states, the governor appoints those officials. The examining boards often ask applicants questions they could not answer themselves without a reference book. As a result, many mine inspectors and mine foremen hold responsible positions, who would be more useful drilling holes and shoveling coal than trying to operate a coal mine.

Under this system, the mine foreman is held responsible for everything and has no protection for himself; he is paid less than the average miner, does twice the amount of work, worries and many a time loses his well earned rest at night. At the end of the month, the superintendent gives him a gentle (?) hint to reduce expenses and increase his output, but does not tell him how to do so, because he does not know how himself. He has hired the foreman to do this, while he draws the pay that the foreman should have.

HERMAN GEDOSH,
Civil and Mining Engineer.

Poteau, Okla.

The Air Factor in Mine Explosions

James Ashworth asks, COAL AGE, May 2, p. 741, where I can find any evidence of a "counter-current" in three experiments he mentions and in which an extraordinary or abnormal force was developed. I have no data regarding the experiments, No. 263 of the Eskmeals series and No. 287 of the Liévin series; consequently, I cannot express an opinion in reference to these two cases. I have, however, the data relating to Experiment No. 25 of the Altofts series and will say that although the record furnished affords no means of showing the probable presence of such a counter-current, neither is there anything in the record to show that a counter-current did not exist as an influential factor in creating the extraordinary explosive force developed.

Mr. Ashworth expresses the opinion that, in the above named experiments, "the speed of the explosive wave must have been far too great to allow of the operation of a reverse impulse such as I suggested in COAL AGE, Apr. 11, p. 603. In this connection, it is worthy of note that Experiment No. 13 of the Altofts series, which resulted in violence about equal to that produced in Experiment No. 25, shows that the existence of even a rather abnormal destructive force does not prevent the operation of a powerful reverse impulse. In the latter experiment No. 25, several steel sections at the gallery entrance were blown away. In Experiment No. 13 the steel gallery for a length of 30 ft. was blown up at a point 160 ft. inby from the entrance. In neither case was it possible to determine the pressure developed at these respective points; but it must have been exceedingly high in Experiment No. 13, because in Experiment No. 24 a pressure of 255 lb. per sq.in. was recorded at a point 294 ft. inby from the gallery entrance, and this was not sufficient to break the steel shell.

Now, notwithstanding the presence of extreme violence there were both direct and circumstantial evidence of the existence of a powerful reverse impulse, in Experiment

No. 13; as we are told, there was a back-suction that produced a pressure of 4 lb., while the conditions reported as existing in the gallery after the explosion, show that the force of the reverse impulse must have caused a pressure far in excess of that recorded.

Mr. Ashworth directs my attention, particularly, to the fact that, in one of these experiments, a ventilating current was present, while, in the other, there was no ventilating current; but in each case a violent explosion resulted. It must be remembered that the magnitude of a dust explosion, other conditions being the same, depends on the amount of dust ignited and the degree of heat developed at its starting point; and, again, the heat developed is largely modified by the method of ignition. There are several methods and combinations of methods by which the initial energy may be materially increased. The method used in Experiment No. 263 apparently proved very effective in this respect; but it is entirely too artificial and useful only in an experimental way. It can have no application in reference to explosions as they occur under ordinary mining conditions.

In Experiment No. 25, the initial energy of the blast was evidently much increased by the effects of the strong air current moving at the rate of more than 20 ft. per sec., and in opposition to the flame projected from the cannon. That this is a fair conclusion is shown by the following statement made by Taffanel: "Ignition was always greater when the shot was opposed to the direction of the air, or, relatively, toward the intake."

The existence of the reverse impulse during the progress of explosions has been shown, by experiments performed in the United States, England and Germany. It is obvious that such a reverse impulse must produce a strong inby movement of the air. Now, if, according to Taffanel, a comparatively feeble air current, traveling in opposition to the flame of a shot, has such a decided influence in increasing the ignition of the dust, it may be properly assumed that the vastly more powerful air blast, traveling in opposition to the explosion's flame, must be an important, if not *the controlling factor,* in propagating explosive combustion. In Experiment No. 21 of the Altofts series, two distinct explosions were observed at the downcast end of the gallery. Is there a more logical explanation of this phenomenon than to say that this was due to the action of such a "reverse impulse" or "counter-current," whereby fresh air and fuel were supplied to the hot and burning gases further inby, which produced again the explosive combustion of the dust?

Mr. Ashworth has a wide knowledge of mine explosions and the data concerning them, and I am, therefore, pleased to note his statement that he "does not recall a single case of mine explosion where the explosive combustion of suspended dust occurred under conditions restricting the power of the reverse impulse to induce a strong draft of dust-laden air moving in an opposite direction to that of the flame." If explosions under such restrictions have occurred, their extent and destructive force were probably very small, for recent experiments, in Germany, have brought out the fact that the effect of the explosion is much smaller in a gallery with the outlet closed, than in one with the outlet open. On the other hand, I am sure, Mr. Ashworth will have no difficulty in recalling many exceedingly disastrous explosions, both with respect to the number of lives lost and the destruction of property, that have occurred in mines where the presence of more than the usual number of openings to the surface and numerous underground passages connecting the mine workings afforded exceptionally good facilities for the propagation of explosive combustion, by giving ample opportunity for the creation of "reverse impulses" of great force.

JOHN VERNER,
Former State Mine Inspector.

Chariton, Iowa.

The Mine Foreman

Letter No. 4—I cannot let the article by Mine Foreman (W. Va.), COAL AGE, Apr. 18, p. 658, pass without protest. This letter seems to me to be misleading and its writer inconsistent. He asserts, in substance, that a competent mine foreman in West Virginia needs "protection from some source;" and adds "The state mining law gives him no protection but makes him responsible for the safe operation of the mine, requiring many things of him, in his official capacity, that he has no power to perform."

After reading and rereading the mining laws of this state, I cannot find anything in them that bears out such a statement. Section 15 of that law provides that "The operator or agent shall employ a competent and practical inside overseer to be called mine foreman." The law then enumerates his duties as mine foreman, and states, finally:

> The mine foreman shall notify the operator or agent of the mine of his inability to comply with any of the requirements of this section, and it shall then become the duty of any operator or agent to at once attend to the matter complained of by the mine foreman, etc.

Following this, the law prescribes a penalty for the failure of the operator or agent to comply with these requirements.

What further protection could a mine foreman wish than that provided by this section of the mining law? Under its provision, by a single word of his, he is able to shift the responsibility for the performance of any or all of his duties onto the operator or agent. In every case where the act requires the mine foreman to attend to certain duties, in his official capacity, it provides the means. I conclude that Mine Foreman is not acquainted with the mining law of his state or interprets it in a different way from what is intended.

In answer to his statement that the operation of the mine is, in almost every case, in the hands of the superintendent or manager, who regards him as a mere "timekeeper" and yet blames him for any accident or mishap that may occur about the mine, I would ask: What competent mine foreman of West Virginia would stand for such treatment as is described in this and succeeding paragraphs of the letter? I have been a mine foreman, myself, in this and other states, for the past eight years, and fully realize the responsibilities and trials of that position; they are legion. Far be it from me to discount the claims of the average mine foreman for consideration. He certainly is entitled to all the help he can receive from the state mining law, the superintendent or manager and the company. I must, however, reiterate my belief that no competent mine foreman needs to work or will continue to work long for a superintendent who treats him in the manner Mine Foreman would

have us believe they are treated in almost every case in West Virginia.

Every mine foreman soon finds that he is responsible for the safety of every man in the mine; and I fail to see how exception can be taken to this fact, which is the very purpose for which the position of foreman is created, according to the first paragraph of Sec. 15 of the Mining Law, which reads:

> In order to better secure the proper ventilation of every coal mine and promote the health and safety of persons employed therein, the operator or agent shall employ a competent and practical inside overseer to be called mine foreman, etc.

In regard to the mine foreman being blamed for financial loss, arising from the carrying out of plans made in the office or by the superintendent, which cannot be put into practice without loss; to my knowledge, there are no mines in this state where the mine foreman has not a voice in reference to the manner of conducting the work and the best methods to be employed. In my opinion, the time is past when a superintendent or manager can go on making blunders and piling up costs against the better judgment of a competent foreman and make him shoulder the blame. In practically every case, the blame will revert to the responsible party.

I do not hesitate to say that, in West Virginia, there are some of the best regulated, most uptodate mines in the world, in charge of men who are the equal, in point of intelligent mine management, to any holding similar positions elsewhere. Granting this to be the fact, does Mine Foreman wish us to believe that the position he holds is an undesirable and humiliating one, in general, in the mines of West Virginia? Or, I may ask, in view of these facts, can we accept the assertion that the superintendents and managers who are capable of producing results such as are produced in West Virginia mines, would be capable of making the errors mentioned and laying the blame on the foreman? We must be fair and form our judgment upon the results attained.

My conclusion is that if any mine foreman, in an isolated place, finds himself surrounded by such conditions as are described in this letter as the common lot of every competent mine foreman in West Virginia, either he is a man not worthy of the name or position; or he is in the wrong place, in which case I would advise him to *"Beat it and beat it quick."* Judging from my own experience as mine foreman and superintendent, it would be hard to find two mine foremen in charge of mines in one district who are forced to work under conditions such as are here described.

SAMUEL M. MCMAHON, Supt.,
West Virginia-Pittsburgh Coal Co., Mine No. 4.
Wellsburg, W. Va.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Pressure Due to Box Regulator—The primary effect of the regulator is to increase the pressure on its intake side, by obstructing the flow of air in the airway or split that it controls. This increase of ventilating pressure is necessary to accomplish the desired increase of circulation in another airway, which remains open or unobstructed and which, for that reason, is called the **"free split."**

The increase of pressure is the pressure due to the regulator ;and is equal to the difference between the natural pressure of the free split and that of the split in which the regulator is placed, calculated for the required distribution of air. For example, in the illustration previously given, the natural pressure required to circulate 30,000 cu.ft. of air in Split C was 13.89 lb. per sq.ft., while that required to circulate 20,000 cu.ft. in Split A was only 2.17 lb. per sq.ft. The pressure due to the regulator in Split A is, therefore,

$$13.89 - 2.17 = 11.72 \text{ lb. per sq.ft.}$$

Velocity of Air Passing Regulator—The velocity of the air flowing through the regulator is determined by the difference of pressure on its two sides or the pressure due to the regulator. This velocity is calculated from the well known formula

$$v = \sqrt{2gh}$$

In the case of a regulator, the pressure head is equal to the pressure (pr) due to the regulator, divided by the weight of 1 cu.ft. of air ($w = 0.0766$ lb.); and taking $2g = 2 \times 32.16 = 64.32$ ft. per sec., the theoretical velocity of the air due to this pressure is

$$v = \sqrt{\frac{64.32\ p_r}{0.0766}} = say\ 29\sqrt{p_r}$$

By this formula, the theoretical velocity corresponding to the pressure due to the regulator in Split A, referred to above, is

$$v = 29\sqrt{11.72} = 99.28 \text{ ft. per sec.}$$

Quantity Passing Regulator—Owing to the vena contracta, at the opening in a box regulator, the effective area of the opening is only 0.62 of the actual area A; and the quantity (Q), in cubic feet per minute, passing through the opening, is

$$Q = 60\ (0.62\ A\ v) = 37.2\ A\ v$$

Or, substituting the value of v, as given above,

$$Q = 37.2 \times 29\ A\sqrt{p_r} = 1078\ A\sqrt{p_r}$$

Or, since $p = 5.2$ w.g.

$$Q = 1078\ A\sqrt{5.2\ w.g.} = 2460\ A\sqrt{w.g.}$$

Area of Opening, Box Regulator—The area of the opening required to pass any given quantity of air, in splitting, is found by solving the last formulas given above, with respect to A, as follows:

$$A = \frac{Q}{2640\sqrt{w.g.}} = \frac{0.0004\ Q}{\sqrt{w.g.}}$$

The Coal Age Pocket Book

Example—Calculate the size of opening in each of the regulators in Splits A, B and D, in the illustration previously given where the required circulation was as follows:

	Required Circulation	Natural Pressure	
Split A,	20,000 cu.ft.;	2.17 lb. per sq.ft.	Regulator
Split B,	40,000 cu.ft.;	11.55 lb. per sq.ft.	Regulator
Split C,	30,000 cu.ft.;	13.89 lb. per sq.ft.	Free split
Split D,	10,000 cu.ft.;	2.98 lb. per sq.ft.	Regulator

Solution—The first step is to find the pressure due to the regulator and reduce that to water gage, in each case. The pressure due to the regulator is found by subtracting the natural pressure for the given split from that of the free split, which is always the one having the greatest natural pressure. Thus,

	Pressure Due to Regulator	Water Gage
Split A,	13.89 — 2.17 = 11.72 lb. per sq.ft.;	11.72 ÷ 5.2 = 2.25 in.
Split B,	13.89 — 11.55 = 2.34 lb. per sq.ft.;	2.34 ÷ 5.2 = 0.45 in.
Split D,	13.89 — 2.98 = 10.91 lb. per sq.ft.;	10.91 ÷ 5.2 = 2.10 in.

Substituting these values for the water gage due to regulator in the formula for finding the area of opening,

Split A, $$A_a = \frac{0.0004\ Q}{\sqrt{w.g.}} = \frac{0.0004 \times 20{,}000}{\sqrt{2.25}} = 5.33 \text{ sq.ft.}$$

Split B, $$A_b = \frac{0.0004 \times 40{,}000}{\sqrt{0.45}} = 23.85 \text{ sq.ft.}$$

Split D, $$A_d = \frac{0.0004 \times 10{,}000}{\sqrt{2.10}} = 2.76 \text{ sq.ft.}$$

Use of the Door Regulator—In the use of the door regulator, the same general formulas apply, except that in estimating the quantity of air that will pass the regulator, for a given gage or pressure; or the area of opening necessary to pass a given quantity under such gage, no allowance should be made for vena contracta, which gives the following:

Quantity of air passing through an area of opening A, under a water gage w.g.,

$$Q = 3960\ A\sqrt{w.g.}$$

Area of opening required to pass a quantity of air Q, under a water gage w.g.,

$$A = \frac{0.00025\ Q}{\sqrt{w.g.}}$$

Example—What must be the width of opening of a regulator door where the height of the entry is 5 ft. in the clear, in order to pass 40,000 cu.ft. per min., if the natural pressure for the required circulation produces a water gage of 1.25 in. for this split and 1.75 in. for the free split?

Solution—The difference of pressure, in this case, is equivalent to a water gage of 1.75 — 1.25 = 0.50 in.; hence,

$$A = \frac{0.00025 \times 40{,}000}{\sqrt{0.50}} = 14.14 \text{ sq.ft.}$$

Width of opening, 14.14 ÷ 5 = 2.83 ft., or 2 ft. 10 in.

Miscellaneous Questions

(Answered by Request)

Ques.—If, when you were half through with the examination of a mine, you discovered that a door had been left open, how would you proceed?

Ans.—If the door stood open for any length of time, dangerous condition of the atmosphere in that section of the mine may be expected. To close this door at once would be to throw a large quantity of gas out into the return airway. Before doing this, the precaution should be taken to safeguard the return air current and any other sections of the mine that may be affected by the closing of the door. The fireboss should make certain that no one will enter the return current after the door is closed. Having done this, he should proceed with caution.

It would be better to partially close the door, at first; and, following the intake current, proceed to examine the first chambers in this section of the mine. Every chamber and every void place or cavity in the roof should be carefully examined for gas, and where necessary, brattices should be erected to clear away any accumulation of gas in these places. Finally, close the door completely and continue the examination. The entire section must thus be carefully inspected to make sure that there are no accumulations of gas left behind. No open light should be taken into this section of the mine while the examination is being made, as a slight fall of roof might drive the gas back and cause disaster. If the condition of this section of the mine is found to be dangerous, no men should be permitted to enter the mine or work in other sections until the danger has been removed.

Ques.—Name six essential features of a safety lamp for testing purposes.

Ans.—A lamp to be used solely for the purpose of testing for gas should possess the following requirements:

1. The lamp should be simple in construction and consist of as few parts as possible.

2. The lamp should have a free upward circulation of air in the combustion chamber. This is necessary to avoid any tendency of the flame to smoke and to insure the same condition of the atmosphere within the combustion chamber as exists outside and surrounding the lamp.

3. To insure sufficient protection against strong air currents, a testing lamp should be provided with a suitable shield; and, to further protect the upper portion of the lamp chimney from the transmission of flame, all testing lamps should be provided with a double-gauze chimney, and all openings below the flame should likewise be protected with double gauze.

4. To insure uniform results in testing, it is preferable to burn a nonvolatile oil in the lamp. Sperm or cottonseed oil gives the best results. A volatile oil, as naphtha or alcohol, gives a slightly increasing flame cap as the lamp heats in gas, owing to the freer volatilization of the oil.

5. The gauze of the lamp should be of standard mesh (784 openings per sq.in.); and the diameter and height of the chimney should be such as to give a sufficient volume within the combustion chamber of the lamp to insure safety. The volume of the combustion chamber should neither be too large nor too small, to overcome the effect of possible slight explosions within the lamp, which occasionally occur when a bonneted lamp is exposed to sharp gas.

6. The lamp should be thoroughly clean and free from obstructions of any kind that would prevent the free circulation of the air and gases passing in and out of the lamp.

Ques.—A sinking bucket is 4 ft. 6 in. deep, 3 ft. 3 in. in diameter at the top and 2 ft. 9 in. at the bottom. What is the cubical contents of the bucket, and what weight of water will it hold?

Ans.—The diameter of the bucket being greater at the top than at the bottom, the cubical contents is calculated in the same manner as the frustum of a cone. Thus

$$vol. = \frac{0.7854\ h}{3}\ \frac{(D^3 - d^3)}{(D - d)}$$

$$= \frac{0.7854 \times 4.5}{3}\ \frac{(3.25^3 - 2.75^3)}{(3.25 - 2.75)} = 31.88\ cu.ft.$$

Taking the weight of 1 cu.ft. of water as 62.5 lb., the total weight of water this bucket will hold is $31.88 \times 62.5 = 1992.5$ lb.

Ques.—A drift is driven, with a dip of 3¾ in. to the yard, a distance of 455 yd., into a hill; the sidehill rises 5¾ in. to the yard. What would be the depth of a vertical shaft sunk to reach the end of the drift, and how far up the hill would the shaft be required to be located?

Ans.—The question does not state whether the inclination is given in inches per yard of *horizontal* measurement or per yard of *inclined* measurement. The calculation is simplest, assuming that all measurements are horizontal; but the results will be somewhat different if it is assumed that the inclination is per yard measured on the incline.

Assuming horizontal measurement, the dip being 3¾ in. and the rise 5¾ in. per yd. of horizontal distance, the increase of depth from the surface to the seam is $3\frac{3}{4} + 5\frac{3}{4} = 9\frac{1}{2}$ in. per yd. The total depth of the shaft, in this case, is $9\frac{1}{2} \times 455 \div 12 = 360.2$ ft. The horizontal distance from the mouth of the drift to the location of the shaft is then $455 \times 3 = 1365$ ft. The corresponding measurement up the hillside would be 1382.3 ft.

If, however, it is assumed that the inclination is given, *per yard measured on the incline*, it is necessary to calculate both the angle of inclination of the dip and the angle of inclination of the rise, the former being 5° 59′ and the latter 9° 11′. In this case, the depth of the shaft would be found to be 361.7 ft., and the distance measured up the side of the hill, 1375.2+ ft.

Coal and Coke News

Harrisburg, Penn.

In order that the Federal Government provide mine employees with more life saving implements the Mines and Mining Committee at a meeting held on May 4, decided to recommend a bill which provides for 10 additional mine rescue stations and 15 mine rescue cars, the distribution and location to be made be Dr. Holmes, the chief of the Federal Bureau of Mines.

A member of the committee and Dr. Holmes have held several informal conferences relative to this bill, and while no definite arrangement has been made as to the location of these cars and stations, yet it is the belief that at least one, possibly two more cars, will be located in both the anthracite and bituminous coal regions of this state.

It was also decided at the meeting of the Mines and Mining Committee to recommend a bill which will provide for the appointment of a commission, composed of five experts, to codify the mine laws of the country.

It is said the purpose of the commission shall be to gather together the best laws in all states, prepare the same and present them to Congress as a tentative code. Before reaching a final decision, however, the commission will hold public hearings in all the principal mining centers, invite and receive suggestions and opinions bearing upon or relating to existing mining laws, and it may consider the laws and experience of other countries with respect to the disposition and development of mines and mining. It is proposed to have the commission hold a session in Wilkes-Barre, in the anthracite region and at Pittsburgh in the bituminous region. It is stated that the laws must be codified and submitted one year from the date of the passage of the bill. The sum of $25,000 is to be appropriated for expenses.

Answers to Government's Suit Filed

The Lehigh Valley Coal Co., the New York & Middle Coal Field Railroad & Coal Co. and Coxe Bros., & Co., Inc., have filed their answers as defendants in the government's equity suit under the Sherman law for dissolution of an alleged combination acting in restraint of trade.

The Lehigh Valley Coal Sales Co.'s answer has already been filed. The answers deny the charges of restraint of trade made in the government's petition.

The Lehigh Valley Coal Co. in its answer denies that it is engaged in interstate commerce, claiming that it sells its entire product to collieries. Of its holdings in coal lands in Pennsylvania 24,746 acres out of 54,299 acres are located upon the Lehigh Valley R.R. tracks, the coal company of that name admits, but it denies that these properties were acquired under the influence or guidance of the railroad. Its holdings are 19 per cent. of all coal lands upon the railroad's lines, it says, and its total product about one-fifth in amount of the total coal shipments on that railroad. Five of its directors are also directors of Coxe Brothers & Co., Inc., the company further admits.

Contracts made with many other coal operators along the Lehigh Valley R.R.'s lines are admitted to exist, but the main inducement in making them, it is asserted, was to obtain a higher standard of preparation of coal. Direct or indirect fixing of percentage paid under these contracts under published rates of transportation, prejudicial to independent operators shipping upon their own account is denied in the answer.

The company has never paid a dividend, and some years it has lost money the answer says. Prior to 1902 it borrowed from the railroad and on Mar. 1, 1912, it paid 4 per cent. interest on an indebtedness aggregating $10,350,000. But the subsequent retirement of certificates of indebtedness by payments in cash and the railroad's debentures were not transactions to cover rebating, nor was the interest paid unusually low, it is claimed. Denial is also made that money was received through the resale to it of the railroads stock in companies owning coal properties.

Flushing Provides Surface Support

Expressing satisfaction that the plan as put into effect nearly three years ago is the best that can possibly be devised, the Delaware, Lackawanna & Western R.R. Co. does not intend indorsing the plan of the People's Coal Co. made to the Scranton Surface Protective Association for the protection of the surface over its workings.

Frank P. Christian, president of the Peoples Coal Co., has made an offer to safeguard the surface in the business section of West Scranton, if the association withdraws several suits against his company. The Christian offer had the endorsement of many prominent engineers, and an amicable court action is to be started so that the offer may be embodied in a decree.

It is estimated by the Lackawanna people that the plans put into effect by the company about three years ago for the protection of the surface and the repairing of property damaged by mine disturbances have resulted in an expenditure of $1,325,000 by the company. Of this sum a total of $1,200,000 went for flushing the workings, and the remaining $125,000 was expended in the repair of properties damaged by mine disturbances.

It is thought that the worst damage resulting from disturbances in the workings of the Lackawanna company has been done, and that Scranton will not have any repetition of the mine cave damage done over the company's workings in South Scranton. The caves in South Scranton, North Scranton and the twenty-second precinct, were in areas marked in the start by outcroppings of the surface veins, and as the mine workings extended further along the vein a larger stratum of rock that served as a solid protection to the surface was encountered.

The Lackawanna company's plan provides for the flushing of the under-ground workings, the leaving of pillars in places where there are valuable properties on the surface, the repair of which might over-balance the gain made in the mining of the pillars and the repairing of properties damaged by settlings.

It is estimated by the Lackawanna people that 125,000 tons of material are flushed into the workings every month at a cost of $3.24 a ton, or $40,000 a month. This would total $480,000 for a year. Since an agitation about two and a half years ago in South Scranton for the solution of the mine cave problem the Lackawanna company has expended $125,000 in this work.

The flushing process provides for the utilization of rock, slate and other material remaining on the ground or coming from the coal when it is being prepared into market size. The material is broken into fine pieces and mixed with the ashes coming from the boiler plants at the collieries, being flushed by gravity into the veins where the elevation is 100 feet or more below the surface. Also there is much hand-packing of the chambers done, and in many instances pillars, sufficient to support the surface are left in place. This latter plan is followed in congested parts of the city where a cave might result in a property damage that would be so great as to offset the profits to be made in the mining of the pillars.

PENNSYLVANIA

Anthracite

Drifton—The Lehigh Valley Coal Co. has resumed operations on its property below Coxe's Addition, formerly the old Tigers' Park. No work has been done in the stripping for over two months, and a number of new hands have been taken on.

Avoca—On May 8, the earth gave way south of the Laurel Line R.R. tracks, making a depression resembling a submerged ampitheater. The water main burst and the rush of the stream into the mine workings could be heard for some distance. Although the ground was falling away all day it did not reach the houses near by nor did it work any closer to the Laurel Line station. The laborers called were handicapped on account of the steady working of the cave and could make little headway.

Summit Hill—Men working in chute No. 22 in the slope of the No. 4 colliery of the Lehigh Coal & Navigation Co., had driven a hole and discharged a blast on May 4, when an explosion of gas followed. The hole had blown into a pocket of gas, which originated by the close proximity of the Summit Hill mine fire, which has been burning for years. Eight men were overcome by the fumes, but with the aid of pulmotors they were brought around. The mine caught fire and a force of fire fighters were employed in an endeavor to subdue the flames.

Hazleton—The Hazle colliery of the Lehigh Valley Coal Co., which was closed down when the men struck to force a dozen delinquent members of the United Mine Workers into the union, has resumed operations again. As soon as the strike occurred the company ordered a shutdown, which lasted 10 days.

Tamaqua—More than 4000 members of District No. 7, United Mine Workers of America, attended a mass meeting here on May 3, and $1000 was donated to the cause of the Western miners. It is expected sub district No. 1 of Tanaqua and the Panther Creek Valley will contribute $5000 or more in a short time.

Norristown—The Lehigh Coal & Navigation Co., the Lytle Coal Co., and the Philadelphia & Reading Coal & Iron Co. were each sued for $7500 damages on May 7 by Annie R. Anderson, a farm owner in lower Providence township, for alleged injuries to her land, pasturage, growing crops and water rights. Mrs. Anderson in her statement asserts that the defendants, in operating their mines, discharge into the Schuylkill River large quantities of coal dirt, mining refuse, culm and muck, and when the river is high, this is carried onto her farm, doing damage to the soil and crops.

Shenandoah—A breaker, owned and operated by the William Nicewinter Coal Co. collapsed on May 4, because of a mine cave. The men and boys employed in the building had just enough warning to allow them to jump through the numerous windows or crawl through the topway, or head plane. Many were bruised, but none seriously injured.

McAdoo—The Grand Jury of Schuylkill County on May 5 returned an indictment against the Lehigh & Wilkes-Barre Coal Co. on a charge of violating the law passed by the recent legislature, known as the "Lenker Docking Law," which requires the keeping of a record of the number of cars of coal mined at the company's chutes. This is the first time on record where a corporation has been criminally indicted on such a charge. The alleged offense occurred at McAdoo, and the officials of the colliery who are the only officers of the Lehigh & Wilkes-Barre Coal Co., in Schuylkill County, will be the defendants. Alexander Bonus, a miner, is the prosecutor.

Springfield—Fires on mountains surrounding this place are approaching numerous collieries of the Philadelphia & Reading and Mineral R.R. & Mining Co. Large numbers of workmen on May 4 started fighting the flames, which have destroyed a large amount of valuable timber.

Bituminous

Smithfield—The tipple at one of the mines of the Republic Iron & Steel Co. collapsed several days ago. No cause is given by the management for the accident. The damage was slight and will soon be repaired. Three men were hurt by being caught by falling timbers.

Fairchance—Options are being secured on the Freeport vein of coal all through this section. It is said that all the territory from Fairchance to Point Marion will be canvassed, and that it is expected to get from 20,000 to 25,000 acres. A. M. Frederick, Sr., of Fairchance, is securing the options. It is understood that papers have already been signed for about 16,000 acres. The price named in the options is $50 per acre. The Freeport vein is from 4 to 6 ft. thick. The coal is high in sulphur and has to be crushed and washed before it will make good coke.

Uniontown—Sheriff Martin A. Kiefer, of Fayette County, amicably settled the strike at the Herbert plant of the Connellsville Central Coke Co. recently. He explained that the trouble was due to a misunderstanding and the men agreed to return to work. The plant was practically shut down with the exception of the boiler room, which was kept in operation by the clerks of the office who volunteered to act as firemen. In this way, the pumps were kept running, and the mine kept free from water.

Punxsutawney—After over a month's idleness, the Clearfield Bituminous Coal Corporations mines at Rossiter, started work May 7. Work was also resumed at the Yatesboro, Lucerne and Jacksonville mines of the Rochester & Pittsburgh Coal & Iron Co.

Braddock—A resumption in coal mining operations in this district upon a large scale is contemplated by all the leading coal mining companies. Inquiries for coal from consumers who had stocked up in anticipation of a strike after Apr. 1 have begun. It is also expected that lake coal will be moving by the middle of the month, which will still further increase activity.

Clearfield—By a large majority the 30,000 miners in this field have voted to accept the 1912 scale of wages, which the operators have agreed to, and this scale will under the vote continue in force until Apr. 1, 1916. There will be no strike in this field, therefore, on the question of wages, although for a time this was regarded as inevitable.

WEST VIRGINIA

Charleston—According to estimates made by the Public Service Commission, based on the reports of the Eccles disaster now available, the state will pay to dependents of miners killed there during the coming year about $2200 per month from the workmen's compensation fund. Each of the 85 widows will receive $20 a month, with $5 additional for each child under 15 years old. Besides this the state will pay the funeral expenses of the men killed, making a substantial lump sum to be disbursed from the fund at once. It is stated that the fund is ample to meet this rather severe test, however, and that there will be and has been no delay in meeting the demands made upon it.

Members of the local unions of the United Mine Workers in the Kanawha district must either return to work pending negotiations for another wage agreement between the coal operators and miners or surrender their charters as members of the national organization. Under these conditions many of the men are returning to work.

Bluefield—The Federal Court convened on May 6 found Sam Tabor and William Thomas not guilty of peonage charges and similar charges preferred against W. J. Pritchard and the Thomas Coal & Coke Co. were dismissed. The government agents who worked the case up claimed to hold absolute proof of the defendants detaining four men who were brought to the W. H. Thomas Coal & Coke Co. works on transportation and were there detained because of their refusal to work out the amount of this indebtedness. The decision is held to signify in a general sense that men cannot avail themselves of such transportation facilities to get over the road and then beat the company bringing them in.

Eckman—Thieves recently entered the offices of the Pulaski Coal & Iron Co., unlocked the safe, and escaped with over $300. From what could be learned of the robbery, it appears that this money had been in the post office, and there being no safe in this building, it was removed to the offices of the Puaski Coal & Iron Co., and placed in the safe. No arrests have yet been made.

Wheeling—The Whitaker-Glessner mines resumed work May 7, the management having signed the run of mine scale in which the pick mining is 71.37 cents and the machine scale 49.64 cents.

Parkersburg—The Big Creek Development Co., has filed against the local internal revenue agent a suit for $20,000 damages, in order to test the 1 per cent Federal tax on corporate incomes.

ALABAMA

Indio—The suit between the holders of $69,000 worth of the De Soto Coal Mining and Development Co.'s bonds and R. A. Porter, trustee, is being heard before the referee in bankruptcy. The original bond issue was for $75,000, of which $6000 has been redeemed.

KENTUCKY

Louisville—Last week saw representatives of the mine owners of the Western Kentucky field and representatives of their employees meeting at Louisville in another futile effort to reach an agreement as to their differences over the wage question. After several days of negotiations the conference was adjourned to give time for each side to confer on suggested compromises. Some 32 mining companies and 6000 employees are directly concerned in the settlement of the dispute, with probably as many more mining companies not affiliated with the operator's organization but which nevertheless are practically bound by whatever agreement is reached.

OHIO

Martins Ferry—The first reports of anything bordering on violence in connection with the strike of Ohio miners were received in Bridgeport, when it was reported to the police by railroad men that bricks and stones had been hurled through the cab windows of locomotives hauling West Virginia coal to the Lakes while the train was passing through Crescent. No railroad men were hurt, but it is expected steps will be taken to protect the men and the trains in the future.

Expectations are entertained in this sub-district that settlements will be made in the Hocking and one or two other districts in Ohio within a few weeks. This is expected to improve the chances for a local settlement. Once the mines in other fields are working, it is believed that it may have some effect on the operators in this locality, although it is realized that West Virginia coal is being quoted in Cleveland at a price lower than eastern Ohio coal can be placed on the cars without considering the freight.

Coshocton—Work has been started by Charles E. Wells and others to reopen the old Black Diamond mine, located at Hardscrabble, near Coshocton. The mine was in operation 40 years ago but was later abandoned. A portion of the entry had caved in.

INDIANA

Indianapolis—The International Executive Board of the United Mine Workers of America adjourned May 8 after being in session for several days discussing the condition of miners, especially those in Colorado, Ohio, and West Virginia. The Board issued a statement advising against a general strike, but affirming in strong terms its support for the striking miners of Colorado.

Terre Haute—Approval of the report of the sub-scale committee by the joint convention of miners and operators on May 7 averted a threatened strike in Indiana, and provided for a contract for two years. Concessions were made by both miners and operators.

Petersburg—Fire destroyed the tipple at the Winslow coal mines near here recently. It is supposed that the origin was accidental. These mines have not been operated for some time and the property was recently sold to the Ingle Coal Co., which owns and operates the mines at Ayreshire.

Sullivan—The Stockton school township, of Greene County, has brought suit against the Vandalia Coal Co. for $9000 damages for trespass and damage to real estate alleging that the company mined the coal from under a school building, and damaged the building and property.

Brazil—An accident in the Lost Creek Mine of the Vandalia Coal Co. near here, recently put 300 miners out of work for a few days. The cage was hoisted before a car of coal had been securely placed upon it, and part of the timbers of the shaft were torn out and the cage practically demolished.

ILLINOIS

Canton—The Simmons coal mine, north of Canton, opened May 4, with a full force of men.

Springfield—Judgment against the Auburn & Alton Coal Co. for $234.87, in favor of the Commercial Electric & Supply Co. was recently entered by Judge Creighton in the Circuit Court. The defendant failed to answer a bill asking for a payment on a running account.

Farmington—The Nickle Plate coal mine which was to start work recently, was examined the day before that set for the beginning of operation and found to be full of black damp. When the men and mules left the mine on Mar 31, the fans were stopped, and the gas began to accumulate. It is believed that a fall of roof has obstructed the circulation of the air.

Edwardsville—The City Coal Co., of Edwardsville, has turned its lease on Mine No. 3 over to the owners, the Edwardsville Coal Co., which is considering converting the property into a large coal yard. The mine has been operated for 35 years.

ARKANSAS

Fort Smith—A representative of an English syndicate is reported to have established headquarters at Fort Smith, and secured options on thousands of acres of coal lands in Arkansas and eastern Oklahoma. The plan of the syndicate, said to be capitalized at $10,000,000, is to develop the land, marketing its coal largely at the Panama canal.

Bates—The Packard Coal & Coke Co. has closed down its mine, as the result of a disagreement with the miners.

Russellville—The Southern Anthracite Coal Co.'s mine at Russellville resumed operation May 6, after having been closed for a few days, following an inspection by Thomas Shaw, state mine inspector. Mr. Shaw objects to the system of driving entries in the mine, and by agreement it was decided to allow the Circuit Court to settle this question. This mine employs about 400 men.

KANSAS

Pittsburg—Two score operators and representatives of railroads held their semi-annual meeting at Pittsburg, Kan., recently to discuss the handling of cars during the coming summer and fall. The operators and railroad men meet twice a year for the purpose of planning expeditious handling of coal.

OKLAHOMA

Bartlesville—The decline in the oil market has renewed interest in the development of coal and other minerals found in Washington County, and it is probable that by fall, work will be well under way and that shipments will be made. A rich deposit of coal has been discovered in the northern part of the county, and a large number of leases on land have been executed. It is believed that actual development will start in a short time.

PERSONALS

Martin Clark, of McAllister, Okla., has announced himself as a candidate for nomination for the office of chief mine inspector subject to the approval of the August Democratic primary.

B. E. Purser recently appointed general superintendent of the mines of the Woodward Co., it is reported will have complete supervision of all the mines in both ore and coal divisions.

W. H. Soper, of Winchester, Ky., has been made general manager of the Wolf Valley Coal Co. This is the property recently sold by Hon & Tomlinson, of Winchester, to the Wolf Valley Company.

John J. Shannon has accepted an important position with the Woodward Iron Co., his title being assistant to the vice-president. He will have charge of the furnace operation at Woodward and Vanderbilt plants.

Hywel Davies, business manager of the Kentucky State University, formerly a coal operator in Kentucky, has left for Colorado where, as one of the mediators in the mining dispute in that state, he will seek to discover a solution of the industrial trouble.

R. H. Gillespie, of Vinita, Okla., and Andrew Voyles, of Woodley, Okla., have secured leases on 10,000 acres of coal lands near Bluejacket, Okla., following the discovery of promising coal deposits. A five-foot coal bed was found near Bluejacket at a depth of 341 feet.

G. W. Hill, general manager of the Virginia-Kentucky Fuel Co., of Cincinnati, who has been suffering for several weeks with an illness resulting from overwork, has gone to French Lick, Ind., to take a course of treatment and to rest up, in the hope of regaining his health shortly.

Ivor Thomas, a prominent hotel man of Boswell, Penn., has purchased a 200-acre tract of coal between Boswell and Ralphton, and will open a mine within a short time, other openings to be made as business may warrant. It is the intention to ship 1000 tons of coal daily to the eastern market.

A. J. Baggs, sales representative and W. H. Bines, mechanical engineer, have severed their connections with the Watt Mining Car Wheel Co., of Barnesville, Ohio, and will engage in the same line of business at Huntington, W. Va. Mr. Baggs has completed 20 years, and Mr. Bines 14 years of service with the Watt Co.

W. H. Cunningham, secretary of the Kentucky Coal Mine Owners Association, has established in his office a sort of clearing house for information on the new Kentucky Workmen's Compensation law. Mr. Cunningham has announced that he will be glad to supply not only mine operators but all other employers of labor with any information on the subject that is available.

John A. Bell has been elected the president and a director of the Carnegie Coal Co., of Pittsburgh, succeeding R. P. Burgan. Mr. Bell is best known as a successful banker in Pittsburgh and western Pennsylvania, but he has had much to do with the development of the coal industry in the Pittsburgh district. R. P. Burgan who he succeeds is retiring from business after many years of activity. He will make a trip abroad this summer, spending some time at Cornwall, England, where he was born.

Frank D. Rash, vice-president and general manager of the St. Bernard Mining Co. in the Western Kentucky field with headquarters at Earlington, has been elected first vice president of the Kentucky Manufacturers & Shippers Association. In that capacity he is taking a prominent part in the efforts of that organization to find a solution of the present fire insurance tangle in Kentucky, foreign companies having withdrawn after the passage by the last Legislature of a law incresing the powers of the State Rating Board.

OBITUARY

John W. Tully, a mine foreman in the Sugar Camp mine, Caperton, W. Va., and one of the most popular miners in the New River field, was electrocuted when he came in contact with an overhead wire while standing on a piece of sheet iron engaged in repairing a mine motor. He was 38 years old.

William H. Cochran, 56 years of age, a well known coke and coal operator, died recently at Dawson, Penn., following several weeks' illness from carbuncle and erysipelas. His death occurred almost 71 years to a day after his father, James Cochran, disposed of the first coke ever sold for money. Mr. Cochran was a part owner in the Washington Coal & Coke Co., and also had coal holdings in West Virginia, being a promotor of the Cosmopolitan Coal Co., of Braxton. He was well and favorably known throughout Fayette County, and has spent practically all his life in and near Dawson. He is survived by his wife, four children, and three brothers.

CONSTRUCTION NEWS

Pineville, Ky.—The Pioneer Coal Co. will soon begin the erection of a large commissary in its camp at Kettle Island. The company will also put up a number of new miners' homes.

Flat Rock, Ky.—The Kentucky Coal & Iron Co., which recently purchased the Coger mines near here, is preparing to install modern machinery, including electric cutters and motors. The power house is now in course of construction.

Penny, Ky.—The Penny Coal Co. is proceeding with the construction of a mining camp and plant to have a monthly capacity of from 35,000 to 40,000 tons. John G. Smith is manager.

Webb, Ohio—Improvements costing in the neighborhood of a quarter of a million dollars have been completed at the Webb Mine, at Webb, formerly called Lashley Station, in the southern part of the county. The mine is now ready to start operations as soon as the mines of the state resume work.

Columbus, Ohio—It is learned from a reliable source that the Hocking Valley Ry. Co. is planning to double-track its line from Columbus to Toledo as soon as the financing can be done. The improvement is to be made, it is said, to take care of the added traffic when the Chesapeake & Ohio connects with the Hocking Valley at Portsmouth.

New Orleans, La.—If a project now being considered by New Orleans capitalists materializes immense coal yards will be established along the New Basin Canal, and the barges of the Alabama & New Orleans Transportation Co. will be enabled to discharge cargoes of coal direct from the Warrior River fields of Alabama in the heart of New Orleans.

Grafton, W. Va.—It is understood that the Austen Coal & Coke Co. will shortly rebuild its tipple and plant, which was burned down a few weeks ago with an estimated loss of $25,000. It is said that preliminary work has already been started and that active preparations to rebuild the entire plant are now under way. It is believed that the new plant will be somewhat larger than the old one.

Chattanooga, Tenn.—The Durham Coal & Iron Co. expect soon to begin the construction of the proposed coke-oven plant, which was recently decided upon. The company's engineers are preparing a plan and specifications, and a site will soon be chosen. The company has decided to undertake this construction work with its own engineers in charge. Approximately one million dollars will be invested, the ovens being built in blocks of 30 and 60, with a view to future additions.

Columbus, Ohio—The announcement is made that within a few weeks ground will be broken for a 40,000-hp. power plant to be erected at Floodwood, midway between Nelsonville and Athens, Ohio for the purpose of supplying coal mines in the Hocking Valley with electrical current. The project is backed by English capitalists and the construction will be under the charge of F. C. Elliott, of Chicago. Herman Hamper, formerly of Columbus, will be engineer in charge of construction.

Winchester, Ky.—In the way of railroad building into coal lands, work is progressing rapidly in the construction of the Winchester-Irvine extension of the Louisville & Nashville to Dry Fork, at which point the steel for a bridge is being delivered. It is expected that the bridge will be in condition for traffic in a few weeks, when construction beyond that point will be begun and track laying pushed through to upper Howard's Creek, where another bridge will be necessary. Gangs operating from the other end will meet the Winchester crew at Red River, where a large bridge is to be erected. Much coal land will be opened up by this road, and more than six miles of new sidetracks have been built in the southeastern section of this city to handle the increased volume of traffic that will result from the new line.

NEW INCORPORATIONS

Ashland, Ky.—The Buffalo Creek Coal Co., with a capital of $50,000, has been incorporated by J. W. M. Stewart, K. M. Fitzgerald and L. S. Wilson.

Harlan, Ky.—The Kentucky-Harlan Fuel Co., with an authorized capital stock of $80,000, has filed articles of incorporation. The incorporators, each of whom holds three shares of stock, are Homer C. McLellan, F. D. Keithly, and Charles Oestrich.

Harrisburg, Penn.—Charters were issued on May 4, for the Grazier Coal & Coke Co., and the Grazier Coal Mining Co. These concerns are capitalized at $200,000. It is expected that in the near future an output of 1000 tons per day will be secured from the mines of these companies at Foustwell, where the operations of the Somerset and Cambria Coal Co. have been purchased by the newly chartered organizations, which are also purchasing additional lands in that section.

INDUSTRIAL NEWS

Columbus, Ohio—A company is being organized in Columbus, Ohio, to make concrete posts suitable for mine supports. The concrete comes in blocks with concave surfaces on both ends.

Steubenville, Ohio—Because of the breaking of a shaft, on the towboat "Cruiser" on the Ohio River recently, four coal barges were crushed and a large amount of coal was thrown into the river.

Springfield, Ill.—The Chicago & Alton R.R. has put on a night shift to handle the apparatus used in picking up stored coal in North Springfield. All of this coal will be removed from storage by June 1.

Wellston, Ohio—The W. H. Warner Coal Co. is planning the purchase of a new mine on the Hocking Valley R.R. and is also arranging to sell the entire output of the Wellston Coal Co.'s mine at Wellston.

Philadelphia, Penn.—The April anthracite shipments totaled 6,072,164 tons against 5,966,189 tons in April of 1913. For the four months ended Apr. 30 shipments were 20,534,050 against 22,886,065 for the same period of the previous year.

Chicago, Ill.—The freight tariff proposed by the Chicago, Burlington & Quincy and the Rock Island railroads advancing rates on coke from Chicago and other Illinois points to St. Paul was suspended recently by the Interstate Commerce Commission until Aug. 30.

Williston, N. D.—Uncle Sam not only owns a railroad in Idaho, but also owns and operates a coal mine in North Dakota, near Williston. The coal is mined to supply fuel for a power plant, which furnishes electricity for a pumping station at a nearby irrigation plant.

Pittsburgh, Penn.—Five towboats of the Monongahela River Consolidated Coal & Coke Co.'s fleet left the Pittsburgh harbor May 7, with a combined tow of 65 towboats, 25 barges, and one freight barge, aggregating 1,720,000 bu. of Pittsburgh coal. This is said to be the largest shipment for one day in recent years.

Estevan, Sask.—The experiments by the Government of Saskatchewan in the carbonizing of the soft coals which are found in the province are being conducted in this village. The result of the tests so far made has proved highly satisfactory, and it is expected that the carbonized coal will shortly be placed on the market at about $5 per ton. It is claimed that by the carbonizing process, the heat value of the fuel is brought up to the standard of Pennsylvania anthracite. Briquettes will also be manufactured under the new process.

Chicago, Ill.—The Gun-crete Co. has opened its new offices in the McCormick Building, Chicago. This firm specializes in cement-gun work for engineering, industrial and mining structures, and has at its disposal a large amount of the most modern cement-gun euipment, and an efficient working organization. Carl Weber, president of this firm, is one of the best known concrete engineers in America, being the inventor of the reinforced-concrete chimney, of which thousands have been built in this and foreign countries. He has been connected with cement-gun operation for some time, and is considered to be one of the leading experts in this line of work.

Coal Trade Reviews

General Review

Steam grades of anthracite beginning to crowd the storage bins, but domestics still continue in fair demand. Bituminous coal absorbed very slowly, curtailment on contracts being the rule and consumers very critical as to quality. Heavy concessions on prompt business.

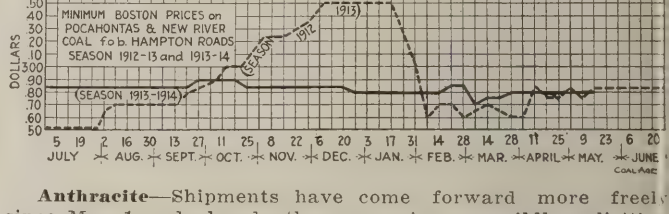
The domestic grades of hard coal are about normal for this period of the year, but the steam sizes are beginning to crowd the storage bins, and individuals are offering substantial discounts to keep these grades moving. Shipments are going forward to the distributing center somewhat more freely, and the agencies are beginning to quietly look around for orders. The demand generally is centering on stove coal which size is bringing a premium all along the line. With large stocks of anthracite in the Northwest the Lake opening is the slowest in the history of the trade. From the generally adverse conditions it is probable that curtailed mining will have to be practised before the summer is over.

Bituminous stocks are large in every direction, while contract consumers are holding producers down to minimum deliveries, and each week sees the business becoming lighter. The month's suspension in mining failed to create the anticipated gap in the supply, and there is no impetus of any kind in the trade, while consumers are becoming very critical regarding quality. Buyers refuse to be interested under any consideration, while shipments are absorbed very slowly, and then only at low figures. In fact the trade seems to be settling down to the lowest point for a number of years.

Surplus stocks in the Pittsburgh district have not been liquidated, and the demand is considerably off; railroad consumption is light, and manufacturing much below normal. Prices are firm on contracts, but heavy cuts are offered on spot business, although such business is so light that it is of little consequence; lake shipments amount to practically nothing, and production is at 40 per cent. capacity. There is some West Virginia coal moving into Ohio, but it is in poor demand, as consumers still seem to be heavily stocked. The return of the miners in the Kanawha district eliminated the possibility of obtaining relief through a general suspension in that district. Negotiations for another conference on the Ohio wage scale are now being arranged for. The quotations at Hampton Roads are being maintained on export business, but there are persistent rumors of concessions being made on coastwise shipments to New England. The past week witnessed a heavy dumping, and the accumulation at some piers is below normal.

The renewal of the wage scale on the same basis as the old one in Indiana is the feature of the Middle-western situation; this has relieved whatever apprehension there was regarding a shortage, and both production and buying have eased off still further. There is practically no demand for domestic coal, dealers showing no disposition to undertake the customary summer stocking, because of the adverse financial situation. A few contracts are being closed up, and it is expected that some of the large railroads may be in the market shortly.

EASTERN MARKET



BOSTON

The lightest week of the season thus far. Consumers who failed to contract early, buy now from hand to mouth. Market cargoes absorbed very slowly. Marine freights unfavorable to Pennsylvania coals. Georges Creek mines under short time. Anthracite shippers seeking orders.

Bituminous—No improvement can be reported in the generally dull situation. The week past has been perhaps the very lightest of the season so far; almost no new business has been taken on and large consumers are holding down their shippers to minimum deliveries. Practically all the buyers now who did not make purchases early are buying only from hand to mouth, confident they will be able to make more advantageous arrangements in mid-summer.

There is no change in prices on Pocahontas and New River, although what few sales are made are on a delivered rather than an f.o.b. basis. Cargoes destined for inland distribution are absorbed slowly and then only at low figures. Stocks are large in every direction.

Marine freights from Philadelphia prevail rather higher than from Hampton Roads and this condition makes hard going for the Pennsylvania grades that sell only 5@10c. less f.o.b. than Pocahontas and New River. Consumers are extremely critical in such a season and the Pennsylvania coals are likely to lose some of the tonnage they gained last year and the year before. All-rail, the demand is only a shade better. Georges Creek shippers are succeeding in placing their current output which is somewhat curtailed. The New River shippers have made some inroads on Georges Creek tonnage this year and the aggregate is likely to be considerable.

Anthracite—Shipments have come forward more freely since May 1 and already the companies are mildly soliciting new orders. Stove size is short at all the loading ports and consignees are now being restricted to a third and in some cases a fourth of a cargo in conjunction with other sizes. The weather is warm and the only retail business is with trade that is willing to fill up for next season.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.95@1.50	$1.20@1.60	$1.67@1.77	
Philadelphia*.....	2.20@2.75	2.45@2.85	2.92@3.02	
New York*.....	2.50@3.05	2.75@3.15	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.80@2.85
Boston†.....	.....	.....	.....	3.55@3.78
Providence†.....	.....	.....	.....	3.50@3.73

* F.o.b. †On cars.

NEW YORK

Heavy curtailment on bituminous contracts. Trade settling down into a dull summer. Anthracite steam grades weak, but domestics approximately natural for this season. Curtailment in mining in sight.

Bituminous—The curtailment in the movement of soft coal has become so general that there scarcely seems to be any business negotiated at all. There is no demand in any direction, and market observers are slowly becoming convinced that the trade is settling down into one of the worst summer seasons for many years. One of the most serious features of the situation is the way in which consumers are curtailing requisitions on contracts. Although little business is expected in the spot trade when conditions are dull, it is seldom the contract requirements are so heavily cut as at present. The general impression is that the situation will continue as at present throughout the summer, or until the crops begin to move, and the railroads are again forced to buy.

Prices, as a rule, are holding remarkably well, considering prevailing conditions. Odd tonnages of demurrage coal are, of course, being forced on the market at heavy sacrifices, one sale being reported down to $1.80 at tidewater. But aside from such abnormal business, the circular quotations are still generally held as follows: West Virginia steam, $2.50@2.60;

fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—It is reported at some points that hard coal is also feeling the effects of the general retrenchment in industrial circles, particularly in the steam grades, but it is generally felt that the market is approximately normal for this period of the year. The demand is still centering on stove coal, which is about the only grade commanding a general premium all along the line, individuals readily obtaining 10c. per ton above the regular circular here. Egg coal is in steady demand, although occasionally selling off to avoid demurrage. In Manhattan, chestnut is absolutely flat, and impossible to move, but Brooklyn dealers are taking some in order to get an allotment of stove coal with it; in an ordinary straight transaction involving chestnut alone, it is difficult to move at 20c. off the circular. With a good demand in the West, it is difficult to understand why so much of that grade is being sent into this market.

Pea coal is selling down to between 20 and 30c. off the circular, where individuals are forced into the market to avoid demurrage. The depressed situation ruling on pea and chestnut at tidewater is due to the sharp falling off in the line trade. Low-grade No. 1 buckwheat has sold as low as 30c. off the circular; high grades are still in fair demand, but are selling off 15c. The high-grade barleys are down to 10c. off the circular, with the lower grades as much as 40c. off.

Indications generally point to a poor summer business in anthracite. It seems probable that it may even be necessary to practice some curtailment in mining, and even then the outlook is not any too cheerful. Quotations are now ruling at the following rather low level:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.70	$4.70	$4.65	$4.65
Egg	4.95	4.90@4.95	4.90	4.80@4.90
Stove	4.95	4.95@5.05	4.90	4.90@5.00
Chestnut	5.20	5.00@5.20	5.15	4.95@5.15
Pea	3.55	3.30@3.55	3.45@3.50	3.20@3.45
Buckwheat	2.80	2.75@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.30@2.40	2.00@2.25	1.75@2.25
Barley	1.80	1.70@1.80	1.70@1.75	1.25@1.70

PHILADELPHIA

Anthracite outlook favorable for May. Mining still at full capacity. Steam sizes flat and considerable going into stock. Bituminous market dull, with prospects poor. Prices and demand at low ebb.

Anthracite—With the first half of May gone, the prospects look favorable for good business until its close, on the steam sizes, which are already crowding the storage bins of the large operating companies. This is no unusual feature, as spring and summer always finds these sizes in excess, and while the individuals create a market by making concessions, the large companies with storage facilities stack their superfluous product in order to take care of the heavy demand on contracts during the fall and winter.

Broken, egg, stove and chestnut are moving off as rapidly as produced, but there seems to be a feeling in the trade that the close of May will see a period of inactivity which is likely to extend throughout the summer months. As a matter of fact, the Northwestern market is supposed to absorb the surplus during the summer months, but the open weather that prevailed during most of the winter, left considerable coal on hand. This spells curtailed mining, although there are no indications as yet, that this will be necessary in the immediate future.

Bituminous—The heavy stocks many consumers had at their plants, are becoming depleted, but there still seems to be nothing that adds any backbone to the market, and the trade generally are not looking for any material change in the near future. The agreement with the miners of the central Pennsylvania district is not likely to open up many operations until there is a better market. The suspension of over a month by many operators does not seem to have made any gap in the apparent supply, and the predicted impetus to the trade has not materialized. The changes in prices over last week have been fractional. Good grades of Pennsylvania coals can be purchased at $1.35@1.55, and the cheaper grades at 35@50c. less.

BALTIMORE

Highly unsatisfactory conditions in the bituminous trade. Anthracite only fairly active, but in much better shape than soft coal.

That the present state of affairs in the bituminous coals leave much to be desired is an undisputed fact. The trade is regarded as the worst spring business for several years back. Not only has demand fallen off, but prices have continued to slump in all save the specialized coals that are practically all taken on contracts.

Considerable coal on consignment at tidewater points has resulted in a sharp breaking of prices in many instances. The worst slump seems to have occurred on the West Virginia gas coals. Slack has been a particularly weak grade, and sold in some cases down to 45c. Offerings are free in every direction and many would not be surprised to see a still further break. Run-of-mine at 75c. and three-quarter at 85c. were easily obtainable. Pennsylvania grades have been offered during the week as low as 90c. Best grades have been generally covered by contract, and any surpluses are held firmly around $1.35.

One encouraging feature just now lies in the export trade. All of the piers were busy the past week loading for European, South American and West Indian ports.

While the anthracite trade is much better than soft coal, there is still no great snap to it either. Steam sizes are in only fair demand, and a good many household consumers have been delaying their spring orders. Deliveries can be made up to the end of the present month on the lowest rate of the season.

A few contracts are being signed up gradually for the coming season, the prices being based on the same scale of wages as paid the past two years in the Illinois field. At the present the retail prices on bituminous coals are: Standard, $2.50; Mt. Olive, $2.75; Carterville, $3.12½. These prices will likely prevail until the first of August.

CENTRAL STATES

PITTSBURGH

Production down to 40% with demand light in all directions. Quotations heavily cut on prompt business, but firm on contracts.

Bituminous—There has been no improvement in the situation. Domestic demand is almost absent, while manufacturing consumption is far below normal, and has been decreasing further in the past week or two; railroad consumption is also light. The stocks accumulated some time ago are not all liquidated yet. Production in the Pittsburgh district is at not over 40% of capacity, or unchanged from last week. The suspension of mining in Ohio does not seem to have thrown any trade at all to this district. While some coal is being shipped in the lake trade the amount is altogether inconsequential.

Producers are holding firmly to regular prices when it comes to making contracts, for with production as light as it is now they have a full realization of the fact that cost of production may be particularly high, and they are possibly less prone to cut prices on contracts than they would be if approximately full operations were assured for the twelvemonth. For spot lots there are deeply cut prices in occasional instances, but the total volume of business is too small to make the prices of importance. Regular quotations are: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.80, per ton at mine, Pittsburgh district.

Connellsville Coke—The market is almost absolutely stagnant. No furnaces contemplate going into blast, while some of those in blast are going out. April saw a net decrease of 18 in the number of furnaces in blast in the country as a whole, and this month there has been a further decrease. The few consumers who were uncovered for May have not contracted, but are buying prompt coke occasionally. One consumer who had a contract for 20,000 tons for April, at $2, has arranged to have shipments continued at the figure indefinitely, but does not contract definitely to take a full month's tonnage. The market is quotable generally as follows: Prompt furnace, $1.85@1.90; contract furnace (nominal), $2; prompt and contract foundry, $2.35@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 2 at 305,610 tons, a decrease of 8147 tons, and shipments at 299,439 tons, a decrease of 10,770 tons. The best average ever maintained for a period of three months was about 425,000 tons a week, so that the movement is now 70% of the record

BUFFALO

Still no improvement in the trade. Some mines resuming work. Stocks begin to run low. Lake shipments much smaller than last season and will likely continue so. Coke quiet.

Bituminous—There are three new features of the trade now, none of which, however, have had any improved effect. The stocks in consumers' hands are running down and soon not only a good many private concerns, but the railroads also, will be back into the market, although they will buy spar-

ingly and will not want to pay fair prices at first. Eventually it will simply be a matter of the volume of business. If that starts up fairly well there will be a sale for coal, but if not it will be a dragging market right along.

A second feature is that there will be more or less of a general resumption of mining this week, and there will soon be more coal on the market. But it is given out by the leading operators that they are not going to mine coal unless they can sell it on orders. The third feature is that there is now enough three-quarter being made to increase the supply of slack. The lake trade, which demands so much three-quarter, is not active, but it is moving a certain amount of coal and as a consequence slack is piling up here and the prices are off.

In fact, the bituminous trade is not very hopeful, since if the mines return to anything like a full output there is going to be a surplus produced again. The quotations on bituminous are much the same as formerly as to price, there still being sales at the regular circular, $2.80 for Pittsburg lump, $2.70 for three-quarter, $2.55 for mine-run, and $2.15 (a reduction of 10c.) for slack. Allegheny slack is about on a par with Pittsburg, but sizes are 15 to 25c. lower.

Coke—There is no improvement in coke. Pig iron sells slowly and is moving still closer in the Canadian market than here. No particular improvement is looked for right away.

Anthracite—The hard-coal movement is light for this time of year, as there is so much in the Northwest unsold. Lake shipments are bound to be quiet for some time. If there is a disposition to sell early in the season the docks will free themselves, but otherwise the business will drag. Just now the small upper-lake ports are buying in order to take advantage of the lower prices. The large ports are bound to carry heavy stocks right along. Shipments by lake for the week were only 50,000 tons.

TORONTO

Domestic grades of anthracite steady with steam sizes dragging.

The market for domestic grades of anthracite is steady and a little more active since the usual spring reduction of prices. Steam coal is quiet owing to dullness in the manufacturing industries with a downward tendency in prices. Quotations are as follows: Retail anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6.25. Bituminous, steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale, f.o.b. cars, ¾ lump $3.60, screenings, $2.75.

TOLEDO

Demand light in all departments, but an improvement expected in the steam grades shortly. Some inquiries and an occasional order noted. Lake movement under way.

The coal trade in Toledo continues quiet, but most of the local dealers are optimistic over the future. The call for both domestic and steam coal is below normal, but it is believed that the demand for the steam grades will increase later on. Most of the factories laid in heavy stocks prior to the strike and many still have good supplies left. The railroads are beginning to run low, however, and inquiries from this source are becoming numerous with an occasional sale.

Large freighters are loading right along at the Toledo docks and a large amount of coal is carried here in the yards, especially those of the T. & O. C. Quick trips have been made by some of the lake freighters. The "E. L. Wallace" has made two round trips and the "Harry Yates," which cleared a short time ago for the Canadian Soo arrived back last Wednesday to take on another cargo. Of the seven big freighters which wintered at Bay View Park, four have loaded and gone on their first trip.

COLUMBUS

National officers of the miners refuse to call a strike in Ohio. Hocking Valley operators to meet with the miners shortly, and the situation is clarifying rapidly. Stocks are still large and demand continues light.

The principal events during the past week were the failure of the national officers of the United Mine Workers to ratify the strike, as voted for by the Ohio miners, and the move for a conference of operators and miners in the Hocking Valley. In other words, the situation is more clear and the stress is gradually passing away.

E. A. Cole, president of the Sunday Creek Co., and also president of the Hocking Valley Operators' Association, sent a letter to John Moore, of the state organization, asking for another conference. So far arrangements for the conference have not been made, but it is expected they will be in the near future. This is the first step in this state to settle the wage question by subdistricts, and the move is being watched with interest. The miners have no authority to agree to a lower scale, but it is probable that a referendum vote may be ordered in case the delegates so recommend.

Apparently stocks among steam users are sufficient for a month or more, and the domestic trade is also quiet. Some West Virginia coal is being shipped in, but it is selling at a rather low figure. The small sizes are somewhat stronger and prices are higher. There is some demand for the better grades of domestic coal and dealers are having a fair business for this time of the year. Dealers stocks are sufficient for some time to come.

Some West Virginia coal is being shipped to the lakes, although the prospects for an active lake trade are not bright. There is still considerable coal on the docks of the upper lake ports, according to reports.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.45@$1.35		$1.50@$1.40	$1.40@$1.3
¾-inch	1.30@ 1.25	$1.20@$1.15	1.35@ 1.30	1.30@ 1.2
Nut	1.25@ 1.20		1.30@ 1.25	1.25@ 1.2
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.15@ 1.1
Nut, pea and slack	0.90@ 0.85		0.85@ 0.80	0.75@ 0.7
Coarse slack	0.80@ 0.75	0.90@ 0.85	0.75@ 0.70	0.65@ 0.6

CLEVELAND

Lake traffic tending to maintain the coal markets in northern Ohio. Youghiogheny gas grades selling on a par with Fairmount gas. Lake vessels scarce because of the dullness in the lake freight market.

The pressure to move coal has held the market down all week and no improvement is anticipated for at least another three or four weeks. Youghiogheny slack was sold on the spot market as low as $1.70 and Fairmount gas mine-run has been traded for Youghiogheny gas on the basis of 20c difference in favor of the mine-run.

There is no demand. The market is so slow that practically no consignment coal has been coming in. Pocahontas operators are holding firmly to the May circular, but are not accepting any new business for prepared sizes. Pocahontas slack has been sold as low as 85c., the mines, and it is reported even lower. The circular price is $1.25.

In the Lake Trade shipments from West Virginia are much larger than the demand or dock space justify. There is no market strong enough to warrant shipping consignment coal and lake ports are full. Shippers are having trouble getting boats because the iron ore and grain traffic is so light the vessels are without and eastbound freight. Lake Michigan shippers have an advantage as boats can at least break even coming back light from there. To the slow docks on Lake Michigan, however, a premnum of 5c. a ton has been paid for boats to run light for coal.

Shipment prices for available coals are as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.05		$2.00@$2.05
Lump, 1½-in.		$2.35	
Lump, ¾-in.		2.25	
Mine run	2.60	2.10	1.85@ 1.90
Egg	3.05		
Nut		2.00	
Slack	2.20	1.70	1.70@ 1.90

CINCINNATI

The market continues sluggish, with practically no change since last week. Lack of activity in industrial lines has affected the steam market, which is now as bad as domestic grades, making the whole situation unprecedentedly dull.

With no signs of a revival and with the domestic market extremely quiet, save in the demand for Pocahontas smokeless, the present situation here is about as bad as it could be. A week ago the prospect of more or less serious labor trouble in the Kanawha district of West Virginia offered a reasonable prospect of a stronger market, but before it had a chance to manifest itself the men returned to work. Notwithstanding the short period of idleness, and the more prolonged shutdown in the Ohio field, the market refuses to respond.

The practical impossibility of securing boats for lake shipments has not changed for the better. It is undoubtedly true that the usual lake markets are to a large extent affected by the same dullness which is noted here and elsewhere, so that there is by no means a pressing demand for coal.

Occasional buyers are in the market for steam coal at fair prices, one or two sales of eastern Kentucky nut and slack being reported last week at 80c. There is nothing like a real movement at this or any other figures, however. Mine-run coal seems to be about the best fuel to send to this market at present.

DETROIT

Contract movement sharply curtailed. West Virginia coal taking the place of the Ohio product where required.

Bituminous—The local market is lifeless, operators sti

having large stocks and not appearing to be the least worried over the restricted output. As a result of the curtailed shipments, slack prices are strengthening up slightly, but West Virginia steam lump and mine-run are offering considerable off the circular. Shipments on contract are heavily curtailed. Considerable of the West Virginia grades are coming in so that the effect of the complete shutdown in Ohio is not being felt. Much of the coal ordinarily going into the lake trade is being dumped into the Detroit market. Contract arrangements for Ohio coal are being delayed, pending the adjustment of the wage scale.

Anthracite—Hard coal is coming in in abundant supply, many of the dealers receiving their full requisitions, contrary to the ordinary rule. The outlook for May is also encouraging.

HAMPTON ROADS

Some improvement in Hampton Roads situation. Dumpings for week show up well. Government taking cargoes for vessels in Mexico and for station at Cavite.

Shipments of coal from Hampton Roads during the week past have shown some improvement. Two naval colliers and one sailing vessel have loaded for Key West and the vessels now in Mexico, and in addition there have been two cargoes shipped by the government to the coaling station at Cavite, P. I.; large coastwise and foreign cargoes have also moved, and, with the number of bunkers which have been taken care of, the dumpings should show up well. The accumulation of coal has been cut down to below normal at some of the piers.

During the early part of the week the Virginian Ry. piers were working to almost their full capacity. During ten hours on May 4 they dumped 303 cars into barges, sailing vessels and steamers, and the same night over 250 cars were dumped, making more than 550 cars, or about 27,500 tons in 24 hr.

The price of coal for export is practically the same as it has been for some months, and while circular figures on coastwise business are still being quoted, it is rumored that some cargoes for New England have been sold at somewhat below these.

Foreign shipments have moved to Dakar, Havana, Port Spain, Naples, Canal Zone, Montevideo and Kingston.

On May 1 retail dealers put in effect summer prices on the various grades of domestic coals. These prices are about 50c. a ton below the winter schedule except on Pocahontas and New River run-of-mine, which remain the same practically all the year round.

LOUISVILLE

Operations generally good, but market shows no improvement. Prices continue unchanged.

Though operations continue on an extensive scale, as compared with other bituminous mining districts, the market in general has showed no signs of improvement. The western Kentucky field is practically at a standstill. The local retail reduction of 25c. a ton, though it has resulted in a considerable volume of orders from domestic consumers, has had no appreciable effect on the general situation.

Steam sizes are plentiful both east and west and are in small demand. Though the reports of the railways seem to indicate that business generally is better than last year, it must be remembered that the railroad's operations a year ago were greatly curtailed by the floods.

Prices run about the same as a week ago, ranging from 50c. a ton for the pea and slack in the West, to from 60 to 75c. for Eastern nut. Of these grades the western Kentucky pea and slack, only, is stiff. The block coals of the Eastern field continue at from $1.30@1.85, the latter for the fancy grades.

SOUTHERN AND MIDDLE-WESTERN

CHICAGO

Slight increase in steam-coal trade. Anthracite quiet. Most contracts for smokeless coal now closed. The demand for Illinois grades is confined to screenings only. Coke market dull.

There is practically no demand for domestic coal and little fuel is being bought for storage because of unfavorable financial conditions. There is also little demand for anthracite coal, dealers showing no disposition to purchase for future. Buying for storage appears to be restricted to the all-rail trade only, and as a result operators are sending smaller shipments. There are two or three companies which have cut their prices to around a dollar. Lump and egg is selling at $1.60 as the market price, but this is only because little of these coals is being produced.

Illinois coals are not very active, screenings being the only kind for which there is any demand at all, and even these are lower by 10c. a ton. It is expected that the large railroads will begin to appear in the market soon. Inch and a half screenings are selling for 90@95c. per ton, while the better grade two-inch coal is selling for 95c.@$1. Conditions in the coke market are dull.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.30@2.40	$2.12	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.65
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.77	1.95@2.05	1.67	

Coke—Connellsville and Wise County, $5@5.25; byproduct egg, stove and nut, $4.45; gas house, $4.25.

INDIANAPOLIS

New wage agreement for the next two years signed up on practically the same basis as the expiring one. Operations increased in spots but still generally at only half capacity.

The most interesting development in the Indiana coal situation is the signing up of a new wage contract for two years. The miners gained a point in their demand for the delivery of the powder to working places and they conceded a point to the operators in assessing fines for the mining of dirty coal, while the wage scale continues the same. Trade conditions have shown little change. Some operators have put additional mines at work but as a general thing, only about half the mines are working.

ST. LOUIS

A further slump in domestic coals about equalizes an advance in the steam grades. Contracts being closed on the same basis as last year. Labor situation being cleared up.

During the past few days there has been a good demand for steam sizes, perhaps better than at any time since the mines suspended operations, but as the price advanced on these grades, the quotations on the domestic and larger sizes went down, so that it is an even break; that is, on a mine-run basis the coal is bringing about the cost of production, or perhaps slightly better. This pertains chiefly to the standard field. In the Carterville and Franklin County field there is little tonnage being produced, and that for the most part, on contract business.

In a retail way, locally, there is nothing doing in bituminous coals, but the tonnage of anthracite, being booked for early delivery, is exceptionally good. The smokeless market is slow, and indications at this time are that anthracite and coke will eventually crowd out, to a great extent, the smokeless tonnage.

KANSAS CITY

Market dull but indications are better for the summer and late fall. Light demand for domestic grades.

The situation in Kansas City has undergone little change except possibly a brisker booking of futures. The retailers are inclined to show more confidence in the fall and late summer trade because of exceptionally bright crop prospects in the Southwest. Immediate business is only fair, though steam lines have shown improvement enough to cause more optimism among operators. The lack of demand for lump has continued to give operators something to puzzle over, however, making the situation rather unsatisfactory in that respect.

FOREIGN MARKETS

GREAT BRITAIN

Apr. 29—There is a brisk demand for prompt coal of which there does not appear to be much available, and prices are rising. Some buyers now seem disposed to negotiate their requirements for ahead loading. Quotations are approximately as follows:

Best Welsh steam	$4.68	Best Monmouthshires	$4.20
Best seconds	4.56	Seconds	4.08
Seconds	4.20	Best Cardiff smalls	2.82
Best dry coals	4.32	Seconds	2.64

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry, $4.80@5.52; furnace, $4.08@4.56.

COAL FREIGHT DECISIONS

I. C. C. Nos. 5572; 5651; 5584—Campbells Creek Coal Co. vs. Ann Arbor R.R. Co. (No. 5572), H. C. Dickinson vs. Ann Arbor R.R. Co. (No. 5651), Compbells Creek R.R. Co., vs. Ann Arbor R.R. Co. (No. 5584).

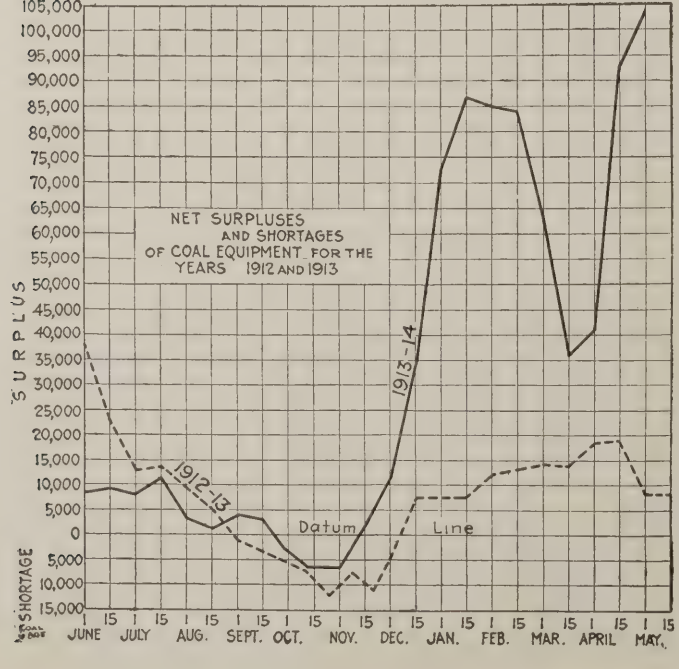
1. Defendants' application of the main-line rates to points on the Kanawha & West Virginia and the Coal & Coke railroads while denying them to complainants constitutes undue and unreasonable prejudice and disadvantage to complainants, which should be corrected either by canceling the main-line rates to points on the lines mentioned or by establishing the main-line rates as joint rates with the Campbell's Creek Railroad.

2. No such undue prejudice may be predicated upon the application of the main-line rates to points on branches of the defendant Kanawha & Michigan Railroad.

3. The portion of section 1 which makes it the duty of every carrier subject to the act to furnish cars must be read into that portion of section 1 which deals with the matter of switching connections between common carriers and lateral branch lines. Huerfano Coal Co. v. C. & S. E. R.R. Co., 28 I. C. C., 502.

4. Defendants' contention that it would be impossible to hold the Campbell's Creek Railroad a common carrier without finding it guilty of a violation of the commodities clause, assuming defendants' construction of the law is correct, is not sustained by the facts.

PRODUCTION AND TRANSPORTATION STATISTICS



THE CAR SITUATION

American Ry. Association reports surplus and shortages of coal equipment for two weeks ended Apr. 15, as follows:

	Surplus	Shortage	Net*
New England Lines	1,620	0	**1,620**
N. Y.; New Jersey, Del.; Maryland; Eastern Penn.	16,536	0	**16,536**
Ohio; Indiana; Michigan; Western Pennsylvania	42,205	0	**42,205**
West Virginia, Virginia, North & South Carolina	4,820	0	**4,820**
Kentucky, Tenn.; Miss.; Alabama, Georgia, Florida	14,039	0	**14,029**
Iowa, Illinois, Wis., Minn.; North & South Dakota	11,675	19	**11,656**
Montana, Wyoming, Nebraska	1,373	0	**1,373**
Kansas, Colorado, Missouri, Arkansas, Oklahoma	3,653	10	**3,643**
Texas, Louisiana, New Mexico	572	0	**582**
Oregon, Idaho, California, Arizona	3,906	0	**3,900**
Canadian Lines	0	0	**6**
Total	100,399	29	**100 370**

	Jan. 1	Jan. 15	Feb. 1	Feb. 15	Mar. 1	Mar. 15	Apr. 1	Apr. 1
Surplus	72,535	87,149	85,489	84,775	64,822	39,133	41,055	41,055

*Bold face type indicates a surplus.

ANTHRACITE SHIPMENTS

Anthracite shipments for April and the first four months of the current year as compared with last year were as follows:

	April		4 Months	
	1914	1913	1914	1913
Phila. & Reading	1,185,930	1,180,115	3,884,153	4,579,408
Lehigh Valley	1,160,742	1,149,896	3,579,875	4,216,678
Cent. R.R. N.J.	748,162	738,579	2,766,684	2,978,872
Del. Lack. & West.	894,513	861,078	2,755,042	3,078,995
Del. & Hudson	615,573	561,700	2,090,979	2,344,688
Pennsylvania	619,159	585,472	2,166,567	2,082,297
Erie	648,426	672,386	2,548,960	2,745,928
Ont. & Western	199,649	216,963	741,790	859,199
Total	6,072,164	5,966,189	20,534,050	22,886,065

COAL MOVEMENT

The following is a statement of the fuel movement of various kinds for the past four months, in short tons, except where otherwise noted:

	January	February	March	April
Anth. shipments[4]	5,175,732	4,121,451	5,164,703	6,072,164
Penn. R.R.[3]	5,885,953	6,081,171	6,853,996	
B. & O. R.R.[2]	3,192,789	2,650,623	3,530,136	
C. & O. Ry.[1]	1,596,704	1,095,082		
N. & W. Ry.	1,679,836	1,666,475	2,112,118	
Va. Ry.	407,109	259,756	336,952	

[1]Bituminous coal only. [2]Coal and coke. [3]Bituminous, anthracite and coke. [4]In long tons.

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during February and March of the current year in short tons:

	February	March
Pocahontas Field	942,477	1,161,793
Tug River District	204,074	246,490
Thacker District	198,228	274,786
Kenova District	71,401	88,616
Clinch Valley District	152,769	153,704
Other N. & W., Territory	3,694	2,741
Total N. & W. Fields	1,572,643	1,928,130
Williamson & Pond Creek R.R.	26,314	43,867
All other railroads	67,518	140,123
Grand total	1,666,475	2,112,118

The following is the destination of shipments for March and the first three months in short tons:

	February		Two Months	
Coal	1913	1914	1913	1914
Tidewater, foreign	120,288	158,247	387,294	428,672
Tidewater, coastwise	327,631	342,530	973,751	991,863
Domestic	1,303,239	1,611,341	4,333,531	4,323,872
Coke				
Tidewater, foreign	70		10,034	1,5
Domestic	147,660	103,070	438,794	317,699
Total	1,898,888	2,215,188	6,143,404	6,062,09

COAL SECURITIES

The following table gives the range of various active coal securities and dividends paid during the week ending May 9:

Stocks	Week's Range High	Low	Last	Year's Range High	Low

No Important Dividends were announced during the week.

Index of Coal Literature

We will furnish a copy of any article (if in print) for the price quoted. Where no price is quoted, the cost will be nominal. Inasmuch as the papers must be ordered from the publishers, there will be some delay for foreign papers. Remittance must be sent with order.

ACCIDENTS AND THEIR PREVENTION

100—Monthly Statement of Coal-Mine Fatalities in the United States, February, 1914. Albert H. Fay. Bureau of Mines; 8 pp.

101—Monthly Statement of Coal-Mine Fatalities in the United States, January, 1914. Albert H. Fay. Bureau of Mines; 6 pp.

BLASTING, EXPLOSIVES

102—Blasting Gelatine: Some Notes and Theories. (Abstract of Paper by W. A. Hargreaves read before the Soc. of Chem. Indus.) Iron Coal Tr. Rev., Apr. 24, 1914; 1⅓ pp. 40c.

103—Flame Phenomena Observed on Firing Permitted Explosives in the Mortar. E. Lemaire. (Translated from Ann. d. M. de Belgique.) Coll. Guard., Apr. 17, 1914; 1⅝ pp. 40c.

104—Priming the Shot. Coll. Engr., May, 1914; ¾ p., illus. 35c.

105—The Use of Fuse and Detonators in Wet Blasting Operations. Clarence Hall. Eng. Mag., May, 1914; 4¾ pp., illus. 35c.

BRIQUETTES

106—Fuel Briquetting in 1913. Edward W. Parker. U. S. Geol. Sur., 1914; 5¼ pp.

COAL DUST

107—A New Method of Treating Coal Dust. Iron Coal Tr. Rev., Apr. 10, 1914; ⅝ p., illus. 40c.

108—Coal Dust Experiments at Tirpentwys Colliery. Coll. Guard., Apr. 3, 1914; 1¼ pp., illus. 40c.

COKE

109—Notes on the Utilization of Coke-Oven and Blast-Furnace Gas for Power Purposes. Heinrich J. Freyn. Bull. A. I. M. E., April, 1914; 28¼ pp. 40c.

172—Modern Coal- and Coke-Handling Machinery. (Paper by J. E. Lister read before the March meeting of the Sheffield Univ. Gas and Coke-Oven Students' Assn.) Gas Wld., Apr. 4, 1914; ½ p. 40c.

RESCUE, SAFETY APPARATUS

173—Training of Rescue Brigades at the North Staffordshire Coal Owners' Central Rescue Station at Berry Hill Colliery. (Paper read by G. H. Greatbatch at the meeting of the No. Staffs. Inst. of Min. & Mech. Engrs.) Coll. Guard., Apr. 9, 1914; 1⅓ pp. 40c.

174—Self-Rescuing Apparatus. Coll. Engr., April, 1914; ⅔ p., illus. 35c.

SHAFTS, SHAFT SINKING

175—Deepening a Shaft by a Rise Method. (Paper by H. B. Pilkington read before the Manchester Geol. & Min. Soc.) Coll. Guard., Apr. 9, 1914; ¾ p. 40c.

176—Proof of the Western Boundary Fault at Holly Bank Colliery. (Paper read before the So. Staffs. and Warwickshire Inst. of Min. Engrs.) Iron Coal Tr. Rev., Apr. 24, 1914; 1¾ pp. 40c.

177—Sinking Through Eleven Fathoms of Difficult Surface at Shettleston Colliery. (Paper by J. Wilson read before the Scottish Federated Inst. of Min. Students.) Iron Coal Tr. Rev., Apr. 3, 1914; 1 p., illus. 40c.

178—Shaft Sinking in the Central Albertan Coal Field. E. I. Roberts, Bull. Can. Min. Inst., February, 1914; 12 pp., illus.

179—Sinking and Equipment of Blairhall Colliery, Fife. (Paper by A. M. Russell read before meeting of Min. Inst. of Scotland.) Iron Coal Tr. Rev., Apr. 17, 1914; ½ p. 40c.

POWER, STEAM ENGINES AND BOILERS

180—Anthracite Colliery Boiler Plants. (Describes how, by the use of modern boilers equipped with proper auxiliaries, the cost of steam at boiler plants may be reduced 60 per cent.) J. F. McMahon. Coal Age, Apr. 25, 1914; 4¼ pp., illus. 10c.

181—Burning Pulverized Coal and Oil Mixed. Alex. Traudt. Iron Age, Apr. 23, 1914; 1¼ pp., illus. 30c.

182—Purchasing Boilers—I. J. E. Terman. Power, May 5, 1914; 2 pp., 15c.

183—The Application of Central-Station Power to Coal-Mining Work. Thos. R. Hay. Penn. State Min. Quart., April, 1914; 15 pp. 35c.

184—The Utilization of Exhaust Steam for Collieries, Ironworks, Etc., and the Cost of Electric Current Generated. (Paper read by W. C. Mountain before the No. of England Inst. of Min. & Mech. Engrs.) Coll. Guard., Apr. 9, 1914; 1 p. 40c.

185—Transmission of Power by Manila Rope. Reginald Trautschold. Power, May 12, 1914; 4 pp., illus. 15c.

186—Unmarketable Coal Used for Generating Electricity. Elec. Wld., May 9, 1914; 5½ pp., illus. 20c.

187—Working Up a Boiler Test. F. R. Low. Power, Apr. 28, 1914; 3½ pp. 15c.

SIGNALING

188—A New Signal Apparatus. Francis P. Mann. Eng. & Min. Jour., Apr. 18, 1914; 1½ pp., illus. 25c.

189—The "Tangent" System of Visual Signaling. Iron Coal Tr. Rev., Apr. 24, 1914; 1¼ pp., illus. 40c.

190—Wood's Signal Indicator. Iron Coal Tr. Rev., May 1, 1914; ½ p., illus. 40c.

TRANSPORTATION

191—Largest Coal-Handling Plant in the World. Iron Age, May 7, 1914; 2½ pp., illus. 30c.

192—Marketing Conditions at New Orleans. Paul Wooton. Coal Age, Apr. 18, 1914; 1¾ pp., illus. 10c.

193—Transportation of Coal Over the Virginian and C. C. & O. R.R. Ry. Age. Gaz., 7½ pp., illus. 25c.

TIMBERING, PACKING, ETC.

194—Overcasts and Stoppings in Mines. A. W. Hesse. Coal Age, May 2, 1914; 1½ pp., illus.

195—The Injection of Cement Grout Into Water-Bearing Fissures. Francis Ronaldson. Bull. A. I. M. E., January, 1914; 3 pp.

VENTILATION

196—Bristol's Pneumatic Type Recording Tachometer. Coll. Engrs., April, 1914; ¾ p., illus. 35c.

197—Safety Air Doors for Coal Mines. (Paper read by James Ashworth before the Manchester Geol. & Min. Soc.) Coll. Guard., Apr. 9, 1914; ⅓ p. 40c.

WORKING OF MINERALS

199—Coal-Mining Practice in District VIII (Danville). S. O. Andres. Ill. Coal Min. Investigations. State Geol. Sur., Bull. 2; 40 pp., illus.

200—Longwall in Seams Liable to Spontaneous Combustion. J. E. Spicer. Coal Age, Apr. 25, 1914; 1 p., illus. 10c.

201—Methods of Working, Ventilation and Transportation in Bituminous Coal Mining. (Lecture delivered by Thos. A. Mather before the Min. Soc.) Penn. State Min. Quart., April, 1914; 10 pp. 35c.

202—Machine Mining in Room Pillars. J. C. Edwards. Coll. Engr., May, 1914; 3⅔ pp., illus. 35c.

203—Problems Encountered in Kentucky Coal Mining. (Abstract of paper by N. G. Alford read before the Ky. Min. Inst., Dec. 8, 1913.) Coal Age, Apr. 25, 1914; 2½ pp., illus. 10c.

Hauling Loaded Trip at Crescent Mine of M.R. C.C.Co., California, Pa.

Gathering Locomotive in Mine of Logan Mining Co., Menbar, W. Va.

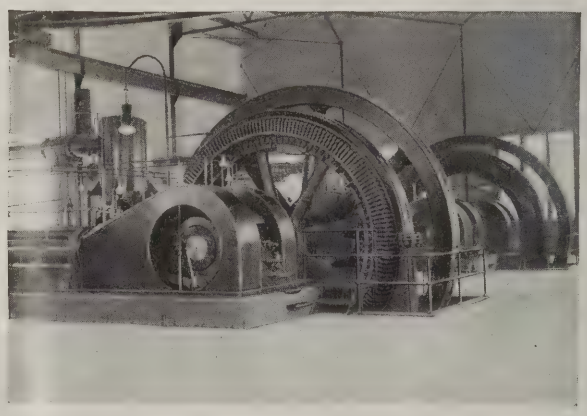
This is an end view of a Westinghouse Electric Synchronous Motor. It is interesting to mining men because these motors provide

The Most Satisfactory Drive for Air Compressors

They can be direct-connected to the compressor and hence **cost less to install** than belted drives and require less floor space. Belt maintenance expense and transmission losses are eliminated.

The first cost is about the same as for other types of drive for compressors of 1000 cubic feet per minute capacity. For larger sizes, it is less.

The efficiency is higher than that of any other type of drive and the high power factor at which these motors can be run improves the operating characteristics of the entire circuit.



The great reliability of these motors is proved beyond all question by successful installations in all parts of the country.

Send for full description of these motors.

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Pages* 833-834

The Colorado Strike and the Press. A résumé of events in the trouble zone. It is suggested that the press of the country at large has been unfair in its treatment of the situation, suppressing such important facts as those brought out by the investigation of the military committee. COAL AGE, Vol. 5.

*ELECTRICITY IN COAL MINING—II: *Pages* 835-836

This is the second article of the series on this subject. The distinction between alternating and direct current is here made, and the explanation given of how Ohm's law must be varied to meet the conditions of impedance. David R. Shearer. COAL AGE, Vol. 5.

CARBIDE LAMPS FREED FROM SUSPICION: *Page* 836

IS HOOKWORM RIFE IN WEST VIRGINIA: *Page* 837

*NOTES ON AUSTRALIAN COAL MINING: *Pages* 838-840

Description of some government-owned mines in Australia. Modern equipment is used throughout. The unusually irregular character of the coal has caused serious difficulties in mining although the introduction of machines has greatly reduced costs. Frequent rolls in the bottom make it necessary to operate the machine in benches. Matt Brodie and P. T. Milligan. COAL AGE, Vol. 5.

CONSTRUCTION AND OPERATION OF MINE SUBSTATION: *Pages* 841-842

Substations, when possible, should be located on the surface, because if located underground, there is danger from fire, dampness weakens insulation and causes corrosion of metallic parts. Underground substations are more costly to construct than those located on the surface as the mine roof is weak and should be arched or built of heavy concrete, the station being made fireproof throughout. H. Booker. COAL AGE, Vol. 5.

SURVEYING METHODS OF THE MADISON COAL CORPORATION: *Pages* 843-845

Typical surveying practice in the Middle West. Some important notes regarding the relative accuracy required under varying conditions are given. Both inside and outside methods are described, together with office computations and map work. G. E. Lyman. COAL AGE, Vol. 5.

EXAMINATION QUESTIONS WITH ANSWERS: *Page* 863

COAL AND COKE NEWS: *Pages* 864-867

RECENT LEGAL DECISIONS: *Page* 845

*THE EXPLOSION AT ECCLES, W. VA.: *Pages* 846-850

A well conducted mine with men both in charge and at work having a more than usual sense of responsibility blows up at Eccles, Raleigh County, W. Va., killing 180 men. The company operating was strict in its discipline and careful in its management. Operating changes are described which will make the mines safer in the future. R. Dawson Hall. COAL AGE, Vol. 5.

THE COLORADO STRIKE: *Pages* 851-852

A brief account of the disarmament in Colorado, the court-martial of Major P. J. Hamrock, the arrest of the Hecla rioters, the voting on the million-dollar appropriation for the payment of the militia and the plans for the reconstruction of the Ludlow camp. COAL AGE, Vol. 5.

EDITORIALS: *Pages* 853-854

The Pioneer Sentiment—When Should Rescue Work Be Abandoned—Why Some Operators Fail—A Trust in Virtue—The World's Coal.

SOCIOLOGICAL DEPARTMENT: *Pages* 855-858

*The Membership of the American Mine Safety Association—*Meeting of the Kentucky Mining Institute.

DISCUSSION BY READERS: *Pages* 859-861

*Explaining an Extraordinary Experience—Safety or Refuse Chambers in Mines. Letter No. 4—The Mine Foreman. Letters Nos. 5 and 6.

*STUDY COURSE IN COAL MINING: *Page* 861

INQUIRIES OF GENERAL INTEREST: *Page* 862

Effect of Short-Circuiting Air on Speed of Fan—A Checking System for Coal Loaded by Miners.

You Readers Should Know This

The Weekly Ad-Talk Page

Big efforts are being made; important steps are being taken by technical-paper publishers to make sure that you get the very best, cleanest, most honest, most valuable papers that can possibly be made.

The latest move in this direction was made the other evening by the New York Trade Press Association when it adopted the following standards of practice:

1. To consider, first, the interests of the subscriber.
2. To subscribe to and work for truth and honesty in all departments.
3. To eliminate, in so far as possible, his personal opinions from his news columns, but to be a leader of thought in his editorial columns, and to make his criticisms constructive.
4. To refuse to publish "puffs," free reading notices or paid "write-ups;" to keep his reading columns independent of advertising considerations, and to measure all news by this standard: "Is it real news?"
5. To decline any advertisement which has a tendency to mislead or which does not conform to business integrity.
6. To solicit subscriptions and advertising solely upon the merits of the publication.
7. To supply all advertisers with full information regarding character and extent of circulation, including detailed circulation statements subject to proper and authentic verification.
8. To co-operate with all organizations and individuals engaged in creative advertising work.
9. To avoid unfair competition.
10. To determine what is the highest and largest function of the field which he serves, and then to strive in every legitimate way to promote that function.

These are the accepted "Ten Commandments" of your paper.

They help to show why it is that you readers can place so much dependability on the reading and the advertising pages of your paper today.

COAL AGE

Vol. 5 NEW YORK, MAY 23, 1914 No. 21

The Colorado Strike and the Press

The venality of the public press has rarely been more clearly exhibited than in its treatment of the Colorado strike. We do not refer to its editorial utterances because it is hard for a paper which is not published for the capitalist to side openly with him, for while he and his sympathizers purchase single copies of the newspapers, his enemies and contemners, being many, purchase perhaps twenty. The press is content to follow its readers and refuses to lead.

But surely while hiding its personal feelings in the editorial columns in the hope of extending circulation, the press should have been willing to enter on the less dangerous policy of publishing the report of the military committee. Had it been a contemptible, driveling defense of the militia, it might have been condemned for partisanship; had it been a dry, uninteresting report, it might have been passed over as of no moment, but its fairness stamps it as a document not to be disputed, and its treatment and subject mark it as a news item not to be despised.

We shall however speak solely of its fairness and not of its dramatic interest. It declares that the militiamen should be court-martialed, that Lieutenant Linderfelt, while an experienced soldier, was an inexperienced sociologist, wholly tactless in his treatment of both mine guards and strikers, that he struck Tikas over the head with the stock of his gun so severely as to break that weapon, that the same man Tikas and two others while attempting escape were shot down most probably by the militia.

The commission also declares that the militia fired on some of the foremost tents in the colony, and that the Ludlow camp was burned and looted by the parties which invaded it. It condemns the operators for introducing "ignorant, lawless and savage South European peasants," though how it can be a crime to hire men which the nation permits to enter at its ports we cannot see. The report also refuses to enter into the relative merits of the controversy between operators and miners.

In fact if the report is in any way *ex parte*, its authors may be credited as having been so upright that they leaned backward in their desire to avoid even the slightest suggestion that their report was dictated by either the militia or the operators. Major Edward J. Boughton, the head of the commission, is a lawyer of high standing, and his findings stamp him as just and impartial.

However, out of all the findings of his committee, only the most unfavorable of the statements we have mentioned have been published by the Eastern press. Others which we quoted last week have been entirely ignored. Had they been printed they would have created an entirely different view from that now current.

The attack on the militia did not start till the soldiers had impatiently watched the riflemen of the colony take up a position of advantage in a railroad cut. The enlisted men bitterly resented the forbearance of their leaders which permitted the gunmen of the camp to pass unmolested across an unprotected area to a position of such strength, and to open battle at their convenience. But those leaders had determined to wait till the strikers attacked and it was only when these men driven from the cut returned to the colony that the fire was directed toward it and then only at the first line of tents.

The burning of the colony, the clubbing of Tikas, the firing on the escaping men followed

only after Martin, one of the militiamen, had been found brutally mutilated and the fight had been waged for many hours. The single non-combatant killed by a bullet was the boy Snyder, and his own father is said to have declared that the child met his death at the hands of strikers and not of the militia.

Tikas was struck by Linderfelt in an altercation and shot at a distance as he was escaping to the colony. Yet his death and that of the other prisoners should certainly be investigated, and it appears unlikely that Linderfelt's violence to Tikas can be completely exonerated.

The military commission declares that many of the bullets of the strikers were made poisonous by the insertion of verdigris. Blood poisoning invariably follows wounds made with such projectiles. The report denies that any of the persons attacking the colony used explosive bullets. It states that the cupronickle jacketed bullets used in the present Springfield rifle make a noise in passing through the air resembling that of an explosion and can easily lead inexperienced spectators to think that the bullets are of the explosive type.

Are we not justified in regarding the bloodshed in Colorado as an aftermath of the Balkan and Italo-Turkish wars? Disbanded soldiers are always dangerous and the Ludlow camp was largely populated with such men. The report says:

> The colony numbered hundreds of people of whom only a few families were American. The rest consisted for the most part of Greeks, Montenegrins, Bulgars, Servians, Italians, Mexicans, Tyrolese, Croatians, Austrians, Savoyards and other aliens from the southern countries of Europe. We are credibly informed that within the colony 22 different tongues were spoken.

There are natives of all countries and races on whom every reliance can be placed, but in view of the stories of the murders, maimings and outrages, almost beyond belief, which followed the Balkan war and caused the appointment of an international board of inquiry, we feel it is but just to give the defenders of American people and American property a fair and unbiased hearing when warring with such races, to suppress nothing which is in their favor and to extenuate nothing which their enemies have done.

If the press on all occasions takes the view that our native-born are always and unalterably wrong, we make our history a lie and our future a misgiving. True; there has been some misdoing on the part of the mine guards and militia; fire has been met in part by fire, such men as were available for defense were hired and some have not always been as well disciplined as the best of regulars. But on the whole we cannot find reason for any general censure of the organization faced as they were by such conscienceless foes.

Sometimes they thought when men came from a camp with arms in their hands and began to fire on them from trenches that they were really in the presence of war and fully justified in using their weapons in actual defense and attack as well as in drill and target practice.

It is not those men who should bear the main brunt of our condemnation, but these aliens who have brought us a new glimpse of the Middle Ages and have disgraced our orderly civilization by their unwonted crimes.

So prone are we today to expect of soldiers a high standard of humanity, whereas we demand little or nothing from the immigrants who come to us from southern Europe, that even we, in preparing this editorial, have given undue prominence to the weaknesses of the former parties and passed over, as to be anticipated, the violence and savagery of the latter.

Who were armed without justification? Who delivered the attack? Who fired the first shot? Who drew the fire toward the shelter pits in which other men in the camp had concealed their women and children? Who refused to rescue these victims? Who mutilated Martin, Hockensmith and Chavez? Who used poisoned bullets, tied Heno to the floor and set the house afire? Who avenged themselves on the helpless mules of the operators? Who stretched wires to trip the horses of the militia when there was no fighting in progress? Who destroyed nine mine plants? Those whose violence has caused the United States army to enter the field.

And now lest these aliens with dripping fingers resent our action, we disarm the coal company guards before compelling the foreigners to surrender their weapons. And we deny to the operators the right to hire men and heap upon them every possible obloquy.

This is the land of the immigrant; truly our neuroticism gives him preference over the native born.

Electricity in Coal Mining

By David R. Shearer*

SYNOPSIS—This is the second article of the series on this subject. The distinction between alternating and direct current is here made and the explanation given of how Ohm's law must be varied to meet the condition of impedance.

An alternating differs from a direct or continuous current in that the voltage and current periodically rise to a maximum value then fall back through zero to a maximum negative value then rise again back to zero, thus repeating indefinitely. The entire period from zero through a positive value, back through zero to a negative value and then to zero again represents what is known as a cycle. The number of cycles occurring during one second and is technically spoken of as the frequency of the system. The most usual frequency is 60 cycles per second or as a cycle is two alternations, 7200 alternations per minute, although for power purposes frequencies are in use as low as 15 cycles and some years ago a lighting frequency as high as 133 was not uncommon.

Represented graphically, a direct current would appear

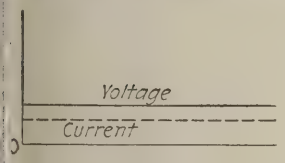

Fig. 1. Direct Current at Constant Load

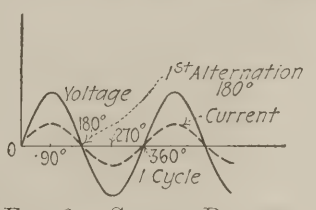

Fig. 2. Single-Phase Alternating Current

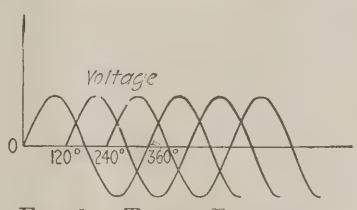

Fig. 3. Three-Phase Alternating Current

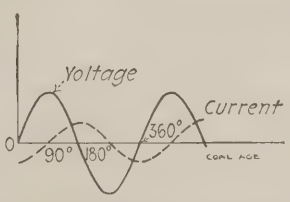

Fig. 4. Current Lagging behind Voltage

as in Fig. 1 when delivering power to a constant load. Alternating current would appear as in Fig. 2 under the same conditions and when the voltage and current are in phase or reach maximum values at the same instant. A curve, such as is shown in this figure, is known as a sinusoid or sine curve.

For more complete understanding of the fundamentals of alternating current, the reader is advised to consult some theoretical work on this subject.

The alternating current represented in Fig. 2 is known as a single phase but if two or more sets of waves are superimposed as in Fig. 3 the current becomes polyphase. The most usual of the polyphase currents is three phase, a voltage wave of which is represented in Fig. 3.

In referring to the voltage and current of an alternating circuit, we do not mean the maximum or peak value of either but the effective or virtual values; that is, a voltage or current equivalent to a direct voltage or current of the same effective values or as an example, if a certain voltage is required to burn a given lamp to a certain value and intensity, we speak of an alternating-current voltage of the same value when it burns the same lamp with the same degree of brilliancy. These values are really the square roots of the mean squares of the ordinates of the current and voltage as outlined graphically.

*Knoxville, Tenn.

The Modification of Ohm's Law

Alternating, like direct current, may be calculated from Ohm's law but this law is altered by the addition of other factors which affect an alternating circuit but not one carrying direct current. Resistance to the flow of a direct current is made up of one factor only, the resistance of the wire forming the circuit, but when we come to consider resistance to an alternating current, we find it composed of two factors, the wire resistance or R that we found in direct-current calculations and in addition another form of resistance known as reactance which is caused by a counter voltage induced by the alternating current itself. This combined effect is known as impedance and is represented by

$$\sqrt{R^2 + r^2}$$

where

r = reactance;

and

R = ohmic resistance.

In direct-current calculations the wattage or power of a circuit was equal to the product of volts by amperes as $I \times E$. This is also true of a single-phase alternating current when the voltage and current are in phase or when they reach a maximum and zero point at the same instant. This will always be the case in an alternating circuit when the load is composed of resistance only, such as incandescent lamps or heating devices depending on ohmic resistance for their operation. However, if the circuit contains reactance, the current wave tends to lag behind the voltage wave as in Fig. 4. In this case, the current is said to be lagging and the power becomes less than the volts multiplied by amperes.

The percentage of true power to apparent power is known as the power factor. Thus, the power factor or

$$PF = \frac{true\ power}{apparent\ power} \text{ or } \frac{wattage}{I \times E}$$

As every circuit contains some reactance, we rarely find the power factor unity or 100 per cent. and if the entire load is inductive, such for instance as induction motors, it frequently drops to 70 per cent. or even to 60 per cent.

The lag in degrees, when a cycle is considered as 360 degrees, is usually represented by the Greek letter ϕ, in which case the power factor may be represented by Cos ϕ.

We find from the foregoing that the power in a single-phase circuit may be calculated as follows:

$$I \times E \times Cos\ \phi$$

In a similar manner, the power in a two-phase circuit and in a three-phase circuit are:

$$\textit{two-phase, wattage} = I \times E \times 2 \times PF$$
$$\textit{three-phase, wattage} = I \times E \times 1.73 \times PF$$

Alternating Current May Be Transformed

Alternating current, unlike direct, may easily be transformed from one voltage to another by means of static transformers and for this reason is used extensively, as the current may be generated at a low voltage and transformed to a much higher one for transmission over long distances, then transformed or stepped down to a working voltage again. The reason for this may be seen readily if we consider Ohm's law, since the wattage or power $I \times E$ remains constant, if we double E we divide I by 2 and have the same amount of power. Now, if we take half of I we may also reduce the capacity or size of our transmission wire by one-half.

From this relation, it may be seen that theoretically, we might transmit thousands of horsepower over a very small wire if the voltage was sufficiently high. In actual practice, an alternating current is usually generated at 2300 volts and is distributed throughout a town at this pressure. Wherever lights or power are needed, a transformer is installed reducing this voltage to either 110 or 220 and correspondingly increasing the current.

When it is necessary to transmit alternating current over long distances, we find that 2300 volts is not sufficiently high to obviate a large amount of drop in the wires. Therefore, it is necessary to raise the voltage to a point somewhere between 13,000 and 160,000, depending on the distance to be covered and the amount of power to be transmitted. Another factor in favor of high voltage is that a given drop in potential when deducted from a low working pressure is much more serious than when taken from a higher voltage. For instance, 10 volts dissipated in a 100-volt circuit is 10 per cent. loss while the same drop in potential in a thousand-volt circuit is only 1 per cent.

From the foregoing sketch of the characteristics of an alternating current, we see many factors in favor of its use and in fact we find alternating current plants making their appearance in mining operations even in the smaller sizes. The special features of this type of plant will be considered in a subsequent article.

Visit of J. Taffanel

J. Taffanel, mining engineer, former French inspector of mines, and now the director of the French mine experiment station at Liévin is the guest of the U. S. Bureau of Mines, and is collaborating with George S. Rice, the chief mining engineer, and others of the staff of the bureau in special tests at the experimental mine near Bruceton, Penn. Mr. Taffanel is known internationally for his original investigations of coal-dust explosions and the means by which they may be prevented.

He arrived in New York from France on Apr. 12, and proceeded immediately to Pittsburgh, where he has been busily engaged in the mine experiments and in studying the records of past tests at the experimental mine. Mr. Taffanel also went with Mr. Rice to Eccles to assist in his investigation. In 1907, on behalf of the French Association of Coal Operators, which had established the Liévin Station as a result of the great Courrières disaster of 1906, he came over to investigate the Monongah disaster. While here he studied on the ground the Darr and Naomi mine explosions. He has also investigated the important British mine disasters of recent years, including those in the Hulton and West Stanley collieries and the recent disaster at the Universal mine, Senghenydd, South Wales.

Besides investigating and testing safety lamps, explosives and mine-rescue apparatus at the Liévin Station, Mr. Taffanel has an organized crew of rescue men ready to assist at any mine disaster in Northern France.

In response to inquiry, Mr. Taffanel said:

I came to this country to study in collaboration with the Bureau of Mines and Mr. Rice some questions concerning the dangers of coal dust and the removal of the risk resulting from its presence.

I began to experiment on this subject in 1907, when the Coal Mine Owners' Association of France decided, some months after the Courrières Disaster, to organize the experimental station at Lievin. I have made up to the present more than 1400 explosions in the experimental gallery and collected many data concerning the relative danger of many coal dusts or coal and stone-dust mixtures. Although the experiments have been made on a big scale, in a gallery 1200 ft. long, the experiments at Liévin do not imitate exactly the mine conditions, and the results must be checked by means of comparative tests in an actual working.

I made such experiments last year, in an abandoned passageway of the Community mine, in France, but was obliged to stop after an explosion which destroyed a part of the passageway. Two months from today I will make tests of the same kind in another abandoned French mine at Montvicq. In the meantime, I was glad to be invited by the Bureau of Mines to follow the experiments in the Bruceton mine, which is perfectly equipped for such experiments.

I find a great profit in studying the important results obtained in this mine by Mr. Rice. Moreover, the experimental comparison of the Liévin and Bruceton results is doubly important, as it gives a confirmation of the Liévin determinations under the real mine conditions. We are able to combine the many data obtained at Liévin with those secured in the Bruceton mine.

Some years ago I designed the first form of arresting barriers, and these have proved, in many tests, to be effective for stopping coal-dust explosions. About a year and a half ago, I began studying new forms of arresting barriers, i.e., tanks or boxes, containing a great quantity of extinguishing materials, water or stone dust, and automatically opened by the air wave preceding the flame. Mr. Rice has followed allel studies and we find much profit in collaborating for the improvement of these devices.

The coal-dust danger forms a difficult problem and one of international interest. All countries which have undertaken to minimize this great danger must unite their efforts for meeting it as effectually and speedily as possible.

Carbide Lamps Freed from Suspicion

Gas and dust was the cause of the explosion which resulted in the death of Frank Hora at the Wheeling Creek (Ohio) mine of the Lorain Coal & Dock Co. at 2 o'clock, Jan. 27, 1914.

It was at first supposed that the residue from carbide lamps had caused the explosion; some of this residue was found in breakthrough 5, about 150 ft. from the center of the explosion. As a preliminary, pending the investigation, a temporary order was issued forbidding the miners of Wheeling Creek mine to use carbide lamps. The local Union passed a resolution demanding a thorough investigation and refused to go to work unless allowed to continue using carbide lamps.

In the meantime, Chief Mine Inspector Davies, Deputy Inspector Gaffney, together with Safety Commissioner of mines, Roan, of the State of Ohio, aided by other deputies, officials and experts were making a most searching in-

vestigation. It was soon demonstrated that as the residue left by the carbide lamps is merely slacked lime, it could therefore not be considered as a cause and it was proved conclusively that even had there been fresh carbide in the breakthrough, it could not have had anything to do with the explosion as the breakthrough was dry.

Carbide will not give off sufficient gas, when exposed to the air, to cause an explosive or even an ignitable mixture unless brought in contact with actual water. The moisture in the air is not sufficient to make enough acetylene to ignite. There can never be an accumulation of gas produced from carbide by moist air for the obvious reason that in order to produce gas, any air which has given up its moisture to produce acetylene must move on and the acetylene goes with it. The careful investigation of the location of the carbide residue showed that as a matter of fact, this residue was shut off from the butt entry in which the explosion occurred by a substantial brattice, the residue being located within 3 ft. of the adjoining butt entry in breakthrough 5, and as before stated with a brattice between it and the butt entry in which the explosion occurred.

Order Forbidding Lamps Was Rescinded

When these facts became apparent, a meeting of the Local Union was called. The order prohibiting the use of acetylene was rescinded by the chief mine inspector, his deputies and the safety commissioner. This action resulted in great relief and satisfaction to all concerned. The investigation into the actual cause of the explosion continued. The work of the Ohio mine inspectors and the safety commissioner was supplemented by an investigation conducted by J. W. Paul of the U. S. Bureau of Mines. It was found that the explosion was caused by an accumulation of methane (firedamp) intensified by dust.

The thoroughness with which the Ohio officials have gone into the matter is indicative of the fact that that state has a very effective mine-inspection department, headed by Chief Inspector Davies. The new Safety Commissioner of Mines, J. M. Roan, was also tireless in his efforts to ascertain the real facts in the case.

Is Hookworm Rife in West Virginia?

As a result of the circulation of a letter from one of the officials of the United States Public Health and Marine Hospital Service to a physician in this state, to the effect that the hookworm disease is prevalent in the southern portion of West Virginia, Governor Hatfield has ordered the bacteriological department of the State University to go to the Pocahontas field and make a rigid investigation. The governor is indignant at the report and declares it is not true.

A little over a month ago, Dr. C. W. Stiles, the zoologist of the Federal Public Health Service wrote a communication, in which he declared that the hookworm was epidemic in the Pocahontas field and that the presence of this disease so generally there was due to the unsanitary conditions of the mining communities.

This matter was brought to the attention of the governor, who declined at first to believe that Doctor Stiles ever wrote any such letter. Later he learned that Doctor Stiles had made a similar report to the officials at Washington. Then he decided to act promptly and he made arrangements for the immediate dispatch of the bacteriologists to McDowell and Mercer Counties.

Declaring that he had practiced medicine in that section of the state for some years, and that he was more or less familiar with sanitary conditions, the governor did not hesitate to say that the report to the Federal Bureau and the statements contained in the Stiles letter were untrue.

But the chief executive did not rely upon his own knowledge. He communicated at once with the leading physicians in the Pocahontas field and asked them for information. The physicians in question and coal operators, with whom the governor had also communicated, began an investigation. A special meeting of the McDowell County Medical Society was called and held at Welch. At this meeting the doctors from the various mining communities of the county reported on conditions in their camps and as a result of these reports resolutions were adopted denouncing the hookworm statements.

In his letter Doctor Stiles said in part:

> I took a trip through the Pocahontas coal-mining region, in West Virginia, on one of the mine-rescue cars sent out by the United States Government. In brief, I found hookworm practically in every place that I visited, but, in general, the clinical appearances were not so marked as in some other portions of the South. The general sanitation of the mining district is very favorable to the development of the hookworm disease.

Some of the physicians worked with Doctor Stiles on his trip through the Pocahontas field. Among them was Dr. C. F. Hicks, superintendent of Miners' Hospital No. 1, at Welch. Doctor Hicks wrote to Governor Hatfield that he had gone through the district with Doctor Stiles. He declared that the Government expert was in the field only two days and that he helped him make tests. Twenty-five tests were made on patients in the hospital the first day and not a single germ of this disease was found. The next day Doctor Stiles visited coal mines in three communities in that section of the state and made a number of tests and found trace of the disease in only one test.

Doctor Hicks declares that Doctor Stiles expressed himself somewhat surprised at not finding traces of the disease and further informed the West Virginian that he believed plenty of the disease was there.

The operators engaged physicians to make reports on the sanitary conditions of the various mining camps and the governor ordered the staff from the State University. The operators have informed the governor that if the disease is there they will do everything in their power to stamp it out. Through their medical staffs the operators keep in close touch with the sanitation of their camps and are careful that the surroundings are healthful.

Governor Hatfield is emphatic in his declaration that the hookworm reports are slanderous to the state and he has ordered the scientists from the university to show just how groundless the reports are. Wherever persons are found to be suffering with the hookworm they will be treated. The governor is confident that only sporadic cases will be found.

By using high boiler settings and by bringing the furnace forward, provision is made for complete combustion before the gases reach the cool surfaces of the boiler. Thus smoke, soot and carbon monoxide are reduced, and more heat obtained. But the larger furnace needs adequate protection against heat radiation and air leakage and inspiration, or as much loss as gain will arise from the improved construction.—Bromley in "Power."

Notes on Australian Coal Mining

By Matt Brodie and P. T. Milligan*

SYNOPSIS—Description of some government-owned mines in Australia. Modern equipment is used throughout. The unusually irregular character of the coal has caused serious difficulties in mining, although the introduction of machines has greatly reduced costs. Frequent rolls in the bottom make it necessary to operate the machine in benches.

At Wonthaggi, Victoria, Australia, the state government owns and operates extensive coal mines, which are under the direct management of the Railways Commission in that state. These mines were opened in 1909 and now rank third among Australian producers of coal. They have supplied nearly the whole of the fuel required by the State Railway for three years past.

Longwall Machine at Work

Note the irregular character of the seam, which is 3 ft. thick at the machine and thins out rapidly to 18 in. on both sides.

The state coal property covers an area of 5100 acres. About one-half of this has been very thoroughly prospected with diamond core drills, and has been shown to bear coal ranging from 2½ ft. to 6 ft. in thickness. The drills employed for this prospecting work were of the diamond core drill pattern, owned by the Victoria State Government, one of them being a class "H" 1000-ft. Sullivan Hydraulic cylinder machine. Since the beginning of this work, nearly 400 bore holes have been put down. During the two years ending June 30, 1913, 27,500 ft. of core borings were taken, in 104 bore holes, with an average depth of 264 feet.

The boring done during the last year proved that a lower seam of coal of workable thickness underlies a considerable area of ground north of the present workings. This discovery has increased the estimate of the quantity of coal, 30 in. thick and over, in the mine area, by some 1,500,000 tons, making a total estimated quantity in the area of 28,000,000 tons. Allowing 20 per cent. for loss in working, and deducting 1,434,000 tons, already extracted, the total still available for production is about 21,000,000 tons. The core borings are being continued to prove the remainder of the ground.

The report of George H. Broome, general manager at Wonthaggi, for the year ending June 30, 1913, has recently been received. It is very complete and a model for such reports. The balance sheet shows a net surplus profit for the year of about $207,000.

Six Hundred and Fifty Acres Developed

The present workings cover an area of about 650 acres, developed by twelve shafts, all of which work the origin-

*Australasia Chambers, Sydney, N. S. W.

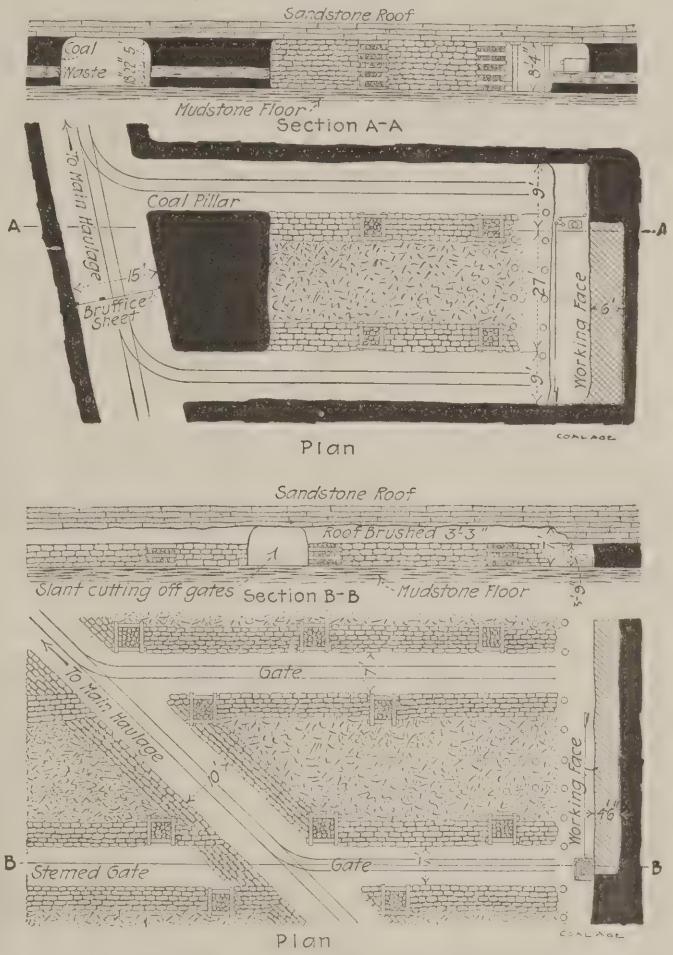
ally discovered or upper seam, which is about 235 ft. from the surface. The coal varies from 2½ to 6 ft. in thickness, and is irregular, the entire area being badly broken up by faults. The roof ranges from sandstone to soft shale, and even to material much broken and as soft as mud. The changes occur sharply, making the problem of mining and of sustaining the roof a difficult one.

The output of the mines is hoisted from three shafts, Nos. 5, 9, and 10. There is but one tipple and coal-handling plant; namely, the one at No. 5, which was enlarged during the past year to handle the entire output of the three mines. The coal from the shafts Nos. 9 and 10, some 450 ft. distant, is conveyed above ground to this point by means of an electrically driven endless rope.

The gross tonnage for the year was 462,588 tons. Of this amount, 258,249 tons were screened, 9239 tons unscreened, and 190,163 tons slack coal—a total of 457,651 tons shipped, of which all but 17,000 tons of screened coal was furnished to the State Government Railway. Ten thousand six hundred tons were furnished to various public departments and 171,000 tons of slack coal only were disposed of to the public. The average number of employees during the year was 939, comprising 468 coal miners, 250 other miscellaneous underground employees, and 221 surface men. The mine worked 260 days during the year, on a basis of two shifts.

The average earnings of the miners were $3.23 per day, after deducting the cost of explosives and light. There was but one fatal accident during the year, this being due to a fall of coal at the working face. Underground miners are paid chiefly on a tonnage basis.

Mining Methods



The accompanying illustrations show two typical methods of mining at Wonthaggi, although, as stated, the great irregularity of the seam makes it difficult to adhere to a given system, as the work progresses from one part of the mine area to another. The sketches show the characteristic methods of working at Nos. 9 and 10 shafts. At present, these two shafts are producing about one-half the output of the mine, and practically the whole of this coal is being mined by coal-cutting machines of the Sullivan electric room-and-pillar and longwall patterns. The upper sketch shows the method of working in No. 9 shaft, where the coal is about 6½ ft. high, with a 22-in. dirt band, 18 in. from the floor. As indicated, the method of working is by the "double stall," with stalls or rooms 42 ft. wide, and two gates, or, as they would be called in this country, room necks, with a track in each.

The coal is first mined with a Sullivan room-and-pillar machine, class "CE-7," on the top of the dirt band, the depth of undercut being six feet. The upper five feet of coal is then shot down and filled away or loaded. The dirt band is next lifted and thrown back into the gob; and lastly, the lower 18 in. of coal is raised and loaded out.

In No. 10 shaft working, where the coal is much lower, averaging about 3 ft. 9 in. in thickness, the longwall method is in vogue. A gate or entrance seven feet wide is provided every 33 ft. for handling the machine and loading out the coal, the space between being filled with packing to support the roof.

The broken nature of the seam is shown by the illustration of a Sullivan longwall machine in operation at No. 5 mine. Where the machine is, the coal is three feet high. A few feet away to the right and left, it is but 18 in. thick.

A new opening or slope, known as the McBride Tunnel, is being driven at a gradient of 1 in 5½, for the development of the area lying to the north of the present workings. It is now several hundred feet in from the entrance, and its object is to cut four successive downthrow faults in the present known seam. This will enable the coal to be extracted from four different levels

Sketches Show Two Typical Methods of Mining

in about three-quarters of a mile of tunneling. The objective point of the tunnel is the lower seam of coal mentioned above, in the northern portion of the area.

Surface Plant

The mines are equipped with the most up-to-date machinery, on the surface as well as underground. The total value of the plant is nearly one million dollars. Electric hoists are employed to raise the coal at the three working shafts. Electric power for the hoists, coal-mining machines, rope hauls, pumps, fans, etc., is generated from a central station, which includes a battery of eight boilers fitted with underfeed stokers for burning slack, two generating sets driven by reciprocating engines, and a horizontal turbo-alternator. Current is generated at 5200 volts. The electric power is distributed from this plant to the different mines, where transformers and rotary converters are located, for operating the coal-handling machinery, screen, hoists, tipples, etc.

At the Nos. 9 and 10 shafts a change house and bath rooms were provided for the workmen during the past

year. The building is of wood and corrugated-iron construction, with a concrete floor, and accommodates 400 men. Forty shower baths are provided, with an ample supply of hot and cold water. The workmen's clothes are dried by steam heat. They are attached to hooks, which are handled by chains passing over pulleys on the rafters, so that they may be raised into position for drying.

Mr. Broome's report for 1912 stated, in regard to the Sullivan coal cutters:

"These machines are working satisfactorily on the long-wall faces, where the coal is from 2 ft. 6 in. to three feet in thickness. Under these conditions, they are effecting a saving in cost of about one shilling per ton, compared with hand mining, and in addition to this, recent tests have shown a reduction of ten per cent. in slack, from the machine faces, which at the present selling price means an increase of over 5 pence per ton in the value of the product."

During that year three machines were in use, while the year ended June 30, 1913, eleven Sullivan machines were in operation.

In all, the Wonthaggi mine now owns about 25 Sullivan continuous coal cutters, of which 17 are of the long-wall pattern.

The 1913 report shows that these state-owned mines are hoisting 2200 tons per day of two shifts.

Mount Kembla Colliery

While there are many American coal cutters of the Sullivan continuous-cutting pattern, in use in the various Australian mines, the following mention is of particular interest, because the machines concerned are of the new alternating-current ironclad pattern. Three of these machines are in operation at the Mount Kembla colliery, South Coast, New South Wales, Australia. The average cutting of these machines is about five places per shift, including 5-yd. headings and 8-yd. rooms or bords. An interesting feature of mining at this colliery is that of cutting the coal on canches (benches). This is due to the frequency of rolls of hard stone in the floor of the mine. These rolls are ordinarily quite gradual, and it is customary to drive the rooms along the floor of the trough, causing the crest of the roll to come in a pillar wherever possible. Where the rolls are sharper, varying in height from 18 to 24 in. above the regular level of the floor, the canches are worked ordinarily about 30 in. above the bottom. The total thickness of the seam, it may be stated, is about 6½ to 7 ft. and it is nearly flat.

In order to operate on these canches or benches, the Sullivan ironclad machines are mounted on special trucks, raised to a height of 2 ft. 9 in. above the floor. These are built up by two pieces of 12-in. I-beams, placed horizontally between the wheel-base frame and the truck frame. The canches are carried about the depth of one machine cut, namely, 6½ ft. back from the face, so that when the coal is blasted down after undercutting, most of it remains on the canch, from which it is loaded direct into the mine cars, thereby saving the labor of lifting the coal from the floor to the top of the car. An individual miner can fill as high as 20 tons in a shift, off one of these benches.

Before the continuous-cutting Sullivan machines were installed, American breast machines had been tried and the greater length of these made it necessary to keep the canch or bench much farther back from the face than is now the case; namely, from 15 to 20 ft. It was, therefore, necessary to handle the coal twice; the face shovelers throwing it back to the edge of the canch, from which point it was loaded into the cars.

With the new alternating-current ironclad machine, the cutting speed in this mine averages 16½ in. per minute, and the average load taken is 40 amp. In some parts of the mine, where the rolls are gradual, the machine follows them, and the canch system is not necessary.

The ironclad machine is driven by a 30-hp., 3-phase, 440-volt, 60-cycle, squirrel-cage induction motor, with a star-delta controller for starting. The motor is gas proof. The advantages of using alternating current at this mine are enhanced by the fact that it is 2¼ miles from the tunnel mouth to the working face, so that much higher efficiency is secured in transmission than would be possible with direct current.

Meeting of Anthracite Section of A. I. M. E.

The Pennsylvania Anthracite Section of the American Institute of Mining Engineers held a meeting in the auditorium of the Lehigh & Wilkes-Barre Building, Wilkes-Barre, on Saturday evening, May 9. Douglas Bunting read a paper entitled "Mining under Heavy Wash." Following the reading of this paper, there was a discussion of the subject by Messrs. Hill, Stearns, Norris, Griffith, Engle, Smith, Otto and Foster.

It was the consensus of opinion of all the members present that the problem of mining coal under heavy wash is a matter of much interest to anthracite people, and is a subject that has not been developed in recent years to an extent its importance justifies.

At subsequent meetings of the Anthracite Section, further discussion of Mr. Bunting's paper will take place, and there is no doubt but that such a broad consideration of the problem will furnish the mining industry with much information of a practical and valuable nature.

At this same meeting, John M. Humphrey was to read a paper on "Stripping." Mr. Humphrey's absence through illness, necessitated the postponement of this latter paper.

The Anthracite Section of the A. I. M. E. is proving to be a healthy branch of the parent organization, and it is expected that this newly organized body of coal-mining men will accomplish much work of a beneficial and lasting nature.

Erratum

On p. 773 of our May 9 issue, a photograph was published, under which appeared the following caption: "These Four Strike-Breakers Were Killed the Day after Picture Was Taken." It seems that the photographer on the ground who secured the picture was either misinformed or deliberately misstated the facts in the case. One of the men in the picture, Evan Jones by name, writes us, stating that he is very much alive and that the only one of the four men who was killed was a blacksmith by the name of Newman. Mr. Jones says that he was not a strikebreaker, having been employed by the Rocky Mountain Fuel Co. as their mine examiner.

Construction and Operation of Mine Substations

By H. Booker*

SYNOPSIS—Substations, when possible, should be located on the surface, because if placed underground there is danger from fire, dampness weakens insulation and causes corrosion of metallic parts. Underground substations are more costly to construct than those located on the surface as the mine roof is weak and should be arched or built of heavy concrete, the station being made fireproof throughout.

There is a growing use of electricity in coal mines, especially during the last two or three years, due to the introduction of central-station power which, strange to say, can be sold to a coal mine cheaper than the mine can produce it itself.

The greatest care should be exercised in the introduction of electric power in a coal mine and the best advice should be obtained. Electric power improperly installed and not properly operated and maintained will no doubt prove a hazard and just such conditions are causing apprehension in some localities regarding the use of electric power in mines.

Does Not Pay to Install Poor Machinery

The danger and unsatisfactory service associated with electric power in the past, has been largely due to the short-sighted policy of the coal-mining companies in purchasing cheap equipment unsuited to the service and in employing incompetent labor. A coal mine is the last place where inferior or poorly designed electrical apparatus should be used, as the risk of trouble is too great.

Even with the best designed and adapted equipment the question of operation and maintenance is one which is often sadly neglected. The matter of compensation is often allowed to play too prominent a part, and the wages offered are such that it is impossible to obtain competent men who will take care of the plant and who will realize the importance of maintaining the apparatus in proper condition.

Rigid, systematic and careful tests should be made periodically on all moving parts of electrical equipment to insure proper operation and records kept of these tests for future reference.

Isolated Plants vs. Central Stations

Until quite recently the electric power in use at coal mines was produced by small isolated plants located at each mine. With the large increase in production and the combination of many small mines, the introduction of central plants and the purchase of central-station power is rapidly gaining ground.

The use of power from a central plant, or of purchased power, requires a substation to supply direct current to operate the mine locomotives, cutting machines, underground pumps and lights. A mine substation, in general, consists of one or more motor-generator sets or synchronous converters used to transform high-voltage alternating-current power to direct current at 250 or 500 volts.

The small isolated plant was generally placed near the mine mouth, provided the coal and water supply was convenient. As the capacity of the mine increased and the distance to the working face became greater the power conditions became unsatisfactory. An increase in the capacity of the existing plant often means a large expenditure of time and money, so that the purchase of central-station power and the installation of a substation offers the best solution. The substation can generally be placed at a more advantageous point than the isolated plant because a substation is independent of the supply of coal and water. An increase in power supply at any time can be easily and quickly provided at a low cost.

Substation Requires Little Care

Substations when properly designed and installed require little attention, and the attendant is needed only to reset circuit-breakers and to see that everything is running properly. If power is not wanted the machines can be cut out and all expense for current stopped. Starting up is a simple matter of closing a switch and full power is available immediately.

The combination of purchased power and the substation system of power distribution is most advantageous for coal companies operating single or widely separated mines. The operator transfers his responsibility to those whose business it is to carry it, leaving him free for his business of mining coal, thus relieving him of the worry and care of his power plant, and thereby greatly increasing the efficiency of his coal-mining department. The operator substitutes his power house with its engineers and firemen and its need for good and abundant water, with a small substation that requires only one attendant and no water supply.

Where Substation Should Be Located

The exact location of the substation is often a hard question to decide. Conditions frequently arise where it would be desirable to install the substation underground, but in general, unless absolutely necessary, the substation should be placed on the surface. The preferable location is at the mine mouth when possible, as it can then be attended by a workman who has other duties to perform. In a small mine the tipple foreman can attend to the station, while in a shaft mine the station should be located in the hoist room and kept in operation by the hoist engineer.

In a large mine requiring more than one station, all substations should be located at working centers to save the expense of heavy copper feeders. The substation can often be located near the fan so that the same operator can look after both. When the direct-current feed wires cannot be carried into the mine by one of the openings, boreholes can be used, as it is comparatively simple to maintain a 500-volt cable installed in a borehole.

*General superintendent of mines, Pittsburgh-Buffalo Co., 455 West Main St., Monongahela, Penn.

Note—Article read before the 293d meeting of the American Institute of Electrical Engineers, Pittsburgh, Penn., Apr. 10, 1914, under the auspices of the Committee on the Use of Electricity in Mines.

Keep Substations on Surface

There are many objections to locating the substation underground. Beside the danger from fire there is almost always much dampness underground which not only weakens the insulation, but causes corrosion of unprotected metallic parts. It is practically impossible to make an underground substation free from moisture, and sufficient ventilation is often difficult to obtain. A suitable current of air is important, for the heat losses in the apparatus must be carried away so that the capacity of the machines will not be impaired. That this heat is not negligible will be readily appreciated when it is considered that the loss of one kilowatt per minute is equal to 57 B.t.u., which is equivalent to heating about 3001 cu.ft. of air 1 deg. F. per minute. The total loss in a 200-kw. station will be approximately 15 kw. The heat generated will, however, help to keep the substation dry in conjunction with proper drainage and pumping.

Use Intake Air in Substation

All underground substations should be ventilated with intake air and all high-tension cables should, when possible, be carried to the substation in the intake airway. This may work a hardship, particularly if the mine is operated from a shaft and a blowing fan is used, as it is practically impossible to maintain wires in a shaft of this kind on account of the high air velocity. I know of mines of this type where it is unsafe for a man to attempt to ascend the stairway, much less do any work while the fan is in operation. Often much coal dust and pure sand are picked up by the air currents and play havoc with the bearings and oiling systems.

The cost of construction of an underground substation is considerably greater than that of such a building on the surface. Since there is always danger of the roof giving way, it should be arched or built of heavy reinforced concrete and the whole station made fireproof. For a 200-kw. substation the dimensions should not be less than 24x24 ft. and the height 12 ft.

Low-Tension Cables Are More Easily Maintained

With the substation located underground it is generally necessary to carry a high-tension cable through a bore hole. With the station located on the surface a low-tension cable suffices and it will be no trouble to maintain. A satisfactory method is to use "lead" covered cable attached to a messenger cable about every 30 ft. by wiped joints or suitable clamps, which will not injure the lead. The high-tension cable is difficult to maintain in deep shafts and boreholes.

Actual experience has taught me that it is impossible to get attendants underground to give machinery the same care they will give it on the surface. There is a greater tendency among men to sleep on the night shift in mines, than on the same shift outside. This may be due to the mine atmosphere, which is often contaminated with gas from gob workings.

In the general design and construction of a mine substation, economy of space should be given consideration, but care must be exercised to see that there is plenty of room for making repairs and replacements. A substation may be required to provide service for a few hours per day or practically without a break. As due provision must be made for inspection and repairs, it is evident that in case of continuous operation, attention must be given to the sectionalization of the apparatus and the duplication of the equipment.

As the consumer will naturally want to supervise the operation of his own station, it is evident that any complications in switching equipment and control apparatus should be avoided. The substation should be constructed of fireproof material, and all high-voltage apparatus should be inclosed to secure maximum safety to attendants. Asbestos lumber should be used for partitions and doors. This serves as a protection against shock and is valuable protection in case of fire.

The common faults in electrical installations of this kind are as follows:

Exposure of high- and medium-pressure conductors at the surface and high- and medium-pressure switching gear underground. The frames of high- and medium-pressure apparatus not properly grounded. (All machine frames should be well grounded.) Switches, cables, rheostats, starting boxes, etc., mounted on wood and surrounded by as much wood as possible. (Such defects in method cause first, a shock when somebody comes in contact with an exposed live part; second, fire due to defective joints in cables.) Omission of tubes, where frames of machines and brattices are pierced by cables.

Defects in Organization

The common defects of organization are as follows: The absence of trained electricians. The handling of live wires or apparatus for adjustment or repair when not absolutely necessary. The absence of a definite and distinct rule that unskilled men may handle electrical cables and apparatus only when the power is off.

The use of central-station power will no doubt bring the operating force at the mine in close touch with the central-station operating force which is always ready and willing to advise the coal operator in regard to his installation and operation.

It is to be hoped that improved legislation and a better coöperation between the mining companies and the Bureau of Mines will greatly increase the safety and improve the operating conditions in connection with the use of electricity in mines.

The World's Coal Production

Wm. G. Gray, statistician of the American Iron and Steel Institute, estimates the world's coal production for the years 1911 and 1912 as follows in metric tons, except where otherwise noted:

Countries	1911	1912
United States	†443,188,505	477,202,304
Germany and Luxemburg	234,521,254	255,810,094
Great Britain	†271,891,899	260,416,338
France	39,229,591	41,308,580
Belgium	23,053,540	22,972,740
Austria*	40,414,914	42,934,500
Hungary	9,444,741	9,587,276
Russia	28,007,239	30,641,163
Sweden	311,809	360,291
Spain	3,915,672	no statistics
Italy	557,137	663,812
Canada	‡11,323,388	14,512,829
Transvaal	†3,878,286	
Natal	†2,392,456	
India	†12,715,534	14,706,339
New South Wales	†8,691,604	9,885,815
New Zealand	†2,066,073	2,177,615
Victoria	†659,598	593,155

Surveying Methods of the Madison Coal Corporation

By G. E. Lyman*

SYNOPSIS—Typical surveying practice in the Middle West. Some important notes regarding the relative accuracy required under varying conditions are given. Both inside and outside methods are described, together with office computations and map work.

The mining operations of this company are conducted in widely separated coal fields, consisting of about four thousand acres each, it being about two hundred miles between the extreme territories. Each field is worked by one or two mines, and it is accordingly necessary to handle each by itself, it being impracticable, as well as unnecessary, to correlate the surveys of the different fields. Therefore, each has its own set of coördinates, base lines, etc., making each coal field with its own mines, a complete unit to itself.

All the mines are at present working in the No. 6 seam, which, with few exceptions, lies so nearly level that corrections for vertical angles are rarely required, the average grades being considerably under one per cent.

Maintaining a Consistent Standard of Accuracy

These conditions largely determine the methods necessary to attain the degree of accuracy desirable for the work. The fixing of such a standard is an important point, as otherwise a great deal of inconsistency will characterize different parts of the work. Nothing is more incongruous, as well as expensive, than the use of extreme refinement at one stage of the work, only to lose all benefit therefrom by subsequent looser work. If transits are used, reading down to a few seconds, temperature compensated-tapes and spring-tension handles should also be employed. Such refinement, however necessary in long tunnel and extended triangulation operations, and fascinating in itself to the engineer, is entirely out of place in the ordinary daily run of mine work.

In the routine work herein described, it has been the effort to confine errors to one in six thousand, and to keep all operations of the survey relatively consistent for the attainment of such results. Transits with plain verniers reading to single minutes are employed, which by interpolation can be read to the nearest half-minute, if desired. Ordinary traverse work is read to minutes. Tapes are graduated to single feet, and are used in lengths of 100, 200, and occasionally 500 ft. The first and last foot is graduated to tenths, and when necessary to measure to hundredths, a pocket scale can be used. Long distances are measured to tenths, shorter ones to hundredths. Office calculations are uniformly carried to hundredths. Adherence to these standards gives results often far within the permissible margin of error. Probably the only exception to the above routine is in shaft plumbing.

The surface survey consists primarily of a traverse of the land corners, with such supplementary work as necessary to locate streams, roads, railroads, buildings, and the other items which go to make up a complete topographic survey. Some of the surface is so level that sights of a mile may be readily taken, and in such cases a plain traverse survey gives good results. When it is too hilly, triangulation is resorted to.

Surface Monuments, Instrument Work and Chaining

Permanent surface monuments are established, consisting of iron pins set in concrete, and where practicable, three are used, so as to detect any disturbance in their angular relation. It is desirable that one of these permanent stations be set sufficiently close to the shaft to permit of its use in the shaft plumbing. Similar groups of monuments, established in outlying districts of the field, enable surveys to be started from them at will. All permanent monuments are carefully tied in by closed surveys.

All traverse work is run with the continuous vernier, the azimuth being read directly off the plate and recorded in the field book. The bearing is next read by the opposite vernier, and recorded. Then, and not before, the transitman compares the two records as he has written them down, and if they check, he knows the verniers have been correctly read. When moving ahead, the upper motion is never released, and after taking his backsight the transitman again reads his vernier to make certain it has not been disturbed before turning on the station ahead. At intervals the vernier readings are checked against the needle, which would disclose any error of magnitude, although except for this approximate check the needle is never employed. When the above routine is faithfully followed, errors in instrument work will be few and far between.

The measurements are carefully taken between stations along the line given by the transit, and where there is no opportunity of closing the traverse or tying it in to a permanent monument, the distances are checked by rechaining in the opposite direction. It is generally in the measuring that the most errors occur. Young engineers, in their anxiety to become instrumentmen, are prone to overlook the careful and concentrated effort necessary for accurate chaining, and the chainman who realizes the importance of this work, and who is able to handle it accurately and with dispatch, is a jewel of the first water. A single wrong plus, taken by a man with his mind on other things, can easily cause more trouble than he is worth. All distances between stations are recorded as individual measurements, continuous chaining, as in railroad work, never being used.

Underground Work

The transference of the azimuth and coördinates of the surface survey to the underground workings, in the case of shaft mines, such as those under consideration, requires the most careful and painstaking work. Each mine has at least two shafts and the method of single wires in each is adopted as affording the greatest accuracy. An effort will be made in a subsequent article to outline the details of this operation.

*Engineer, Madison Coal Corporation, Glen Carbon, Ill.

The underground survey is carried forward by the same traverse methods as already described for the surface work, making only such variations as necessitated by the changed environment. The stations are all set in 1-in. wooden plugs, driven firmly into holes drilled two or three inches into the roof. Timbers are used only when the nature of the roof makes it unavoidable. The transit is set under the station, the telescope being centered on top for this purpose. Sights of ordinary length are taken on the string of the plumb-bob, and those of greater distance are taken on the point of the bob. Carbide lamps are used, on account of their excellent illumination, all the mines being worked with open lights.

Stations are set in the rock roof where possible, considerable time being taken to so place them, since their permanancy makes it well worth the extra time and trouble. Sights as long as 1600 ft. have been taken underground, but on account of the difficulty of handling them, sights over seven or eight hundred feet are seldom used.

The entry sights, or "pointers," as well as all sights for connections and other special work, are set by the engineers, and where the roof is good, consist of two points, about three feet apart, set in the slate or rock top, from which plumb lines may be suspended for sighting ahead. Where necessary to use entry timbers, three and often four points are set, so any movement may be detected before the entry gets off line.

The uniformity of the seam makes it possible to project the workings far ahead of actual mining. When within a reasonable distance of the place to turn a new entry, the mine manager is given written instructions which enable him to mark off the correct location by measuring the proper distance from the last pair of entry sights. As soon as it is ready, an engineer sets the sights for the new entry to conform to its projected location. These entry sights are tied in to the traverse work and are advanced about every 200 ft. At the proper interval, one point will be converted into a permanent station and again carefully tied in to the preceding traverse. The distance and azimuth are compared with the record of sight extension, and if any discrepancy exists it is at once investigated.

Room Sights and Tie Surveys

At each mine there is one man who is directly charged with the duty of watching the entry sights set by the engineers, seeing that they are kept on the lines designated, and in case of accident affecting the sights he sets temporary ones until they can be reset by the engineer. This man works as an assistant to the mine manager, and with a transit sets the sights for the rooms as fast as they are necked. All rooms being turned at right angles to the entry this is a simple process, and one with which trouble is seldom experienced. He further sees that all places are stopped when driven the required distance, and when finished, measures them up, notes the crosscuts right and left, and places the information on a report which goes monthly to the engineering department. This is used afterward for checking purposes in a manner described further on.

Advantage is taken of every opportunity to close portions of the traverse between different parts of the mine, and thus obtain the only possible mathematical check on the work. In important cases where a closure is highly desirable and it is not deemed wise to connect the workings, satisfactory results are readily obtained by advancing the faces to within 10 or 15 ft. of each other and putting through a 2- or 3-in. drillhole, thus allowing the survey to be closed. A little cement mortar readily closes the hole when it has served its purpose. Large drill holes from the surface, to accommodate pump discharges and other purposes, afford an excellent opportunity of checking the coördination of the top and bottom surveys, while an occasional connection between adjacent mines offers the severest test of all, involving as it does two sets of shaft plumbing.

Levels

Levels are required by the law of Illinois to be shown "at reasonable intervals along the main and cross entries," the elevations being referred to the base of coal at the hoisting shaft. The advantages, however, of having them referred to the bench marks of the United States Geological Survey, and being able to use them in connection with the topographic sheets, are sufficient to warrant two sets of maps, if necessary—one to comply with the letter of the law, and the other for practical working purposes.

In taking the entry levels, the main entries are first carefully chained, continuous notes being kept, entirely distinct from the traverse work. Accurate plusses are taken to all cross-entry switches and to all permanent stations of the traverse survey. As opportunity permits, the distance between permanent stations is figured from these continuous chaining notes and compared with the distances recorded in the traverse book, affording an additional check on the mensuration. In the cross entries the same method is followed, the chaining being picked up from the plus to its switch and carried ahead continuously to the face. The advantage of this lies in the fact that it is thus possible, without any rearrangement of notes, to plat a continuous profile of any haulage road from the main shaft out to the face. A 22-in. wye level is used, and elevations taken every hundred feet, ordinarily, along the top of the rail. Elevations of permanent stations are taken to serve as benchmarks, and advantage taken of all connections to close the work.

Map Extensions and Office Computations

Complete measurements for map extensions are made at intervals varying with the working time of the various mines. This is mostly done independently of the traverse and sight-setting work, generally after the latter have just been extended all around. The entries, as a rule, are held so rigidly to the sights set by the engineers that little more is necessary than to locate the crosscuts and room necks. This is done by measurements from permanent stations of the traverse survey, and at the same time any necessary side measurements are obtained. The rooms are measured, the crosscuts located, pillar widths obtained, and if the room has got off the sights its bearing is obtained by a Brunton pocket transit, care being taken to observe the magnetic bearing of the entry and room from the same point, so as to eliminate errors of local attraction. Any work which may have gone badly out of line is located by a traverse survey, and an effort made to place the responsibility for same where it belongs. Details of ventilation, location of doors, motor partings, pumps, and miscellaneous information of like

character are obtained at the same time, and at more or less frequent intervals the height of the working faces is taken to check the tonnage extraction.

In the office, the traverse notes are transcribed from the field book into the survey record sheets, copy of which is shown herewith. Any distances which may have been measured on a sufficient angle from the horizontal to materially affect results are first reduced to horizontal measurements. Each entry has its separate sheet, and each mine its individual loose-leaf binder. The sines and cosines are first worked up by Gurden's traverse tables and entered on the record. The natural functions of the bearing are then placed on the record, and multiplied by the distance with a Thatcher slide rule, of the large cylindrical type, which will readily handle to two decimal places any distance less than a thousand feet.

The results obtained by these two methods are compared as they stand on the sheet, and any discrepancy checked by another man. When correct, each is given its plus or minus sign, everything north and east being plus, and those south and west, minus. Their algebraic sum then gives the longitude and latitude of each station, or as it is often called the "latitude and departure." The algebraic addition is checked, the sheet O.K'd, and indexed. In the column for remarks, closures are noted, references given to other sheets, and any other information recorded.

Closures of simple underground circuits are frequently made with an error of not less than one in ten to twelve thousand, while surface and underground closures by means of drill holes often come within the eight thousand limit. Connections with adjacent mines, through two sets of shaft plumbing have been made with an error of one in eight thousand.

Map Work

The coördinate maps are made on the best obtainable quality of heavy, cloth-mounted drawing paper, and as a rule are on a scale of 200 ft. equals 1 in. The sheets are laid off in squares two thousand feet each way, properly designated, and the location of each station platted on from the office record sheets. The platting is checked by scaling the distances between stations and comparing with the actual length of the course. All underground survey lines are shown in red, and form the framework around which is drawn the mine workings in black. The work of each fiscal year is given its color, and dated. Should it happen that any place has become inaccessible for measurement when the engineers were making their extensions, reference is had to the mine reports previously mentioned and the place shown in accordance therewith, in dotted lines, to differentiate it from the work of the engineering department. These reports are further checked over in detail against the newly extended maps, and any discrepancies investigated.

Tracings are extended with the coördinate maps, and prints furnished the various officials. Once a year maps are filed in accordance with law with the State Mine Inspector, State Rescue Stations, and the County Recorder. Small scale maps of the different coal fields are made for those officials who would find the larger ones cumbersome, and in making such reductions the pantograph, photography and proportional dividers are employed. Photography is frequently used in place of, or to supplement drawings, with excellent results.

The mine projects are always kept on separate tracings, and prints furnished those who have need for them. These are made on a scale of 200 ft. equals 1 in., the same as the mine maps, and photo reductions are made and attached to the field books of the various mines.

Separate tracings are made and extended yearly to show the outline of the worked out acreage. This tracing is carefully adjusted over the coördinate map, and a line drawn around the faces. The areas are then measured with a planimeter, and entered on the tax-record sheets. These sheets show the worked out and remaining acreages by quarter sections, and furnish the necessary data by which the district superintendents make the yearly returns to the assessors. This method of handling prevents absolutely the possibility of overlapping measurements from year to year, and furnishes a permanent record of the worked out areas.

From the data now available, statements are prepared showing by mines and coal fields the areas mined out and remaining, percentages of extraction, and other information required by the executive departments in preparing their annual statements.

Recent Legal Decisions

Amount Recoverable For Loss of Eyesight—Where a mine pumpman lost his eyesight in an accident attributable to negligence on the part of his employer, $1000 was not excessive recovery. (Kentucky Court of Appeals, Stearns Coal & Lumber Co. vs. Tuggle, 164 Southwestern Reporter 74.)

Liability for Viciousness of Horse—A retail coal dealer, whose delivery horse bit a pedestrian while the latter was passing along a sidewalk, is not liable for the accident, unless the dealer previously had notice of the horse's vicious tendencies. (Massachusetts Supreme Judicial Court, Dix vs. Somerset Coal Co., 104 Northeastern Reporter 433.)

Liability for Injury to Miner in Kansas—Under the Kansas Mine Law, which requires the owner or operator of a coal mine to employ a mine boss to make inspections to promote the safety of employees, an operator is liable for injury to a miner attributable to non-compliance with the law. (Kansas Supreme Court, Baisdrenghein vs. M. K. & T. Ry. Co., 139 Pacific Reporter 428.)

Legal Right of Miners to Strike—Recognizing the right of every employee to quit work when dissatisfied with the conditions under which he is working, where he is not bound by contract for a definite term, without assigning any reason, and recognizing the right of any number of workmen to do collectively what they might do individually, it is held that neither a union of mine workers nor its members are liable in damages to a nonunion miner who is discharged under threat of the union men to quit unless he should be discharged. (Oklahoma Supreme Court, Roddy vs. United Mine Workers of America, 139 Pacific Reporter 126.)

The Explosion at Eccles, W. Va.

By R. Dawson Hall

SYNOPSIS—A well conducted mine with men both in charge and at work having a more than usual sense of responsibility blows up at Eccles, Raleigh County, West Virginia, killing 180 men. The company operating was strict in its discipline and careful in its management. Operating changes are described which will make the mines safer in the future. It is not safe to rely on ventilation and sprinkling in a bituminous-coal mine which generates gas.

The Eccles explosion in the mine of the New River Collieries Co. exhibits clearly the inevitable dangers of mining and should teach important lessons to operators. It should be followed by some drastic legislation and this

Description of Mine

The Eccles Mines are four in number, No. 1, which is no longer working, No. 3, and two mines, which were the seat of the recent explosion, Nos. 5 and 6. No. 5 is operating in the Beckley seam, the landing being 523 ft. from the surface in that shaft. The Sewell seam in the same shaft is 254 ft. below the surface. No. 6 is in the Sewell seam which, at that point, is 275 ft. below the ground. The bottom of the Beckley bed at No. 6 is 534 ft. from the surface landing, but only the airway is extended to this lower seam.

The Beckley seam in No. 5 varies from 9 ft. on the south to about 7 ft. 6 in. on the north and west. It will average in that mine about 8 ft. The roof is of sand-

Shaft No. 5, the Intake, with Shaft No. 6, the Return, in the Distance

should be advocated by the coal-mine owners, no less than by the men. When in ordinary industries one man commits a folly, he is injured or killed. In coal mining, not only he himself is killed, but all his coworkers. There is, therefore, hardly a business except powder making or railroading in which stringent precautions are more absolutely necessary.

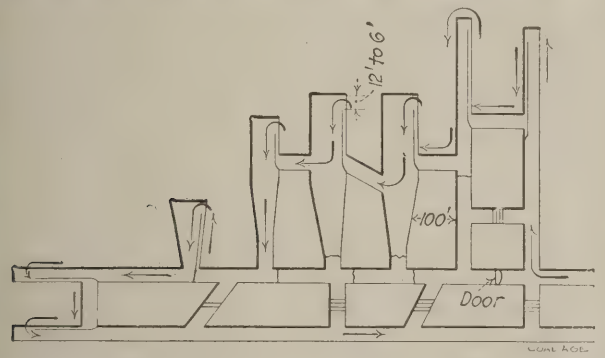
The law is wholly inadequate; the Eccles authorities realized this and supplemented it in many ways, and hereafter they intend to be even more careful and it is only just that their competitors in business should be compelled to take precautions assuring equal safety. For excessive caution inconveniences and alarms the workman, and he does not like to work in the mines where he is thus handicapped or where the precautions adopted remind him hourly of the risks of the employment in which he is engaged. He would sooner face those risks unguarded in mines where they are less frankly acknowledged, though not less certainly existent.

stone without pot-holes or draw slate. Sometimes it will break after some exposure from weathering, but on the whole it is a reliable roof. The bottom is of shale.

The Mine Was Kept Moist

It is important perhaps to remember this, for it is evident that aside from the sand scattered by the motors to assist adhesion, there was probably little material of a non-carbonaceous nature to stay the progress of an explosion. The reliance of the management was wholly on the removal of coal dust and its continuous dampening.

In this matter, every precaution was taken. There was a system of piping along all the roadways and connections at every room. Though it was not customary to sprinkle before every shot, the rooms were kept damp by copious spraying with water.



But the management, not satisfied with spraying, turned the exhaust from the fan into the intake and kept

the air damp. The humidity was frequently and carefully measured and averaged 98 per cent. of complete saturation. The roof was at all times dripping with water.

The Ventilating Precautions

The mine made gas freely, but many precautions were taken to prevent a dangerous accumulation. At every place the ventilation was carried within 12 ft. of the working face, not only in entries but in rooms and in crosscuts. When a room was started a fly across the heading baffled the entering air, and a well secured brattice cloth up the roomway conducted the air to the face of the room.

As soon as a room crosscut was driven to the room above, flies were put inby, outby and in the room neck. Thus the air could not enter by the heading, and even

Method of Ventilating by Stoppings, Curtains and Flies

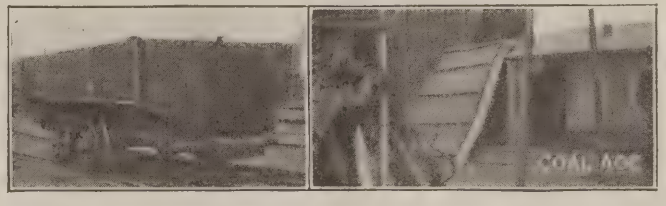
when a fly was lifted in the entry for the passage of a man or a trip, the fly in the room being closed, the air was kept from circulating by any path except that prescribed near the working face. Thus the gas was effectually swept out by the current.

The air was provided by a 22-ft. Jeffrey fan generating about a 1-in. water gage. The two mines were still small and the airways large, so that much air pressure was not needed. I understand that no analyses were made to determine the methane in the return airway, nor were any more refined tests of its gas content made than are afforded by the ordinary safety lamp.

The mine cars are of the end-gate type. They are in excellent condition and reasonably tight for cars so constructed. The end gate is of iron, though the car is of wood. Self-dumping cages are in use.

The Shafts

No. 5 was the intake. The shaft had three compartments, one for air and two for hoisting, the airway being partitioned from the hoistway by tongued and grooved flooring. The same construction detail was followed in shaft No. 6, but the airway alone extended to the level of the Beckley seam and it served as a return instead of an intake.



The top of the airway in No. 5 was covered by steel doors to open should an explosion occur and thus protect the fan. These proved effectual, when the explosions occurred; they did not open, it is true, but were blown bodily from their hinges. However, the fan was amply protected.

The map will show how carefully the mine was laid out and driven. The management of other details was just as thorough. All the room crosscuts were closed by stoppings of wood or of brattice cloth. The heading breakthroughs were closed by walls of masonry 4 to 6 ft. thick, except that in a few cases there were brick walls 16 in. in thickness. The masonry walls were of good construction, being plastered all over their faces with lime mortar.

Shooting Arrangements

The pick miners fired their own shots. They were required to use Monobel No. 2 powder and to tamp with clay, which was supplied them. The company engaged two safety inspectors, but it is too much to assume that these men were able to stop entirely the pernicious habit of shooting from the solid or could assure themselves always that clay and not coal slack was used in tamping.

It is nearly always possible for a man who has fired a shot of greater depth than his undermining to slip up after his shot is fired and cut a small undercut near the floor, which will resemble the extreme end of a *bona-fide* undercut, as it is revealed after the coal is shot down. Of course, these inspectors, if faithful in their work,

No. 5 Mine Car
The end gate was of steel and comparatively tight fitting. The cars were of tight construction.

A Shaft Door
This was blown off when the mine exploded. The round hole shows where a pipe was blown through the door.

must have reduced the amount of such solid shooting, but they could not absolutely prevent it nor always detect it after it had been done. The shotfiring of machine-mined coal was done by the company's shotfirers, the holes being both loaded and fired by them.

The haulage and even the gathering were performed mainly by electric motors, using 500-volt direct current. The transmission was all at that voltage, though 2300-volt alternating current was used for the town transmission, the current being transformed for lighting to 110 volts.

No. 5 mine was producing about 1500 tons per day and No. 6, 500. No. 3 mine, which is in the Beckley seam, is producing about 1200 tons.

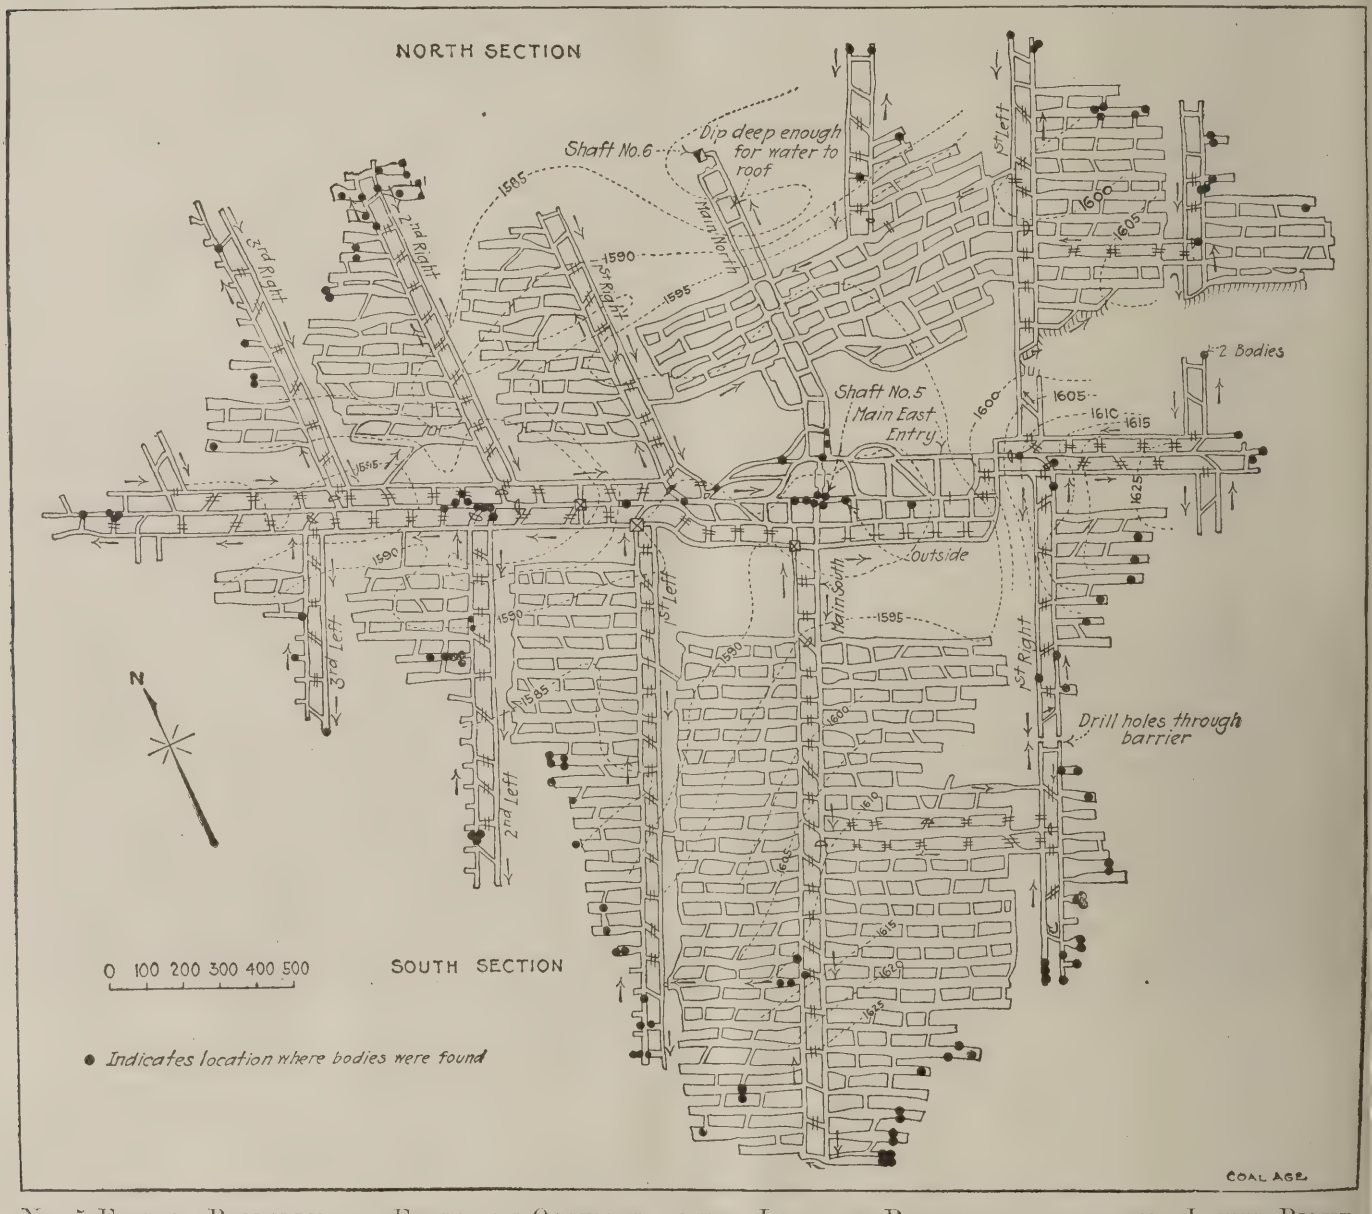
The Explosions

The first and most violent explosion occurred at about 2 p.m., Apr. 28. It threw out large portions of the partitions in both shafts with a large quantity of mud. One head cager was blown away from the shaft mouth but was not severely hurt. The upper part of a man was thrown up No. 5 shaft and landed on the surface. A boy who was on one of the railroad cars was blown off and fell, breaking his arm. No other men on the surface were injured.

A pipe was driven up through the doors of the airway in shaft No. 5, making quite a neat perforation. Neither of the wooden headframes was in any way injured, but the stairs, of course, in No. 6 mine were blown out. The approach also by Shaft No. 5 was completely cut off by the wreckage caused.

Twelve minutes later another and less violent explosion occurred, which threw out of the shafts material which

had possibly fallen back after the first explosion. Fortunately this event occurred before any rescue work had been attempted and no further explosions occurring there was no addition to the list of dead from such work.



The Fan Is Reversed

The mine officials soon realized that the hope of rescuing any men in No. 5 was wholly in vain, whereas it seemed quite hopeful that the men in No. 6 could largely be saved. After the fan had been stopped and the shaft doors replaced in No. 5 shaft, the fan was reversed so as to prevent driving the air through from No. 5 to No. 6. The result showed that this was wise as all the men but eight were saved in those workings, 67 being rescued.

All the men but thirteen have been found in No. 5; some, it is true, were not immediately killed by the force of the first explosion and some had their faces down in water, which they had sought for self-protection, but none apparently had traveled far and it seems certain that had the direction of the current been maintained, it would only have resulted in the destruction of the men who were saved in No. 6.

Great Care to Ascertain Cause of Explosion

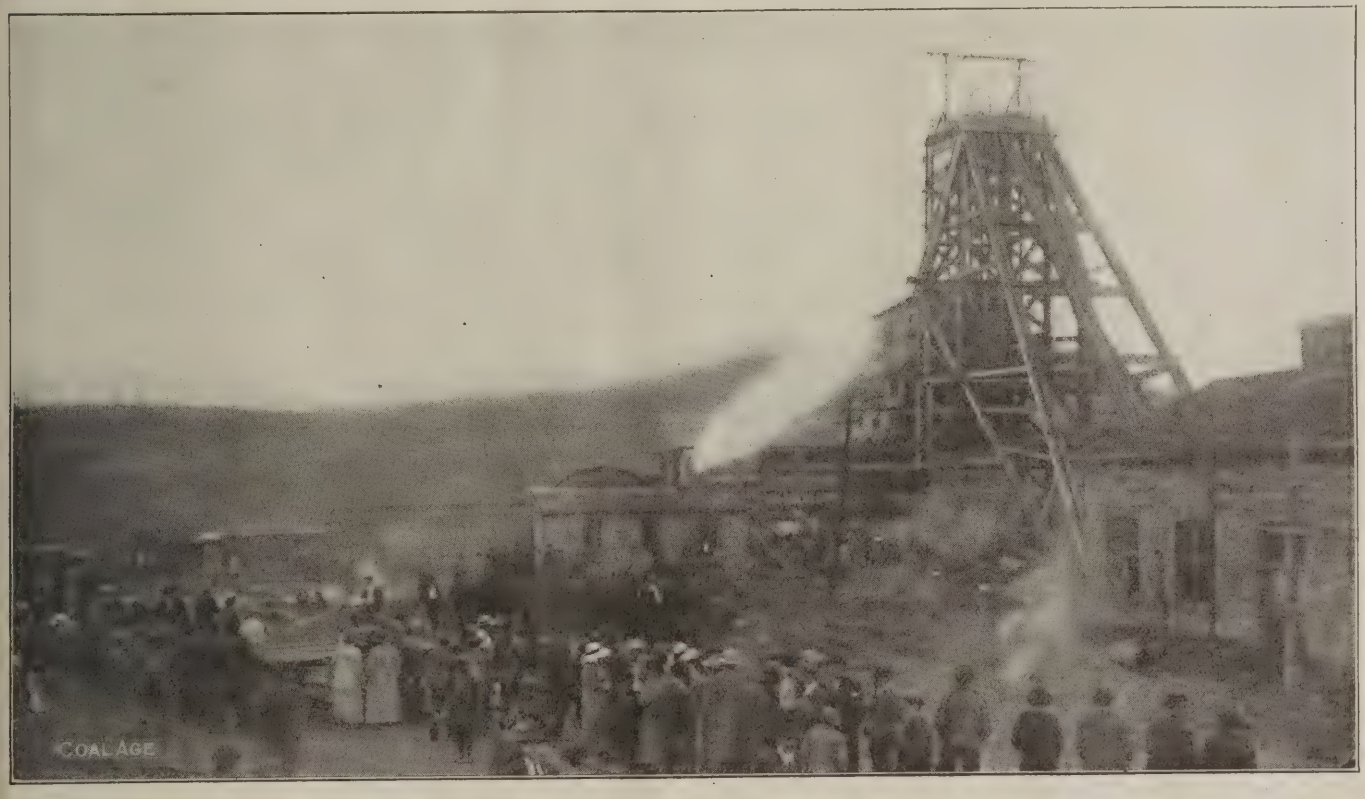
The company has always maintained a careful checking-in system. Every man takes a check off a board on going down and replaces it on his return. The number is also checked by the man in charge of the cage, who counts the number of his passengers on each trip and totals the figures thus obtained. The number loss is, therefore, absolutely certain, though 13 bodies are still buried (May 7) and have not been found.

No. 5 Eccles. Probably the Explosion Occurred in the Locality Represented near the Lower Right Corner of the Map in a High Portion of the Mine

Many of the bodies were not identified because the violence of the explosion stripped them of their clothing and scattered the checks. The engineers of the rescuing force carefully noted where every man was found, how he was lying, his condition, his valuables and all other details. They are especially anxious to ascertain the direction of force. Partly because of there being two explosions and partly because of the complication of the phenomena exhibited in even the most simple of these accidents, there is no sufficient evidence yet (May 7) to show where the accident originated.

Great Violence Exhibited

The violence of the explosion was exhibited almost everywhere. Concrete overcasts with rail reinforcing have been entirely removed and destroyed. The roof has been blown down to a considerable height. This seems to be the cause for the delay in finding the bodies, for it does not seem likely that any of the undiscovered men are far from the places in which they had been working, in fact the mine is too small and new for that to be possible, but nevertheless it is useless to search for them except as a part of the general overhauling the mine will have to receive in being put ready for operation.



The rescue work was made more difficult by the fact that the pumps were put out of commission by the explosion. When the rescue men reached the foot of No. 5 slope the rails were covered already by 18 in. of water and in one place where the coal dipped between No. 5 and No. 6, the water soon rose so that only the fact that the roof had fallen to a considerable height made it possible to continue recovery work. However, it was soon seen that the clearing of the mine of water by pumps must precede any further work for the recovery of bodies, and proper steps were taken to that end.

The only place where the explosion did not appear to have done much harm was in the Second Left in the South half of the mine, where there were two local dips, in which the water stood about 8 in. deep. This section not only was too wet for the extension of the explosion, but also was possibly protected by the perfect stopping, which the explosion had itself erected by piling a trip of cars near the mouth of the entry.

It will be noted that rooms in the Main South had been driven up and extended to the line of what was known as the First Right in that section of the mine. Headings had been driven back to meet this First Right entry, but were not pushed completely through. The small block of coal remaining had been pierced by drill holes. When the explosion came, these curtains of coal appear to have been blown out.

It may be reasonably objected that there were not enough splits for a gassy mine. One split passed up 2nd, 3rd and 4th Left of the South section, then crossed over and ventilated 4th, 3rd, 2nd and 1st Right in the North section. Another split passed along the nearer half of 1st Right and all the 2nd Right in the South section, and then passed over and ventilated 2nd and 1st Left and another unnamed heading in the North section. In this distance they must have gathered no little gas, even though some of these entries were short, in fact, mere stubs of headings and were producing but little coal.

Fortunately there was at no time any fire in the mine and the rescuers established the ventilation without preliminary skirmishing in helmets for the location of fires. It is only right to note that had a fire started near the shaft, there was no lack of material to feed it.

Shaft No. 5 after the Explosion. The Fan Was Not Injured nor the Surface Works though Much Lumber, Mud and Even a Human Body Were Ejected from the Shaft

The Social Conditions

The mining village of Eccles is one of the newer towns in the West Virginia field and like many of those now building, is far superior to the old. The houses are well built, neatly painted, and the streets are kept clean. Standing on high ground, where the mountains are not forbidding, the general appearance of the camp is strongly in its favor.

The relations between the company and the men are extremely favorable. The town is not far enough from Paint and Cabin Creeks to have failed to feel the disturbing effects of the virtual civil war in that section. Yet only a few days idleness resulted at Eccles. The company has a little emergency hospital, and on the day of the

explosion had just opened a bath-house for its men. There is an air of cleanly hopefulness about the company store and the people, which betokens the excellent character of the management and personnel.

One is, therefore, disposed to feel that at this mine less than at any others should this unfortunate accident have occurred. Neither operators nor miners merited any such unkindly fate and one begins to realize what a problem is to be confronted if accidents are to be ruled out of mines operated by men of less responsibility and filled with men of shiftless, characterless type, such as are often to be found where all the conditions of life are unfavorable.

Safety Provisions

The president, Frank Guiterman, has determined to take three steps to assure greater safety. Shaft No. 3 is already operated as a safety-lamp mine, all the miners and day men being provided with Hirsch electric mine lamps. Miners will no longer be permitted to load or fire their own shots. In that way "solid shots" will be eliminated and the character of the explosive used will be

Eccles, No. 6 Where the Men Escaped

known beyond question as also the nature of the tamping. Moreover, the shooting will be done at night when the mines are nearly empty of men. Lastly, the voltage used in the electrification of the mine will be lowered to 220 volts.

These changes will involve much expense, but there is no question but that they are necessary. The workings will still be electrically operated gaseous mines. While the machines can and may be made explosion-proof, there is still a risk from the locomotives should a door be left open and a heading become charged as a result, with gas in explosive quantity.

An Incident in the Rescue

It is interesting to note that in moving a dead body in a room already so filled with gas that the bearers had to hold their lights low to avoid it, a cadger of carbide rolled out of the dead man's pocket into a pool of water and immediately filled the air with acetylene gas, against which a safety lamp is said not to be a sufficient protection.

Nothing happened, but the rescuers were not satisfied till they were well removed from the place. Provided the cadger head is reasonably water-tight and is closed, no harm could result, but a loose capped cadger under such circumstances might cause a deplorable result. However, cadgers of carbide and a room full of gas rarely occur together. It would not, however, be impossible to start an explosion in that manner, even in a nongaseous mine.

Need for Greater Strictness

It is to be hoped that the chief inspector of mines will err on the side of strictness in classifying mines, so that all which are in the least gassy shall be declared to generate gas in dangerous quantities and shall be required to be operated with the use of safety lamps. There is really no logical reason any more why safety lamps should not be used. They give a better light than ever before, so that the risks from roof falls and other dangers will not be unnecessarily increased by their use. And it is only right to note that not only in West Virginia, but in many other states are excessive risks being taken by the use of open lights in dangerously gaseous mines.

The provision of shotfirers is also to be commended to the chief inspector's attention. So long as shooting is done by all the miners and during working hours, there is great risk of illegitimate charging of holes and solid shooting and an assurance that when an explosion occurs as a result of this cause, nearly every man in the mine will be the victim of that one man's carelessness.

The company readily supplied every detail of information requested and gave every assistance to those who reported the disaster. F. P. Bayles is assistant general manager, M. E. Kent, superintendent of the three Eccles mines and of the Sun colliery, and R. J. Burmeister is chief engineer.

Coroner's Verdict

The verdict of the coroner's jury which was returned Sunday, May 17, after two days of investigation is as follows:

We, the jury, find that John Adams and the 171 other men who were killed in shaft mine No. 5, at Eccles, Raleigh County, W. Va., on Tuesday, Apr. 28, 1914, came to their death by an explosion of gas in the said mine. And we do further find that the eight men who came to their death in shaft mine No. 6 at Eccles, W. Va., on the evening of Tuesday, Apr. 28, 1914, came to their death as a result of an explosion of gas and dust in shaft mine No. 5 at Eccles, W. Va., they having been overcome by afterdamp entering mine No. 6 after the explosion in mine No. 5, the two mines being connected.

The accumulation of gas in mine No. 5, which was the primary cause of the explosion, was due to a short circuit of the air in the southern section of the mine. This gas was ignited by an open lamp and the explosion followed.

We, the jury, furthermore find that this short circuit of air was caused without the knowledge or consent of the company or any of its operating staff, and that the company is in no way to blame for the disaster.

Later Note

S. R. Ritchie, of the company, said that the cause above stated seemed the real origin of the accident. A contractor whose work in two parts of the mine had been rendered difficult by an intervening pillar of coal had blown a hole through it and was found dead not far from the pillar. Probably this pillar was one of the two in the First Right, Southern Section, where headings had been driven both inby and outby to meet.

An air receiver with an accumulation of oily waste is liable to take fire if allowed to get hot. Consequently oil should not be allowed to collect in quantity at the top of the water which is drained from the air. When the water is drawn off, the oil will be deposited on the inner surfaces of the receiver and will be in suitable condition to evaporate and cause an explosion of great violence.

The Colorado Strike

SYNOPSIS—The strikers are not surrendering their guns in sufficient numbers to give assurance of peace should troops be withdrawn. The army forces have done hardly anything to compel disarmament. Several men brought in by the operators since the Ludlow battle to work in the mines have been restrained by United States troops. A court martial is examining Major P. J. Hamrock on charges of arson, murder, manslaughter and larceny. The testimony of the militia in this trial is given in some detail.

The striking mine workers have been somewhat slow to surrender their arms, much to the discomforture of the operators and their employees, who are now disarmed and constantly hear that the U. S. troops will soon be withdrawn.

Confiscation has been long delayed and there has been given an excellent opportunity for the burying of guns. The troops entered the field Apr. 29, and only at 5 o'clock, May 13, did the confiscatory order go into effect. Two whole weeks passed during which the hiding of arms could proceed. It is said the foreigners do not understand American ways and must be handled with gloves. We readily grant them such a lack of understanding and we conceive that they are utterly at a loss to comprehend our dilatoriness in enforcing that most organic law of battle which prescribes disarmament of all persons not forming part of the army of occupation. Surely they draw the conclusion that we fear them and are too weak to attempt confiscation of their arms.

THE STRIKERS ACCUSE OPERATORS OF HIDING ARMS

The strikers have repeatedly declared that the operators are hiding their arms; E. L. Doyle, secretary-treasurer of the United Mine Workers and apparently a man not given to careful statement, is freely circulating such reports. One specific declaration to this effect was made in a local newspaper and the editor was ordered by the military authorities to retract this statement in the pages of his publication.

Colonel Lockett is making careful search for a weapon from the stock of which a rubber fragment was broken during the Forbes fight. On May 15 this gun had not been delivered by the strikers to the military authorities.

The danger to the men working in the mines is considerable in case protection is removed by the United States and it is likely that the nation will have to pay heavy damages to foreign countries should the Greeks and Bulgarians start a marauding expedition on unprotected mine camps. This fact has appealed to Doctor Dumba, the Austro-Hungarian ambassador, so forcefully, that he visited the Secretary of War and urged the retention of the United States troops at the seat of war.

THE U. S. ARMY SHOULD NOT LEAVE

In fact, the sense that the army should not be removed is expressed by nearly all parties and there is everywhere a fear of replacing the Federal forces by the militia. It is true that the militia which numbered, at the best, 1427 men, which was the number on Dec. 8, managed to keep order scarcely less complete than is now maintained by 1700 U. S. soldiers, but this militia was supported by the arms in the hands of the guards employed by the corporations.

But the company men are now disarmed and the feeling is so much more bitter that a larger force is needed, especially as the forces of law and order realizing that the public is backing the disorderly are severely crippled in handling them. To show what a severe task is confronted, we may call attention to the fact that Colonel Lockett requested the governor on May 8 to send militiamen to Glenwood Springs, Oak Creek and Crested Butte in Garfield, Gunnison and Routt Counties, respectively, where conditions were extremely grave. He said that until he had at least 300 more men it would be hazardous to weaken the forces now in charge of the disturbed districts of eastern Colorado.

THE WIDE DISTRIBUTION OF THE DISTURBANCE

The reader should carefully remember how remote these places are. Thus Crested Butte while barely 51 miles from Glenwood Springs is 253 miles by railroad. Oak Creek is only 53 miles from the latter place, but to reach it you must go to Denver, 194 miles, and almost retrace your itinerary for a further 360 miles. With an insurrection of such magnitude it is necessary to be sure that protection is adequate for all the widely separated mining camps.

Those city people who insist on a policeman at every block can hardly understand the needs of a scattered population of peaceful workmen menaced by roving armed forces. There seems to be a degree of question as to the extent to which confiscation is to be carried. Advices state "no search for concealed weapons will be made without further orders from the War Department."

THE COURT MARTIAL

The court martial of Major Patrick J. Hamrock, of the First Regiment of the Colorado National Guard, opened May 13 with Col. W. A. Davis as president and Capt. Edwin A. Smith, acting judge advocate. All the members of the court were present except Capt. Ralph Dorn, who was absent in Routt County on military duty. Maj. H. A. Williams was substituted as a member of the court for Col. George M. Lee. Col. A. C. Sharpe, of the U. S. Army, is attending the sessions as a spectator.

The militia seems ready to assist the court in arriving at the truth. Lieut. K. E. Linderfelt very frankly testified that he had fired into the tents at Ludlow but not until the strikers had opened fire. He said he had prevented his men from shooting when they could have killed 100 men at a volley. He told how Captain Carson had rescued several women and children from the tents.

Lieut. S. J. Lamme, a physician at La Veta, Colo., who acted as aide to Major Hamrock, during the attack of the Ludlow colonists and its repulse, testified that he carried orders from his commander to Captain Edwin S. Carson when that officer arrived with 40 members of Troop A from Trinidad. He stated that he heard Major Hamrock order the machine-gun operators to fire at the pump house and at the rifle pits in the rear of the colony. He did not order them to fire at the tents.

THE LUDLOW CAMPERS FIRED FIRST

Two other officers also in the battle swore that the strikers opened the fight by firing on the militiamen, that the bombs the soldiers fired were used simply as a signal for assistance as the telephone was too slow and uncertain a means of communication. They also declared that Major Hamrock was near the camp when the fire started and that they thought it originated from the upsetting of an oil lamp. In their view the victims died of suffocation, hours before the camp burned.

Lieutenant Benedict of the National Guard declared that the timbers in the shelter pit where the women and children were suffocated or burned were charred to a considerable depth and the wrist and arm of one woman was found removed to a distance from the body. He testified that after he had come up from an arroyo that night he saw men running into the tents and women rushing out crying "Dynamite, dynamite."

Captain Edward F. Carson gave straightforward testimony declaring that the soldiers and civilians looted suits of clothing, miscellaneous garments, umbrellas, jewelry, blankets, grips and satchels full of all kinds of articles. These he said would have been burned had they been allowed to remain. He said it was impossible to obtain discipline, even when he desired to prevent his men from unduly exposing themselves to the fire. Carson further testified that Lieut. Lamme delivered him a message from Major Hamrock ending with the words: "You've got to smoke them out."

Sergeant Patrick Cullom was the man in whose charge were placed Louis Tikas, the leader of the Greek strikers and probably as the Commission states the general of the whole colony, James Tyler and Frank Rebine. He declared that these escaped when the militia suffered a setback due to the firing from the Ludlow settlement. He described their being shot as they crossed the firing line.

It seems that Troop A, which aided in repulsing the attack of the strikers at Ludlow, comprised 130 men of whom all but eight were mine guards and mine clerks. This agrees with the statement of the Military Commission which said that the troop had been so recently recruited that it had not yet selected its officers nor was it supplied with arms or ammunition.

THE UNION FORBIDS MEN TO TESTIFY

So far no testimony has been taken from the inhabitants of the colony. When the Military Commission met, the strike leaders refused to testify because the inquiry was not open. Now they give as a reason for silence that the court-martial

intends to whitewash the militia. John McLennan, district secretary of the United Mine Workers announced that the strikers would not be permitted to testify.

There were some truthful people in Ludlow and apparently the union is afraid of them. J. R. Lawson, who is a member of the National Executive Board of U. M. W. of A. some time ago declared to the press that he did not know positively who fired the first shots. He must have had a somewhat clear idea and did not want to inculpate his followers and so took refuge in a disingenuous ignorance.

He also asserted that Louis Tikas was sent for by Hamrock in order that he might be induced to surrender a non-union man which the strikers had in custody. This was Carindo Tuttoilmando. Now Lawson though he had every reason to deny the presence of this man if he were not there, failed to do so. These facts have given us some confidence in his veracity and probably after some shuffling if he faced the court martial he might tell the truth. The father of the boy Snyder who was shot and several others might likewise be good witnesses. The union leaders have, however, no stomach to meet such an investigation.

Striking Miners at Headquarters of U. M. W. of A., in Trinidad, Colo.

UNION LEADERS INDICTED

John R. Lawson, Colorado member of the executive board of the United Mine Workers, Edward L. Doyle, secretary-treasurer of District No. 15, and W. T. Hickey, secretary of the State Federation of Labor and about 150 men were indicted on May 14 by the local grand jury on charges of conspiracy to murder and attempt to murder in the Hecla mine attack.

WILL NOT PERMIT COAL COMPANY TO BRING IN MEN

The United States troops have been removing several men who have been recently brought in by the companies to work in the mines. Their presence has been provocative to the strikers whose wrath the administration is determined to appease by every possible concession. Twenty-five mine workers who had been brought in by the operators to work in the Oakdale mine of the Oakdale Coal Co., and five men who were going to Primero were stopped by the troops on May 14. On the day before six men employed to work at the Royal mine of the National Fuel Co. were prevented from going to work. From a letter received from an official of one of the coal companies it appears that there will be no objection to individuals entering the state or passing from one part of the state to another to accept work from the coal companies. Only the deliberate importing of men is prohibited.

THE MILLION-DOLLAR BOND

The legislature of Colorado has been divided on the bond issue of $1,000,000 for the payment of the state troops. The Ardourel faction among the Democrats in the House desired to put the burden of the taxation on the well-to-do people in proportion to their wealth and especially on the coal operators who hired the men causing the disturbance. There is said to have been a gentlemen's agreement with the Slattery-Fincher faction to introduce the bond bill with another which would provide for an income tax.

The lack of parliamentary knowledge of the Ardourel faction, who mistook the second reading for the first, at which only the title is read, caused them to permit the bond bill to go to a second reading. The income-tax bill was not passed. The bond measure provides for certificates to run 20 years and to draw 4 per cent. interest, with a sinking fund after 14 years to take up the bonds at maturity.

The whole financing is clearly contrary to public policy. Riot bonds should not be of so long a duration. Of the million dollars, $691,000 are already owing; the state has more serious expenditures to face than before and only $309,000 with which to meet them. The contributions of the Union may be expected to keep up the agitation for a long time as the fund for the strikers is more popular than ever.

Editorials

The Pioneer Sentiment

The pleasures of "roughing it," of returning to the elemental, of getting back to nature, appeal to us all. And roughness, the elements and nature generally produce in every man a degree of virility not to be despised.

Is it not true, however, that those who thus face nature find themselves scarred by the crudity of it all and become fiercer in their hates, less restrained in their ambition and less fettered by their environment.

The pioneer, strong and forceful, has always been a leader in violence. The history of our own West exhibits this fact. The story of the world in general affords plenty of illustrations as to the truth of this dictum.

It is the establishment of civilization, with its comforts and its restraints, which prevents violence and lowers the force of passion.

All this seems a far cry from coal mining. But if the personal element, as a mine superintendent declared recently, is the most important study in coal mining, surely we have a right to refer to the effect a change in material conditions will have on success in operation.

We believe that the operators must endeavor to improve their villages, to remove the rough-and-ready pioneer feeling, with its picturesque indifference to discomfort and its disposition to make each man an independent unit, utterly irresponsive to popular sentiment. Every effort must be made to bring the outstanding characters under the influence of family ties, human association, education and religion. Every endeavor should be made to hire, not mere bone and brawn, but character.

When Should Rescue Work Be Abandoned?

Prof. Redmayne's remarks concerning the unnecessary sacrifice of life in connection with rescue work following a mine explosion, when workers place themselves in great danger in their endeavor to save entombed miners, have met with considerable criticism. It is recalled that in many instances men have been given up for lost, and yet have been ultimately rescued. The circumstances attending the Courrieres disaster in France have not been forgotten, and an instance of another form of disaster, namely the flooding of the Caradog Vale colliery in Great Britain, has been advanced to show that it is not always the highest wisdom to "dogmatize upon theory." In this latter case, even the local mine inspector intimated definitely that all hope of rescuing the few men who were still in the mine had been abandoned.

No one questions the ability or competence of the average mine examiner, but in this case, the inspector's assumption was completely falsified by subsequent events. Curiously enough, one of the entombed men was able to walk out of the mine before it was discovered that any were alive. What, it is asked, would have been the situation if the mine had been closed down? It may easily be conceived, in the event of a disaster, that one of two extremes may readily be taken.

On the one hand, hope may be abandoned at too early a stage, and men be lost who had merely entrenched themselves in some position of temporary security. The other extremity was demonstrated at Cadeby in England, and at many other mines, where the number of rescuers whose lives were sacrificed was in excess of the number of entombed workers.

The problem bristles with difficulties, and each individual holocaust must be accepted generally as its own guide. The circumstances in one case may vary from those in a second instance. There can be no really "safe rule" for guidance in these matters, and when a mistake or error of judgment occurs in any particular accident, the colliery community very likely will be unwilling to accept the excuse that action based on precedent was strictly followed.

It is well to remember that at the Cadeby colliery in England, three mine inspectors were involved in such an error of judgment, and where authorities of such high standing are liable to be deceived—either one way or the other—the ordinary miner may be pardoned for resenting any interference should he still perceive the least ray of hope in continuing his work of rescue. When the folly of proceeding further is clearly evidenced, then, of course, there is sufficient justification for making a determined stand against further possible sacrifice. Until then everything that is possible should be done.

In connection with the discussion of this serious problem, there is one important reflection: It would be unfortunate to induce a state of mind, or point of view, making it possible for the acknowledged bravery of the mining community to go out of fashion. Science may achieve a great deal, but, balanced by sound practical common sense brave men should still perform brave deeds.

Why Some Operators Fail

Operators too often begin their reforms at the wrong end. They select their material without judgment, and grumble and declaim when it does not reach up to their expectations.

The woman who marries a man to reform him is like the operator who hires a miner whom he knows has been in debt needlessly for the last ten or fifteen years. Such a workman is utterly beyond reform.

Every man around a mine should, if possible, be an efficient worker and a money saver. It is hard to thrust out the inefficient with the union to oppose such action; but it is not hard, we believe, to keep him from coming in. Give good living conditions and get a reputation for fair treatment; this will attract good men.

But do not go out and bring in men of unknown character and agree to advance them transportation, tools and a week's living. If the men have not enough money to come to your camp, they are liberal spenders and perhaps drunkards. They are probably inefficient men and not at all to be desired.

Above all, do not do your colonizing by sending out

padrones who will lie to and mislead the men whom they secure. Such exploiters of both capital and labor regard all two-legged creatures as men. No one is so out-at-heels, so lazy, shiftless, drunken, but that he will satisfy them.

And, lastly, do not regard drunkenness as a light offense, or put a saloon in your mining town. Men who drink should be weeded out and no attempt should be made to accommodate them. The sentiment of the public supports the operator in this move and will be with him when he removes the wife beater and the man who neglects his children.

Character must be the watchword. The tonnage may be raised temporarily by disregarding it, but trouble ultimately results. Many a mine runs along with poor human equipment, and when ultimately there is a general smash-up, there is no reason for surprise. If operators selected their machines as they do their men, they could expect no other result than disaster.

A Trust in Virtue

It has been said that industrial corporations have brought criticism on themselves by allowing some of their competitors to engage in questionable practices. It is certain that the public is convinced that there is a trust in morals even more truly than there is in prices. The man on the street regards the morals of one corporation as a fair basis for the indictment of them all.

It is necessary, therefore, that there should be a strong attempt among all right-thinking, right-acting corporations to bring pressure to bear on all those who use their men wrongfully and which do not seek safety in operation. As a body the industry should endeavor to clear away dishonesty and carelessness from its mining operations. In no better way can harmful legislation arising from the indignation of an aroused public be avoided.

Moreover, only by compelling every one in the business to deal with fairness, can upright men continue in a business where competition is as fierce as in coal mining.

In no matter should there be more stringent endeavor than in arranging for fair weight. It is true that coal sometimes loses in weight from drying and again by theft on the railroad, but these losses should be sustained by the operator, not the miner. The miner is surely contributing all that can be demanded of him when he loses what dribbles off the mine cars. Only when there is a violent wreck does the miner get compensation for such losses. The loss of coal at many mines during the careless transportation to the surface is much larger than the corporation suffers during the trip to the scales. Consequently, we think it an extremely questionable practice to try and make the weigh scales of the tipple check the scales of the railroad company by manipulation of the former.

Especially is it wrong to make the whole tonnage sold balance the tonnage for which the miner is paid, overlooking all the tonnage used in power output at the mine. Moreover, it is unfair to take the weight of empty cars in the winter, when they are well sodden, to compute the net weight of the loads, and make no change in the summer when the majority of the cars are dried out.

It is essential to do everything to prevent all such irregularites, even if we have to introduce scales to weigh each empty car on its return from the dump. There are devices now by which such a weighing can be made automatic and which need no watching. By averaging weights of empties one day, the fair tare could be found for the next.

Most of the coal companies are above little tricks in their weighing. Those that are striving to balance evenly their debits to the miners with the credits from the railroads are giving reasonably accurate weight and are satisfying themselves with the thought that the contrivance used is largely to avoid paying for water which the miner did not dig, dirt which he should not have loaded, coal which the children should not have stolen or which the railroad should not have bumped off the car. But some companies seek even a balance in their favor and in any event a scale committee formed of miners' and operators' representatives traveling from mine to mine with an adequate equipment for testing scales would give the men an assurance they would not otherwise have.

There are several ways in which a union of operators, a trust of virtue, could be formed, which would make everyone, operator, miner and public better satisfied. The agreement of the operators is made as a result of their combined effort, but never do these same coal-mine owners join hand in hand to force all the members of their organization to keep the agreement to the letter.

We would suggest that all those operators who believe in safety in their mines to such a degree that they want strict laws to make those safety provisions binding on all, join the American Mine Safety Association and make it a live body and equal to the work it proposes to do.

We would urge that all the associations of operators use their coercion not only on their employees, but on themselves to the end that the agreements made shall be kept to the letter and to so modify those agreements that unsanitary and unsafe conditions in camps and mines may not be possible.

The coal industry is a public necessity Nobody can escape paying for coal or taxes. The mind of the man on the street is obsessed against the coal operator and the tax collector. He cannot escape the coal operator's charges any more than he can transportation dues, and so he rebels against the coal operators as he does against the railroad. Only by conducting the coal business on a higher moral plane than the traffic of the rest of the world can the operator hope to free himself from censure.

The World's Coal

The world's output of coal at the present time is approximately 1,300,000,000 metric tons annually. Of this enormous total the greater part, or about 75 per cent., comes from the United States, Great Britain and Germany. The value of the world's output of coal is about $2,300,000,000. More than 3,000,000 men are now engaged in this great industry.

It is interesting to note that in the United States where we produce more than half a billion tons each year, only 800,000 men are employed, while in Great Britain, where the production is considerably less than 300,000,000 tons annually, more than 1,100,000 men are employed. Even in Germany, where efficiency is supposed to be high, 700,000 men are employed to produce 240,000,000 tons.

It is possible, however, that our high mechanical efficiency, and consequent rush, is partly responsible for the high death rate in American mines.

Sociological Department

The Membership of the American Mine Safety Association

It may not be generally known that the American Mine Safety Association has memberships of various kinds. There are "active members," who are permitted to join because their occupation, affiliation or interest qualifies them to consider the issues and forward the aims for which the association is organized. Of these there were 127 at the last enumeration. The annual dues are $3.

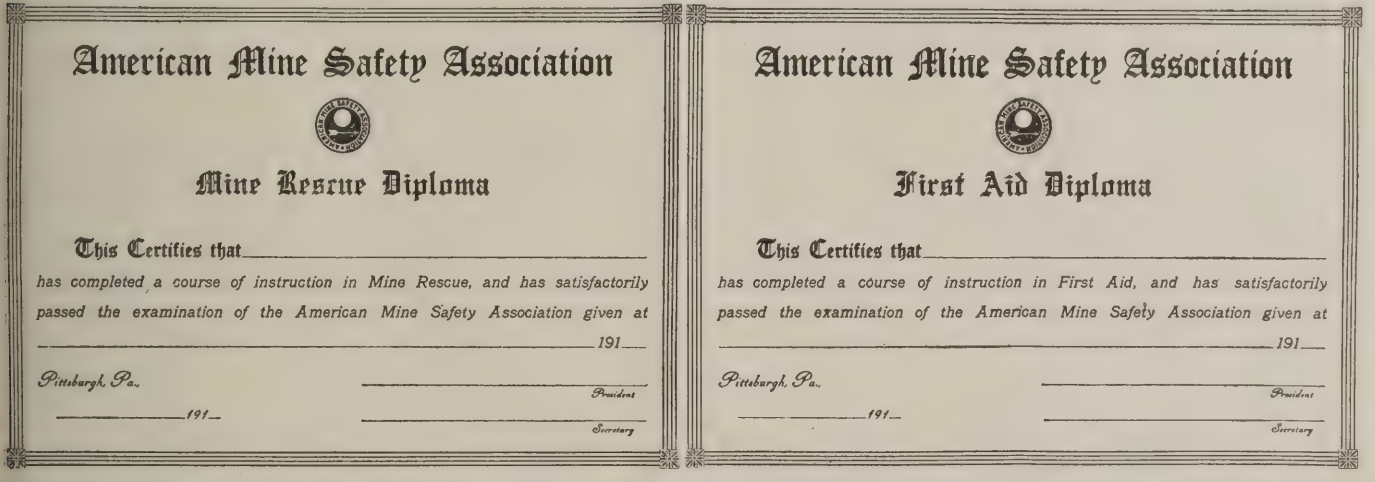
The Incorporated Members

Then there are associate members, which are not persons of flesh and blood, but national institutes, societies and associations, national and state departments and bureaus; and firms and corporations concerned in the mining industry or whose principal object is the reduction of the loss of life and property in mines. The annual dues are $10, except to the Federal Bureau of Mines, which is prohibited by a statute from payment of membership fees or dues in societies or associations. These associate members are entitled to representation by three persons, each of whom is entitled to all the privileges of active members. Of these there were 29 mentioned in the last report. Three manufacturing corporations only have so far entered under this head, the Sullivan Machinery Co., the Mannesmann Light Co. and the E. I. Dupont de Nemours Powder Co. More of such concerns should become members.

There are two mining associations, only one of which is a coal-mining body, the Rocky Mountain Coal Mining Institute, and the Gogebic Range Mining Association. All the other institutes should incorporate in this society. The list of mining companies is larger and includes nearly all the largest concerns, especially those in the anthracite region. There are also several of the smaller corporations. When a company itself is interested it has some right to appeal to its men to belong.

The National Service Corps

The National Service Corps contains 226 members, who pay 50c. dues per annum. Only those can belong who are actively connected with mining or metallurgy and have received sufficient instruction and training or have had such experience as may enable them to act as a member of either a mine-rescue or a first-aid team.



Only those can belong as mine rescuers who hold a certificate of proficiency from the U. S. Bureau of Mines from any of its coöperative stations or from the state mine-rescue departments. But the association retains the power to recognize the certificates of other bodies.

To join the Service Corps as a first-aid man, the applicant must be certified as proficient by the U. S. Bureau of Mines, any of its coöperative stations, the state mine-rescue departments, the American Red Cross, the Army, Navy or similar Hospital Corps or the St. John's Ambulance Corps, or their equivalents, as may be duly authorized by the association.

Instead of such certificates of training, applicants may be admitted upon presentation of sufficient evidence of having been engaged in such organized and scientifically conducted rescue or first-aid work as to warrant their approval by members of the committee: To have won a place in mine-rescue or first-aid contests, field meets, demonstrations or maneuvers and training work in preparation for the same may be accepted as evidence of eligibility for service membership.

The Button Is a Badge of Honor

Thus those who are service members may wear their buttons with a great degree of pride. The regular or active members and the associates do not partake of that distinction, the badge they wear showing their interest and desire to assist and not their ability to perform such acts of mercy. There is no little merit in deserving the button of the service member, for it shows training and education and not merely the contribution of money to the cause.

American Mine Safety Association

_____ 191__ _____ Secretary

Mine-Rescue and First-Aid Diplomas Issued by the American Mine Safety Association

Of course, the applicant for service membership must fill out an application form, showing his training, experience and practical work in mine rescue, first-aid, or both. This will be checked by the secretary from such records as are available and if it cannot be thus checked it will be forwarded to that member of the service membership who lives nearest the applicant, for his approval or rejection.

Title to Membership Must Be Maintained

Each service corps member will receive a diploma like those shown and will also receive a button like that illus-

Buttons Worn by Service Members

trated above. Each member has to submit a statement each year certified by his mine manager, physician or safety engineer or by an active or associate member of the association, showing he has taken supplemental training during the year.

Any man, therefore, who is duly a member of the service corps, not only has been a first-aid or mine-rescue man, but has, moreover, kept up his training and is fit for service.

We believe there will be several who will qualify this year and will wear this badge of honor. Every first-aid and mine-rescue corps should make it a point to induce its members to join the association.

Meeting of the Kentucky Mining Institute

SYNOPSIS—A well attended institute with a successful first-aid meet. Some observations and criticisms of the work performed by the teams in the latter.

The Kentucky Mining Institute held its summer meeting, May 8 and 9, in Lexington, Ky. The sessions were well attended, and it is evident that its future will be most successful though its earlier history was not so assuring. The session of the first day was held in the Mining Engineering Building of the Kentucky State University. Unfortunately the president, W. L. Moss, was not able to be present on that day, and R. D. Rash, his immediate predecessor in the chair, presided in his stead.

Major R. U. Patterson, Medical Corps, U. S. Army, who is in charge of the First-Aid Department of the American Red Cross, made an address. A buffet lunch was then served in the Buell Armory by the department of domestic science of the University. In the afternoon, C. W. Strickland, mining engineer for the West Kentucky Coal Co., Sturgis, Ky., read an article on "Some Other Difficulties"; E. Drennen, manager of the Elkhorn Division of the Consolidation Coal Co., Jenkins, Ky., a paper on "Mine Motors"; I. P. Tashof, of the State University of Kentucky, an account of "Mine Safety in the Lake Superior Copper District." "The Workmen's Compensation Law" was discussed by W. H. Cunningham, secretary of the Kentucky Mine Owners' Association, Ashland, Ky., and "The New Mining Law," by C. J. Norwood, chief inspector of mines, Lexington, Ky.

The Banquet

At 8:45 p.m., a banquet was held in the dining hall of the Phoenix Hotel. Johnson N. Camden acted as toastmaster, and the grace was delivered by Bishop Burton. John G. Cramer, secretary of the Lexington Commercial Club, delivered an address on "Lexington as a Mining Town." Henry S. Barker, president of the State University, then spoke on the "State University and its Relation to the Mining Industry of Kentucky."

Major R. U. Patterson's remarks related to the present condition of Mexico and the preparation of the Red Cross to meet the situation should further unfortunate developments occur. W. L. Moss, being still absent, F. D. Rash spoke on various topics and Van H. Manning followed with an address on "The National Bureau of Mines." As the hour was late the impromptu remarks scheduled on the program were omitted.

Mining Pictures and Business Session

On the following day exhibits of "Safe Methods of Mining Bituminous Coal at the Mines of the United States Coal & Coke Co., Gary, W. Va., and of "An American in the Making" were made at a local moving-picture theater. A short business session was then held in the ballroom of the hotel.

The discussion of funds which is perennial at most of such institutes took up much time. Like all organizations to which the subscription rate is only $2, there is a shortage in the treasury. Part of this is due to the cost of moving the experimental gallery to Lexington for the meet and part is accountable to expenditures for printing and postage. The operators of western Kentucky contributed liberally toward the expenses of moving the gallery and the eastern Kentucky operators will doubtless do equally well when so requested, so the only deficit remaining will be that for regular expenditures and, as a result of a vote, an assessment of $1 will be levied on members to wipe out this item.

The New Officers

The following were elected officers of the institute: President, H. La Viers, Paintsville, Ky.; secretary-treasurer, I. P. Tashof, State University, Lexington, Ky.; vice-presidents: W. C. Tucker, Benham, Ky.; L. B. Abbott, Jenkins, Ky.; W. S. Wells, Prestonburg, Ky.; J. E. Butler, Stearns, Ky.; B. R. Hutchcraft, Lexington, Ky.; C. W. Taylor, Greenville, Ky.; and T. E. Jenkins, Sturgis, Ky.

In the afternoon the first-aid men and the band met at the Chesapeake & Ohio Ry. station and marched to the athletic field of the University. The students were holding a track meet and the spectators divided their attention between the first-aid events, the track exploits and the explosion gallery.

The contesting teams were as follows:

1. Continental Coal Corporation, team No. 1. 2. Stearns Coal Co., Barthell team. 3. Consolidation Coal Co., Van Lear team. 4. St. Bernard Mning Co., team No. 1. 5. Continental Coal Corporation, team No. 2. 6. W. G. Duncan Coal Co.,

Graham team. 7. Stearns Coal Co., Stearns team. 8. Consolidation Coal Co., Jenkins team No. 1. 9. Continental Coal Corporation, Barker team. 10. Wisconsin Steel Co., Benham team. 11. W. G. Duncan Coal Co., Skibo team, Greenville, Ky. 12. North East Coal Co., Auxier team. 13. W. G. Duncan Coal Co., Luzerne team. 14. Stearns Coal Co., Worley team. 15. Consolidation Coal Co., Jenkins team No. 2. 16. Continental Coal Corporation, team No. 4. 17. Stearns Coal Co., Yamacraw team.

Unconscious But Not Asphyxiated

The first event was for one man only:

Man is found unconscious, having sustained a lacerated wound on the left side of the head (temple) and a like wound about 2x1 in. in diameter on the point of the left shoulder. Treat the case and carry 25 ft.

First-Aid Squads Competing at Institute Meet

Banquet of the Kentucky Mining Institute, Lexington, Kentucky

In the view of the judges, resuscitation was unnecessary in this case. Of course, if the unconsciousness had been the result of electric shock or asphyxiation from bad air, in fact, had he not been breathing, then the pulmotor, the Shaeffer method or some other device, might have been used with advantage. But it is to be noted, the statement is merely that he is *unconscious,* and there seems reason enough for that condition in the lacerated wounds of the temple and shoulder. It is essential that the man receive treatment for both these injuries immediately and not for a condition which the first-aid men have little or no reason to believe exists.

It is waste of time to treat for injuries not received, especially those demanding when indicated such extended treatment as resuscitation. If the man is actually breathing, the unnecessary work of stimulating the lungs would take place while he was rapidly losing blood and strength. It would make the condition of the patient worse rather than better.

Some favored the Sylvester method because that system had been taught them. It did not occur to them that a lacerated wound on the point of the shoulder would be made far more dangerous if the pump-handle motion of the Sylvester method were used on the patient. First-aid men must think. The problems, doctors have taught, will not necessarily be the conditions underground, and if a first-aid man cannot distinguish between the spirit of the instruction and the letter of it, he is a mere automaton and unworthy of a medal.

Where to Arrest Bleeding

The second was a full-team event:

After falling off a car a man is found to have the following injuries: A compound fracture of the lower jaw on the right side with slight bleeding, a deep lacerated wound on the inner side of the left ankle with profuse bright red bleeding. Treat and carry 50 ft. on a stretcher.

Last year both at the Knoxville, Tenn., meet and at that at Pittsburgh, Penn., several men made the mistake of putting the tourniquet too far from the injury when there was profuse bleeding. Let the first-aid man remember that the tourniquet is not a harmless instrument. It has a long record of deaths as well as of life savings. It might be well to quote from the new American Red Cross book:

"In consequence of cutting off the circulation" by the tourniquet "mortification and death of the part may follow. Therefore, tourniquets should never be used except when necessary and they should be removed as soon as possible." In this case, several men put the tourniquet on the artery of the thigh. The circulation was thus destroyed throughout the limb. There was no need whatever to press the artery so far away from the injury.

Event No. 3 was for two men:

Coal has fallen on a miner. When reached he is found to be unconscious and has received the following visible injuries: Left ear torn off and the ends of the fingers of right hand crushed off, all wounds bleeding profusely. Treat and carry 50 ft. without a stretcher.

In this event also some first-aid men put the tourniquet on the upper arm instead of near the injury. The artery of the arm is divided at the wrist, as shown in the illustration, but by using two pads, this difficulty can be

Arteries and Bones in Arm Showing Where Blood Flow Can Be Stopped

Wherever there is an exposed artery and a bone against which it can be thrust there will be found a place where bleeding can be arrested.

met. "For arresting bleeding of the hand alone," says the Red Cross Textbook, "pressure on the pulse at the outer side of the wrist and at the same place on the inner side will stop bleeding." Both parts of the artery must be controlled as they form a loop from which other arteries to the fingers branch.

No Bleeding and Therefore No Tourniquet

Event No. 4 was for the full teams:

A miner fell out of a cage a distance of about 15 ft., just as the cage started up the shaft. He is found to be unconscious and to have the following injuries: Compound fracture of the left leg below the knee with bone sticking out on inside of the leg. Practically no hemorrhage. Treat and carry on an improvised stretcher.

The first-aid men should have read the remarks quoted before on the dangers of the tourniquet. They certainly would not have then, with unanimity, clapped it on the

patient's leg before he started to bleed. Perhaps his leg artery may have received some injury and shock has caused a temporary cessation of the blood flow. Well and good. The right practice would be to put the tourniquet in place untightened, so that it could be tightened up should the blood flow become dangerous. But with a hemorrhage, such as described, the probabilities are that nothing worse than capillary bleeding is to be anticipated and the tourniquet is really not likely to be needed. However, the first-aid men put it on, subjecting the patient to both unnecessary pain and needless danger.

Do Not Smother a Patient after Reviving Him

Event No. 5 was also a full-team event:

A miner is found unconscious due to afterdamp and has received burns of the hands, forearms, neck and face. Treat and carry 50 ft. on a stretcher made of coats and poles.

Here the most marked error made was to put the gauze on the patient before making holes for his nose and mouth. The man has become unconscious from afterdamp; his breathing is doubtless labored and it is most important to delay long enough to provide for his untrameled respiration.

The Penalties and Awards

The penalties and discounts used by the American Mine Safety Association were adopted. The judges were all medical men; in fact, the Red Cross will not permit laymen to act as judges in events in which it participates. The principal awards were as follows:

Sanchez Challege Cup. Donated by M. Sanchez, of Lexington, Ky., to W. G. Duncan Coal Co., Graham, Tenn. (Cup must be won twice in succession before it becomes the property of any team; meantime, it is to be competed for annually.)

State University Trophy Cup. Donated by the State University and presented by Henry S. Barker, the president of the university, to the Continental Coal Corporation team No. 1.

Lungmotor, donated by the Life Savings Devices Co. Won by the W. G. Duncan Coal Co., Luzerne team.

Sixty dollars in gold, donated by the Jeffrey Manufacturing Co. and an Anemometer donated by the Davis Instrument & Manufacturing Co. This was presented for division between the Stearns Coal Co. Barthell team and the Wisconsin Steel Co. Benham team.

Six vest-pocket compasses, donated by the Fairmont Machinery Co. Won by W. G. Duncan, Skibo team, Greenville, Ky.

Fifteen dollars in gold, donated by Ohio Brass Co. Won by the Continental Coal Corporation, Barker team.

Twelve dollars cash, donated by Bryan-Hunt Co., of Lexington, Ky. Won by the Consolidation Coal Co. Jenkins team No. 1.

The Benham team of the Wisconsin Steel Co. getting a larger score than the Barker team of the Continental Coal Corporation received the 1913 first prize for which the two teams had previously tied. This was a large silver cup presented by the Goodman Manufacturing Co.

There were several other smaller prizes. Medals were awarded to the members of the team receiving the highest average, by the American Red Cross and the American Mine Safety Association.

During the afternoon the large explosion gallery was fired, twice, once with a permissible explosive with a deflective force equal to a half pound of 40-per cent. glycerin dynamite, tamped by one pound of clay and once with black blasting powder of equal deflective force tamped by two pounds of dry clay. In each case, plenty of bituminous coal dust was present, and as might be anticipated, there was no explosion in the first instance and a most severe one in the second.

Free Course of Instruction for West Virginia Miners

In order to further the work of the operators in improving mining methods and conditions in West Virginia, and to assist the State Mining Department in an educational and safety campaign, the Board of Regents of the State University has appointed an additional member of the faculty, whose business it will be to organize training schools for the miners throughout the state. This new faculty member is Robert S. Gatherum, who has been designated as Assistant Professor in Mining, and his appointment will become effective July 1.

Mr. Gatherum's duties will keep him constantly in the mining fields, and as the classes in mining instruction are organized, the work will be put in charge of some well qualified local man. The courses of instruction will be such as are recommended by the Department of Mining at the University, and will be selected according to the conditions in each locality. Lantern slides and motion pictures will show how mining camps may be made both sanitary and attractive; how accidents occur and how they may be avoided; the safe method of undercutting coal by pick and machine; how roofs should be examined and posts set; the proper handling and storage of explosives, etc. These pictures have been made to develop the "safety-first" idea, and will be readily understood by the foreigners who are unable to speak English.

Equipment will also be carried to demonstrate the characteristics and behavior of the various mine gases, and a few simple experiments with each gas will impress upon the miners their properties and dangers. A number of instructive experiments will also be performed upon coal dust, for the purpose of emphasizing its danger. The lectures will include such subjects as sanitation, first-aid-to-the-injured, the raising of garden produce, etc.

Mr. Gatherum is a practical mining man, and is especially well fitted for the duties of his position. He made his start as a trapper boy in the mines of West Virginia at the age of 14, and after wielding the pick for a number of years, he accumulated sufficient funds to secure an education as mining engineer at the West Virginia University, and has since been located in the New River and Kanawha fields.

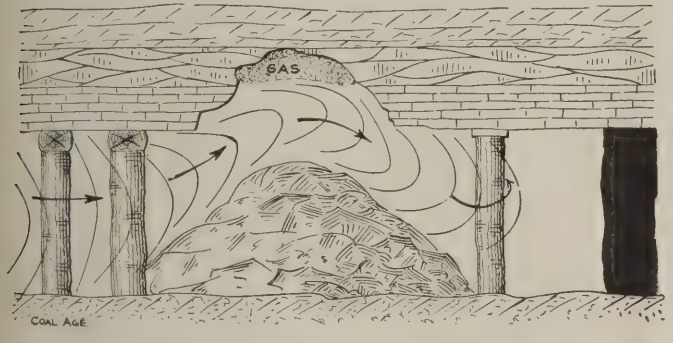
This further indication of the University's desire to extend its usefulness and carry its instruction to the miners will be generally commended. That such movements tend to decrease the death and accident rates can be proved from the results that have attended similar efforts elsewhere. The Kanawha and New River fields have been chosen to inaugurate the movement, which will be extended to other fields as soon as possible.

Coming Meetings

The summer meeting of the **West Virginia Coal Mining Institute** will be held in Cumberland, Md., June 2, 3 and 4.

The annual meeting of the **Mine Inspectors' Institute of the U. S. A.** will be held in Pittsburgh, Penn., June 9, 10, 11 and 12, with headquarters at the Seventh Avenue Hotel.

The annual meeting of the **International Railway Fuel Association** will be held in Chicago, Ill., June 18, 19, 20 and 21, with headquarters at the Hotel La Salle, La Salle and Madison Sts.



Discussion By Readers

Explaining an Extraordinary Experience

The extraordinary experience described by John Lawlor, Jr., COAL AGE, Apr. 25, p. 682, while unique, will not, I believe, be regarded as wholly phenomenal, when the attendant circumstances are taken into consideration. In my opinion, the peculiar action of the flame of the open light, the flame cap and the inflammation of the mixture with its billowy or undulatory movement can be explained in accordance with the operation of natural laws under unusual conditions and experimented with in an unusual manner.

According to the description given, the roof fell to a height of about 3½ ft. above the line of stratification of the drawslate. By the building of a brattice extending toward the face, from the last cut-through, the sectional area of the air passage was considerably reduced and, as a result, the air traveled with a much higher velocity. When this current reached the cavity left by the fall, it would naturally expand some, but its course would be deflected upward above the fall.

Referring to the accompanying figure, I have indicated by the light curved lines the comparative velocity

ILLUSTRATING ACTION OF AIR CURRENT ON ACCUMULATIONS OF GAS

of the air waves passing over the fall. At the top of the fall and above the passing air current, I have indicated by dotted lines the gas which is issuing from the crevices of the strata and is in different stages of dilution by the air current. Under these conditions, while the air passing over the fall might be practically free from gas to any extent that could be detected by the lamp, the gas close to the roof would be almost pure (unmixed with air). Between the passing air and the accumulating gas, there would be a more or less undefined line where the mixture of gas and air would be inflammable and above this line a light would be extinguished by the sharp gas near the roof. A lamp raised into this mixture would, therefore, first show a cap; but, later, the lamp would be extinguished by the sharp gas.

Referring to the flame cap leaving the lamp, and floating upward with a gyratory movement, it is possible to imagine that in this contracted area and limited space, with a free flow of gas above and a pure air current flowing below, the peculiar phenomenon was presented of a sharp transition from an inflammable to an extinctive atmosphere. Again, by any sudden deflection of the air into the cavity, it may be supposed that, with the rapid diffusion of the gas assisted thus by the velocity of the air current, an inflammable portion of this accumulation was swept from the main body and carried forward as described.

The wave-like appearance of the burning mixture is sufficiently common to need no explanation. It is a well known fact that gas often travels a considerable distance in stratified layers, in a strong current of air. In my own experience, I have often been forced to the conclusion that a higher percentage of gas is found in the air close to the roof and extending partly down the sides or ribs of the entry. This condition, I believe to be due to the air current being retarded more at these points of contact with the roof and sides of the entry, whereby the air supply is less in proportion to the quantity of gas present at those points. The impression that there was "gas all around;" as Mr. Lawlor expresses it, is most assuredly correct; but it was this fact that made the experiment he conducted more dangerous. Again, since the gas acted in the usual manner when the air current was cut off, it is reasonable to suppose that there was nothing in the composition of the gas that would give rise to the peculiar manifestations described.

Safety or Refuge Chambers in Mines

Letter No. 4—I am an ardent believer in the adoption of any means that will tend to the conservation of human life. In respect to the construction of safety chambers in mines, as a means to this end, the question naturally suggests itself: Will such chambers provide the greatest degree of safety, without making suitable auxiliary provisions that will render them available under all conditions. I am inclined to answer this question in the negative. I do not offer this statement as an argument against the installation of such refuge places in mines, or to detract, in any degree, from their utility. I simply want to draw attention to a fact that is already well known, but too apt to be overlooked; namely, that such chambers provided in mines will not be "havens of refuge" under all conditions.

Ignoring, for the present, the number, location and manner of construction of the chambers, and confining this discussion to the question of their accessibility at the moment of need, as a measure of their efficiency, I think that the chances are chiefly against their availability, in most mine disasters. In discussing the question, knowing by experience that an explosion may occur in any portion of the mine, we should consider three cases:

First, assuming the explosion takes place at a point *inby* from the location of the chamber. It is apparent that the pasageways leading to the place of refuge may be rendered impassable, either by the destruction caused by the force of the explosion, or by the presence of afterdamp or fires. In either case, the refuge chamber would be inaccessible to the survivors at the working face.

Second, assuming the explosion occurred at a point *outby* from the location of the chamber, while the passageways leading thereto may not be obstructed as in the previous case, by broken timbers and falls of roof, they may soon be so filled with afterdamp as to be impassable, and access to the refuge chamber again cut off.

Third, if the explosion should occur in the immediate vicinity of the refuge chamber, it is possible that not only the roadways would be rendered impassable, but the chamber itself might be destroyed or the entrance thereto effectively blocked. It is necessary to consider these contingencies as possible, whether there be provided one or more such places of refuge.

Granting the truth of the foregoing remarks, we must conclude that to make the refuge-chamber idea effective, it will be necessary to supply the workmen with appliances that will be a protection and enable them to reach the refuge chamber under conditions that would otherwise make this impossible, owing to the intervening afterdamp. In line with my previous statement, I would suggest the advisability of installing in every working place a breathing apparatus and portable electric lamp that would be available for each man, in time of need. I believe this provision would help to make the refuge chamber available to survivors of an explosion.

While much attention has been given to the work of rescue following an explosion, it seems to me, as has been suggested by John Rose, COAL AGE, Apr. 18, p. 657, that more attention should be given to precautionary and protective measures, both legal and otherwise. The question of expense is a minor factor in comparison with the possibility of saving human lives. There is probably no more hazardous business or occupation than that of coal mining, and few in which there is more recklessness and carelessness displayed on the part of the workers. It will be generally admitted that there are no greater gamblers on human life than miners, and this must be controlled by moral suasion or physical force—law.

I. C. PARFITT.

Jerome, Penn.

The Mine Foreman

Letter No. 5—I have been much interested in what has been written in regard to the responsibilities resting on the mine foreman and his relation to the superintendent. While I think that every man serving in the capacity of superintendent of mines should be capable of passing any examination required of mine foremen, I believe that many foremen who find fault because the superintendent does not accept their suggestions and adopt the methods they propose, are themselves to blame. In many such cases, the incompetency rests with the foreman and not with the superintendent.

It is well known that there are many incompetent mine foremen who hold certificates of competency, but who surely have never passed a rigid examination. Such men lack the necessary ambition to make them successful in the operation of a mine; they are, in fact, only "timekeepers." All men are alike to them; they know little of the work being done, because they do not get around the mine to personally inspect and superintend the work.

Compare such a man with the competent and ambitious mine foreman who realizes that he is more than a mere "timekeeper." This man is known to all his men and he, in turn, knows the character of every man in the mine. He is a good judge of human nature and this fact gives him the ability to handle men successfully. He is always ready to adopt improved means or methods; he consults his assistants and firebosses on every important question. He is devoid of prejudice or biased opinions. Such a mine foreman is not satisfied except when he has everything working in proper order. After starting the men to work in the morning, he proceeds to examine the roadways, travelingways, air courses and working places in the mine. He thus acquaints himself with every condition that exists in the workings. He expects his assistants and firebosses to spare no pains or effort in making the mine safe. He instructs them to report to him at once any place in regard to which there may be a doubt.

It is unnecessary to state that such a man has generally the hearty coöperation of his superintendent; and even when this is lacking, he seldom complains, but strives to produce the best results with the material at his command. His knowledge of mining and thorough acquaintance with the conditions underground enable him to impress his ideas and to offer practical suggestions.

By thus comparing the competent and incompetent mine foremen and the manner in which each performs his work, it is made plainly apparent that it is the negligence, incompetency and lack of ambition on the part of a foreman that is more often the cause of mine accidents, than the incompetency of the superintendent.

B. J. CROOKS, Asst. Foreman,

Midway, Penn. Carnegie Coal Co.

Letter No. 6—The mine foreman is a greater factor and plays a more important part in the coal-mining industry of today than is generally supposed. The plan of development, methods of producing coal and provisions for the safety of the men, in many of the smaller operations, are left wholly to him; and the results obtained are measured by his ability and management.

With respect to the elements necessary to produce results, mine foremen may be classified as competent and incompetent; successful and unsuccessful; ambitious and unambitious; industrious and indolent, etc. The successful mine foreman of today must be both practical and progressive, the methods of operation in the mining of coal are constantly changing. Old and defective systems are being replaced by new and improved means and methods. To such an extent is this true that the successful foreman of a few years ago, following the same methods now as then, would be a failure today.

The mining law of Tennessee, in prescribing the duties of mine foremen, places on them the burden and responsibility of maintaining safe and sanitary conditions in the mine. The position thus involves great responsibilities, and the mine foreman should realize this fact and prepare himself to meet its requirements and demands, as far as possible. Again, the operator places on him the burden and responsibility of putting out the coal at a minimum cost.

With the duties and responsibilities imposed by the mining law on the one hand, and the results demanded by the operator on the other hand, the mine foreman's position is not an easy one, but one requiring careful preparation, thought and the exercise of good judgment. It is apparent at a glance that the duties of the mine foreman are many and arduous. Mine managers and superintendents frequently make the mistake of permitting the mine foreman to be over-taxed. Because he is on a fixed salary and responds willingly to calls at any hour is no excuse why he should be expected to work nights and Sundays, almost without cessation. There is a limit to human strength and endurance, and a nervous strain produced by such over-taxation will often develop a nervous and discouraged worker. Relaxation and rest are even more essential for the mine foreman than for the mine mule, whose working hours are well guarded.

Mine foremen, to a certain extent, become what their superior officials make them, and this effect, in turn, is reflected in the character of men he draws around him. An energetic, active, painstaking foreman develops the same characteristics, in time, among his men. His position is thus a high and responsible one, and the influence he exerts is a potent factor in the success or failure of the operations in his charge. He must be a leader and not a driver of men, faithful in his attention to duties in the mine and persistent in his endeavors to acquire knowledge. Though holding a higher position than the men under him, the successful mine foreman, if not lacking in common sense, will consult with his men and develop among them advisers and efficient assistants in the carrying out of his plans.

A valuable element in the make-up of a mine foreman is honesty of purpose that should be plainly manifest in all his dealings between the company and the men. He can show no favoritism. In his efforts to improve conditions and achieve results, he will doubtless make mistakes, as have all men who have accomplished things worth while.

There is today an increasing demand, in the coal-mining industry, for intelligent mine foremen—men with strong minds and active brains, men who are studying the problems of safety in mining and economy in production with all the zest at their command. Foremen are needed with moral and elevating force of character, who can wield an educating influence over the miners in their charge; inspiring them to better and nobler aims in life, which make for better homes, better citizens and better communities. These are the essential elements of success.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

SECONDARY SPLITTING

Secondary splitting involves the principles of both tandem and split circulations. The tandem portion consists of the main airway of the primary split and the airways branching from this and forming the secondary split.

It is necessary to first find the general pressure potential for the secondary split section. This is equal to the sum of the pressure potentials of the airways forming that split. This general potential for the secondary split is then combined with the corresponding primary potential, according to the method employed for a tandem circulation, which is thus regarded as one branch of the primary split.

The accompanying diagram shows clearly the method of naming the splits and indicating them by symbols. The

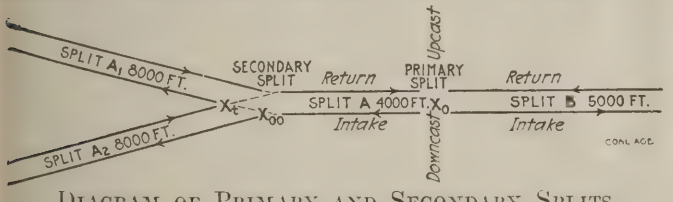

DIAGRAM OF PRIMARY AND SECONDARY SPLITS

primary splits, branching from the point where the air current is first divided, are designated by the letters A, B, C, etc., and the corresponding potentials by X_a, X_b, X_c, etc.

Secondary Splits are designated A_1, A_2, etc., and B_1, B_2, etc., depending on the primary split from which they branch: and the corresponding split potentials by X_{a_1}, X_{a_2}; X_{b_1}, X_{b_2}, etc. The general potential for a primary split is designated X_o, and for a secondary split X_{oo}, or X_{a_o}, X_{b_o}, etc.

In secondary splitting the operation is much simplified by calculating the general potential for each consecutive point or section, beginning always at the inby end of the system and finding first the general potential for the secondary split; then combining this in tandem with the corresponding primary potential; and using this result to find the general potential for the primary split, in the same manner as for the secondary split. Two formulas only are necessary; the one expressing the summation of the potential values for a split circulation, and the other a similar summation for a tandem circulation. They are as follows:

General split potential, $X_{po} = \Sigma X_p$

General tandem potential, $X_{pt} = \dfrac{1}{\sqrt{\Sigma\,(1/X_p^2)}}$

In all splitting calculations it will generally be found more convenient to use the pressure potential, for the reason that the calculation of the distribution of the air is based on equal pressures, for all splits starting from one point.

The Coal Age Pocket Book

Example—An air current of 120,000 cu.ft. per min. is passing in a mine in two splits, as follows:
Split A, 5x10 ft., 20,000 ft. long; 40,000 cu.ft. per min.
Split B, 5x10 ft., 5,000 ft. long; 80,000 cu.ft. per min.

More air being required, a careful investigation shows that Split A can be again divided at a point 2000 ft. inby from the foot of the downcast shaft, thereby forming two secondary air splits, each 5x10 ft., 8000 ft. long, including the return. This would make Split A 4000 ft. long including the return. With the same power on the air, what quantity of air will be circulated in this mine after dividing Split A?

Solution—The first step is to calculate the potential values of the different sections or splits, both before and after dividing split A to form the two secondary splits A_1 and A_2. This being a comparison of two circulations, it is possible to use the relative potentials, reducing the areas, perimeters and lengths to their lowest relative values, which gives

		(Relative values)
Before dividing Split A:		
Split A,	$a = 50;\ o = 30;\ l = 20{,}000$	$a = 1;\ o = 1;\ l = 20$
Split B,	$a = 50;\ o = 30;\ l = 5{,}000$	$a = 1;\ o = 1;\ l = 5$
After dividing Split A:		
Split A,	$a = 50;\ o = 30;\ l = 4{,}000$	$a = 1;\ o = 1;\ l = 4$
Split B,	$a = 50;\ o = 30;\ l = 5{,}000$	$a = 1;\ o = 1;\ l = 5$
Split A_1,	$a = 50;\ o = 30;\ l = 8{,}000$	$a = 1;\ o = 1;\ l = 8$
Split A_2,	$a = 50;\ o = 30;\ l = 8{,}000$	$a = 1;\ o = 1;\ l = 8$

Relative potentials, before division:

$$X_a = a\sqrt{\frac{a}{lo}} = 1\sqrt{\frac{1}{20\times 1}} = \frac{1}{\sqrt{20}} = 0.2236$$

$$X_b = 1\sqrt{\frac{1}{5\times 1}} = \frac{1}{\sqrt{5}} = 0.4472 \qquad \Sigma X = 0.6708$$

Relative potentials, after division:

$$X_a = a\sqrt{\frac{a}{lo}} = 1\sqrt{\frac{1}{4\times 1}} = \frac{1}{\sqrt{4}} = 0.5000$$

X_b = *Same as before* = 0.4472

$$X_{a_1} = 1\sqrt{\frac{1}{8\times 1}} = \frac{1}{\sqrt{8}} = 0.3535 \qquad X_{ao} = 0.7070$$

X_{a_2} = *do* = 0.3535

Tandem summation (X_a and X_{ao}):

$$X_t = \frac{1}{\sqrt{1/X_a^2 + 1/X_{oo}^2}} = \frac{1}{\sqrt{1/0.5^2 + 1/0.707^2}} = 0.4082$$

$$X_o = X_t + X_b = 0.4082 + 0.4472 = 0.8554$$

Since the power is the same, before and after division

$$\frac{Q_1^3}{(\Sigma X)^2} = \frac{Q_2^3}{X_o^2};\ \text{and}\ \frac{120{,}000^3}{0.6708^2} = \frac{Q_2^3}{0.8554^2}$$

$$Q_2 = 120{,}000\sqrt[3]{\left(\frac{0.8554}{0.6708}\right)^2} = 141{,}100\ \textit{cu.ft. per min.}$$

Inquiries of General Interest

Effect of Short-Circuiting Air on Speed of Fan

A mine ventilating fan is discharging a certain quantity of air into a mine when a door is set open between the main-intake and return airways in the mine, thereby short-circuiting the air current at that point. When this occurs, I have noticed that the load on the engine or motor driving the fan is increased. Will you kindly explain the reason for this effect?

INQUIRER.

Stotesbury, W. Va.

The setting open of the door and the consequent short-circuiting of the air current underground, at once cuts out the mine resistance and the pressure on the air in the fan drift drops accordingly. Under this decreased pressure, a much larger quantity of air flows through the fan, which greatly increases the work or power absorbed in the fan itself.

It is this work, which is absorbed or lost in the fan, that affects, in a measure, the torque or turning moment. The work thus absorbed varies directly as the square of the velocity of the air passing through the fan. The ratio of increase in the velocity and quantity of the air current, caused by the short-circuiting of the air, will be determined by the relative mine potentials or the relative resisting capacities of the airways before and after the short-circuit takes place. It should be perfectly evident, therefore, that the load on the engine or motor will be increased as the square of this ratio, and the power as the cube of the same.

A Checking System for Coal Loaded by Miners

I will appreciate an expression of opinion with reference to a problem that is a constant source of trouble to all mine operators and also in respect to a plan I have devised for obviating the difficulty.

I refer to the matter of properly checking the amounts of slate and slack loaded by the miners; and of keeping a check also on those portions of the mine from which the dirtiest coal is loaded. Heretofore, this checking of the miner's output has been attempted by selecting mine cars at random and picking over the whole car, which meant that in all probability, a miner would not have more than two or three of his cars picked a month. The result was a tendency for the miner to take chances and load excessive quantities of rock, and shoot his coal carelessly with a resulting abnormally low percentage of lump to slack. If each mine car could be picked and records kept of the percentage of rock, slack and lump, the problem would be solved at once, but that is impracticable.

According to my scheme, a sample of a predetermined quantity is taken from each car and in such a manner as to prevent the car being loaded so as to affect the fair average character of the sample taken. This sample of, say 100 lb. to the car is delivered to a "sample box," which is marked with the same check number as that of the car from which it is taken. This sample is then treated in any convenient manner to determine the percentages therein of rock, lump and slack. A daily report is kept in which the percentages of rock, lump and slack, as shown by the tests of the samples taken, are tabulated under each check number. We have had this system in effect at Banner Mines for some time, and the results obtained I regard as very satisfactory.

As soon as the men became aware that a large proportion of their cars would be sampled the percentages of rock began to fall off so noticeably that in less than ten days' time the amount of rock loaded, as shown by the amount of refuse hauled away from the picking belt and washer, had decreased very materially. The amount of slate picked by hand at the picking tables was practically reduced one-half.

By arranging a bonus system for rewarding miners whose percentages of rock were below a predetermined average amount, and whose percentages of lump were above a predetermined average amount, it seems quite probable that the men might be stimulated to better mining and loading. The tabulated report of the tests could be kept uptodate and placed where the miners could inspect it. The men that are in the "bonus class" could be designated each day. This tabulated sheet would show the operator at a glance what men are loading the cleanest coal, what men are shooting their coal best and hence have the highest percentage of lump where lump is desired; and, by knowing the location of the working places of the respective miners, it will indicate which parts of the mine, if any, are producing the dirtiest coal.

Such a system would also serve as a warning to men whose percentages are constantly poor, and would enable the operator to eliminate, when opportunity occurs, by a system the fairness of which cannot be questioned, the undesirable ones from among his miners. A vital feature of the system is the maintenance of the check number on the sample corresponding to that of the car, so that the samples can be taken without interrupting the usual rapid dumping of the mine cars. The samples can be tested at leisure, and the results tabulated.

A discussion of this system with such suggestions as you see fit to make will be appreciated.

ERSKINE RAMSAY,
Vice-President and Gen'l Manager,
Pratt Consolidated Coal Co.

Birmingham, Ala.

[The above draws attention to an exceedingly practical and important matter. Let COAL AGE readers suggest how an effective checking system of each miner's daily output of coal can be maintained without delaying the dumping of the cars. Or, it may be, someone can offer a substitute for the system suggested that will be equally effective in securing the loading of clean coal, as well as an accurate knowledge of the coal mined in different sections of the mine.—ED.]

Examination Questions

Pennsylvania Bituminous Mine Foremen's Examination, May 5 and 6, 1914

Ques. 1—What observations would you make on your daily examination of the working places in a mine?

Ans.—Observe closely the condition of the roof and coal face, to see that it is properly secured with the necessary timbers and sprags; observe the condition of the working face with respect to fine coal and refuse; observe the general manner in which the miner performs his work, keeps up his place, loads his cars, handles his supplies of powder, oil, timber and tracking and otherwise observes the rules and regulations of the mine. If safety lamps are used, observe carefully the condition of the lamp and manner of its use by the miner. If machines are used for cutting the coal, observe the manner in which this work is being done. Inspect all drill holes and shots to be fired and give necessary instructions to insure the safety of the men working in each place.

Ques. 2—What instruction, oversight and attention would you give the workmen on your daily rounds and what special attention must be given to pillar work?

Ans.—Besides what is mentioned in the previous answer, it is important to observe that each man has the needed supplies of timber, tracking, etc., to make his place safe and that he timbers his place promptly and securely. Careful attention should be given to see that each man performs his work in a safe manner. In pillar work, it is most important to see that sufficient timbers are set to secure the roof behind the men and prevent the falls from extending over the loose end of the pillar. It is also important to observe that the line of pillar work is kept fairly straight.

Ques. 3—Before hiring a workman in any capacity, what questions would you ask before giving him employment?

Ans.—Ask him for his certificate and references, if he has any; find out where he has worked before; in what capacity, and ascertain why he left that place. Inquire how he would proceed to timber his place, mine and load his coal; and ask him to explain his manner of charging and firing a blast. If safety lamps are in use, ascertain if he has had any experience in gas and give him a safety lamp to take apart and put together again. Give him a set of instructions to read and see if he can read and understand them to your satisfaction.

Ques. 4—What are the efficient limits to which the ventilation of a mine may be split?

Ans.—The velocity of the air current practically determines the limit of splitting or dividing the air. This limit of velocity at the working face varies under different conditions, but should seldom fall below 200 ft. per min.; and, in many cases, the velocity of the air current passing the working place should not be less than 400 or 450 ft. per min.

Ques. 5—State clearly what provisions should be made and appliances installed to insure a mine being thoroughly and efficiently ventilated, and state where such appliances should be placed.

Ans.—The ventilating equipment of a mine starts at the surface, although, in a few exceptional cases, a deep shaft and the absence of any gas may admit of furnace ventilation being employed, which, however, is not a safe or practicable system for use in a gaseous or a shallow mine. The mine ventilator located on the surface should be a fan of sufficient capacity to supply the required quantity of air against the necessary water gage, the latter being determined by the resisting power of the mine. If a mine is gaseous or dusty, there is the possibility of explosion; and, to prevent the destruction of the ventilating apparatus, explosion doors should be provided above the fan shaft. The fan should be set a sufficient distance back from the top of the shaft to avoid damage from any cause arising from its proximity to the shaft.

In the mine, air bridges, preferably overcasts, should be built at the mouth of each section of the workings, so as to provide a separate split of air, as early in its development as practicable. The air current should be properly conducted throughout the mine, by substantial air-tight doors and stoppings. The air should be made to sweep all working faces, and, wherever necessary, temporary brattices should be constructed to carry the air forward, or for the purpose of deflecting the air current into cavities in the roof or other void places. Regulators should be used to properly regulate the air so as to proportion the supply to the need in each section of the mine. Such regulators must be placed where they will not interfere with the haulage of coal.

Ques. 6—What provision should be made for the safe handling of explosives and detonators in mines, including transportation of the same?

Ans.—General Rule 13, Art. 25, of the bituminous-mine law of Pennsylvania, provides that no person shall carry into the mine, at one time, a greater quantity of powder or other high explosive than is required for use in one shift and such quantity shall never exceed 5 lb., except in the case of shotfirers requiring a larger amount to complete their work, as provided in Art. 16. It is also provided that all powder carried into the mine must be contained in metallic cans or canisters.

Art. 16 further provides that no powder or high explosive shall be stored in any mine. Black powder, for use in mines, must be put up in 5-, 10-, 15- and 25-lb. metallic cans, or canisters, or equally safe receptacles. No black powder, explosives or detonators shall be hauled on any electric motor trip, unless encased in boxes of non-conductive material. In dry and dusty mines where gas can be detected on the safety lamp, none but permissible explosives shall be used. No charge shall consist of more than one kind of explosive. The law provides that all permissible explosives, for use in bituminous mines, must be marked with the name of the manufacturer, name of the explosive, method of handling and full instructions for use. Detonators must at all times be kept in securely locked cases and separate from other explosives.

Coal and Coke News

Harrisburg, Penn.

Taking issue with the opinion of the Interstate Commerce Commission regarding the joint freight rates on what are known as industrial railroads or "tap lines," which roads connect with a great many bituminous mines, the Public Service Commission on May 14, decided that the proposed cancellation of established joint rates is not justified and should not, therefore, go into effect.

At the final hearing of this case on the above date, attorneys for trunk lines contended that under a ruling of the Interstate Commerce Commission there was ample justification for the withdrawal of joint rates heretofore maintained with the terminal connecting roads, while counsel for the Union and Monongahela railroads, the complainants in the case, were emphatic in their declarations that interstate commerce is not subject to the regulatory control exercised by the Federal Commission.

George S. Patterson, representing the Pennsylvania R.R., questioned the authority of the Public Service Commission to suspend the rates, which became effective on the above date. There is no empowering clause in the act creating the commission he asserted, and the Interstate Commerce Commission has already declared the practice of terminal allowance to be illegal.

Charles MacVeigh, general counsel for the United States Steel corporation, and representing the Union road and shippers along its lines, appealed for a just recognition of state rights, notwithstanding the Interstate Commerce Commission's decision.

In reviewing the case, it was shown the trunk lines allege, under the Interstate Commerce ruling, that delivery of cars at points of inter-change is actual delivery of cars at destination. Under the new tariff there will be an additional tonnage charge of 15 cents for hauls of only 14 miles, in many instances. In the Pittsburgh district, the region most affected in the case, there are approximately 30,000,000 tons of freight transported annually, the greater portion being coal and steel. An adverse decision means a yearly loss of $2,500,000 to the Monongahela Connecting R.R. and $5,000,000 to the Union Railroad.

The Lehigh Valley Answers Government

The Lehigh Valley R.R. on May 14, denied in the Federal Court that it had entered into combination or conspiracy to restrain or monopolize the production, transportation and sale in interstate commerce of anthracite trade, located along the lines of the company. The denial was set forth in the road's answer to the government's suit under the Sherman anti-trust law.

Another defendant company, the Delaware, Lackawanna & Schuylkill R.R. also filed answer, making denial of the charges that it is a party to any combination to restrain the anthracite trade. This road, 50 miles long, was acquired by the Lehigh Valley R.R. to serve collieries in the anthracite region.

Denial of similar character was filed on behalf of the various individual defendants, who are officials and directors of the company sued by the government, and who are personally mentioned in the government complaint.

The Lehigh Valley Coal Sales Co. and various other railroad and coal companies, which are defendants, filed their answer about two weeks ago.

In its general effect, the answer of the Lehigh Valley R.R. is a complete and specific denial of all the charges made by the government. The transportation of anthracite has not been moderately profitable, this company sets forth and up to the present time the owners have not received and are not now receiving a return commensurate with the value of their investment in the property.

The railroad company denies it owns or has ever owned anthracite lands in Pennsylvania or elsewhere, although it admits that some of its constituent companies were chartered by the State of Pennsylvania, both as railroad and coal companies. For many years, the answer asserts, it was the policy of the State of Pennsylvania, "to bring about a joint development of the anthracite mining and transportation industries."

The railroad company denies any domination of the Lehigh Valley Coal Co. or any other coal companies through stock ownership or otherwise, but asserts that the mines of the coal mining company are operated and its affairs are entirely controlled by officers who have no connection whatever with the railroad company. It is conceded that the president of the railroad company is the president of the coal company, but as president of the latter, the answer says, "he acts solely in an advisory way respecting the fiscal affairs of said company, and has never exercised any jurisdiction in regard to the mining or production or sale of coal."

Denial is made also that the road has been guilty of granting rebates or of charging unreasonably high rates for transportation of anthracite over its lines to the coal markets, or that the railroad company advised the coal company to organize a coal sales company or that any restriction was placed upon its stockholders when the Lehigh Valley Coal Sales Co. was organized.

PENNSYLVANIA

Anthracite

Edwardsville—Settling in the old workings of No. 3 shaft of the Delaware & Hudson Co. on May 9, caused a cave 10 ft. in diameter and more than 20 ft. deep on Summit Street, opposite two school houses, and for several hours the people of the neighborhood were driven from their homes and given much uneasiness. The most apprehension was felt over the condition of the gas and water mains on the affected street.

Minersville—While eating supper on May 11, the family of Mrs. Kerns, had a narrow escape from being swallowed into the old workings of William Penn Colliery. The earth suddenly caved under the front portion of their home and in their front yard to a width of 70 ft. the depression being 50 ft. in diameter. The house was pulled from its foundation walls and left on the brink of the pit.

Exeter—The Pennsylvania Coal Co. has erected at the old Schooley shaft, a most modern plant for the removal of water from this old abandoned operation. Two large pumps, electrically driven, are working to perfection. The water is now 200 ft. from the top of the shaft, and it is expected that in a short time the Checker seam may be entered. Gas has been encountered and a large fan has been installed for its removal. When the Checker is reached a large force of men will be put to work cleaning away the débris and rotted timber, replacing the same with new, preparatory to resuming mining. The shaft is about 500 ft. deep, but it is considered the worst part of the pumping is over.

Hanover—Representatives of the Taxpayers Association, which is composed of all the large coal companies, were unable to secure an injunction to restrain the commissioners of Hanover Township from letting contracts for the repairing of roads, entailing an expenditure of $100,000.

Scranton—There was a general exodus from their homes of the people living in the 600 Block on Luzerne St. on May 16, when the Lackawanna Coal Co. officials notified them that the neighborhood is threatened with a mine cave in the Bellevue Colliery workings.

Mahanoy City—James Brothers have leased the East Bear Ridge Mine near Mahonoy from the Girard Estate and will build shortly a breaker employing about 800 men.

Mt. Carmel—The Richard Colliery operated by the Susquehanna Coal Co. was the scene of a disastrous explosion on May 15, when one man was killed and seven more injured. All the injured were taken to the Shamokin hospital. It is thought that one of the men opened his safety lamp and ignited the gas. It is also considered remarkable that more fatalities were not recorded, as not only the breast but the entire gangway was filled with gas when the explosion occurred.

Bituminous

Pittsburgh—The Conemaugh Smokeless Coal Co. has started the opening of a large development in Indiana Co. The contract involves the sinking of a 200-ft. shaft and the excavation of a slope 950 ft. in length, and will entail an expenditure of about $100,000. The tract of coal land embraces about 2000 acres and adjoins a tract of 3000 acres

owned by the Operatives Coal Mining Co. of Johnstown. The capacity of the mine will be about 200 tons of coal per day. The mine will be operated by electricity exclusively.

Connellsville—The strike at the Herbert plant of the Connellsville Central Coke Co. has been settled, but the plant is not being operated, having suspended because of lack of orders. No reduction in wages took place. The men who remain on the job to keep the plant in working condition are being paid the old wages. The shut-down is indefinite but is not expected to last for any considerable length of time.

Marianna—The mines here which have been shut down for some time may be re-opened shortly. Large numbers of men have been out of work for months and times have been hard.

Wishaw—A part of the air-shaft at No. 1 Mine caved in recently and a number of timbers dropped into the shaft. Although it will take some time to complete repairs and get the mine in shape for running, the damage is not as extensive as was at first reported. It was rumored shortly after the accident that the fan had fallen into the air-shaft.

Cresson—One of the mine cages at No. 9 shaft of the Pennsylvania Coal & Coke Corporation fell nearly 800 ft. down the shaft May 14, when the hoisting rope broke. The cage and the loaded car which it contained were completely wrecked. Fortunately no workmen were injured, but it was night before sufficient repairs could be made to hoist the miners out of the shaft.

WEST VIRGINIA

Wellsburg—Mine No. 3 of the West Virginia-Pittsburgh Coal Co., formerly known as La Belle mine, near this city, is shut down on account of the strike of practically all of the men working in it. Some violence has occurred, several men having been attacked by the strikers.

Charleston—After meeting May 15 for further consideration of the wage scale between the miners and operators of the Kanawha field, the joint sub-scale committee adjourned until May 25, upon which date another attempt will be made to adjust the existing differences. In the meantime the miners in the Kanawha field who walked out on an unofficial strike have been induced to return to work pending a settlement.

Kingwood—It is stated that the Preston Coal Co. located at Independence will soon be able to resume operations upon a full scale. The company owns several hundred acres of coal, and a new plant said to be one of the most modern in the state will shortly be completed when employment will be given to some hundreds of men.

Bluefield—In the first aid contest held in Bluefield, May 13, under the auspices of the Pocahontas Operators Association, the first prize was won by the team from the Louisville Coal & Coke Co. at Goodwill, the second, by the team from the Pocahontas Consolidated Collieries Co. at Maybeury while the third place was taken by the team from the No. 6 Works of the United States Coal & Coke Co. at Gary. In the one man event George E. Wysor, of the Crane Creek Coal & Coke Co., C. C. Bailey, of the Louisville Coal & Coke Co. and T. J. Burwell of the Pocahontas Consolidated Collieries Co. tied for first place, all making perfect scores. It has been arranged that this tie shall be decided in another contest to be held in Bluefield on May 30 next. Sixteen teams including a colored team and a woman's team participated in the contest.

ALABAMA

Birmingham—The property of the Wadsworth Red Ash Coal Co., comprising about 1200 acres of rich Cahaba coal land near Falliston, Shelby County, Alabama, has been purchased by R. N. McDonough, J. H. McDonough and J. T. Robertson, all of Birmingham, the consideration being about $175,000. It is the intention of the new owners to continue the name of the old company and to double the capacity, which is now 200 tons per day, as rapidly as possible. Stephen H. Green will continue as general manager of the new company.

KENTUCKY

Louisville—After nearly two months of lagging negotiations the operators and union miners of the Western Kentucky coal field agreed recently on the terms of a contract as to wage scale and working conditions to run for two years from Apr. 1, last. The three points, which, had been the principal bones of contention were at length decided as follows: Mule drivers shall draw 10 cents more each day and the operators will pay for and own the harness; the operators shall have the right to change the method of computing wages from the "run of mine" to "screened coal" at any time they see fit, except during the course of a working day; the operators shall have the right to change the method of cutting from the "ton" to the "square foot" upon a day's notice.

OHIO

Logan—A general appeal has been sent out on behalf of the miners in this vicinity, who have not been working since the general suspension on Apr. 1, and who had worked on short time for months prior to that date. It is said that women and children are in many cases insufficiently fed and clothed, and that help is badly needed. The appeal is signed by the committee in charge of the work of collecting supplies and cash contributions necessary to relieve the distress existing.

Columbus—Negotiations by which John S. Jones, of Chicago, Ill., and Newark, Ohio, as head of a syndicate was to take over the Sunday Creek Co. properties, have been declared off. Although the sale was announced last week as being practically closed, some of the details could not be agreed upon when it came to preparing for the transfer. There are reports that the affair will be reopened. Recent rulings of the federal court, growing out of the Sunday Creek Co.'s former relations with the Hocking Valley Ry., demand some form of reorganization for the big coal corporation.

Martin's Ferry—Miners in the eastern Ohio field are considerably interested in the report from attorneys that the new wage-scale agreement cannot contain a check-off clause. It is said that the Longshoremen's Act recently passed by the legislature will not allow a workman to sign away his wages.

Farmers in the mining section of Belmont Co. are blaming the strike of the coal miners for the many robberies being committed. It is said that chickens and live stock are special objects for theft.

INDIANA

Sullivan—The Monon Coal Co. has begun sinking shafts at the Steel Tipple and Mammoth mines to vein No. 5, the others having been mined out. Walter Bledsoe and A. T. Bennett, of Chicago, have leased the Baldridge mine near Farmersburg and will reopen it. The Peabody-Alwert Co., which operates the Reliance mine, near Shelburn, has dissolved partnership, Mr. Alwert taking over his partner's interest.

Linton—The Vandalia Coal Co. recently announced that it would start two more of its mines immediately. This will give employment to about 500 idle workmen.

ILLINOIS

Herrin—The Chicago & Carterville Coal Co. is rebuilding its washer at mine A at this point, entailing an expenditure of several thousand dollars.

Harrisburg—The Illinois Mine Rescue Car No. 3, from the Benton station, which has been in Harrisburg for the past month, has completed the work here and gone to Eldorado. During the time the car was at Harrisburg, Messrs. Scott and Nicholls trained 26 men in first aid and helmet work.

East St. Louis—Fines aggregating $15,000 were assessed against the "Big Four" and the Indiana Harbor lines when they pleaded guilty in the U. S. District Court on May 14 to charges of rebating and conspiracy. Each road was fined $7500. This virtually completed the cases which grew out of the government's investigation in which three railroads were charged with making discriminatory rates for hauling coal mined by the O'Gara Coal Co., of El Dorado, Ill. The third railroad, the Grand Trunk, several months ago pleaded guilty to charges of rebating and was fined $5000.

Canton—The coal mines of Illinois are again in operation after a delay of several weeks awaiting an adjustment of the new wage scale. The operators state that the new agreement is satisfactory and that no labor troubles are anticipated. The demand for coal is also reported good. In the signing of the contract, while both sides had to make numerous concessions, the operators are pleased that no material increase in the cost of production has been entailed, and the miners are glad to have gained improved working conditions.

Pekin—A petition of creditors was recently filed in the U. S. Courts to have the Champion Coal Co. of Pekin adjudged bankrupt. It is believed that the liabilities will approximate $6000 and the assets are expected to be in an equal amount when the schedules are filed. Ira J. Covey is the representative of the petitioning creditors.

ARKANSAS

Little Rock—Petitions bearing over 18,000 signatures to establish a miners qualification law under the initiative and referendum acts were recently filed with the secretary of state. This qualification measure would provide for the es-

tablishment of a board of examiners for coal miners, and also for numerous other reforms advocated by the Arkansas Federation of Labor.

Prairie Creek—Attorney General McReynolds has authorized the use of United States deputies as mine guards to protect the property of the Mammoth Vein Coal Co., at this place. The miners are locked out and there is a rumor that the operators intend to resume operations on the open-shop plan.

RECENT COAL AND COKE PATENTS

Coal and Gas Furnace. M. J. Farquhar, Wilmington, Ohio. 1,088,559. Feb. 24, 1914. Filed Dec. 16, 1909. Serial No. 533,375.

Chimney Cap. W. L. Carter, Waterloo, Iowa. 1,088,060. Feb. 24, 1914. Filed Apr. 12, 1913. Serial No. 760,679.

Draft Regulator for Furnaces. J. Hefferon, Cheyenne, Wyo. 1,088,572. Feb. 24, 1914. Filed Apr. 24, 1913. Serial No. 763,403.

Coal-Leveling Machine for Bee-Hive Ovens. W. Sangster, assignor to Covington Machine Co., Covington, Va. 1,089,675. Mar. 10, 1914. Filed July 7, 1908. Serial No. 442,306.

Bucket Conveyer. M. A. Kendall, assignor to Stephens-Adamson Mfg. Co., Aurora, Ill. 1,090,156. Mar. 17, 1914. Filed Aug. 10, 1911. Serial No. 643,358.

PERSONALS

Wade Harley, a coal mine foreman operating near Adrian in Upshur County, West Virginia, was shot and severely wounded by an Italian on the evening of May 14.

Joseph Northover, of Seanor, Penn., has been promoted from assistant mine foreman to mine foreman at the Eureka No. 39 mine of the Berwind White Coal Mining Co.

Colonel William Leckie recently purchased 200 acres of coal land in Pike County, Ky., and will shortly open a coal operation under the name of the Douglas Coal Company.

Benjamin Allen, mine examiner of the Black Diamond Coal Co. was killed by an explosion of firedamp on Sunday night, May 10, at about 10 o'clock p.m. Mr. Allen was considered a very careful mine examiner.

J. W. Galloway, vice-president of the Maryland Coal Co. of West Virginia was recently elected president of that firm at a meeting of the directors held in New York. He succeeds William H. Ziegler who resigned some time ago.

J. H. Woodward, president of the Woodward Iron Co., who has been for some weeks ill at his winter home at Orlando, Fla., has returned to his Birmingham home much improved in health. It was feared for a time that he would not recover.

Wm. Nicholson, for many years deputy mine inspector in West Virginia, has accepted a position with the New River Collieries Co. This places him in entire charge of the underground working of the mines at and near Eccles. Mr. Nicholson has resigned his position with the Jewell Ridge Coal Co., and after a short vacation will enter upon his new duties.

CONSTRUCTION NEWS

Benham, Ky.—The Wisconsin Steel Co., Benham, Ky., announces the further extension of the Wasioto & Black Mountain R.R. and the opening of a new coal development on Poor Fork, three miles from the Benham plant. Work is to be started within 30 days.

Kingwood, W. Va.—It is reported that the work of opening the big mine of the Kingwood Collieries Co. at Snyder will be commenced soon. The output of this company will be large and many men will be employed. The general offices will probably be located at Kingwood.

Pound, Va.—The Indian Creek & Pound River R.R. has been purchased by Knoxville and Bristol capitalists who announce a 12-mile extension of the road from Pound to Freeling, Va., to open an extensive coal and timber area. A large coal plant and an extensive lumber mill will be installed within six months.

Whitesburg, Ky.—The Roberta Coal Co., with hearquarters at Baltimore, makes the announcement of another new development near Thornton or Sargent, Ky., the exact location yet to be determined. A short line branch of railroad will be necessary. June 1 is the day named for the beginning of the development work.

Pittsburgh, Penn.—Contractors at work on the construction of the Montour R.R., which reaches the new coal mines of the Pittsburgh Coal Co. in Allegheny and Washington counties expect to have the road completed by July 1. The road will be 52 miles long, and will reach a field that has for years been held in reserve.

Whitesburg, Ky.—One thousand men are at work at Haymond on the construction of the industrial city which the Mineral Fuel Co. is erecting there. The company has just added a big planing mill to the band-saw mill which has been in operation for some time and is pushing operations. Rapid progress is being made in construction.

Hanlin Station, Penn.—A Pittsburgh coal mining company has recently driven stakes for the erection of a tipple to develop a large territory at this place. This structure will occupy the same location as one erected here some 25 years ago by the Keystone Coal Co. Work will also be started at once for erecting houses for miners.

Hazard, Ky.—The Ashless Coal Co., recently organized, will make an extensive coal development near Hazard, three miles from the Lexington & Eastern R.R., and will build a three-mile branch of the road out to the property, the construction to be started at once. The coal plant will have a capacity of 2500 tons per day from the start.

Whitesburg, Ky.—Track laying on the Younts Fork, Potters Fork and Bottom Creek branch lines of the Lexington & Eastern R.R. from Fleming to Naymond and Hemphill, is being pushed with all possible speed. Within a short time all three branch lines will be completed and in operation. At least 60,000 tons of coal is now mined and ready to be shipped out.

St. Louis, Mo.—Work was started May 11 on the 56 coke ovens, to cost $750,000, for the Laclede Gas Light Co., on South Broadway, adjoining the city limits. The ovens will form a row 30 ft. wide and 300 ft. long. Each oven will be 22 in. wide inside, 29 ft. long, and between 8 and 9 ft. deep, and will hold 14 tons of coal. In addition to the coke ovens, a holder is being built to contain 1,000,000 cu.ft. of gas.

Brownsville, Penn.—Improvements aggregating about half a million dollars are to be made at the Alicia coke plant of the W. H. Brown interests, two and half miles south of Brownsville. It is proposed to let a contract for 400 ovens within the next few days. These will cost approximately $700 each. It will be necessary to build new tracks, increase the power plant, and provide other necessary and extensive equipment to meet the additional output.

Columbus, Ohio—The construction of the proposed 40,000-hp. electric power plant at Floodwood, Ohio, which is backed by English capitalists, and which will furnish power to a large number of coal operations in the Hocking Valley field, seems practically assured, as Herman Gamper, who is in charge of the project, states that a market for the current is assured under contracts already made, sufficient to warrant the construction of the plant. It is believed that some of the units will be in operation by November.

NEW INCORPORATIONS

Knoxville, Tenn.—The Climax River Coal Co. has been incorporated with a capital stock of $5000. The incorporators are Nell S. Jenkins, Kyle B. Jenkins, Charles Jenkins, E. P. Luttrell, and J. H. Frantz.

Dayton, Ohio—The S. J. Patterson Pocahontas Co. has been organized for the purpose of mining coal. The capital stock is $75,000, and the incorporators are S. J. Patterson, H. J. Cresse, E. L. Fleming, D. E. Durnell, and H. B. Cromer.

Pineville, Ky.—The Straight Creek-Bell Coal Co. has been organized here with $50,000 capital by J. T. Asher, F. N. Asher and others for the purpose of developing Bell and Harlan County coal properties. Developments will be started during the summer.

Philippi, W. Va.—The High Carbon Coal Co. has been organized with a capital stock of $75,000 for the purpose of mining coal. The incorporators are S. A. Moore of Charleston, William G. George, R. E. Talbott, H. J. Wilcox and J. B. Ware, of Philippi, W. Va.

INDUSTRIAL NEWS

Hellier, Ky.—The Rockhouse Mining Co. has made an increase in its Hellier plant and is now shipping 75 cars per day. This is soon to be increased by 100 or more cars daily.

Richardson, Ky.—The T. J. Philips Coal Co., which lately incorporated, has purchased 2340 acres of coal land near here for development. T. J. Philips is the president and manager and L. R. Swain secretary and treasurer.

Somerset, Penn.—The Consolidation Coal Co. is said to have recently booked orders for 1,140,000 tons of Somerset County coal for the South American trade. This means that all the mines will be worked to capacity during the current year.

Evansville, Ind.—The Spacer Epperson coal mine, a few miles east of this city, which was appraised by the Warrick County Circuit Court at $23,000 was recently sold at public auction to William Epperson for $1500, he being the only bidder.

Cincinnati, Ohio—An extension of time until Oct. 15, 1914, has been allowed the Chesapeake & Ohio Ry. Co. in which to sell its holdings in the Kanawha & Michigan Ry. Co. The original time set for disposing of these holdings expired May 13.

Fayetteville, W. Va.—The Logan Mining Co. has closed a lease on the Lawson tract of 1100 acres on Main Island Creek. This area will be developed together with the Covey tract which it adjoins by a 200 ton mine. The development will be begun immediately.

Connellsville, Penn.—The Republic Iron & Steel Co. recently shut down 50 of its 400 beehive ovens at the Republic plant in order to ship coal to its recently completed by-product ovens at Youngstown, O. It is understood that this suspension is only temporary.

El Paso, Tex.—American soldiers on duty at the International Bridges have a strenuous time when coal is being shipped across the boundary. Fuel is being imported in considerable quantity for the Mexican railroads, and each carload of coal has to be shifted and probed in a search for hidden rifles and cartridges.

Hazard, Ky.—The Slemp Consolidated Coal Co. has leased another 1000-acre coal tract near Hamden to Pennsylvania and Maryland capitalists who will start at once the development of the property. A good-sized coal plant will be established. The work will be directly on the line of the Lexington & Eastern Railroad.

Cornettsville, Ky.—The Cornettsville Coal Co. has been organized by Arch Cornett, T. S. Tarbell and others with a capital stock of $40,000 for the purpose of making extensive coal developments on Big Leatherwood Creek, five miles from here. A short branch line of the Lexington & Eastern will be built to reach the new coal operation.

Jenkins, Ky.—The Consolidation Coal Co. has made an increase in tonnage at its 201, 202 and 203 mines at Burdine, three miles from here, and is now shipping 125 cars per day. Another increase will be made, it is said, by June 1, and all the company's plants in Jenkins, Dunham and McRoberts will make big increases soon afterward.

Mater, Ky.—The Elkhorn Coal Co., recetly organized by J. Henry Hall, C. L. Bastin and others, of Lexington, is beginning the mining of coal, building miners' houses, tipples, etc., and will be shipping within three weeks. This work is directly on the Lexington & Eastern R.R. Several hundred hands will be employed when the operation is in full swing.

Washington, Penn.—Owen Murphy, who is developing the coal interest on Coon Island, has purchased the Pittsburgh coal underlying the farm of the late Henry Cain, containing 222 acres. This tract is well located for development. The coal measure where the shaft is being excavated is 412 ft. below the surface. The work is progressing in good shape.

New Orleans, La.—Pierre Lacaze, vice consul of France at New Orleans, recently stated that the French Government had purchased a large tonnage of Alabama coal for its vessels in Mexican waters, and that probably a much larger tonnage would result a little later on. He stated that the French Government saved $2 per ton by buying the Alabama fuel.

Toronto, Ont.—The Grand Trunk Pacific Ry. recently let the contract for the new coal dock to be erected at the mouth of the Mission River at Fort William, Ont., to the Thunder Bay Contracting Co. The cost will be about $1,250,000. The buildings will have a capacity of 100,000 tons of anthracite, and equal amount of bituminous, in addition to the unroofed storage yards.

Birmingham, Ala.—The Maryland Coal & Coke Co. recently purchased the business of W. G. Coyle & Co., Inc., coal dealers of New Orleans, La., including all retail yards, docks, barges, tugs, etc. The deal involved several hundred thousand dollars, and was made to provide a market for the company's Sipsy River coal, which it is expected will largely go to export.

Cincinnati, Ohio—As a result of the establishment of a new management for the "Big Four" R.R. independent of that of the New York Central Lines, it is authoritatively stated that the coal and ore department headquarters will be removed from Chicago to Cincinnati. H. M. Griggs, general coal and ore agent, with his entire force, will maintain headquarters in Cincinnati, with branches in Pittsburgh and Cleveland.

Bluefield, W. Va.—The statement issued by Comptroller Cox covering the shipments of the Pocahontas coal field for the month of April shows these exceeded the shipments of the corresponding month for 1913 by about half a million tons. The total shipments during April, 1914, aggregated 2,117,286 tons, as compared with 1,534,220 tons for April, 1913. Up to the present time, the appearances indicate that May, 1914, will run far in excess of the corresponding month of last year.

Ashland, Penn.—One of the largest transfers in anthracite coal properties in this vicinity in recent years, occurred on May 16, when Abel I. Culver, of New York, purchased the holdings of the Shipman Coal Co., owners and operators of the Colbert Colliery, consisting of 500 acres of virgin coal land with deposits of almost 20,000,000 tons. The average yearly production is about 225,000 tons. The former owners were John B. Corliss, of Detroit, Mich., Robert E. Carter and J. M. Stauffer, of Hazleton, Penn.

Youngstown, Ohio—Byproduct gas produced at the new coke ovens of the Republic Iron & Steel Co. is said to be displacing producer gas and coal at the company's Lansingville, mills, and connections are being made in order to enable other mills and open-hearth furnaces to use this fuel. A large coal consumption will be displaced by the use of this by-product of the company's coke ovens, besides considerable natural gas.

Jackson, Ohio—Decrease in mining activity throughout this field as the result of exhaustion is the reason given by the Hocking Valley Ry. Co. for abandoning an electric railway between Jackson and Wellston. The line is 10 miles long and has been operated electrically for nearly 20 years. There were hourly trains, the patronage coming largely from the mining camps, but the company claims the road is now a losing proposition. Taking effect May 25, the electrical equipment will be entirely discontinued, but for the purpose of holding the franchise, temporarily at least, a few steam trains a day will be run. Some of the communities which bought lighting service of the company will be in darkness until other arrangements can be made.

La Follette, Tenn.—Edward V. d'Invilliers, a coal-mining expert of Philadelphia, together with his associates, Walter Gilman and J. B. Dilworth, are making an inspection of the coal and coke properties of the La Follette Coal, Iron & Ry. Co., at La Follette, Tenn., in the interest of the bondholders, the Electric Corporation, the Old Colony Trust Co., and the American Trust Co., all of Boston, Mass. This firm was placed in the hands of Neil Robinson, of Charleston, W. Va., as receiver on Dec. 23 last, by whom it has been since operated chiefly to furnish coking coal for the La Follette Iron Co., which firm operates the furnaces, ore mines, stone quarries, coke ovens, coal washers, etc., under lease from the La Follette Coal, Iron & Ry. Co., the latter firm furnishing the coal to the Iron company under contract.

Birmingham, Ala.—Looking to submitting bids for a big supply of coal to the United States Government, through the port of Galveston, for use during the presence of the fleet in Mexican waters, representatives of the coal-mining interests of Birmingham are now in New Orleans. Some of the larger corporations have gone so far as to make arrangements for the handling of large quantities of coal through Pensacola or New Orleans, and for loading same at Galveston on government vessels. Capt. W. O. Smith, army quartermaster at New Orleans, will open bids within a few days, the stipulation being the producer must be in a position to furnish at least 10,000 tons, if not more, every month. The bidding is open to all coal concerns in the South able to fulfill the conditions. Tests have recently been made at Pensacola by the government, and while there is no information as to the necessary qualifications, it is understood that the Alabama coal stood the test well.

Coal Trade Reviews

General Review

Anthracite slowing down into the customary midsummer dullness. Distress prices prevailing on bituminous, but surplus stocks are nearly exhausted and there is a more hopeful feeling. Lake shipments make a big increase.

The domestic grades of anthracite continue in moderately good demand, but the steam sizes are under steadily increasing pressure. The May circular is generally maintained on the prepared grades, but the agencies are now openly seeking for business, and the next move will be a restriction in the production. It is evident that the customary midsummer dullness is now close at hand. Orders are generally plentiful for the current month, but the outlook for next month is not encouraging by any means. Any unusual dullness is ascribed partially to the tight money situation which is making it inconvenient for buyers to accumulate stocks as in previous years.

There has been a further sharp decline in tidewater bituminous quotations at down East points, where the market seems to be on the verge of the utter demoralization which has characterized previous dull seasons. With the distress prices now prevailing, consumers not already contracted will prefer to take their chances in the open market for the time being at least. The demand is down to the vanishing point and the market is as dull and flat as it is possible to imagine. Even the steamship demand has eased off. Consumers generally show no anxiety over delays in shipments on contracts, and there is scarcely any movement from the mines, except on specific orders.

A heavier movement in the Lake trade has resulted in an increased production in the Pittsburgh district particularly as regards the larger interests, many of whom are under nearly full time operations. Ostensibly circular prices are ruling, but it is known that occasional concessions are offered. There are no favorable indications of any increased consumption, and the conservative operating interests are quietly looking around for some temporary business at moderate prices to carry them over the dull period.

Although the Ohio market continues at a complete standstill, operators are expressing anxiety as regards their Lake contracts, which they are in danger of losing unless they are able to resume operations shortly. A plentiful supply of vessels is now available in the Lake trade, and all the demurrage coal at the loading ports has been cleaned up.

As a result of an excellent week dumpings at the Hampton Road piers the supplies in the local yards there is below normal and circular prices are being generally maintained as a rule. A decidedly optimistic feeling also prevails in the Southern market due partially to some heavy government orders for American warships operating in Mexican waters, and likewise to some inquiries from foreign governments for the same purpose. It is generally thought that the bottom corner of the trade has been turned, and a more hopeful feeling prevails over the future.

The Middle Western consumers appear to be reaching the end of their surplus stocks and the market seem to be slightly better. The wage scale question has now been definitely disposed of throughout the Middle Western states and mines are gradually getting under operation again. Prices as a rule are somewhat steadier, though weak at certain points.

EASTERN MARKET

Delivered price materially less and market for Pocahontas and New River is on the verge of being demoralized. Extraordinary dullness prevails on all grades. Marine freights low. Anthracite quiet; the shippers running short of orders.

Bituminous—To some degree the expected has happened. Prices alongside and on cars at practically all the New England ports have receded materially during the past week. While the $2.85 f.o.b. price has not yet been shaded on f.o.b. sales, there can be no further pretence of netting back anything like that figure on the orders recently closed on a delivered basis; $3.40 on cars at Providence, $3.30 or less alongside Boston, and $3.70 on cars Bangor, the latter for deliveries to Dec. 1, cannot by any possibility yield $2.85, f.o.b. Norfolk, and the indications are that still lower figures will be made the next fortnight or so. Various West Virginia operators have apparently concluded it is better to keep mines running and get what prices can be had. It really looks as if the market in this territory were on the verge of demoralization.

Meanwhile, the consumers who did close contracts are increasingly dilatory about accepting deliveries. The supply of water for the textile mills is the highest of recent years and instances could be multiplied of plants that on that account are using only 10@15% of their normal amount of fuel. The uncertainty of fall business for many kinds of manufactures is another factor in a situation that is almost unparalleled for summer dullness.

The call for Pennsylvania grades is almost at the vanishing point, the scattering business that offers being mostly confined to Pocahontas and New River. Operators are not loading cars except on firm orders; the risk of demurrage is too great.

Marine Freights are quiet. So much coal is standing at all the shiping ports that record dispatch prevails and that means quicker trips and more coal brought forward. The result is that shippers are at a loss to place steamers and some low rates have been quoted. Large schooners can be had at 55c., Hampton Roads to Boston.

Anthracite—Orders are being sought now by practically all the companies except on stove size. There is no gossip on prices, the May circular being rigidly maintained in all directions. A restriction of mining is the next move looked for.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.90@1.50	$1.20@1.65	$1.67@1.77	
Philadelphia*.....	2.15@2.75	2.45@2.90	2.92@3.02	
New York*.....	2.45@3.05	2.75@3.20	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.80@2.85
Boston†.....	.....	.....	.....	3.40@3.70
Providence†.....	.....	.....	.....	3.50@3.78

* F.o.b. †On cars.

NEW YORK

A discouraging dullness still characterizes the bituminous market. However, close observers report surpluses exhausted while there is a tendency to hold tonnages closer and a better feeling prevails. Anthracite slowing down.

Bituminous—The New York soft-coal market is about as dull and flat as it is possible to imagine. Even the steamship business has slowed up perceptibly, and consumers under contract show no anxiety whatever even when their shipments get one to two weeks behind. There is scarcely any business being negotiated on new contracts, buyers not already covered preferring to take their chances in the open market for the time being at least. Slack coal which was in such heavy demand last year has fallen off to 40c. a ton while some Western Maryland coal has been offered in the local market at $1.85 with no buyers. Mines in the Central Pennsylvania district are operating at probably 40 to 50 per cent. capacity.

But even in the face of all these adverse conditions, it is a notable fact that the market is being relatively well maintained, at least as compared with the utter demoralization which has characterized other dull seasons. The general feeling prevails that there is a great deal of coal at tidewater, but if there were a normal market, the supply would be entirely inadequate. In fact authentic reports are to the effect that the accumulated surpluses are now practically all cleaned up. There is little or no tonnage coming in on consignment, shippers refusing to risk such shipments under prevailing market conditions; as a result, there is not so much demurrage coal reported. Stocks are being generally kept low.

The market continues quotable about as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—Full time operations continue the rule in the hard-coal regions, but the customary mid-summers dullness is already becoming evident. The domestic grades are mostly in active demand, but there is more pressure on the steam sizes and some restriction in operations next month seem to be inevitable.

In the prepared grades, stove coal is the only size that is generally active all along the line. Egg coal, which was in such good demand a few weeks ago, has now slowed up materially, while chestnut is also in long supply. Pea coal is heavy while the poor grades of barley are selling at figures which will scarcely cover the freight charges, and rice is about the same.

We quote the New York hard-coal market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.70	$4.55@4.70	$4.65	$4.50@4.65
Egg	4.95	4.95@4.95	4.90	4.80@4.90
Stove	4.95	4.95@4.95	4.90	4.90@4.90
Chestnut	5.20	5.05@5.20	5.15	5.00@5.15
Pea	3.55	3.25@3.55	3.45@3.50	3.20@3.45
Buckwheat	2.80	2.65@2.80	2.50@2.75	2.10@2.75
Rice	2.30	2.30@2.30	2.00@2.25	1.75@2.25
Barley	1.80	1.65@1.80	1.70@1.75	1.25@1.70

PHILADELPHIA

No marked change in anthracite situation, although there is a tendency toward dullness as the season progresses. Prospects not considered good for June, and curtailed mining possible. Bituminous on a parity with week previous, with no improvement in sight.

Anthracite—As the season progresses, it is becoming more apparent that with the close of the month of May, there is likely to be a period of dullness lasting through most, if not all, of the summer months. This is indicated by a perceptible falling off in the placing of orders. It is understood that the operators are fairly well filled up with orders, sufficient to carry them over the current month, without recourse to curtailment, but the situation looks anything but favorable for the ensuing month, and it is feared that the market can be well taken care of by short-time work at the mines.

This dullness is probably due to the fact that many householders are postponing the filling of their bins until the fall. It is a fact that many people who have heretofore purchased their supplies in the spring, are simply buying as necessity requires, instead of placing orders for their entire requirements. Lack of industrial activity may be responsible for this, in a measure.

It is understood that the market is absorbing the output of egg, stove and broken, but chestnut still continues to drag, and it is only with a hard pull, and liberal concessions on the part of the individual operators that this latter size is moving off. As indicated last week, steam sizes still continue to flood the market, and concessions of 25 to 30c. per ton are currently reported.

Price at tidewater are as follows:

	Circular	Individual
Broken	$4.35	$4.35 @ 4.45
Egg	4.60	4.60
Stove	4.60	4.60 @ } 4.70
Chestnut	4.85	4.70
Pea	3.25	3.00

Bituminous—The last week witnessed no change in the soft-coal situation. As a matter of fact, conditions seem to grow worse, instead of better. Industrial establishments are buying from hand to mouth, rather than enter into new contracts at the present figures demanded.

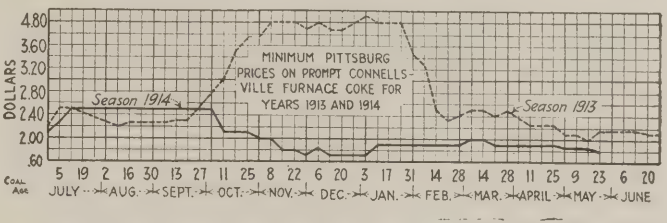
BALTIMORE

Production heavily curtailed to avoid surpluses. The hard-coal men are also complaining that business is light.

During the week just closed a half dozen more foreign charters were announced for late May shipment, and the prospect is that this class of business will show a heavy total for the month. The coastwise movement to the north is largely restricted to company-owned colliers, while southward the sailing vessel delivery is a feature

Mining districts of Pennsylvania and West Virginia are still busy urging coal upon agencies and consumers. Production has been largely cut to prevent surpluses. West Virginia slack was in somewhat better demand, several Western industries of importance having entered the field for this fuel. Slack was selling around 55c.; run-of-mine at 80c. and three-quarter at 85 to 90c. Pennsylvania low-grade fuels are offering at unprofitable prices in many cases at from 95c. to $1. Little or no change was noted in better fuels, selling to the trade at from $1.15 to $1.35.

Hard-coal men are also complaining of rather poor business. The spring ordering is not as brisk as it might be. The solid foundation of the anthracite trade, however, make it certain that any ground lost now will be made up by heavier business in mid-summer and early fall.



CENTRAL STATES

PITTSBURGH

Coal production increased, and nearing 60% of capacity. Lake shipments larger, demand being otherwise very poor. Prices fairly well maintained, particularly on contract. Connellsville coke stagnant with prices weak and production exceeding shipments.

Bituminous—Coal production in the Pittsburgh district is up to between 50 and 60% of capacity, contrasting with a rate of about 40% ten days ago. The largest coal interest is operating at 60% or more, but a number of the smaller ones are either closed or working at a low rate.

There has been no increase in consumption either by railroads or by industrial plants, while domestic consumption has, of course, decreased further. A slight improvement in demand has occurred through the further exhaustion of stocks, but these are still fairly important. The chief improvement has been by reason of heavier shipments in the lake trade. These are now of moderate volume, though still well below the average for this date. The Northwest does not seem to be much in need of coal, and the lake season as a whole promises to involve a light tonnage, though the rate toward the close of the season may mount up to normal.

Reports generally are that full prices are being obtained, but there is still some cutting, particularly in slack, caused by increased production of slack through the heavier lake shipments. Regular prices, which are quite well maintained for contracts, are: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

Connellsville Coke—The market continues stagnant. There is practically no demand for furnace coke, either prompt or contract, and odd lots are frequently offered at under the regularly quoted market without finding takers. Consumers manifest no interest whatever in contracts for second half. Few foundry-coke contracts are being negotiated for the twelvemonth beginning July 1, though the great majority of contracts expire at that time. The market is quotable approximately as follows: Prompt furnace, $1.80@1.90; contract furnace, $2; prompt and contract foundry, $2.35@2.50 per ton at mines.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 9 at 312,100 tons, an increase of 6490 tons, and shipments at 291,166 tons, a decrease of 8273 tons. Production appears to have exceeded shipments by 20,934 tons.

BUFFALO

Miners accept old scale and return to work. Prospect of much surplus coal unless operators are cautious. Mines must prepare to meet slack conditions. Anthracite only fairly active. Coke unchanged.

Bituminous—There is no particular improvement in the trade and none can be expected until the surplus is much reduced. The mines tributary to this market are practically all active again, though the operators protest that they are not going to produce coal any faster than they can sell it. But there is quite an amount of it at different points awaiting disposition, some of which is paying car service, although Buffalo is not so overstocked as certain Canadian points. Most of this coal comes from a few sources, the operators seeming to be willing to suppose that they will come out better next time. The rule is to run the mines somewhat more than is necessary to take care of contracts and depend on semiregular customers to absorb the balance.

The prospect is for a slow market for an indefinite time. The lake trade is as dull as any other and there is no indication of any increase of consumption in any line. From present indications nothing to be expected beyond a possible slow improvement late in the season. Conservative coal operators and jobbers are looking for a few contracts and regular orders at living prices, pending a return of better conditions. Quotations remain weak on the basis of $2.80 for Pittsburgh

lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny valley sizes about 25c. lower.

The Allegheny Valley operators and miners, at a meeting on May 12 signed an agreement to continue the old wage scale for two years longer. The only change was to put the blacksmithing charge on a tonnage basis.

Coke—The coke trade is not active and shows no indications of improvement. Prices being at the bottom, do not change as makers of the best coke refuse to make further reductions. Quotations remain on the basis of $4.50 for best 72-hr. Connellsville foundry.

Anthracite—The demand is moderate in general, though the supply is not liberal. It is stated that the mines are not running full and that the tidewater demand is stronger than it is Westward. Some jobbers of independent anthracite report that they have difficulty in obtaining enough to fill their orders. The Canadian demand is still light.

The lake shippers are not getting much coal and are handicapped by the scarcity of small vessels, which are wanted for minor ports. Lake shipments for the week were 102,000 tons. The amount reported includes some cargoes that should have been put into last week's list.

COLUMBUS

Interest centered on the court's decision on the screen law. Ohio operators fear they will lose Lake contracts while considerable outside coal consigned to the Lakes is backing up into the regular market because of the shortage of vessel tonnage.

At this writing operators are anxiously awaiting the decision of the Federal court judges, advising whether or not the mine-run law shall become effective on May 20. Arguments on the restraining order were made May 2 and all negotiations between miners and operators are being held in suspense for the time being. Both sides are ready to take the matter up again as soon as the legal status is established. The constitutionality of the law will come up for later hearing, but while being fought out in the courts the mines can resume work under a temporary agreement.

The Hocking Valley contingent is anxious to get to work on account of their lake trade. Lake shippers have orders on which they could have been loading two weeks ago, but for labor trouble and there is danger that this business will be cancelled to large extent and placed with districts which are not idle. Eastern Ohio coals being largely for steam purposes, feel no special demand at this time, and the producers there are likely to be more independent in their dealings with the miners. There is practically no difference between the two on a screen scale, but in case the mine-run law became effective there will be a varience of about 8c. per ton.

As far as the general market is concerned it would seem to make no difference whether or not Ohio mines resumed at this time. Demand for all grades in competition with this field is still sluggish. About the only signs of life are inquiries from public-service companies and some other big steam users, looking to the replenishing of storage stocks thirty or sixty days hence. This is having no effect upon the low-priced offerings made by West Virginia and Kentucky. Advices from these states show much dead coal in railway yards, with mines only running part time.

Orders being placed by the dealer trade for fancy splints are largely for July and August delivery, and can hardly be considered current business. The smokeless grades are maintaining schedule with difficulty, as prices are being shaded by independent producers.

Pending the resumption of work, the old circular is nominally in force as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.45@$1.35		$1.50@$1.40	$1.40@$1.35
3-inch	1.30@ 1.25	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.25@ 1.20		1.30@ 1.25	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.15@ 1.10
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.75@ 0.70
Coarse slack	0.75@ 0.70	0.95@ 0.80	0.75@ 0.70	0.65@ 0.60

TOLEDO

Market continues quiet, but the outlook is more hopeful. Crop prospects never before so favorable. Industrial demand showing a tendency to improve and Lake trade looking better.

Nearly all the coal concerns report the situation quiet, but almost without exception they declare that business is bound to be better, later on. There is already some picking up in trade from the large manufacturing concerns; the railroads are also beginning to buy some little coal. The crop prospects in northwestern Ohio continue splendid in spite of the heavy rains of the past week which washed out some. The lake shipping is beginning to look better and it is believed that there will be a large demand from uplake ports as soon as the over-supply stocks are disposed of. There is a great deal of coal on track in Toledo and considerable is being loaded on big lake freighters. Prices remain unchanged and are being largely ruled by the law of supply and demand.

CLEVELAND

Demand for spot coal much improved and the approach of general buying movement seems near at hand. Retail circulars announced, but buying is limited. Lake shippers finding vessel capacity much easier.

Though prices have not changed materially the last week, the number of companies in the market has materially increased. The orders are not large, but indicate that stocks in consumers' bins are nearing exhaustion. Fairmount gas coal continues to be the principal product offered with Youghiogheny and odd lots of other Pennsylvania fuel appearing. West Virginia operators are not consigning much coal, but are accepting orders at prices no higher than consignment coal normally brings.

Youghiogheny shippers have had some slack on the market the last week at prices that compare favorably with Fairmount. Bargain prices on Pocahontas slack are being offered and operators are trying to move all they can to make it profitable to prepare sizes that are in good demand.

The Lake Market has improved from the shippers' standpoint. A week ago there were more coal cargoes than vessel capacity, but now the supply of tonnage is in excess of the demand. The first rush is over and coal that was under car service has been moved though not without leaving a large expense behind. The supply of cargoes from upper lake ports is so small independent vessel owners are having difficulty finding enough business to make it worth while to keep all of their vessels in commission. This has resulted in a few boats being temporarily tied at the docks.

The retail dealers have issued summer circulars. Hard coal is 15c. a ton higher than last year, 10c. of the advance being caused by the Pennsylvania tax and the 5c. was due to increased operating expense in the local yards. Other grades and kinds of coal have not changed prices this year. The issuing of summer prices is not an indication of retail sales. The bulk of the present business is booking orders for delivery in July and August.

Shipment at spot prices are practically the same, as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.05		
Lump, 1¼-in.		$2.35@2.45	
Lump, ¾-in.		2.25	$2.00@$2.05
Mine run	2.60	2.10	1.90
Egg	3.05		
Slack	2.20@2.60	1.70@1.80	1.70@ 1.90

CINCINNATI

A slight improvement in the situation is apparent, largely due to the partial removal of the embargo on shipments to lake ports. Stocking of domestic coal is heavier locally, but the steam market is still slow.

With a steady increase in the movement of domestic grades, due to the beginning of deliveries by dealers, the market on this line of fuel is in much better shape than for some time. Smokeless is usually the leader, with contracts taking care of all available coal for several months ahead; and with a marked stimulation to the lake movement, it seems that the situation is in a fair way to be straightened out, as far as the domestic market is concerned.

The persistent depression existing in a number of industries which are normally large consumers of steam coal continues, and keeps this side of the market decidedly slow. In fact, despite several factors which have for some time tended to stimulate the trade, such as embargoes, labor troubles and lockouts, the market has for some weeks been decidedly dull. The increased production of screenings, due to the improvement in the domestic market, has therefore resulted in some cheap nut and slack being placed before consumers in this market, but this, as usual, has failed to help things to any extent.

DETROIT

Bituminous supplies still excessive and there is an almost complete absence of any business. Slack particularly heavy selling down to practically nothing.

Bituminous—The domestic market is quiet; in fact there is almost a complete adsence of any business. This applies equally well to contract business, the requirements on which are much reduced as a result of the accumulated stock. There are many of the new contracts that have not been closed as yet, and consumers are expecting to obtain concessions on last years prices on these. The steam trade is also dull and heavy with much unsold coal on the market, some of which is occasionally moved at sacrifice prices.

Slack is particularly heavy, and selling down to practically nothing. In general, shipments to this market are so much in excess of requirements, that it is going to be exceedingly difficult to maintain any circular at all shortly. Supplies are in such excess that it is impossible to foretell when normal conditions will be reestablished.

Anthracite—The hard-coal trade continues up to full expectations, all the tonnages coming in having been easily absorbed so far.

HAMPTON ROADS

Dumpings for week have been good. Demand for run-of-mine showing some improvement. Less than a normal number cars in railway yards.

Dumpings over the piers at Hampton Roads during past week have shown up well and in consequence there is less than a normal supply of coal in railway yards. The principal shipments during the week as usual have gone to the New England market with foreign shipments to Port of Spain, Kingston, Canal Zone, Dakar, Para, Manaos, Santiago and Brindisi. So far as can be ascertained circular prices are being maintained. There is no demand for high volatile and no extra large amount of this coal on hand at tidewater.

The new pier of the Chesapeake & Ohio Ry., at Newport News, is now about completed and vessels may be loaded from there any day. This pier is about 200 ft. longer than the new one of the Norfolk & Western at Lamberts Point, but otherwise is almost identical in construction. It is understood that the Chesapeake & Ohio intend doing away with three of their small wooden piers, leaving only No. 12, which will be used to take care of barge loadings and perhaps small schooners or any overflow when the berths at the new pier are all occupied.

LOUISVILLE

Wage settlement expected to adversely affect the market. Some curtailment, but a few operators are selling at a sacrifice in order to keep the mines going.

No marked changes have taken place in the Kentucky coal market, though the labor settlement in a part of the western Kentucky field is expected to have a bearish influence on the market. The demand has shown no increase and though in the eastern Kentucky field work has continued on a rather generous scale, some of the operators are beginning to curtail.

Here and there in the eastern field an operator has sold at sharply cut prices, seeking to keep his organization going, even when necessary to sell below the cost of production. In a general way, however, prices continue at the former level. Orders for June are slow coming in.

In the western field, pea and slack, while scarce, is at a slightly lower price, ranging from 45 to 50c., f.o.b. mine, with nut and slack both east and west ranging from 60 to 75c. Eastern lump and block coals range from $1.30 to $1.80.

SOUTHERN AND MIDDLE-WESTERN

BIRMINGHAM

Improvement shown in steam grades, but lump coal still quiet. Furnace and foundry coke also dull. Pig-iron market is stagnant and car supply ample.

The Alabama operators are in a more optimistic mood than they have been for the past six months, believing that the worst of the dull market is over, and that business is on the eve of a prosperous season. While the market at the moment is far from satisfactory on steam coal, recent developments show an improvement in that line.

The government is now testing Alabama coals for use on the warships through the ports of Pensacola, Mobile and New Orleans, and will also probably place an order locally for approximately 10,000 tons of steam coal per month, for an indefinite period, to be delivered at Galveston for use on the warships, transports, etc. The French government has recently purchased a large tonnage of coal from this district for use on its warship in the Gulf, stating that a test has shown it to be equal to any in the world, and much cheaper, and that probably a much larger tonnage will be contracted for in the near future.

All of this has had a tendency to dispel the clouds of depression. The lump-coal market is only fair, though the majority of dealers are holding back, believing that they will get a reduction in price later on. The tonnage being moved is not as large as ordinarily at this time of the year. Blacksmith coal continues in a satisfactory condition, while both furnace and foundry coke are quiet. There is practically nothing doing in the pig-iron market, sales being small.

INDIANAPOLIS

Large buyers have about cleaned up the storage piles and are in the market again in a small way. Operators look for increased orders soon. Some domestic trade on account of cool weather.

With the Indiana wage scale settled for the next two years, operators are now busying themselves making contracts and are succeeding fairly well. The railroads, having exhausted the stocks laid by to tide them over the wage-settlement period, are now in the market again. The public utilities and factories are also near the end of their supplies. Most of the contracts being made or renewed are for two years. The factory situation seems about normal for the season. As the time for the wheat harvest approaches, there is a more optimistic feeling, and operators expect results soon from this improved sentiment.

Prices at the mines hold generally steady, although concessions of 10c. a ton are reported in spots, except for screenings, which are scarce. The domestic trade in Indianapolis has been better than usual for May, although after the signing of the scale there was a let-up in demand from consumers. Retailers say that such contracts as they have been able to make for Eastern coal are on about the same basis as last year's. The fact that the Illinois operators and miners have signed up, takes away somewhat from the expectations of the Indiana coal operators that they would reap advantage from any continued trouble in neighboring states.

CHICAGO

Market shows improvement. Spot buying increased by railroads and other public utilities. Many contracts renewed on last year's basis. No improvement seen in anthracite or smokeless coals. Coke market continues dull.

Slightly better conditions were evident n the Chicago market during the week. With railroads running through their storage piles and factories doing the same, some spot buying has developed. The demand is steady, but there were no purchases of unusually large lots. The majority of the companies are renewing contracts on practically the same basis as last year. The only increase in price is in screenings, in a few cases this being from three to five cents higher. But the dealers are not buying much for the future, as money continues tight with them. They are, however, taking the attitude that the small amount of business evident is a herald of more to come.

The tone of the anthracite market continues dull, with but little buying. Conditions are not up to the normal expected for this time in May. The trade is disturbed somewhat by an announcement that tariffs have been filed by the larger roads requesting an advance of 25c. a ton on anthracite in Chicago and the territory reached by the Chicago market.

Mines are sending smaller shipments of smokeless than is customary, as a result of warm weather. Contract shipments are being filled, but there is little outside buying. The market for this coal is practically established at $1. Illinois mines resumed operations following an agreement between producers and miners, but they are being run only on half time. With dull conditions in the iron and steel trade, furnace and foundry coke is also slow. There is little active trading in domestic coke, due to conditions which effect other domestic fuels.

Prevailing prices at Chicago are:

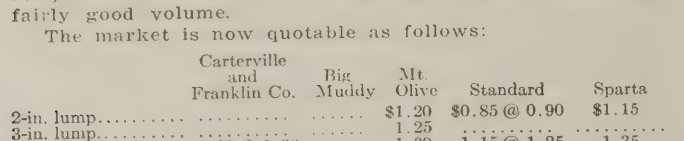
	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.30@2.40	$2.12	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.65
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.77	1.95	1.67	

Coke—Connellsville and Wise County, $5@5:25; byproduct egg, stove and nut, $4.45; gas house, $4.25.

ST. LOUIS

New wage scale signed up on the same basis as the old one. Mines resuming operations and there is a surplus of coal with prices low.

The labor situation in Illinois is practically cleared up with the same arrangement for the coming two years as the operators and miners had before. Mines are gradually resuming in Williamson and Franklin counties, and also in the fifth and ninth districts. Several of the operations started in to apply lump coal on mine-run contracts, with the result that a heavy tonnage of screenings was produced, which cut the price from 95c.@$1 down to 80c. and 85c. in the high-grade field, and the Standard about the same.



The St. Louis Public School contract was awarded the Polar Wave Ice & Fuel Co. on Standard coal, at a price of $1.74¾ per ton delivered, up to $1.77 delivered. Figuring on

the $1.77 price, with 52c. for freight, this leaves $1.25, and deducting 40c. there is only 85c. left; there is also a city scale ticket and the natural loss on a car of coal, which brings the price down to about 85c. at the very most. In addition, the coal has to stand inspection before it is delivered. Contracts are being taken on steam business for wagon-load delivery, at the rate of two loads a week, at $1.78 per ton delivered, for Standard lump coal. The only result of this competition will be a few more bankrupt operation shortly.

The Franklin County operators have advised that their coals will advance 10c. a ton per month, beginning with June 1 for domestic sizes, and it is expected that this action will be followed by the better producing mines in Williamson County. Domestic business locally is at a standstill, with the exception of anthracite, which is moving in fairly good volume.

The market is now quotable as follows:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	.....	$1.20	$0.85 @ 0.90	$1.15
3-in. lump	.....	.....	1.25	.....	.....
6-in. lump	$1.20 @ 1.30	.....	1.30	1.15 @ 1.25	1.35
Lump and egg	1.85 @ 2.15	$2.00	.....	.....	1.15
No. 1 nut	1.20 @ 1.30	.....	.....	.....	.....
Screenings	0.80 @ 0.85	.....	.....	0.65 @ 0.70	0.75 @ 0.80
Mine-run	1.10 @ 1.20	.....	.....	0.80 @ 0.85	.....

No. 2 washed nut	1.35 @ 1.45	.....	1.25	.....	.....
No. 3 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 4 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 5 washed nut	0.80 @ 0.85	.....	.....	.....	.....

KANSAS CITY

Decreased production injects a better tone into the trade. Prospects of a record-breaking wheat crop also creating a more hopeful feeling.

Business has apparently improved in the Southwest, though some sales managers take the attitude that the increase in demand is rather apparent than real, being the result of decreased production. A new source of business has opened up, however, following preparations for the harvesting of one of the biggest wheat crops of years in Kansas and neighboring states. All of the threshers burn coal, and operators are looking forward to the harvesting with almost as much eagerness as the farmers themselves. The indirect results of the big crops also are worth noting, having a highly favorable effect on business in general. The lack of demand for lump has resulted in cut prices in some cases, though many operators prefer holding it rather than selling at the quotations which have obtained in some quarters recently.

PORTLAND, ORE.

Warm weather causes rapid falling off in demand. Inquiries regarding coal shipping through Canal. Australian coal has dropped out of the local market.

Warm weather set in a couple of weeks ago and since then the coal trade here has been decidedly sluggish. In fact, it is said that business has not been so slack for many years. The chief demand is for domestic purposes, industries mostly using electricity, fuel oil or wood. It is pointed out, however, that if the opening of the Panama Canal results in lower freight rates, the consumption of coal will be much increased. Under existing conditions coal and wood prices are about equal. Pennsylvania anthracite now is quoted at $18 per ton here, it will be possible to retail it at $12@13 per ton when shipped in vessels by canal route. West Virginia coals, such as New River and Pocahontas, that now sell here at about $18 per ton can be retailed at $10 or $12 per ton. At present these coals are brought here by rail and the Great Lakes route.

With Utah coal selling here at $9.50 a ton, delivered, it is expected that if West Virginia coal can be obtained at $10 or $12 per ton, the railroads carrying the Utah, Wyoming and Washington coals will grant more liberal freight rates. This would bring coal prices to a lower level than wood and result in a larger consumption.

Coal dealers are of the opinion that very little Australian coal will be imported here in the future, as freight rates are too high at present, and it also means tying up of too much money.

PRODUCTION AND TRANSPORTATION STATISTICS

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports in the United States for March, 1913-14, and for the nine months ending March, 1912-13-14, in long tons:

	9 Months			March	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	5,911	7,451	9,691	96	1,23
Canada	729,584	1,061,411	746,411	107,048	91,64
Japan	12,885	42,657	83,208	440	1,73

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for March and the nine months ending Mar. 31, 1913 and 13, in short tons:

	March				Nine Months			
Destination	1914	%	1913	%	1914	%	1913	
Tidewater	323,567	20	328,442	24	2,587,748	19	2,720,022	2
East	242,136	15	292,410	20	1,987,701	15	2,032,099	1
West	931,657	59	700,150	50	8,163,886	60	5,809,347	5
Total	1,497,360		1,321,002		12,739,335		11,561,468	
From Connections								
Bituminous	98,733	06	71,588	05	825,951	6	494,699	(
Anthracite	945		309	01	11,421		9,138	(
Total	1,597,038	100	1,392,899	100	13,576,707	100	12,065,305	10
Coke	40,658		32,207		292,105		227,550	

FOREIGN MARKETS

GREAT BRITAIN

May 8—The market is not quite so firm. Buyers are only arranging their pressing requirements in anticipation that with a reduction of present tonnage supplies and increased production, easier conditions will be in evidence. Chartering has recently been rather slow. Quotations are approximately as follows:

Best Welsh steam	$4.68	Best Monmouthshires	$4
Best seconds	4.44	Seconds	4
Seconds	4.26	Best Cardiff smalls	2
Best dry coals	4.32	Seconds	2

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry $4.80@5.52; furnace, $4.08@4.56.

COAL FREIGHT DECISIONS

I. C. C. No. 5912—Lombard Brick & Tile Co., vs. Chicago and North Western.

Following **Hammerschmidt & Franzen Co. v C. & N. W. Ry. Co., ante,** page 71; **Held.** That defendants' rates for the through transportation of coal and coke from points east of the Illinois-Indiana state line to Lombard, Glen Ellyn, Wheaton, and West Chicago, Ill., are unduly prejudicial to those points and unduly preferential to Chicago and Provis Ill., in the amounts stated herein.

A Barsteel Gathering Locomotive
That Will Operate in a 29-Inch Clearance

Here is an illustration of a Baldwin-Westinghouse Barsteel electric gathering locomotive that operates successfully in a clearance of twenty-nine inches—36 inches was heretofore considered about the limit for locomotives.

Great care has been exercised in keeping the overall height to a minimum, as is shown in the general construction of the locomotive and the location of the reel.

There is not a projection above the top of the frame anywhere and ample room has been provided to permit the operator to crouch upon his seat.

The reel is driven by an independent motor contained inside the reel drum. This motor is in effect an electrical spring. It tends to wind the cable up and its turning force acts as a brake and keeps the cable taut when the locomotive enters the room and promptly takes up all slack when the locomotive returns.

With this type of reel there is easy access to the locomotive motors, because of its being located out of the way on the rear of the frame. The armature of the reel motor can be readily removed for inspection and overhauling.

Locomotives of this type have successfully solved the problem of gathering in very low rooms. Our specialists in mine haulage, who make a careful study of various mining problems will be glad to assist you in selecting the proper equipment for your mines.

Get in touch with them by writing to either company.

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 873

Safety. Poem by Berton Braley.

CAUSE AND EFFECT OF COLORADO STRIKE: *Page* 874

A letter from E. H. Weitzel, manager of Colorado Fuel & Iron Co.'s coal mines.

HANDLING THE NEGRO MINER IN THE SOUTH: *Page* 875

This class of labor is naturally shiftless, being content to let the morrow look out for itself. Laws should be passed prohibiting garnishments and compelling merchants and money lenders to look to the man rather than the company for payment. More frequent paydays are also advisable. COAL AGE, Vol. 5.

*A MODERN KENTUCKY PLANT: *Pages* 876-877

A small but well equipped plant and coal washery in the Cumberland Gap coal field of Kentucky. The double-entry room-and-pillar system of mining is employed. R. J. Sampson. COAL AGE, Vol. 5.

THE ECONOMY OF MACHINE MINING: *Pages* 878-879

The difficulty of obtaining accurate figures in which to base a just comparison of the cost of machine-mined and pick-mined coal. The need of carefully considering the peculiarities of the coal seam and all the conditions affecting the mining of the coal. A brief review and classifications of charges, including a due regard to danger of accident due to use of machines for cutting the coal, breakdowns, opposition of men to installations, etc. Wesley S. Harris. COAL AGE, Vol. 5.

DEEPER MINING MORE DANGEROUS: *Page* 879

*EFFICIENCY AND THE PURCHASE OF POWER IN COAL MINING: *Pages* 880-881

Purchasing power usually awakens the coal-mine management to the possibilities of saving good money in the use of current. While these possibilities undoubtedly exist and might be taken advantage of under private supply, the significant fact remains that this is seldom done. A. E. Gregory. COAL AGE, Vol. 5.

The Weekly Ad-Talk Page

IMAGINE that advertisement, which recently appeared in the New York World, in a paper ten years ago! You would have thought some one had gone crazy—but today it's only commonplace. That's how rapidly things are progressing in the machinery field. The machines, processes and methods of yesterday are antiquated.

A coal mine quits on Saturday night with mule haulage and opens Monday morning with electric motive power.

This is the day of quick progress and every mother's son of us must step lively to hold the pace.

Which is one of the best reasons why technical papers are about as valuable today for their advertising pages as for their editorials.

Our ad section contains the advertisements of the latest, most efficient and most economical things in machinery, equipment and supplies for coal mines.

Do you follow the ads—*closely?*

It pays.

COAL AGE

Vol. 5. NEW YORK, MAY 30, 1914 No. 22

Safety

By Berton Braley

Written expressly for Coal Age

When everything is going right
And life is merry as a song,
When there is lots of work in sight
And luck is running good and strong,
It's fun to travel with the bunch
And blow your money like a king,
But—just you get my little hunch,
A bank account's a handy thing.

Today you mine the good black coal
And do your work and draw your pay,
And then you spend your little roll
And life is glorious and gay,
Tomorrow—things may go to smash
Your luck may turn from fine to rank,
And then you'll wish you had the cash
You might have salted in the bank.

You can't be certain of your fate,
The roof may fall, the damp explode,
And that'll be a bit too late
To save the money that you "blowed,"
Your wife and kids will mourn for you
And starve, perhaps, because you died,
Why not cut out a spree or two
And lay a little roll aside?

The game of life is mighty tough
And rainy days are often met,
It's wise to lay away the stuff
To keep you safely from the wet,
Just bank a little of your pelf,
Don't spend your earnings fast and free,
—I never saved a cent, myself,
But don't you be a fool like me!

Cause and Effect of Colorado Strike

[A personal letter to the editor of Coal Age, and published by special permission.]

I regret that the press of the country has been so willing to print sensational stories concerning the strike in Colorado. Prior to the trouble which commenced last September, we were paying higher prices for labor in our mines than were paid in most Eastern fields, and our men were receiving better wages as a whole than in almost any section of the country.

We were, and had been for some time, working eight hours per day; were paying twice a month in cash; had abolished the use of scrip; were always willing to allow the miners a checkweighman; and in fact were complying with all the demands made except the increase of wages and recognition of the union. Our men were, so far as we could tell, entirely contented and subsequent developments strengthened our belief in this matter.

Agitators Were Imported

The United Mine Workers of America brought in about 30 agitators of different nationalities from outside the state, and these men did all they could for several months prior to September to inflame the minds of our employees and to persuade them to believe that they were being unfairly treated.

A convention was finally called in Trinidad on Sept. 16, 1913, which was attended by delegates purporting to come from our mines, but who really were brought in in a number of cases from other districts. At only one of our 21 mines was a meeting held and delegates sent from our property to the Trinidad convention. Delegates furnished by the leaders and who did not represent our mines, of course, were willing to vote for a strike.

The strike call was responded to by approximately 25 per cent of the miners in the Trinidad and Walsenburg districts. Immediately following the call, every means of intimidation known to the Mine Workers Union were used to force our men to quit work. This action resulted in another 20 per cent. leaving the collieries.

The strike was called on Sept. 23, and acts of intimidation began on Sept. 26 when hacks going to the mines were stopped by armed men and the passengers taken from the vehicles and forced to return to the railroad depots under threats of death. A considerable supply of firearms was bought and shipped into the district by the union leaders as early as ten days before the strike was called. A reign of terror was instituted by the Mine Workers Union, and the promiscuous shooting of people who were traveling in the direction of the mines, the burning and dynamiting of bridges on the railroads serving mine properties, and many other unlawful acts resulted in the Governor calling out the militia on Oct. 28.

Most of the Men Returned to Work

Immediately after peace had been restored the miners began to return and by the middle of January we had all the men needed to produce the coal necessary to fill our orders, and before the first of April we were losing time at some of the mines on account of shortage of orders.

The militia was withdrawn on April 16, and on April 20, the strikers resumed their lawless acts. They began by perpetrating assaults on different mining properties, attempting to massacre men at work and destroy properties with fire and dynamite. This, of course, finally resulted in the calling out of federal troops.

The deplorable happenings at Ludlow on April 20 and 21, which have been so grossly misrepresented in the press, were certainly not chargeable to the mine operators. The continual talk about armed thugs being used as mine guards is the veriest rot, as is also the stories circulated about shooting the women and children. There has not been a single striker's wife or child killed or molested by a mine guard. However, two children of one of our employees were shot by strikers while in their home at our Tabasco mine on Oct. 26.

Women and Children Were Suffocated

The women and children who lost their lives in the burning of the Ludlow tent colony were suffocated by being placed in a cellar under one of the tents and covered over by tight plank boards with mattresses thrown over the floor. This was done by strikers themselves in their ignorance of natural laws, and the women and children were suffocated not by the burning of the tents, but by the lack of air circulation in the hole in which they were placed by their would be protectors.

In the different stories sent out by the union and published in the newspapers of the country, there is no mention made of the wives and children of the five or six thousand miners who are now at work, and had it not been for the volunteer services of these men, many of our properties would have been destroyed in the recent reign of terror instituted by the strikers.

At all of our collieries our miners begged for means of protection and when it could be furnished, they willingly went out and assisted in driving back the strikers who were attempting to come in and murder their women and children and destroy our property.

Mines Are Operating to Normal Capacity

We have now practically all the men we can use in our mines, and while I am not certain that this condition prevails at the plants of all the other companies I am sure that the Colorado operators as a whole could produce coal enough to fill their orders if they were left alone and not molested by men on strike.

Conditions are quiet at the present time, and our mines are working every day and will continue to do so as long as the authorities are able to prevent act of violence on the part of the strikers. *It is absurd for the United Mine Workers to demand of us that we discharge or force into the union our loyal employees who have stood by us throughout the trouble and are satisfied with their working conditions.*

Handling the Negro Miner in the South

SYNOPSIS—This class of labor is naturally shiftless, being contented to let the morrow look out for itself. Laws should be passed prohibiting garnishments and compelling merchants and money lenders to look to the man rather than the company for payment. More frequent paydays are also advisable.

"A nigger is a colored person who has no money."

The above is an epigrammatic definition of a class constituting from one-half to two-thirds of the labor at most coal-mining operations in the South.

The aptness of the definition will immediately appeal to those who are familiar with the negro and the treatment so generally accorded him around many Southern operations.

It is to be regretted that such a definition has any significance, but many will, upon reflection, admit that it is too true.

It is on account of the characteristic disregard of the negro for money beyond today's need, and the fact that, as a rule, he can hardly be induced to put in a full month's work, that the attitude of many operators is simply to make the best they can of his labor without paying any regard to the whys and wherefores of his shiftlessness or give any study to methods and measures that would keep him at work more steadily and make a better laborer of him.

It is not altogether the fault of the negro that he is so aptly designated as a "colored person without money." There are a number of contributing causes, some of which the operator has direct control over and others which he can do much to minimize.

His Checks Are Often Heavily Discounted for Cash

The first cause and one which most operators control directly is the operation of commissaries and the issue of checks which can be traded there. These are too often, heavily discounted for cash before they get to the store. By nature the negro is glad to get hold of "real money." When payday comes only once a month, the check window, which is usually open all day, is a constant invitation to him to draw his day's earnings, which he can either trade at the commissary or sell to ready buyers for cash, say 60 or 70c. on the dollar. Under the latter plan he loses a good percent. of his earnings, so as to enjoy spending what is left immediately.

In too many cases the commissary is an adjunct of coal-mining operations, not as a necessity to take care of laborers, but as a money-making proposition. In such cases, the company store is an absolute preventive against the acquiring of any ideas of thrift on the part of the workmen and causes them to live from hand to mouth.

Some operators will claim that this is the only way to handle negro labor. These officials go blindly forward on the assumption that the sooner the negro can get hold of and spend his money, the quicker he will get back to work. On the other hand, this theory has been disproved by the practice of many operators of running their commissaries simply as a plant necessity, supplying the best goods at the lowest cost and getting their returns from increased tonnage mined by more contented workmen.

How the Negro Can Be Enabled to Get Out of Debt

The negro can be cured of his natural shiftlessness if the "white folks" will help him. As far as the commissaries are concerned, this can be done by issuing store checks once or twice a week instead of every day and paying off twice a month. The negro after all likes to feel that he has a little ahead and like any other human being he likes to find some money in his envelope on payday. If you don't believe it, try it on him.

The greatest indirect contribution to the general shiftlessness of the negro and one that keeps him jumping from place to place, going to court, etc., is the ease with which he can be induced to borrow money, buy furniture, clothes, books and pictures, on the installment plan—in too many cases far beyond his means and at exorbitant rates and prices. In most of the Southern states the garnishment laws are such that as soon as he fails to make a payment, he is garnisheed and in most cases this means the holding up of his wages until he can either pay or secure a release, to say nothing of the costs which he must pay.

However, in some states even the existing laws covering garnishments will be found very effective in affording relief to the man who is garnisheed by a loan shark or installment furniture man, if the company will only help the man to help himself. For example, in one Southern state the law states plainly that $25 of a man's earnings are exempt from garnishment, yet some operators honor garnishments served on their workmen without giving them the benefit of such exemption. It is not enough to fire a negro for being garnisheed. He simply moves and goes to work at another place, but the man he owes trails him and garnishees him again.

Garnishment Laws Should Be Changed

The remedy for the garnishment evil is to remove the trouble at the source. This can be done in some cases by taking advantage of existing laws, and in others by taking steps to secure better laws. People will quit lending money at illegal rates and selling furniture, clothing, etc., at extortionate prices when they learn they must look to the man and not the company for payment.

It is pleasing to note that all over the South, people are learning that it pays to give the negro every chance to improve his condition, and that when this is done he becomes a better workman. There is plenty of room for improvement yet, and especially will coal-mining people find that it pays to conserve the earnings of negro workmen rather than feed and fatten on them.

There is reason to believe the day is not far distant when our epigram will have lost most of its significance. There is no doubt its coming will mean increased production and profit for the coal-mining concerns, for the negro will work harder to save money than he will to pay an unfair debt incurred to buy something he no longer wants.

A Modern Kentucky Plant

By R. J. Sampson*

SYNOPSIS—A small but well equipped plant and coal washery in the Cumberland Gap Coal Field of Kentucky. The double-entry room-and-pillar system of mining is employed.

The mines of the Yellow Creek Coal Co. are located at Bosworth, Bell County, Kentucky, in what is known as the Cumberland Gap Coal Field. They are some 5 miles west of Middlesboro and are reached by a branch of the Louisville & Nashville R.R., over which the Southern Ry. also has track rights.

Analysis of the Sandstone Parting coal shows: Moisture, 2 per cent.; volatile matter, 33; fixed carbon, 57 ash, 7.2; sulphur, 0.55 per cent.

The lower or "stray" seam has a thickness of 36 in clean coal. No analysis of a sample taken at this mine i available.

The Deane seam is 4 ft. 2 in. thick, clean, with the ex ception of a very thin stratum of soft clay near the top

Some 40 ft. over the Poplar Lick is the Klondike seam Its average thickness is about 4 ft. 6 in., with a shal parting some 2 ft. from the bottom, which varies greatly

General View of Power Plant and Washery

The company first began operations in the Poplar Lick and the Sandstone Parting seams, these two being opened at the same time. Coal was first shipped in January, 1902.

These two seams, only, were worked until 1912, when another bed, some 750 ft. below the Sandstone Parting coal, was opened. This has not been satisfactorily correlated, but is believed by some authorities to be the Straight Creek seam.

In 1913 development of the Deane seam, on the north side of the hollow, was begun. The Poplar Lick seam, at an elevation of approximately 2500 ft. above sea level, here shows a section of 4 ft. 6 in. of clean coal.

Analysis of this coal is as follows: Moisture, 4.46 per cent.; volatile matter, 33.57; fixed carbon, 60.12; ash, 1.43; sulphur, 0.52 per cent.

The Sandstone Parting coal, some 700 ft. below the Poplar Lick, has an average thickness of 48 in. One foot from the bottom there is a sandstone parting some 4 in. or 5 in. thick.

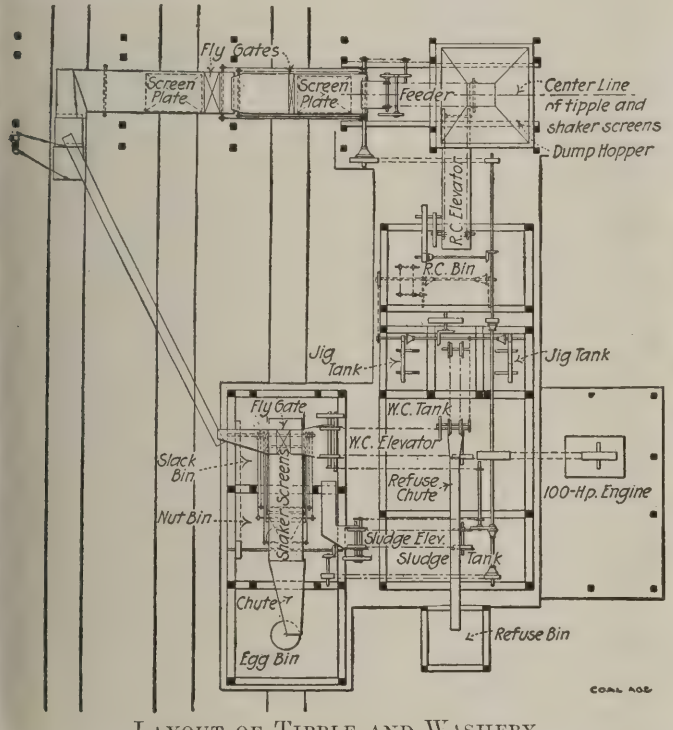
*Middlesboro, Ky.

in thickness. The Yellow Creek company has as ye done no work in this measure.

The Double-Entry Room-and-Pillar System Is Use

In all of the mines the ordinary double-entry room and-pillar system of mining is used. Fans have been in stalled at all but the newest of these openings. On th south side, in the two old mines, the air is not split, bu in the lower mine on that side and in the mine on th north side splitting of the air is accomplished by mean of overcasts—a split being made for each cross-entry.

In the two new mines, the coal is undercut with short wall chain cutters, two Sullivan, one Jeffrey and on Goodman machine having been installed for this purpose In the other two mines the coal is undercut by hand.



Three 7½-ton Goodman electric locomotives compris the haulage equipment.

From the Poplar Lick seam the coal is lowered b means of a retarding conveyor of the rope and disk typ The conveyor trough is 36x18 in., the disks being a tached to a ⅞-in. wire rope, on 4-ft. centers. The ca pacity of this conveyor is 100 tons per hour. It di

charges into bins, from which the coal, together with that from the Sandstone Parting seam is loaded into 8-ton monitors. These acting on a gravity incline, also carry the coal from the lower seam.

On the north side of the hollow, monitors also handle the coal to the same tipple as that from the south side, but onto a separate dump. All of the coal passes over the same screens. Up to the present time, it has been possible to load only three sizes of coal at one time, the tipple having been provided with but three railroad tracks.

For several years the company has had a contract with the Southern Ry., which practically covered its entire output. This contract will expire during 1914, throwing the coal on the open market in competition with that from other sources.

Layout of Tipple and Washery

Immediately under the lower seam there is a thin stratum of clay, which comes up with the coal; this, together with some of the parting in the Sandstone Parting bed, makes it imperative that it be mechanically washed.

To accomplish this, there was recently begun the construction of the most complete and largest washing plant which has yet been built in this section. It has a capacity of 1200 tons per day and was designed and built by the Pittsburgh Coal Washer Co.

The coal is dumped as before and passes over a 4-in. screen. The screenings go into a chute to the boot of the "raw-coal" elevator, while the oversize is loaded at the tipple as block coal.

Under the 4-in. is placed a 2½-in. screen. By means of a fly-gate, the oversize from this screen may or may not be passed into the chute, which feeds the raw coal elevator, i.e., in case it is not necessary to wash this size, it can be loaded at the tipple as egg.

From the raw-coal elevator, the material is passed down through a "retarding tower" into a bin. An opening on each side in the bottom of this bin supplies raw coal to conveyors, which feed two Pittsburgh jigs of a guaranteed capacity of 50 tons per hour each.

From the jigs it is carried to the screens at the top by the washed-coal elevator. Waste from the washers is carried by the refuse elevator to a chute, which empties into a bin on the outside of the building.

At the screens are made three grades of fuel, slack, nut and egg. The nut and egg sizes are lowered into bins by means of spiral lowering chutes, which prevent breakage. In case a run-of-mine product is desired, there is provided a chute from the screens back to the tipple bins, which carries all of the washed coal and loads it with the block at the tipple track.

The bin gates are cast with a hollow rim provided with openings for pipes. Steam is circulated through this rim to prevent freezing of the water which, of course, collects at the lowest point.

The chutes just below the gates are provided with openings, through which is circulated the cleanest water available. The finer particles thus taken out pass to a hopper,

View on the Jig Floor

thence by means of a chute to the sludge elevator and thence to the sludge tank and slack bin. The nut and egg sizes are loaded from the chutes by movable loaders.

The Power Plant

The boiler house is equipped with two batteries of two 150-hp., fire-tube boilers each. One battery is held in reserve. In the engine room a Ridgeway duplex engine drives a 300-kw., General Electric generator, by belt connection. A Houston-Stanwood, 100-hp., duplex engine furnishes power for the washer. It operates on 100-lb. pressure at the throttle.

A camp of 152 comfortable cottages shelters some 200 employees. There will be added shortly 75 to 100 men, materially increasing this force. A well stocked company store supplies the camp with all of the necessities and not a few of the luxuries of life.

At present the output is from 400 to 500 tons per day, but this will probably be increased in a few months to from 800 to 900 tons daily. To run the washer at its full capacity of 1200 tons, an approximate total output of 1700 tons would be required.

The coals of this district are gradually getting onto the market in the North and Northwest. The opening of the Panama Canal should divert no little West Virginia fuel which is now being shipped into that section, thus creating a greater demand for the product of this field, a demand which the operators here are preparing to supply satisfactorily.

The Economy of Machine Mining

By Wesley S. Harris*

SYNOPSIS—The difficulty of obtaining accurate figures on which to base a just comparison of the cost of machine-mined and pick-mined coal. The need of carefully considering the peculiarities of the coal seam and all the conditions affecting the mining of the coal. A brief review and classifications of charges, including a due regard to danger of accident due to use of machines for cutting the coal; breakdowns, opposition of men to installations, etc.

This is a question of vast importance to the mining industry of the country and especially so in Indiana at the present time inasmuch as the miners in joint convention with the operators at Terre Haute have just demanded that the differential between pick-mined and machine-mined coal be reduced to 7c. per ton. As yet, however, it has received little or no consideration by operators and mine managers. Absolutely accurate figures are not obtainable, because accurate data are not available. Comparison is an argument, but fails to establish a fact because of varying conditions. Items of cost that should properly be charged to the production of machine-mined coal are, ofttimes, charged to another account, or to the production as a whole where the coal is part machine-mined and part pick coal, thus affording an opportunity for serious error in judgment.

Coal operations are in many particulars analogous to the high cost of living about which we hear so much, in that we as mine managers, in many instances, fail to produce dividends for our companies on account of our zeal to own or operate so called modernly equipped mines. In this age of efficient apparatus, it is, of course, necessary to be uptodate and abreast of the times in order to successfully compete with the live wires of our business; but this does not necessarily mean or imply that all mines must be equipped with mining machines in order to be modern.

Cost of Equipment Justified

Mining machines and the necessary equipment for successfully operating them at the average colliery cost an immense amount of money. If money is injudiciously spent in equipping a plant for cutting coal with machines, overhead charges for interest, maintenance, depreciation and taxes will be correspondingly heavy. Conditions may justify the expenditure in order to properly recover certain coals and at the same time safeguard life and property; but such moneys should be judiciously and wisely expended and then only after exhaustive analysis of conditions surrounding the proposed operation. The fact that one's neighbor mines his coal with machines is not sufficient reason for one to so equip his own property. Usually each mine, and especially each coal, has its peculiarities that deserve careful consideration. Many pointers and suggestions that are worthy of serious deliberation may be had from the man at the face. Such pointers and suggestions only cost when ignored or neglected.

It is fair to assume that all uptodate companies maintain accounting systems that are a criterion by which they may determine approximately the relative costs of pick-mined and machine-mined coal; and it would appear from the large number of machines in operation that opinion is practically unanimous in their favor. However, there are many angles that afford viewpoints not generally considered in this connection, a few of which it will be the purpose of this article to now briefly enumerate in order to open a discussion of the matter by readers of Coal Age.

Classification of Charges

The writer submits that interest on investment, maintainance, depreciation and taxes on all extra equipment over that necessary for the successful operation of the property as a pick mine should properly be charged to machine-mined coal. In this list should be included all extra housing, boilers, boiler settings, boiler fittings and accessories such as feed pumps, steam headers, etc., in addition to generating units, settings, switchboards and accessories, transmission lines and machines. Further, also, under the head of supplies should be included and charged to machine-mined coal all extra repairs, fuel, water, oil, tools and office supplies over and above that necessary for the successful operation of the property as a pick mine; and under the head of labor, should be included and charged to machine-mined coal all extra expenditures for electricians, wiremen, firemen, oilers, jerries, drivers, tracklayers, bit sharpeners or blacksmiths and clerical force over and above that necessary for the successful operation of the property as a pick mine.

It will be readily conceded that all extra expenditures for electricians, wiremen, firemen and oilers should properly be charged to machine-mined coal, however, it may be well to call attention to the fact that jerries are quite frequently required to timber after machines, clean slate and refuse at switches and turns on account of the additional space required for machines to turn; extra drivers are frequently necessary due to the fact that they are required to get sharp bits to the machines and dull bits to the shop, must occasionally await the moving of a machine thereby losing time and in most mines in Indiana must drive further for their loads or past one extra place out of every three, due to the fact that three working places are allowed each two loaders; extra track layers are frequently required for the same reason, viz., that they have more track to keep up and over a larger territory due to the fact that three places are allowed two loaders; bit sharpener or extra blacksmith should properly be charged to machine-mined coal where the machine men are not charged for smithing; clerks, purchasing agents, accountants and bookkeepers will readily call to mind countless hours that have been spent in ordering machine supplies, checking freight bills and keeping track of supplies. Delays and shutdowns due to trouble with boilers or generating units should properly be charged to machine-mined coal where machines are responsible for such trouble. Many of us have experienced delays in both hoisting and haulage due to our generating plants being overloaded by reason of having been required to put ad-

*Superintendent, Little Giant Mine, Monon Coal Co., Linton, Ind.

ditional machines in operation when the generating plant was already working at or above its rated capacity.

Danger of Accidents Considered

All expenditures for personal injuries directly due to mining machines or transmission lines used exclusively for supplying power to mining machines should properly be charged to machine-mined coal as should also all expenditures or loss by reason of mules or horses being killed by such transmission lines. While discussing this phase of the subject, it may be well to call attention to the matter of accidents in general. The fact is well recognized by many mining men that there is more danger from falls of coal, roof and drawslate where machines are used than in pickwork. This is undoubtedly due to the fact that the charge of powder is placed nearer to, against or in the roof, in the case of machine work, where the shattering effect of the charge is greater on the cover than when a larger charge is placed more remote from it. This is of great importance when we consider the large proportion of accidents from these causes. This is emphasized by quoting John Dunlop, state mine inspector, third district of Illinois, as reported on page 984 of Coal Age, June 28, 1913, wherein he says: "It is true that more powder is used where coal is being shot off the solid and it is probable that the roof is affected by the heavy shooting, but careful perusal of the reports of the state inspector of mines shows that 60 per cent. of the men killed by falling coal, roof and drawslate are struck down in mines where the coal is almost all undercut by machines. As these mines produce only about 52 per cent. of the total output, it seems that they have an undue proportion of accidents, and it is not fair to ascribe the maintenance of rate or increase in accidents to shooting out of the solid."

With respect to the recovery of coal, it may be said that the machine has proved to be an advantage, but even this will be a difficult matter to substantiate when we take into consideration the fact that machine bottoms are seldom taken up by the loader and when machine men make their own bottoms, they leave from 2 to 8 in. of coal. The coal is thus not only lost, but the working thickness of the seam is decreased by reason of the bottom coal being left.

We pass the matter of loss on powder sales without comment, due to the fact that the price to the miner has remained the same for several years while the operator has been required to pay more and more for it each year until at the present time the margin of profit is small.

The writer is of the opinion that it is possible to maintain a more regular output at pick mines than at machine mines unless the operation has a surplus of both miners and working territory. Machine breakdowns are largely responsible for this situation. If we maintain an excess of machines and territory in order to offset such a condition, it requires an additional investment.

Last, but not least, is the matter of the good will of employees. The writer holds that the mining machine, even in its most perfected state, is responsible for much of the dissatisfaction, discontent and labor trouble around mines. There are many reasons for this conclusion which must be manifest to all mine managers. Probably the most important of these is that men are ofttimes thrown idle for a day or days by reason of being out of coal due to the machine being broken or the machine men being out.

The fact that three of the sixteen demands presented to the operators by the miners of Indiana would tend to decrease the differential between pick and machine coal is significant.

Deeper Mining More Dangerous

The official figures of the accidents in the anthracite mines of Pennsylvania, in the last annual report of the Department of Mines, just published, show a marked improvement over those of the previous year, but the report also carries a warning. Of the 615 accidents that occurred inside the mines in 1911, 337, or 54.7 per cent., were attributed to the carelessness of the victims themselves, 45, or 7.31 per cent. to the carelessness of others, and 233, or 37.89 per cent., to unavoidable accidents. In 1912 there was 498 accidents, or 117 less than in the previous year, but of these 322, or 64.66 per cent., were attributed to the carelessness of the victims themselves, 32, or 6.43 per cent., to the carelessness of others, and 144, or 28.91 per cent., to unavoidable accidents.

Thus it would seem that the mine workers are growing more careful of others, but also more careless of their own safety. In this connection, Chief James E. Roderick, of the Department of Mines, writes:

"If the accidents resulting from carelessness and disobedience of rules could be eliminated, the fatalities in the mines would not be greater than in many vocations in the cities.

"The work of the coal miner becomes more dangerous as the operations grow more extensive and attain to greater depth. This has become apparent in recent years to mining officials and other persons interested in mining, and has created a demand for stricter and more modern legislation and for the adoption of the most approved means and methods for the protection of human life."

Cost of Maintaining Strikes During the Year 1913

Special Correspondence

In his annual report for the year 1913, submitted to the International Convention of Miners at Indianapolis, in February of this year, Secretary-Treasurer William Green makes the following statement:

On account of the strong opposition of the coal operators and their friends, in the non union fields, we have been forced to spend large sums of money.

During the year 1912 we spent	$706,225.20
For 1913 for relief alone	1,621,942.67
Total for the two years	$2,328,942.87

The amount spent for aid in the year 1913 was distributed as follows:

District No. 7 (Penna Anthracite)	$600.00
District No. 8 (Block Coal Indiana)	9,400.00
District No. 10 (Washington)	20,000.00
District No. 13 (Iowa)	986.43
District No. 15 (Colorado)	661,600.00
District No. 17 (West Virginia)	318,600.00
District No. 19 (Tenn. & Kentucky)	2,832.75
District No. 20 (Alabama)	4,134.16
District No. 23 (Kentucky)	8,500.00
District No. 28 (Vancouver Island)	584,000.00

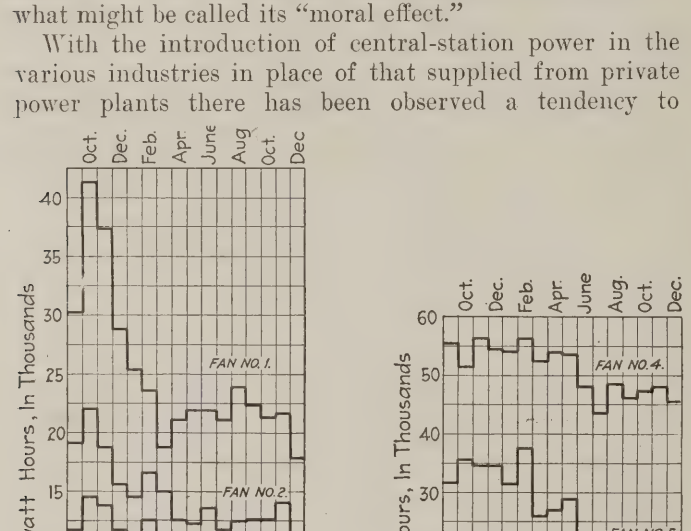
Miscellaneous expenditures were as follows:

American Federation of Labor tax	$56,337.18
Salaries and expenses, officers, organizers and employees, for 1913	290,764.09
Supplies	4,431.95
Office expenses	7,161.98
Printing	12,589.72
Telephone, postage and express	5,307.45

The report summarizes

Total income	2,159,031.69
Total expenditures	2,102,261.44
Balance on hand	278,032.30

The above items furnish interesting food for thought in connection with the article on Lessons of the Vancouver Strike, published in our issue, May 16, p. 801.



Efficiency and the Purchase of Power in Coal Mining

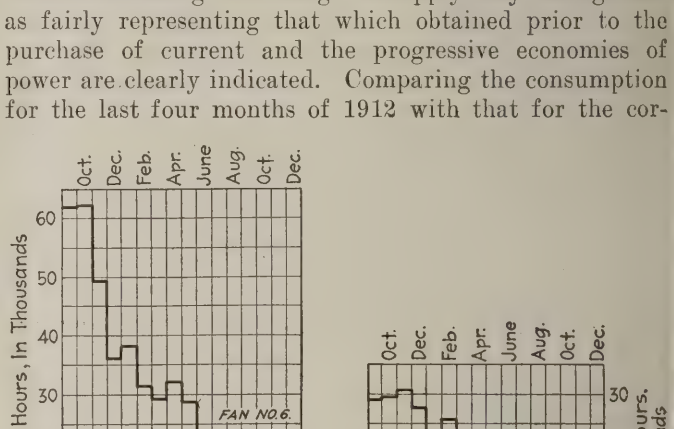
By A. E. Gregory*

SYNOPSIS—Purchasing power usually awakens the coal-mine management to the possibilities of saving good money in the use of current. While these possibilities undoubtedly exist and might be taken advantage of under private supply the significant fact remains that this is seldom done.

There is one phase of the use of central-station power which has not received the consideration which it deserves; that is, its bearing upon operating efficiency or what might be called its "moral effect."

With the introduction of central-station power in the various industries in place of that supplied from private power plants there has been observed a tendency to

Charts Showing Decreasing Power Requirements of Fans Nos. 1 to 5 Inclusive



greater efficiency in the use of current. Wasteful methods long tolerated under operation from private plants give place, in many cases, to a regimen of careful economy in the use of power.

Probably few situations offer greater possibilities for improvement in this respect than the average coal mine as operated from its own plant. Coal is cheap and, consequently, little thought is given to economy in the use of power. Moreover, this attitude is largely justified inasmuch as any saving in current consumption can reduce the power costs but little except as regards the single item of fuel, since labor, interest, depreciation and other so called fixed charges remain practically the same in any case.

With the employment of purchased power on the other hand any economies in its use show a much greater proportionate saving in money and, what is of more importance as an incentive to economy, the entire cost of power is represented in the monthly bill rendered by the central station. With private-plant operation the manager rarely knows even approximately the cost of power; when buying it, however, it is impossible that he should be ignorant of its cost since every power bill is a reminder.

Considerable Savings Are Shown

The accompanying charts give a graphic representation of results actually secured in the saving of power as applied to the ventilation of a number of mines in the Pocahontas coal field, following the change to central-station power, which took place in August, 1912. Prior to this time these fans had been electrically operated from private plants. The power consumption for the first few months following the change in supply may be regarded as fairly representing that which obtained prior to the purchase of current and the progressive economies of power are clearly indicated. Comparing the consumption for the last four months of 1912 with that for the cor-

Charts Showing Decreasing Power Required by Fans Nos. 6 and 7.

responding period of 1913, the reduction in the cases of five of the seven fans represented varies from 40 per cent. to over 60 per cent., while for the other two the reduction was 34 per cent. in one case and 14 per cent. in the other.

These economies were secured by a variety of means. In several cases where fans had been operated at constant speed 24 hours per day, and where the conditions permitted of operation at a reduced capacity at night, the old motors were replaced with those of the two-speed type which permitted the rapidity of rotation to be reduced one-half. As a reduction of 50 per cent. in the speed of a fan reduces the power required by about 80 to 85 per cent., this change in itself accounts for a large part of the saving of power.

In some cases there was found to be considerable waste of power in the short-circuit of air currents as a result of leaky brattices between the air courses and the haulage ways. The remedy was obvious and inexpensive. In one or two cases the air delivery was found to be larger than was necessary or desirable, and in these instances the re-

*Appalachian Power Co., Bluefield, W. Va.

duction of fan speed resulted not only in a saving of power, but in a lessened tendency to dust disturbance by reason of the reduced air velocity.

Power Saving Is Not Restricted to Fans

The saving of waste energy has not been limited by any means to the operation of mine fans. The power consumption for haulage and cutting and even for pumping has been materially reduced although the results cannot so readily be demonstrated as in the case of ventilation, owing to the more variable nature of the load.

Of even more importance perhaps than the saving in power consumption, as a result of the improvements in distribution and use of power, may be the improved performance of the operating equipment. Defective bonding, for instance, not only entails loss of power, but what is worse, is likely to cause overheating of such equipment as locomotives and cutting machines, thus reducing their working capacity. It may easily happen, therefore, that improvements having as their object simply the reduction of the power bill will result in other benefits of even greater value.

While it is true that the economies described in this article could have been effected quite as well in connection with power service from private plants, the significant fact is that they were not thus secured. Indeed, it is doubtful if the possibilities of economy were even suspected until after the purchase of current. Moreover, the cause of the newly awakened interest in power economy is not that the purchased energy costs more; on the contrary, even for equal power consumption the costs usually are less than under private plant operation.

No, it is not that the cost of power is higher than before but simply that it is now known, whereas before it was not. As one operator expressed it, "Your meter is the best boss I have."

Handling Coal Electrically

The loading or unloading of granular material in bulk such as coal from cars or boat and its transportation to some nearby point is today seldom accomplished by manual labor. For unloading particularly, the laborer with his wheelbarrow, the horse hoisting a bucket and similar devices have been superseded in most cases by some form or other of electrically operated "grab" or "clam shell" suspended and actuated either from a crane or monorail carried on an overhead framework.

The accompanying illustrations show some of the many applications of this principle to industrial practice. Fig. 1 shows a gantry crane employed for the unloading and storing of coal from railroad cars. Fig. 2 shows the adaptation of the suspended grab bucket to the coaling of a power plant. In this case the track or trolley passes entirely through the building and is so arranged that the same apparatus that supplies coal to the bunkers from the right discharges ashes from the left of the building to railroad cars.

Fig. 1. Gantry Crane with Grab Bucket for Unloading and Storing Coal

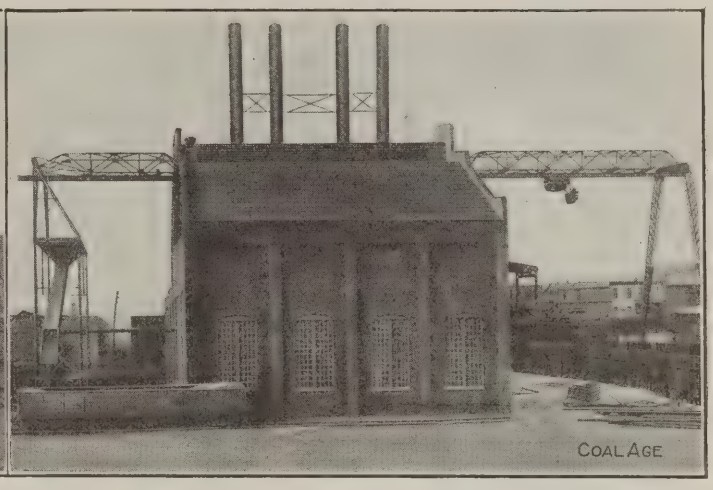


Fig. 2. A Grab Bucket Arranged to Deliver Coal to and Remove Ashes from a Power Plant

Fig. 3 is a general view of a grab bucket and monorail tram for unloading coal or other granular substance and conveying it or other material about storage yards or works. Fig. 4 shows the bucket and traveler in greater

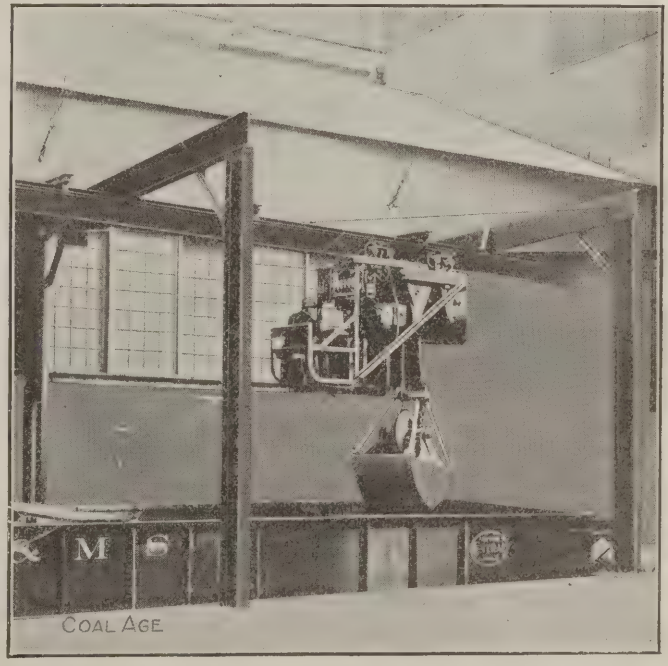

Fig. 3. A Grab Bucket, Operated from an Overhead Monorail

detail. It will be noted that the operator sits in a cab on the traveler and rides back and forth with it. He is thus enabled to see all that goes on at both traveler and bucket. He can, therefore, place the latter in the most advantageous position to pick up its load or to discharge its contents at any point desired.

In the case of the equipment above illustrated the trolley rail is a 15-in., 42-lb. I-beam, the bucket has a capacity of 1⅝ cu.yd. and the total weight of bucket and trolley is 13,000 lb. The full bucket may be hoisted at the rate of 150 ft. per min. and travel along the track can be accomplished at the rate of 350 ft. to 700 ft. per min.

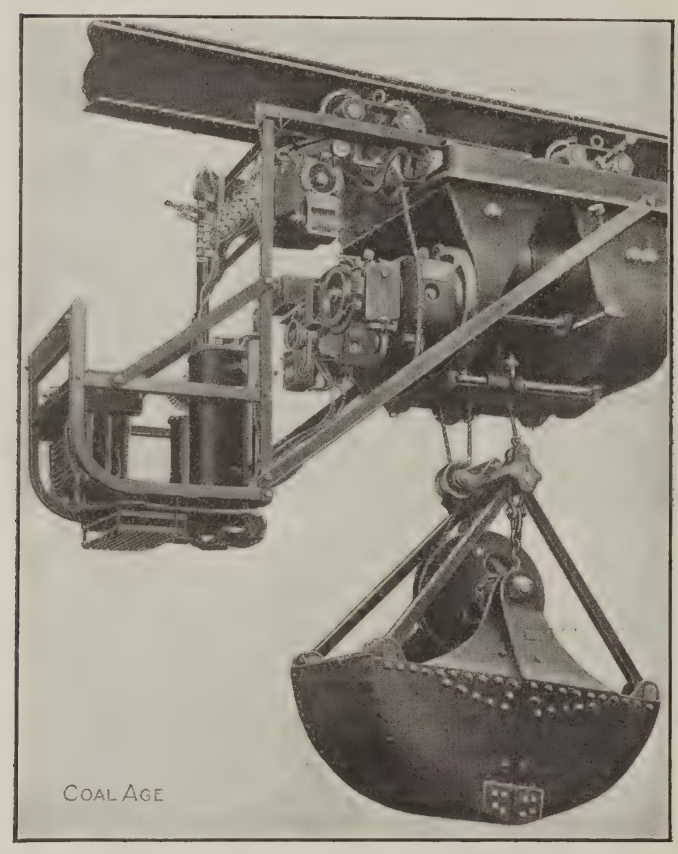

FIG. 4. NEAR VIEW OF GRAB BUCKET AND TROLLEY

Choosing a Trade in Pennsylvania

If you want to make money as a wage earner in Pennsylvania, get a job in a tin-plate factory. Your average daily wage will be $3.10, your annual income $837, and you will work 270 days in the year. These figures were compiled, for the benefit of those about to choose a trade, from the last Annual Report of the Secretary of Internal Affairs of Pennsylvania.

If you covet more leisure and want to earn the third largest average daily wage in the state, get a job in the anthracite mines. Your average daily wage will be $2.60, your annual income $605.80, and you will work only 233 days in the year. Your choice of a trade depends on whether you prefer a high daily wage, maximum annual income, or fewest working days.

In order to present these alternatives graphically, tables have been worked out from the above mentioned Annual Report, covering the nineteen industries in Pennsylvania, each of which pay out over $4,000,000 a year in wages to employees. In the first table, showing the average daily wage, the manufacture of tin plate leads with a daily wage of $3.10, the manufacture of pig iron comes second with a daily wage of $2.66, and anthracite mining comes third with a daily wage of $2.60. In the second table, showing the number of working days, anthracite mining has the minimum of 233 days, the manufacture of pig iron is second with 237 days, and bituminous mining third with 248 days. In the third table, showing the annual income based on the product of the first two, the manufacture of tin plate leads with $837, the manufacture of steam and electric locomotives is second with $750, iron and steel, rolled into finished form, is third with $694.98, while anthracite mining with its many holidays and more abundant leisure has fallen to seventh place with $605.80.

AVERAGE DAILY WAGE OF ALL WAGE EARNERS EMPLOYED IN THE NINETEEN LARGEST INDUSTRIES IN THE STATE OF PENNSYLVANIA

1	Tin plate	$3.10
2	Pig iron	2.66
3	Anthracite mining	2.60
4	Steam and electric locomotives	2.50
5	Iron and steel, rolled into finished form	2.43
6	Bituminous mining	2.35
7	Iron and steel, ingots and castings	2.28
8	Cars and car wheels	2.24
9	Furniture	2.03
10	Electrical supplies	1.96
11	Machinery	1.91
12	Hats	1.86
13	Cement	1.80
14	Carpets and rugs	1.69
15	Cotton goods	1.56
16	Boots and shoes	1.47
17	Yarns	1.35
18	Silk	1.22
19	Hosiery	1.21

AVERAGE NUMBER OF DAYS WORKED IN THE NINETEEN LARGEST INDUSTRIES IN THE STATE OF PENNSYLVANIA

1	Anthracite mining	233
2	Pig iron	237
3	Bituminous mining	248
4	Furniture	262
5	Tin plate	270
6	Carpets and rugs	277
7	Yarns	282
8	Silk	284
9	Iron and steel, rolled into finished form	286
10	Iron and steel, ingots and castings	289
11	Boots and shoes	289
12	Hosiery	289
13	Hats	291
14	Cement	292
15	Cotton goods	293
16	Steam and electric locomotives	300
17	Machinery	301
18	Cars and car wheels	302
19	Electrical supplies	304

AVERAGE ANNUAL INCOME OF ALL WAGE EARNERS EMPLOYED IN THE NINETEEN LARGEST INDUSTRIES IN THE STATE OF PENNSYLVANIA

1	Tin plate	$837.00
2	Steam and electric locomotives	750.00
3	Iron and steel, rolled into finished form	694.98
4	Cars and car wheels	676.48
5	Iron and steel, ingots and castings	658.92
6	Pig iron	630.42
7	Anthracite mining	605.80
8	Electrical supplies	595.84
9	Bituminous mining	582.80
10	Machinery	574.91
11	Hats	541.26
12	Furniture	531.86
13	Cement	525.60
14	Carpets and rugs	468.13
15	Cotton goods	457.08
16	Boots and shoes	424.83
17	Yarns	380.70
18	Hosiery	349.69
19	Silk	346.48

It is claimed that the adoption of the hydraulic system of stowing wastes would be beneficial in many directions. There being no loose wastes or gobs, a reduction in the loss of "effective" ventilation would accrue. There would be less liability of explosions. The risk of falls would be reduced, owing to the more substantial support afforded the roof. Again, collieries would be more sightly if we put back into the worked-out places of the mine the material drawn therefrom in the process of working. The waste at present goes to form the huge, unsightly culm piles so frequently seen on the surface near coal mines.

Electricity in Coal Mining

By David R. Shearer*

SYNOPSIS—This is the third article of the series on this subject. Explanations and diagrams are given of the various electric signaling systems prevalent in coal-mining operations.

Since the earliest days of mine operation, it has been necessary to have some method of communication between those employed on the surface and the men working underground. At first these methods were very crude, taking the form of mechanical bells or gongs, operated by a system of wires from the bottom of the shaft by a series of jerks or pulls from handles located at some convenient place. Later we find the first simple electric system, consisting of one electric bell and one push button, using either two wires, or one wire and a ground return to complete the circuit.

A system of this type in its simplest form is shown in Fig. 1. Communication was carried on over the wires by means of a system of signals, in some instances, this being the Morse telegraph code. After some time this simple bell service was made more efficient by adding additional buttons and additional bells to the same circuit, forming a multiple system, Fig. 2. We next find the return-call method of wiring being used with a bell and push button at each end, thus, either station could signal the other without ringing the local bell, Fig. 3. This system may be used with three wires or two wires and a ground return.

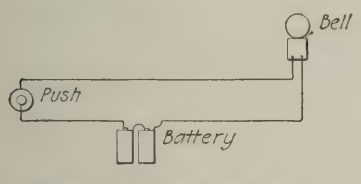

Fig. 1. Simple Bell Signal Circuit

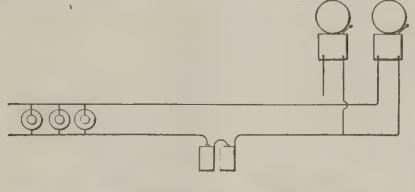

Fig. 2. Multiple-Bell Signal System

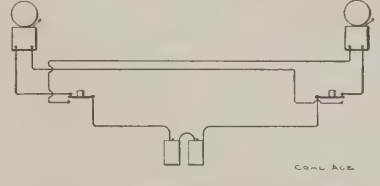

Fig. 3. Return Call Bell System

All of these arrangements work satisfactorily for short distances. But as extensions were made, adding more resistance to the line and increasing the number of points at which leakage might take place, it was found necessary to employ a great number of batteries in order to force sufficient current through the line wires to adequately operate the electric bells. This difficulty was overcome by two methods, each of which, however, added a certain amount of complexity to the operating system.

One of these methods consisted in the use of mechanical gongs, which contained a heavy clock spring operating the bell, together with a very delicate release mechanism, operated by a magnet, Fig. 4, through which a weak line current was passed. The electricity, although not of sufficient force to ring the bell, could nevertheless release the mechanical spring so as to operate the hammer striking the gong. This system operated very well if the springs were kept wound up, but frequently those in charge neglected the winding, in which case, of course, no signals could be received.

Relays May Be Introduced

To obviate this difficulty, electric relays were introduced. The operation of this system is as follows: The weak current from the line is passed through a magnet coil which actuates a delicate pivoted contact which in turn opens and closes a local circuit operating an electric bell, Fig. 5. In this case one battery is required for the line and another for each local bell section. Practically all modern systems of bell wiring used for great distances are operated on this principle and almost an infinite number of arrangements are possible and many complicated systems are in use at the present time.

One of the advantages of using relays on the line is that a closed-circuit relay may be used and the bell operated only when the current passing through the line wire is interrupted. Thus, the system automatically makes known any trouble arising from a break in the line wire from bad contact or from failure of the line battery

Several sources of power are available for operating bell systems. The earlier signaling arrangements used wet cells almost exclusively, the Leclanche type for open-circuit line work and for local bells and the gravity or bluestone type for closed-circuit line work. Owing to their convenience and adaptability, dry cells are used to a large extent in many of the smaller mines, while storage cells are employed in many of the larger operations. Where alternating current is available, a low-voltage transformer can be used with marked success, especially for local bell work. These transformers require a very small amount of power, which is taken directly from the line wires furnishing light. A transformer, however, cannot be used on a direct-current system, although the storage battery used on the bell system may be charged from direct-current lighting mains, thus avoiding the recharging and upkeep found necessary with ordinary wet cells.

Many types of wiring are used in running from one part of the mine operation to another, each method probably having some favorable points. Perhaps the most common practice is the use of bare iron telephone wire, supported on porcelain knobs, though insulated wire fastened to the woodwork by staples is sometimes employed. The chief objection to this method lies in the fact that dampness or moisture gathering on the wires allows a leakage of current and sometimes short-circuits the system entirely.

Neither method is applicable if many wires are to be used as too much room is occupied by the lines and their supports. In case several wires are to be used and especially where space is limited, as in a small shaft or tunnel, it is advisable to use a cable containing the number of wires required. In dry places, this cable may have a weatherproof braid insulation, but where dampness is prevalent, it becomes necessary to further protect the wires from moisture by an additional covering of lead.

Telephone Wiring Is Employed above Ground

Outside the mine or on the surface the wiring methods usually used are similar to those employed in telegraph or telephone work, consisting of poles, cross-arms, insulators and iron wires.

Probably the best of all known methods of communication between the different parts of the mining operation is by the use of mine telephones. If these are properly installed, and the wiring carefully done, the system is almost trouble proof. The telephones are usualy inclosed together with the battery necessary for their operation in waterproof iron boxes. The cable is lead covered and waterproof throughout. Several of these phones may be used on one line, and an easy method of communication established between numerous points in and around the mine. In some instances an inter-communicating system is used, whereby any one station can call any other station without interfering with those remaining or even ringing the bell of any but the one called. This system is especially common in large mining operations where it is frequently necessary to talk between the different offices, store rooms, or supply houses.

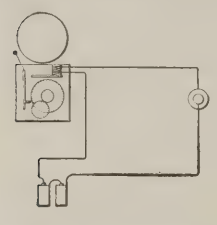

Fig. 4. Electrically Released Mechanical Bell

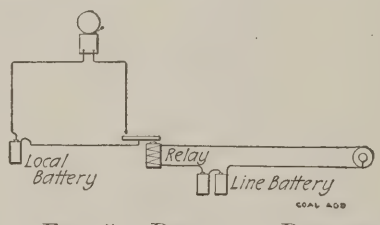

Fig. 5. Relay or Double-Circuit Electric Signal System

A mine telephone, in underground work, is especially useful at the time of a fall or explosion in the mine, for if any men are imprisoned in the workings they may be able to notify those on the surface of their condition and give such directions as might be of assistance toward their release.

Another system of wiring which is coming into some use is that of the automatic fire alarm. This system contemplates the use of many contact-closing thermostats, located at different points of the operation where danger of fire might be expected. In the event that a fire does occur, the heat communicated to these thermostats closes an electric circuit and rings a bell used for fire purposes only.

To adequately cover the many methods of signaling used in mines would require several volumes and a brief outline only is given of the ordinary methods in use. It is to be noted, however, that much time may be saved and sometimes even life and property preserved by the use of carefully erected signal systems. To secure the installation of an outfit suitable for the use of the given mine, the services of an engineer are usually to be required, as frequently the owners are not sufficiently acquainted with the methods available to determine the most suitable or efficient installation.

A Map Should Be Made

After such a system is installed and thoroughly tested under working conditions, a map should be drawn, showing the methods of wiring, the location of the batteries, sources of power and the exact position of every station. This diagram should not only be kept in the office of the superintendent, but should be posted up in the power house. At regular intervals an electrician should thoroughly test every part of the equipment, determining at the same time the strength of the batteries, if batteries are used, and their probable life. The man whose duty it is to inspect such a system should be required to furnish a written report, noting any defects or variations from normal operation. If defects exist, they should be remedied at once, as at any moment the satisfactory operation of bells or signals may be absolutely necessary.

Wage Conditions in N. M.

The following figures are supplied by the state mine inspector of New Mexico, Rees H. Beddow:

COAL THICKNESS, CONTRACT RATES, DAY AND MONTHLY WAGES AND DEDUCTIONS IN NEW MEXICO MINES

Number of corporation...	1	2	3	4	5	6
Thickness of coal bed, ft...	3-9	4-12	4-5	4-7	6	2-4
Contracts						
Mine run per short ton	0.55	0.55	0.55	0.63	0.63	0.75
Entry per yard	1.75	1.75	1.75	2.00	1.50	4.00

Average, per room, per month	2.00	2.00	2.00	2.00	2.33	2.00

In this table 1 = Stag Canon Fuel Co., Dawson, N. M.; 2 = St. Louis, Rocky Mountain & Pacific Co., Raton, N. M.; 3 = New Mexico & Colorado Coal & Mining Co., Raton, N. M.; 4 = Victor-American Fuel Co., Gibson, N. M.; 5 = Diamond Coal Co., Allison, N. M.; 6 = Albuquerque & Cerillos Coal Co., Madrid, N. M.

Stoppings should be made of incombustible material and so constructed that there will be no leakage of air through them. Recently some investigations have been made as to the amount of leakage through stoppings, and the results obtained have been quite surprising. The amount of air lost through brattices as ordinarily constructed is very considerable. The efficiency of stoppings of various materials is a subject worthy of investigation by all large mining companies.

The Labor War in Colorado

By A. J. Hoskin*

SYNOPSIS—A regularly paid militia with proper support would have made peace in Colorado without bloodshed. But the sense that the militia was without the necessary backing emboldened the malcontents to acts of violence.

The general public is aware that a distressing condition exists in the Colorado coal-mining districts. There is no question regarding the seriousness of this state of affairs, and to set the entire matter before the readers of "Coal Age," the following explanations are presented.

In the Mar. 7, 1914, issue appeared an account of the early portion of the investigation then being conducted by congressional authority. During the stay of the congressional committee in the state, warfare in the camps was but temporarily suspended for everybody who was sufficiently familiar with the long-standing trouble to formulate opinions was convinced that the trouble was but smoldering and that the withdrawal of the congressmen would be a signal for renewed deadly activities. Governor Ammons, one citizen who held this belief, expressed it to a few friends at that time, adding that he wished the committee could remain in Colorado permanently.

U. S. Regulars Detraining for Service at Ludlow, Colo.

AMMONS IMPARTIAL

There can be no doubt that Ammons has endeavored to remain absolutely impartial in handling this situation. Indeed, his refusal to take sides brought upon him criticism first from one side and then from the other—criticisms that were quite unfair. Perhaps the statement that he has been weak-kneed possesses an element of fact but he should be given credit for trying to be square. This freedom from bias on his part is substantiated by the fact that, up to date (May 11), neither faction has been ready to make any specific charge against him, although both unionists and operators have suggested his impeachment.

MILITIA UNPAID

Governor Ammons was seriously handicapped from the start by the fact that the treasurer of the state, Roady Kenahan, is a union member and sympathizer. The sending of the militia into the troubled zone was absolutely warranted, and unprejudiced persons are unanimous in believing that, with proper appreciation for their services, these men would have been able to reëstablish peace in a short time. But remuneration for their distasteful and extremely hazardous duties was effectually blocked through the refusal of Kenahan to pay, or to devise ways for paying, the military bills.

Just as soon as the officers of the union found themselves protected at the state house and were assured that the congressmen were out of the state, they were emboldened to renew their offensive tactics on a stronger scale than ever.

*Mining engineer, 308 Commonwealth Building, Denver, Colo.

Because Ammons strove to compel Kenahan to pay the expenses of the national guard, he was denounced by the union officials and by all the strikers.

HOW LAW AND ORDER WAS DEFIED

Guerilla warfare increased daily until it finally mounted to pitched battles. Ridicule of the militia was expressed by all unionists who were openly pronounced in their efforts to exterminate these men. The soldiers were obliged to protect themselves, and their duties were thus made manifold, viz., to protect lives of all citizens; to protect property against incendiarism and other forms of destruction; and to preserve their own lives. It was no wonder that these men who went into this campaign unprejudiced and from all walks of life should acquire hatred for these willful enemies of law and order.

The breach continued to widen. Murder, arson and theft were probably perpetrated by representatives of both the union and the militia. This chaos culminated in an all-day battle that destroyed a tent colony at Ludlow. In this conflict, the strikers suffered heavily. Frail tent houses that had been erected to house families of striking miners were destroyed by fire and, of course, the soldiers were accused of willfully starting the conflagration. After the battle ceased, the bodies of 3 women and 11 children were found in a cellar or cave that had been excavated beneath one of the main tents, and the report was spread broadcast that the soldiers had wantonly murdered them.

UNION HAS ACTIVE PRESS AGENT

The secretary-treasurer of the United Mine Workers of America for this district, E. L. Doyle, wired lurid, misleading statements and accusations to all unions in the state and to editors of the press generally. In his telegram to the press he said "a score or more women and children probably murdered in the most terrible massacre in American industrial history. Women and babes forced to lie in ditches and cellars 24 hours without food or water. Murderous guards keep up attack on men, and all may be slaughtered." He wired the unions: "Tell the miners of your communities to defend themselves at any cost."

It seems probable, as reliable witnesses, who were on the ground, have said, that the women and children died in the pit through suffocation; that they had been placed there by their own men; and that the house-tents were not fired, at least, at first, by the soldiers who were a considerable distance away, but through the accidental overturning of stoves. Positively no wounds could be found upon the bodies of these victims. Moreover, officers of the militia are pronounced in declaring that the soldiers did not know that women and children were imprisoned until their bodies were found in the ruins.

A few days later, during another battle, a uniformed Red Cross surgeon, while attending a wounded militiaman, was shot dead by strikers.

THE UNITED STATES ARMY IS CALLED TO COLORADO

Thus the warfare has continued. There have probably been numerous casualties that did not reach the press. This bitterness between the state troops and the strikers can never be eliminated. The situation finally became such that the general public demanded the presence of Federal troops, and, after a few days of petitioning, President Wilson and Secretary Garrison complied with the almost universal request. Troops were slow in arriving, however, and many atrocities were committed. It seemed that as much damage as possible should be done before the government soldiers arrived.

The coming of the United States army was hailed with satisfaction by not only the public, but by the striking element, and it was hoped that peace could be quickly established. As fast as regulars reached a coal-mining district, the state troops evacuated or relinquished authority. But even yet, there are several unprotected camps. Leading men of the union have, in instances, met the Federal troops and greeted them cordially, professing perfect faith in them. How much of this was really sincere remains to be seen, but already there have been numerous acts committed by the unionists that upset the hopes of Colorado's noncombatant citizens.

During the occupation of the camps by the Federals, Chairman Foster, of the Congressional Investigation Committee, endeavored to induce John D. Rockfeller, Jr., one of the heavy holders of stock in the Colorado Fuel & Iron Co., to arbitrate with the union. It is not necessary to repeat here the telegraphic correspondence for it was published in these columns, but it will be well, perhaps, to recall some of it. Mr. Rockefeller wired back to Mr. Foster that the proposal had been forwarded to the officers of the company in Colorado.

TEN THOUSAND MEN WORKING

Upon receipt of the proposal, the principal operators in the state convened, Apr. 29, and sent to Mr. Foster a long telegram reciting events about as given herein but going into detail regarding the destruction by strikers of various mining plants throughout the state. The operators then claimed to be working 10,000 contented nonunion miners to whom they had pledged protection, and whom they declined to discharge from service at the behest of any organization. The telegram said: "We cannot enter into negotiations of any character with the officers and agents of the United Mine Workers of America who alone are responsible for the terrible reign of disorder and bloodshed." This document was signed by 20 leading operators in the state, including the Colorado Fuel & Iron Co.

On May 3, while serious demonstrations against Mr. Rockefeller were being enacted in New York, the same operators with the exception of the Colorado Fuel & Iron Co., held a conference and sent a remarkable telegram to President Wilson, deploring the attacks upon Mr. Rockefeller and denying that they, the operators, should be overlooked in the placing of responsibility. They announced their refusal to have any dealings with the "organization purporting to be a labor union calling itself the United Mine Workers of America."

LAWS ARE EXTREMELY DRASTIC

The telegram, which was lengthy, went on to say that the coal-mining code of Colorado is very strict, that it was approved by John Lawson, and it has been and is being enforced by James Dalrymple, a state coal-mine inspector and a member of a labor organization. It further charged that the leaders of the United Mine Workers of America, "by their criminal acts, have foreclosed any right it may ever have possessed to demand of us that we have business relations."

A proclamation from President Wilson is daily expected ordering the dispersal of all mine guards and strikers. The surrender of firearms to the Federal soldiers, in compliance with orders from Secretary of War Garrison, has not been as prompt on the part of the strikers as the war department had expected, and one union official is quoted as having said yesterday that his men's confidence in the troops had been betrayed. If this be true, it forebodes continued trouble and the Federal soldiers may witness the expression of an animosity such as was shown toward the state troops, though, of course, there will be less uneasiness as to the outcome. It is doubtful if the strike leaders are now able to control their followers in this matter of disarmament.

At this writing, operators and unions are standing pat and the situation threatens to be decidedly worse before it improves. The disinterested citizen can see no immediate settlement unless it comes about in some way as yet unsuspected.

Electric Lamps for the Prevention of Mine Accidents

By Francis A. Pocock*

The recent explosion at Eccles, W. Va., where 180 men lost their lives, should stir up the whole world to determine what method will eliminate such casualties.

The coroner's jury in its verdict, in part, found:

> The accumulation of gas in Mine No. 5, which was the primary cause of the explosion, was due to a short circuit of the air in the southern section of the mine. This gas was ignited by an open lamp and the explosion followed.

In this twentieth century of progress and development, there is no good reason for the existence of open flame lamps in the mines. These lamps are tolerated simply for lack of something better. Now that that something is on the market, in the form of the electric safety lamp, which decreases mine fatalities and makes chances of fire remote, why then does the operator still take that chance?

Advocates Use of Electric Lamps Everywhere

In every mine, there is room for a practical electric lamp that is clean, convenient, economical and safe under

*2203 N. Franklin St., Philadelphia, Penn.

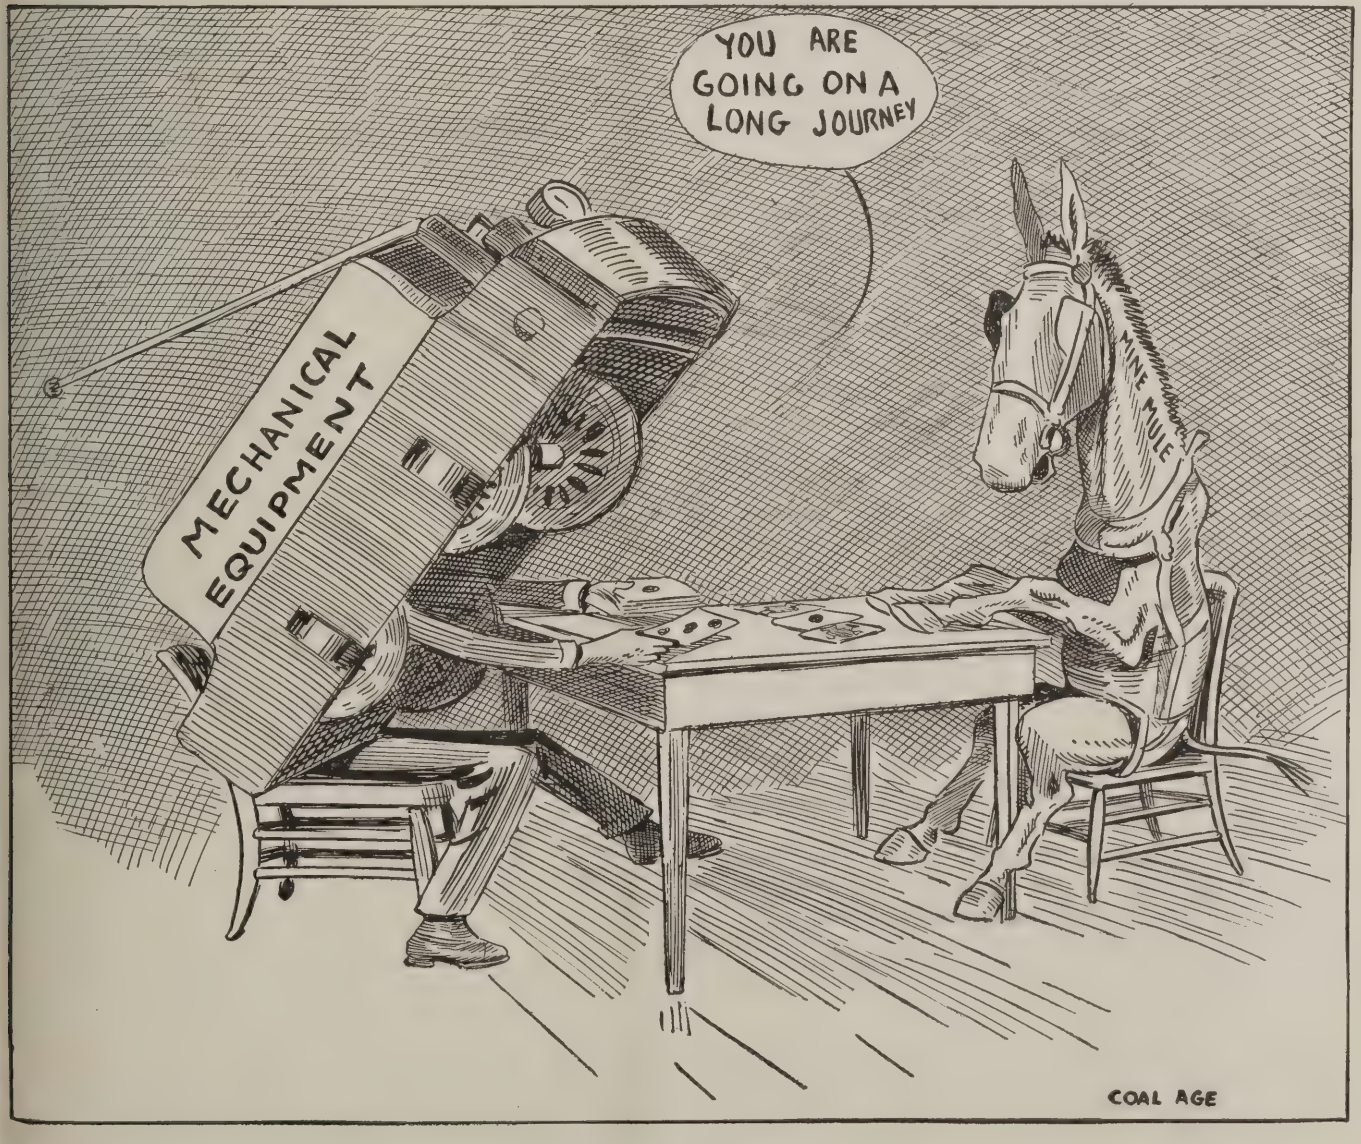
all conditions. The electric mine lamp of today, in its latest improved form, is gradually being and must surely become universally recognized as the most practical, most efficient, and by far the safest of all existing mine lamps of any class.

It is an indisputable fact that in every mine there is a light problem. Whether the workings produce anthracite or bituminous coal, whether they are gaseous or nongaseous, whether they constitute a small or a large operation; the fact remains that the miners must be absolutely dependent upon artificial light in the execution of their work.

The electric lamp is the only light which really assures safety, and if all workers were equipped with electric lamps, and the so called flame safety lamps were placed in the hands of experienced men only, for the sole purpose of testing for gas, accidents in the mines would be reduced to a minimum. The electric lamp is one of the best devices ever invented as a preventive of mine accidents.

The U. S. Bureau of Mines has approved several electric lamps as permissible for use in gaseous mines, and that electric lamps are practical is proved by the number now used by coal operators throughout the country and by the many repeat orders these operators are placing for such lamps.

Aside from the importance of safety, everybody knows how uncomfortable and annoying to the miner is the foul-smelling, smoking oil torch, the fumes of which are detrimental to his health and decrease the efficiency of his work.



Mixed lights in gaseous mines are dangerous, and the use of safety lamps should be required by law in all such mines. Men will be careless, so why should operators take the risk of using both safe and unsafe lights in the same mine? Moreover, many powder explosions will be avoided by dispensing with open-flame lamps.

Coming Meetings

The summer meeting of the **West Virginia Coal Mining Institute** will be held in Cumberland, Md., June 2, 3 and 4.

The annual meeting of the **Mine Inspectors' Institute of the U. S. A.** will be held in Pittsburgh, Penn., June 9, 10, 11 and 12, with headquarters at the Seventh Avenue Hotel.

The annual meeting of the **International Railway Fuel Association** will be held in Chicago, Ill., June 18, 19, 20 and 21, with headquarters at the Hotel La Salle, La Salle and Madison Sts.

TELLING HIS FORTUNE

Effect of Panama Canal on World's Coal Markets

By F. R. Wadleigh*

SYNOPSIS—A careful analysis of Ex-Governor MacCorkle's interesting paper on this subject. As probably one of the best informed men in the country on our export trade, Mr. Wadleigh's frequent exceptions to statements in the original paper, are of particular interest. The second installment of the article will appear in an early issue.

I beg leave to offer a few criticisms of an article in Coal Age, beginning Feb. 14, entitled, "The Relation of West Virginia Coal to the Panama Canal." A paper of this kind to be valuable should be accurate as to facts, its deductions carefully made or it is of doubtful value.

This article begins with the following statements:

> The Suez and Panama Canal routes, respectively, control the great international trade lines of the world. Which of the rival routes will receive the bulk of the traffic will not be decided solely by the relative distances of travel, which, using one or the other will entail. After a somewhat careful investigation of these great trade routes, it seems that the shipowner will use one route or the other, actuated not only by mere distance but also by the price and quality of the fuel he can purchase along the line.

The first statement is one of those general and inaccurate statements so often made in selling arguments. The Suez Canal is now a controlling factor in one of the great international trade lines; it does not "control" anything. There is as yet no Panama Canal route. When the canal is completed, its effect on the great trade lines will still be an unsolved problem.

The shipowner or charterer will undoubtedly use one route or the other, but there are factors to be considered besides those of the distance and the quality and price of fuel. One such factor and a most important one is the number of available markets *en route,* from point of origin to destination. On the Suez Canal route there are numerous markets which would give employment to steamers and abundant freights, while the Panama route from Europe will be a long sea voyage with no available markets for trading.

Another factor to be considered is the number and distances between coaling stations, an important item when freights are high. The article under discussion makes the following erroneous statement in this connection:

> If the route through the Panama Canal becomes that most generally used by the ocean-going ships of the world, the isthmus will in itself become **the greatest coal-distributing point** upon which the sun shines, and this fact will make the fuel of West Virginia one of the preponderating influences in the world of trade.

It is obvious that the Panama Canal route cannot be that most generally used by the ocean-going ships of the world, but only by those trading in certain ports and between the Atlantic and Pacific, and therefore cannot become the greatest coal distributing point, etc.

The Panama vs. the Suez Route

The fuel of West Virginia, good as some of it is (not by any means all), can never be more than a detail in the world's trade. The only West Virginia coals that can be used at Panama are the New River-Pocahontas, and their production is limited while their quality is not altogether uniform. Out of the 148 billion tons of West Virginia coal remaining unmined (as stated in the article under discussion), by far the greater portion is not suitable or available for the export trade, unless for special purposes.

Still another factor that must be taken into consideration on the use of the Panama route, will be the attitude of the underwriters. Will they stiffen rates on ships naming the Panama route, on account of the possible dangers from slides and earthquakes? Upon their decision on these matters the commercial aspects of the Panama Canal will and must largely depend. So far no collective action has been taken or decision arrived at, but the question must come up soon and is likely to be a deciding factor in the commercial success of the canal.

It is, of course, true that many, in fact most of the Far East ports, Australia and Asia, are nearer Europe by the Suez Canal than they will be by the Panama. The distances to various Pacific ports, as given in the article under discussion, are not altogether accurate, according to the latest English distance tables (Philips, 1913).

The article gives the following distance data (not tabulated):

	Distance, Miles	In Favor of	Miles
Liverpool to Adelaide via Suez...	11,142	Suez	23[illegible]
Liverpool to Adelaide via Panama	13,478		
Liverpool to Manila via Suez....	9,701	Suez	442[illegible]
Liverpool to Manila via Panama.	14,122		
Liverpool to Hong Kong via Suez	9,785	Suez	417[illegible]
Liverpool to Hong Kong via Panama	13,957		
Liverpool to Yokohama via Suez.	11,678	Suez	69[illegible]
Liverpool to Yokohama via Panama	12,372		
Liverpool to Wellington via Suez.	.....		
New York to Wellington via Panama	.....	Panama	413[illegible]

Distances between same ports, according to Philips' tables, are as follows:

	Distance, Nautical Miles	In Favor of	Miles
Liverpool to Adelaide via Suez...	10,710		
Liverpool to Adelaide via Panama	13,440	Suez	2730
New York to Adelaide via Panama	10,882	New York	172
Liverpool to Manila via Suez.....	9,554		
Liverpool to Manila via Panama.	13,973	Suez	4419
New York to Manila via Panama.	11,415	Liverpool	1861
Liverpool to Hong Kong via Suez	9,651		
Liverpool to Hong Kong via Panama	13,904	Suez	4253
New York to Hong Kong via Panama	11,346	Liverpool	1695
Liverpool to Yokohama via Suez.	11,113		
Liverpool to Yokohama via Panama	12,282	Suez	1169
New York to Yokohama via Panama	9,724	New York	1389
Liverpool to Wellington, N. Z. Suez	11,981		
New York to Wellington via Panama	8,510	New York	3471

The article then says:

> The use of the Panama Canal will give New York 4138 miles advantage over Liverpool on the journey to Wellington, New Zealand, and the distances will be about equalized, relatively speaking, on the journey from New York and Liverpool to the countries I have mentioned.

As a matter of fact, New York will have only 3471 miles advantage over Liverpool to Wellington, not 4138. Distances on trips from New York and Liverpool to

*Consulting engineer, 426 Real Estate Bldg., Philadelphia, Penn.

points mentioned above will not be equalized by use of Panama Canal, as is shown by the second table.

Again it is stated in the article that:

> The canal should allow this country largely to dominate by distance the coast of South and Central America.

As far as coal is concerned, the Panama Canal should enable us to dominate the coal trade of the *west* coast of South and Central America.

The article then states further that one advantage is possessed by the Suez Canal, namely, that coaling stations are located along the great English trade routes (why English alone?) and that if this country proposes to take any part of the "steaming demand" (meaning, it is presumed, the supplying of coals for ship bunkers) it must provide ample coaling stations for international commerce.

The Transportation Problem and the South American Markets

This is true, of course, but the building of large coaling stations at Panama alone is only partly filling this need. We should have a coaling station at the Azores, another in the West Indies (where there are now several private ones, carrying West Virginia coals in stock), and one at San Francisco, or otherwise the West Virginia product may be restricted to the Panama Canal stations or be dependent on private enterprise and strong competition.

There are, however, two possibilities that would alter entirely the conclusions arrived at by Mr. MacCorkle and which he seems not to know about or to have lost sight of.

First—If the statements of Government officials are true, it is the intention of the Government to build 12,000- to 15,000-ton colliers to carry coal to the Isthmus; it is estimated that coals can be carried by these colliers at about 90c. per ton.

Second—The building of 15,000-ton cargo ships for carrying iron ore between Chile and New York, for the Bethlehem Steel Co. may enable private shippers to compete with the Government-built colliers in carrying coal to Panama. These ships, to be operated under the Norwegian flag, is is said, will be able to carry coal as a return cargo very cheaply.

The United States has the coal, but cannot build ships in competition with England or Norway and Italy, nor can she operate them at less than 50% higher cost under the United States flag. What this country, under our present navigation laws, can and must do in order to ship coal into foreign markets, is to build ships abroad and run them under a foreign flag.

As regards coal and freight rates to the South American coasts, the coal used in the West Coast is British and Australian, because of the certainty of return cargoes, which tends to make low rates, but the British ships do not "control" the markets by any means; there is also a large tonnage of native coal used in Chile. The British coal owners, however, have other strong and active interests in South America, with which the West Virginia coals must reckon. Stock ownership in railroads and steam plants, organized and aggressive selling agencies, ownership of docks and handling facilities, and (strong factors in South American countries) custom, use, friendship and prejudice.

Take the British exports alone to South America in 1913:

Brazil	1,886,000	Chile	588,000
Argentine	723,000	Peru	60,000
Uruaguay	3,693,000	Ecuador	10,000
Total	6,302,000	Total	658,000

As will be noted, by far the largest coal markets in South America are those that will only be indirectly affected by the Panama Canal, Brazil, the Argentine and Uruguay, whose imports of coal are about five times as large as those of the whole west coast.

Fuel-Oil Competition and the American Marine

There is also no mention made of the strong competition that may be expected from the large and increasing use of fuel oils at Panama; yet even the U. S. Government is making preparations to meet the demand for oil as fuel. There is already a pipe line across the Isthmus and large storage tanks. The power plants on the canal work, with the exception of those at or near Colon, are now using oil, or were a short time ago, the Canal Commission having a contract with the Union Oil Co. for California oils.

The use of oil as a steamship fuel is growing rapidly and Panama is within easy reach of several oil fields, California, Texas and Peru, beside the developing fields of Venezuela, Ecuador and Trinidad. While the price of fuel oil is still high, it has decreased since January over 1 cent a gallon, and the West Virginia coals may look for strong and growing competition from its increasing use.

Moreover, if the carrying trade between the west coast of North America and Europe is made larger by the Panama Canal, then cargo-carrying space will become most important and the owners of motor ships using oil will be able to carry produce to Europe at a lower rate than can be made on coal-burning vessels.

Under the caption, "Need for an American Marine," the article says:

> If these markets become as important in American commerce as they should be, America must control the ships necessary for her trade. Let me illustrate my argument by showing that length of voyage and cheapness of fuel do not always settle the cost of transportation. The marvelous ability of the Englishman to ship his coal to every part of the world and sail his ship in every sea, despite the competition of the nations, is well exemplified on the coast of South America. At Valparaiso, Iquique, Antofagasta and other points on the Western coast of South America, the coal is largely Welsh and Australian, because of the low freight rates on vessels bound for Chili to secure nitrates. On the eastern coast of South America the same condition exists; British ships control the markets and are able to take coal cheaply to different coasts, as they can obtain the return traffic.
>
> In other words, American coals cannot obtain the markets to which they are entitled, unless American ships are more plentiful upon the seas and American trade is more diversified under new laws and new conditions. Only then may we send our products into every country and among every people.

By American is meant, of course, the United States. The factors that settle transportation costs are: 1. Length of voyage. 2. Cost of running the ship; fuel, wages, stores, machinery, interest and depreciation.

But the freight rates are governed by: Demand and supply, market and return cargoes, in addition to the actual costs, plus what profit the traffic will stand.

The ability of the Englishman to ship his coal to every port of the world is due to two facts: He has the coal, owns the ships and can operate them cheaply.

Cost of Coal at Panama

The article states that the prices paid for coal by the Government have been fixed for two and a half years. This period began Apr. 1, 1912, and on the new contract, which is nearly due, it is very doubtful if the present price of $2.70, f.o.b. Hampton Roads, will be renewed, because of the higher level now prevailing.

Bids opened recently for supplying coal to the Navy were on a basis of $2.90, f.o.b. Hampton Roads. The ocean freight transportation to Panama is also likely to vary, as it has in the past; it is now $1.39½ and not $1.29½, as stated by Mr. MacCorkle. The following are the ocean freight rates paid in the last nine years:

1905	$1.44½	1910	$1.34½
1906	1.65	1911	1.29½
1907	1.52	1912	1.39½
1908	1.49	1913	1.39½
1909	1.40	1914 to Oct. 1	1.39½

This would make the present *cost* of coal, c.i.f. Panama, $4.09½, to which must be added, handling, interest, depreciation and profit, easily $1.50 more, or a total of $5.59½.

The present *prices* for coal at the Isthmus, as sold by the Panama R.R., are:

Colon	$5.75 alongside to U. S. Navy 5.27 @ 7.62 on railroad cars 8.62 on lighters alongside
Panama	$10.12 on lighter alongside.

Under this caption: "Welsh Coal at Port Said," the article states: "In 1912 the contract price for Welsh coal at Port Said was $6.33 per ton." This was not the price of Welsh coal, but of Durham unscreened bunkers, and today this is being quoted at $6.95, f.o.b., which is $2.04 above c.i.f. cost.

What "Welsh" Coal Is

The term "Welsh" coal is loosely used throughout this article and in many other similar discussions on British coals. In South Wales, alone there are 22 seams of workable thickness and the coal varies considerably, the steam fuels alone ranging from 11 to 29 per cent. volatile, so that to speak of Welsh coals lumped together and as of the same character, is about as inaccurate as to refer to the Pennsylvania fuels in the same way.

Moreover, the Durham unscreened bunker coal is largely supplanting Welsh bunker fuels for use at foreign steamship coaling stations. At the Canary Islands, for instance, in 1913, out of the 827,000 tons supplied steamships at Las Palmas, 427,000 tons were Welsh and 257,000 Durham coals, while at Algiers, 48 per cent. of the coal used was also Durham.

A typical analysis of this coal from an actual shipment is as follows:

Moisture	1.50	Ash	6.10
Volatile	30.13	Sulphur	0.92
Fixed carbon	62.27	B.t.u.	14,413

The present price for this coal, f.o.b. River Tyne ports, is $3.16.

The attitude of the British coal shippers is indicated by the following extract from an editorial in the *Iron and Coal Trades Review* (London).

Possible Changes in Trade

Beyond the bunkering business it is difficult to see how the opening of the Panama Canal will benefit the American or injure the British coal trade to any great extent. It will not alter our position with regard to the Atlantic States, to which the great bulk of our South American coal exports is shipped. The Pacific Coast of South America will certainly be more vulnerable to American attack, but our exports to those markets are not very large, and, moreover, British firms have secured an excellent footing there; on the confession of the accredited consular representatives of the United States in the countries in question, it will be difficult to shake ou hold on these markets.

It is easy, therefore, to exaggerate the consequences of th opening of the Panama Canal so far as our coal trade is con cerned, and we feel sure that British exporters having con nections with markets likely to be affected at all are full alive to possible dangers and are taking steps accordingly In his paper on the Panama Canal, read before the Britis Association, Professor Kirkaldy seemed to suggest that i might enable the United States to displace British coa throughout the world, and he urged both the capital an labor interested to forget internal causes of difference an to unite against the common enemy.

This certainly appears to be an entirely alarmist view o the situation. For some years past now our American friend have been paying more attention to their coal-shipping trad which, while still small as compared with our own, has in creased rapidly of late. It is certain that they are not likel to miss any fresh opportunities which the opening of th canal may afford them, but why this impending event, im portant as it is, should deliver a mortal blow to the Britis coal-shipping trade, we cannot conceive. It is better to b warned, however, even in exaggerated terms, than to remai over-confident when a wealthy and enterprising rival is i the field and it will be well to keep an eye upon the activitie of our American competitors.

(*To be Continued June 13*)

Coal Mining Active in New Mexico

The production of coal in New Mexico in 1913 wa 3,708,806 short tons, with a value at the mines of $5 401,260, according to E. W. Parker, of the United Stat Geological Survey, who compiled the figures in coöper tion with the State Geological Survey.

In 1913, as in 1912, New Mexico outstripped all pr vious records in the production of coal. The output i 1912 was 3,536,824 short tons, valued at $5,036,82 compared with which that of 1913 showed an increase 171,982 tons in quantity and of $364,209 in value. Th average price per ton in 1913 was $1.33. Colfax Coun in 1913 produced 2,749,765 short tons.

The number of men employed in the coal mines New Mexico increased from 3928 in 1912 to 4329 i 1913. The average production per man decreased fro 900 tons in 1912 to 857 tons in 1913. This decrea was not due to any falling off in efficiency, but was or of the minor effects of an appalling disaster which o curred at Mine No. 2 of the Stag Cañon Fuel Co., Dawson, in October, 1913. This accident, one of th most disastrous of the year in coal mining and the wor in the history of the state, caused the death of 261 pe sons. It occurred in one of the mines of a company whic had spared no expense and had taken every precautio human intelligence could suggest to reduce the hazar of coal-mining operations. The other fatalities reporte to the United States Bureau of Mines outside of the e plosion at Dawson were 11, making a total of 272.

BY THE WAY

A sack is best tied before it is full.

It is not enough to run; one must start in time.

The rock that resists a crow-bar gives way to the roo of a tender plant.

He that will not sail until he has a full, fair wind, wi lose many a voyage.

The Colorado Strike

SYNOPSIS—The strike is largely over in Colorado, but is in strong evidence still in Washington and New York, where a determined effort is being made to create sentiment adverse to the operators, so that the troops will be ordered to close the mines. Lieut. K. E. Linderfelt denies that he struck Tikas, and charges the residents of the armed camp at Ludlow with many crimes.

The settlement in Colorado does not rapidly approach a conclusion. The mines are working, but the men, who are seeking to replace the present workers, are still undispersed, and trouble may at any time arise if their belligerent attitude to the employees of the coal companies is not kept in check by a strong hand, and rumors are even afloat that the strikers have received and buried some machine guns.

The bill in the legislature providing for a bond issue was finally passed. Some of the legislators desired that there should be incorporated in it a provision requiring that no payment should be made to those who were subjected to the attack of the strikers at Ludlow or were at any time employed by the companies as mine guards. It appears, however, that in the end the legislature took the position that even granting unlawful acts were committeed by the militia in repulsing the attack of the strikers, the pay for lawful service could not be refused and that the state could not repudiate its obligations to any militiaman who was engaged by the properly constituted authorities. Nor is the legislature a court of law to decide either the guilt of the militiaman or the authority of its agents, especially without a hearing.

Any other conclusion would be a folly of which many of the present legislature would doubtless be capable, but if the proviso were added to the bill, it would inevitably make it hard for the state in the future to engage the services of a militia. In fact, it is likely that when that body is next called for service, none may respond, for the men who would serve are heartily sickened not of military service but of unmilitary partisan criticism and condemnation.

THE ANXIETY OF THE PRESIDENT

As has been already stated, the bill providing the $1,000,000 bond issue to pay the militia for past and future services was finally enacted.

It seemed doubtful whether Governor Ammons would be able to secure its passage and the President wrote to him urging the necessity for such provision as the troops could not be kept for a lengthy period at the scene of war. Governor Ammons assured the President that acts had been passed for closing saloons, prohibiting the carrying and transporting of arms, providing for a committee on mediation and authorizing the million-dollar bond issue. The United Mine Workers expect to contest the validity of this last provision.

The President's insistence aroused considerable excitement. The Women's Peace Association, through Mrs. Alma Lafferty, and also E. Keating, the Congressman-at-large made vehement protests against a return of the militia, causing Secretary of War Garrison to declare that there was no intention to withdraw the troops. Governor Ammons is said to have made the stupid promise not to send out the militia until its presence might seem imperative even if the federal troops should be withdrawn.

THE LUDLOW CAMP

The Secretary of War is permitting the reëstablishment of the Ludlow tent colony, and a detail of men have been preparing the site and removing rubbish. A ban has been placed forbidding any man to move into the colony who was not employed at one of the neighboring camps prior to the beginning of the strike. The military will check this information by means of the operators' pay-rolls, and it is hoped by this move to keep out sojourners and a large percentage of the rough element, who had no right to be in the colony and who were responsible, in a large measure, for much of the trouble which occurring, ultimately caused the destruction of the camp.

The position of the administration is difficult. The property rights of the United Mine Workers of America cannot be denied, and the colony, though used as a hostile camp, is not on its face a menace to public order and, therefore, not subject to seizure like a gun. Only one member of the Military Commission, the major and judge advocate of the military district, urged in his report of the Ludlow battle that the colony should not be rebuilt.

There were doubtless many men and women in Ludlow of reasonably peaceful disposition who were much incensed at the leaders who brought war upon them by firing on the militia and retreating on the camp. It was significant that these men who thus drew the fight into the heart of the camp turned a deaf ear to the women and children when the tents began to burn and consume the noncombatants.

A fund of $25,000 is said to have been raised for the rehabilitation of the Ludlow camp. The new colony will be built in almost the same location as the old.

JUDGE LINDSEY

Judge Ben B. Lindsey, of Children's Court fame, visited the President, May 21, accompanied by Mrs. Lee Champion, chairman of the relief committee, which investigated the conditions in the strike district for 20 days, Mrs. Adolph Germer, wife of a strike leader, Mrs. Petrucci, Mrs. M. H. Thomas and Mrs. Pearl Jolly, the three latter being widows of men killed in their attacks on the militia. Mr. Lindsey endeavored to have the President close the mines till the settlement between the idle miners and the companies was completed. Apparently he has not succeeded in modifying the President's decision.

Judge Lindsey's trip has been condemned both by the Real Estate Exchange and the Chamber of Commerce, both of Denver. The Colorado Woman's Law and Order League has sent its vice-president, Mrs. Helen M. Grenfell, to urge the President not to accept Judge Lindsey's views of the situation. She strongly defends the action of the militia. On the other hand, the Woman's Peace Association is sending a representative to offset the action of the Law and Order League.

Mrs. M. H. Thomas and Mrs. Jolly have delivered their story before several organizations in New York City, and the former, after declaring that she loaded the guns of the Ludlow disturbers of the peace, added that she did not know why she was arrested.

LINDERFELT'S TESTIMONY

Lieut. K. E. Linderfelt in his testimony in the trial of Major P. J. Hamrock stated that he did not strike Louis Tikas and could find no evidence of Tikas' head having been smashed in. He said he did not tell his men to shoot Tikas, Rubino and Fyler if they tried to escape, but he assumed they knew their duties under military law. He denied that any tents were fired deliberately and stated that "spread" bullets and those with "percussion caps" were found among the ammunition of the strikers. He said such bullets would "cut a man in two" and were manufactured for killing "elephants, tigers and big game." He declares that two men in a buggy carrying a white flag fired on the militia as they passed. He repeated his story about the rescue of the women and children.

The trial of Major Hamrock closed May 20, the accused himself being the last witness. There are 30 others to be tried The report will be forwarded to Gen. John Chase and later to Governor Ammons. Linderfelt's trial commenced on the 20th inst.

UNION RECOGNITION NOT WAIVED

The prospect of arbitration has received a body blow from William Green, of the United Mine Workers. He stated to the union miners of Illinois at Peoria, that he was misrepresented as having said that the organization was prepared to arbitrate even if the recognition of the union was waived. He agreed with the Illinois miners that this recognition was the purpose of the strike and could not be compromised.

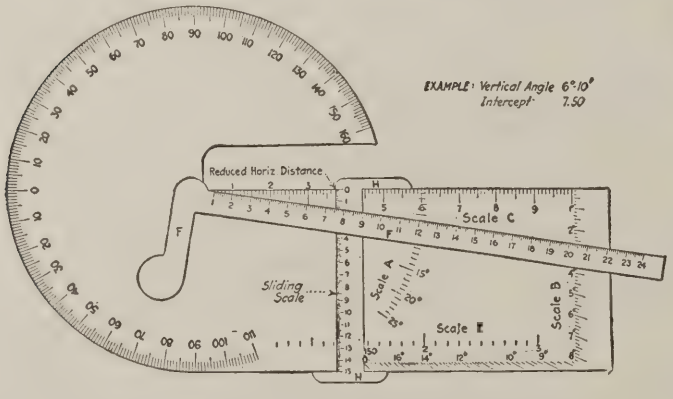
So the statement of Martin D. Foster to John D. Rockefeller, Jr., that it was possible to arrange such arbitration was premature, based as it was on the alleged statement of William Green only and he denies that he made any such declaration.

DECIDING WITHOUT HEARING

Attempts toward conciliation are being made by a general committee from every county in Colorado to meet June 6 in Denver. The legislative investigating committee is also trying to make progress and has been promised the cooperation of the operators. It is seeking to settle the strike without investigation, a very frank procedure to be commended to other would-be arbitrators. If you are seeking only to divide hostile claims in half, why waste time by find-

ing out whether the claims are just. The members of the "investigating" committee refuse to state whether the operators are willing to arbitrate. It is understood, however, that they are only desirious of supplying them with the facts.

DISSATISFIED WITH FEDERAL INTERVENTION



There are not a few signs that the action of the Army is losing popularity among the union officials. Speaking at Beethoven Hall, New York City, May 25, James Lord, the representative of the United Mine Workers of America in the American Federation of Labor said, according to the "New York Times:"

"We prayed to President Wilson for months in vain before he finally sent the troops. He dispatched them only when at last we were in a position to fight back. We do not know why he sent the troops, but if it was to drive us back to the old slavery, he won't be able to do it. If he tries or if he surrenders us to the militia, then it stands to reason that we will not again try to fight the hired gunmen of John D. Rockefeller. Instead we will go after the Rockefellers themselves.

A Rapid Stadia Plotting Apparatus

In the development of large tracts of land the preliminary work must be a good topographical map having all details and contour lines. For the preparation of such maps there is no method so rapid and convenient as the stadia survey by which the distance and elevation of any point can be ascertained by the reading of a vertical angle, and the space included between the horizontal wires of the instrument as seen projected on a level rod.

There has hitherto been delay in getting the desired results on the map, since the horizontal and vertical distances had to be obtained by calculation. The Averill

STADIAGRAPH INVENTED BY C. K. AVERILL FOR PLOTTING STADIA NOTES

stadiagraph overcomes this inconvenience and makes it possible to plot results as rapidly as the observations can be taken in the field. The instrument consists of a protractor turning on its center, and carrying a straightedge, also a revolving scale of the map, and a sliding scale showing elevations.

The operation is clearly shown in the illustration printed herewith. Some of the largest coal companies in the country have used this instrument, and their engineers are unanimous in their praise of its ability to accomplish what is claimed for it in reducing the cost and time of map-making in stadia work.

The apparatus is manufactured by C. K. Averill, Bridgeport, Conn.

American Mine Safety Association's Medals

Last year the American Mine Safety Association presented medals at Lexington, Ky., to the Wisconsin Steel Co.'s team, at Benham, Ky., and the Continental Coal Corporation's team of Pineville, Ky.; at Cresson, Penn., to the Pennsylvania Coal & Coke Co.'s team of Patton, Penn., and to the Hastings team of the same corporation; at Somerset, Penn., to the team of the Consolidation Coal Co., of Acosta, Penn.; at Oakford Park, Penn., to the Magee team of the Westmoreland Coal Co.; at Central City, Ky., to the Graham team of the W. G. Duncan Coal Co., and at Knoxville, Tenn., to the Briceville, Tenn., team of the Tennessee Coal Co., to the Westbourne, Tenn. team of the Westbourne Coal Co., and to the Mountain Ash, Ky. team of the Jellico Coal Mining Co., as well as a large number of prizes at its annual field meet in Pittsburgh, Penn.

MEDALS OF AMERICAN MINE SAFETY ASSOCIATION

The presentation of these medals has done a great deal to increase the interest in first-aid and mine-rescue work. There is no better way to increase that interest than by the award of medals by a national authority in the fairness of which all the contestants will have confidence.

The association gives (1) a first prize in bronze at any intercompany contest, (2) first and second prizes in silver and bronze at state-wide contests, and (3) first, second and third prizes in gold, silver and bronze at national contests. But in intercompany contests there must be not less than 5 teams representing 3 separate mining companies; in state-wide contests, 10 teams representative of the various mining districts in a state; and in national contests not less than 15 teams representing as many different mining companies from not less than 5 different states. A medal is given to each of the five members of each winning team.

Prof. W. H. McMillan in a lecture says the difficulties of deep mining can be placed under two heads: Mechanical and physical. The hoisting, owing to the strain on the rope, may have to be done in stages. Ventilation will have to receive serious consideration. Horses will probably have to be dispensed with and mechanical haulage sobstituted, while electric lamps will take the place of oil lamps. As the miner will be more subject to such diseases as pneumonia, bronchitis and anemia, baths and dress houses at the pit surface will be a necessity.

Editorials

The Purest of Human Pleasures

"God Almighty first planted a garden; and indeed it is the purest of human pleasures. It is the great refreshment to the spirits of man." Thus wrote Francis Bacon, three hundred years ago.

Three hundred years is quite a long time, and yet, in all that time, no one has given us a better description of a garden, nor one that is better calculated to start a man to digging in his own back yard. And so, now that springtime has arrived, we reprint it here, hoping that its message may have the desired effect, and that, forthwith, all our readers will go to gardening.

Many of the larger coal-mining companies have realized the advantage, to their employees, as well as to themselves, to be derived from private gardens and each spring they offer every possible encouragement to all who express any interest in such an undertaking.

In this connection, we have observed many interesting happenings. Superintendents, who, for selfish reasons alone, have offered prizes, to get their men interested in gardens, have unconsciously followed the progress of the gardens so carefully, that they soon were the best informed and most enthusiastic gardeners in their respective camps and, during the following years, have been known to enter the contests, of their own free will.

Pessimists who were "agin" the companies, tooth and toenail and consequently who disapproved the garden scheme, have been known to hanker after the vegetables in their neighbor's gardens later on, and eventually to have removed pickets in division fences and left suspicious trails winding about among the greens.

Getting in the Spotlight

The Colorado coal strike has afforded Judge Ben B. Lindsey, of Denver, a means to an end. His aim seems to be to secure publicity for Ben Lindsey rather than to obtain a solution of the labor troubles.

His method of approach smacked considerable of the plan pursued by a circus press agent. If he had hoped to be instrumental in aiding a settlement of the Colorado trouble, his interviews along his route of travel eastward were more than sufficient to render ineffective all his subsequent efforts.

One would expect dignity and logic rather than redfire and an appeal to class prejudice from a man holding an important judicial position such as is filled by Judge Lindsey. However, there is a greater lure to some men in a two-column headline on the front page than there is in maintaining a reputation for unbiased judgment in the face of mistaken public clamor.

Some of us are too prone to forget that other men have wives and children besides those few disaffected individuals who are always ready to lend an ear to foreign persuasion. Not a few Colorado women with babies have gone hungry and suffered because their husbands were prevented from working in satisfied employment by the violence and threats of a small majority of the miners in Colorado.

Sympathy to be helpful must be fair to all. We are, therefore, not surprised that the Law and Order League of Denver has started a petition for the recall of Judge Lindsey, for a man in his position must himself be a respecter of the law, if he is to administer it fairly.

The fight in Colorado is not a local affair, it is a national issue. The coal industry by chance rather than choice has become the battleground of a great social controversy. The questions are, can an employer exercise his own discretion in the selection or dismissal of his employees, or must he follow the bidding of his men? Must every man working at a trade become a member of the union, whether he wants to or not? In other words, must all industry in the United States be conducted on the closed-shop plan?

President Wilson and his administration are not dealing with the Colorado coal operators and miners alone, they are confronted with a great national labor issue, the solution of which is going to be a matter of vital importance to the conduct of all business in America.

Men like Judge Lindsey do not help things by stirring up class hatred at a time when all appeals should be based on a calm recognition of the absolute necessity of upholding the constitutional rights of both men and property.

An Application for a New Position

If at all times we only get what we deserve, then a lot of COAL AGE readers will never secure a new job through their written applications.

Three weeks ago the manager of a large coal corporation asked us to suggest a man for the position of mine superintendent, the job to pay $225 per month. We advised our friend to insert an advertisement in COAL AGE, as being the most likely way to get in touch with competent men. This was done and about 70 replies have already been received, and the inflow is undiminished. We now understand why recently a mine president wrote us saying: "Please stop ad, more than a hundred replies already."

But the interesting fact in the matter to us is the carelessness and lack of judgment exhibited by many of the applicants. Several men wrote brief notes, saying: "Please put me in touch with the parties." Two letters were not even signed, although one of the two was neatly typewritten. About one-third of the applicants failed to state their age or whether they were married; others made no mention of present employment and cited no references.

Now, is it likely when a hundred, or perhaps two hundred applications are before a manager or mine president, he is going to bother writing for further information if none is given in the man's original letter? The chances are he is going to pick out a half dozen, or maybe a dozen

of the most likely men and concentrate on them. His is a game of elimination, and the sooner he can get down to two or three possible candidates for the job, the better he will be pleased.

We have heard so much concerning brevity, conciseness, etc., we are apt to carry the idea to a ridiculous extreme. No one seeking an assistant or other subordinate wants to read all the details of the man's life; but he would like to know a few important facts concerning his age, education, experience, habits and present employment.

The Need of a Balanced Publicity

The situation in Colorado is of the utmost gravity because it shows on all sides the weakening of the elements of democracy, on which our national life is based. We are beginning to view the masses of the people with a decreased respect and the masses themselves are commencing to take a similar view.

No longer do they realize the importance of *their* part in maintaining the integrity of the national life. The prominent figures of society, the aristocracy if you will, are called upon to change discontent and a struggle into happiness and peace. A war arises in Colorado, obviously fanned by financial help from outside that state, admittedly subsidized by outside influences, and yet there is a call not to the many, but to the important outstanding figure, John D. Rockefeller, Jr. "What will *he* do about it?"

The cry of an enlightened democracy would be rather what *we*, the people, would do to still the artificially created discontent. A real democracy would not acknowledge supermen like Rockefeller from whom to demand a supernal virtue so self-sacrificing as to restore by concessions, a national trouble arising from intrigue.

Let us suppose Rockefeller saying of the strikers of Ludlow: "We will go after them. God being my witness, we will send them back to the hell from which they came." From end to end of the nation that statement would be printed. If the younger J. D. Rockefeller lived 30 years, it would still be quoted by the newspapers to his dishonor, as his body was borne to the grave. The word of shame would never die.

But James Lord, representative of the United Mine Workers of America, in the American Federation of Labor made that statement and can make it unrebuked *about Rockefeller*. No one regards it as deserving of the severest condemnation, for we have lost faith in the democracy. We now no longer expect anything better of it. It is useless any longer to condemn it for its follies, the false balance of its justice or its inhumanity. If anything is wrong, we look for a scapegoat and choose a prominent man, the moat in whose eye is the excuse for the beam in the eye of the people.

It is necessary that the democracy be reëstablished, that a renewed sense of personal responsibility be created and indeed it is time that the Rockefellers and others realized that we can no longer, with our large influxes of people, rely on the chances of our national life to illumine those who do not know our language or understand our spirit. There must be a strengthening of our schools, a deepening of our community and religious life and an attempt made to recreate social solidarity.

Political economy must no longer be taught only by the discontented youth of the country; the press must not depend solely on the pennies of the multitude. But a fairer economy and a nontechnical press which is frankly subsidized, but strictly honest, must be created. It must be confessed that this is a concession to our present undemocratic state, for a democracy should be self-educating, but it is obviously a necessity, if democracy is to be maintained.

Perhaps when the hordes of foreign workmen cease coming, demagogery may be at an end and an era of quiet, constructive effort may take its place. We may yet distinguish clearly between murder and a refusal to arbitrate, so that we will not pass over the recognized felony to visit with maledictions a fault of doubtful character, if fault it really be.

The coal companies may as well take warning now as later and endeavor to create better feeling, and a clearer understanding of the social issues. The democracy has in it the basis of good government, so long as it is not persistently mislead.

Do not let the operator forget that arguments made by him have their effect. Not even the wildest visionaries are wholly confident in the honesty of their leaders, yet they are swayed by their oratory. Similarly, much as the operator's logic may be doubted, there is little question that where it is truthful and honest, it will sink deeply into the minds of its hearers.

Because a few people laugh and sneer at the arguments of the operators and manufacturers, these latter usually resolve to say nothing whatever. But a moment's reflection will show that the diatribes of the socialist and labor leader are similarly treated, but they nevertheless sink home and do their work, sometimes helpful but more often pernicious. So will the arguments of the employers have their effect.

The operators, however, have always been ill-advised and have discussed public questions largely in their own organs and institutes. They must try to reach a wider field and do a broader work among the masses at large. Let them not be afraid to do it. It will not fall on unfruitful ground. The bulk of the American people, like the operators, are fair and may be relied on to give all sides an attentive hearing.

The time has come when real success means something more than the accumulation of money. Today we are commencing to applaud the man who does most for others, rather than the fellow who has made most for himself. Service rather than dollars is the new measure of manhood. The climate of America is becoming uncongenial for those who have fattened their purse by crushing ambition out of their employees. The big man of the future is to be the one who does most for mankind, not the one who takes most from mankind. Success will be a state of mind, not a state of pocket.

We have always believed that a little muckraking of corporations does no harm, because in the process we are raising up a high ideal, too high at present for ordinary mortals to reach, too exalted for Congress, but still very meet and right for big business to follow. Make the corporation toe a straight line; in time the "common people" in their private affairs and in their public concerns will try and learn the lessons of which they have been efficient teachers.

Who's Who in Coal Mining

John C. Reid

John Callum Reid is one of the influential personalities in Canadian coal mining. He is not a native of Canada, however, having been born at Sharon, Penn., in 1871.

Mr. Reid was educated as a mining engineer in the Missouri School of Mines at Rolla, Mo., and received the degree of E. M. from that institution in 1893.

His first experience in mining work was secured when he was mining engineer in the coal department of the M., K. & T. R.R. He served this corporation as an engineer from 1895 to 1900, when he was promoted to the position of mine superintendent in Oklahoma by the same concern.

In 1902, Mr. Reid severed his connection with the railroad company to become general superintendent of the Great Western Coal & Coke Co. and the Osage Coal & Mining Co., with headquarters at McAlester, Okla. In 1906 he became general manager of the Great Western and the Osage Coal companies. He continued in this position five years.

In 1911 Mr. Reid accepted a place as general manager of the Chinook Coal Co., Ltd., of Canada. He still holds that position with this corporation and has his headquarters at Lethbridge, Alberta.

He is an active figure in the councils of the coal-mine operators of Alberta Province, and is vice-president of the Western Coal Operators' Association. He is also a member of the Canadian Mining Institute.

JOHN C. REID

W. L. Moss

W. L. Moss, vice-president and general manager of the Continental Coal Corporation, Pineville, Ky., is a live wire of this progressive Kentucky corporation. He sure is a native of the sod and hasn't wandered very far from home, for he was born in Pineville, in September, 1883. The affection of Mr. Moss for his native state is reciprocated in kind, for he is one of the most popular of the younger men in this wonderful new field.

Mr. Moss received his education at Valparaiso University, graduating in 1902 as a Doctor of Pharmacy. On entering the coal business, he became secretary and general manager of the Straight Creek Coal Mining Co., and remained with this concern until it was consolidated with several other mining companies to form the Continental Coal Corporation, operating in Kentucky, but incorporated in Wyoming. Mr. Moss was later advanced to the position of vice-president and general manager of the Continental company and still retains that position. He is the retiring president of the Kentucky Mining Institute.

Among other positions, Mr. Moss is president of the Moss & Sons Coal Co.; president of the Straight Creek Fuel Co.; vice-president of the Moss Coal Mining Co.; director of the Wilhoit Coal Co., and director of the Pineville Building & Amusement Co.

Mr. Moss has served as mayor of the city of Pineville, and is a member of the Kokoals and Southern Appalachian Coal Operators' Association.

Recent Decisions

By A. L. H. STREET*

Reformation of Contract on Ground of Mistake—In order to entitle a person to maintain a suit to reform the language of a written contract on the ground of mistake, there must be clear and satisfactory proof that a mistake has been actually made. (Kentucky Court of Appeals, Rockport Coal Co. vs. Carter, 163 Southwestern Reporter 734.)

Liability Concerning Vicious Mules—If a mine operator knows that a particular mule used in a mine is vicious and dangerous, he will be liable for any injury resulting from that cause to a miner who does not know the danger, notwithstanding any inherent unreliability of mules. (Kentucky Court of Appeals, Gatliff Coal Co. vs. Wright, 163 Southwestern Reporter 1110.)

Recovery of Taxes Unlawfully Assessed—"Taxes voluntarily paid or paid under protest cannot be recovered without some statute authorizing the recovery." The laws of Indiana require refund of taxes voluntarily paid under an erroneous assessment, if proof of such payment and of the improper assessment is made before the board of County Commissioners. (Indiana Supreme Court, Jackson Hill Coal & Coke Co. vs. Board of Commissioners of Sullivan County, 104 Northeastern Reporter, 497).

When Operator Is Not Liable for Falling Slate—At last here's a case where a coal-mining company has been declared not to have been responsible for injury to a miner, caused by falling slate: A miner cannot recover for injury sustained through a fall of slate at his place of work, if he knew the necessity for propping the roof, but failed to do so, although props were provided for his use. (Kentucky Court of Appeals, Branson vs. Clover Fork Coal Co., 164 Southwestern Reporter 304).

Warning Miners against Unsafe Roofs—When miners are directed by their boss to work at a certain place, they are entitled to assume that the place is safe in the absence of knowledge to the contrary. In a suit for injury to a miner caused by rock falling from a roof, it is no defense to show that the nature of the work contributed in some degree to the accident. But, if the place was reasonably safe, and the fall was caused merely by carrying on the work, the employer is not liable. (Kentucky Court of Appeals, Jellico Coal Mining Co. vs. Hilton, 163 Southwestern Reporter 744.)

Right to Rescind Purchase of Coal Lands—One who has contracted to purchase lands supposed to contain valuable beds of coal is entitled to rescind his agreement on discovering the falsity of willful or reckless misrepresentations as to the character of the land, made by representatives of the seller. Even though the owner did not authorize the perpetration of the fraud, he ratifies his representatives' acts in making the misrepresentations, by retaining payments made on the price by the purchaser. (Missouri Supreme Court, Morgan County Coal Co. vs. Halderman, 163 Southwestern Reporter 828.)

Instruments Which Must Be in Writing—An owner of land is not bound by a contract to sell it made by a third person as his agent, unless the agent's authority to make the contract was conferred by a writing signed by the owner, or unless the owner afterward signed an instrument ratifying the agreement. A receipt for a payment made on the purchase price of a tract of land is ineffectual as written evidence of the owner's contract to sell, if it does not describe the land nor disclose the parties to the agreement and the terms of sale. (Pennsylvania Supreme Court, Llewellyn vs. Sunnyside Coal Co., 89 Atlantic Reporter 575.)

Coal Not "Material" for Improvement—A seller of coal to be used by a State highway contractor in producing steam in road rollers and traction engines, utilized in performing a contract, is not entitled to the protection of the New York law, which gives a lien against funds in the hands of a contractor to secure payment for "materials" furnished him for the construction of a public improvement. (New York Court of Appeals, Shultz vs. C. H. Quereau Co., 104 Northeastern Reporter 621). In reaching this decision the New York Court cities similar holdings by the Massachusetts Supreme Judicial Court.

Safety of Mine Room Neck—Damages Recoverable for Personal Injury—A miner can recover against his employer for injury sustained through fall of rock from a room neck through which he was required to pass, if the employer failed to take reasonable precautions to make the place safe. Four thousand five hundred dollars is not excessive recovery for such an accident, it appearing that the injured miner is 43 years old and has previously earned from $50 to $70 fortnightly, that his leg was broken, his ankle badly crushed and he has been unable to work for more than two years. (St. Louis Court of Appeals, Gambino vs. Manufacturers' Coal & Coke Co., 164 Southwestern Reporter 264).

Damages for Breach of Mining Contract—Under a contract whereby a party undertakes to mine coal for agreed compensation, according to the quantity mined and the length of entries and breakthroughs driven, he is entitled to treat the contract as broken by the mine owner, and sue for damages for the breach, as well as for compensation due on showing that the owner refused to pay sums due or to permit further performance. The measure of damages for breach of such a contract is the difference between the cost of performing the contract and the agreed price. (West Virginia Supreme Court of Appeals, Bare vs. Victoria Coal & Coke Co., 80 Southeastern Reporter 940.)

Excessive Freight Charges as "Extortion"—Under the statutes of Kentucky, charging by a railway company of an unreasonably high freight rate on interstate shipments of coal constitutes extortion, and, on a finding of such extortion the State Railroad Commission is authorized to fix a reasonable rate. When the Commission finds that an existing rate is unreasonable, an aggrieved shipper need not prove actual damages, in order to be entitled to recover the difference between the rate charged and that fixed by the Commission as being reasonable. (Kentucky Court of Appeals, Illinois Central R.R. Co. vs. Paducah Brewing Co., 163 Southwestern Reporter 239.)

Effect of Wyoming Mine-Foreman Law—The Wyoming statute which provides for the inspection of coal mines by licensed foremen does not relieve operators of the duty of using a reasonable degree of care to provide a safe place of work for the miners. In entering upon employment, a miner assumes all risks of injury of which he knows or which he would discover by exercising ordinary prudence for his own safety. The burden of inspecting appliances and places of work may be placed on the employees using them. Thus an operator may impose on a machine runner the duty of assisting in cleaning up coal after a blast and in taking down loose coal near his place of work. (United States Circuit Court of Appeals, Eighth Circuit; Owl Creek Coal Co. v. Goleb; 210 Federal Reporter 209.)

Penalty for Refusing to Permit Survey of Mine—A statute in force in Indiana authorizes an owner of land adjoining a tract on which a coal mine is being operated, and his surveyors, to enter the mine to make surveys in order to determine whether coal is being removed from beneath his land, and prescribes a penalty for refusal of the owner, lessee or operator of the mine to permit such survey. Held: "Penal statutes are always strictly construed, and to enable appellant to recover the penalty sued for he must make it appear that the substantial provisions contained in the foregoing statute have been violated. That is, he would be required to show not only that he owned land coterminous with the land in the possession and control of appellee, either as owner, tenant, occupant, or agent, and that the coal mine sought to be surveyed was one that was open and being operated, such as is contemplated by the statute, but that some request had been made of appellee for a permit to enter his mine for the purpose of making such exploration, survey and measurements, and that such permission had been refused." (Indiana Appellate Court, Rowell vs. Snoddy, 104 Northeastern Reporter 104.)

Discussion By Readers

Calorific Value and Volatility of Coal Dust as Affecting the Violence of Explosion

In connection with the question of the explosibility of anthracite dust, I note that a recent editorial writer takes exception to the statement in COAL AGE, Jan. 24, p. 172, which is as follows:

> The scientific conclusion, therefore, is that the violence of a dust explosion depends not on the volatility of the coal, but on the calorific value of the dust. If this is true, anthracite dust, though difficult to inflame, will ultimately produce an explosion as violent as those produced by high-grade bituminous coals.

The criticism of this statement speaks of it as a fallacy," basing the opinion on the recent experiments with anthracite dust at Bruceton. I want to say, that all that the Bruceton experiments show is that anthracite dust, under the conditions of the experiment did not ignite. There is no warrant for the categorical conclusion being drawn that such dust cannot be ignited and burned explosively under other conditions than those that existed in that experiment.

The writer of this criticism did not apparently analyze the statement in COAL AGE sufficiently, since he failed to recognize that the *inflammation of the dust* and the *violence of the explosion,* should one occur, are two different propositions. Anthracite dust may be difficult to inflame, which explains the fact that the anthracite mines have been free from true dust explosions in the past. But this fact and the fact of the difficulty of its inflammation cannot affect, in the slightest degree, the statement in COAL AGE, that "the violence of a dust explosion depends on the calorific value of the dust."

It is worthy of note, moreover, that this statement does not say that the violence of a dust explosion depends *wholly* or *alone* on the calorific value of the dust. The statement simply draws attention to the fact that the calorific value of the dust is an important factor in respect to the violence of the explosion, should one occur.

In this connection, it is worthy of note that the percentage of volatile matter present in Iowa coals is as great or greater than the percentage of volatile matter in the coals of Pennsylvania or West Virginia; but the calorific value of the Iowa coals, per pound of coal, is far less than that of the other coals mentioned. Now observe that while there have been many ignitions in the mines of Iowa, the violence of the explosion has invariably been less than that of similar explosions in Pennsylvania or West Virginia. This fact has an important bearing on the question of the relative importance of the *calorific value* and the *volatility* of coal dust, as affecting the *violence* of the explosion, should one occur.

In closing, I want to call attention to what may rightly be considered the essential factor in developing the full calorific value of any combustible substance, whether anthracite, bituminous coal, methane or other gas. The answer is obviously *the presence of available oxygen in sufficient quantity to produce complete combustion.* For example, a firedamp mixture (methane and air) develops its maximum violence in explosions when the proportion of gas to air is 1 : 9½, which is practically the proportion of gas and air required to produce complete combustion.

Anthracite dust under ordinary mining conditions has not proved to be explosive, and, in my judgment, under ordinary mining conditions, it cannot be exploded. But that is not to say that it *may* not be exploded under conditions of heat and air supply favorable for its combustion. It has been rightly stated that the magnitude of a dust explosion depends on the air supply. I believe it is this fact that limits the extent and violence of many mine explosions, because the air supply is limited by virtue of the environment.

The fact is well known that it requires more air to burn the same amount and grade of anthracite than to burn a like amount of bituminous coal. Then, if the air supply is generally insufficient to support the explosive combustion of dust in a bituminous mine, it will be still less sufficient for an explosion of dust in an anthracite mine. Again, inasmuch as anthracite dust is nonflaming, it may be assumed that the dust cloud must be of greater density than that required in the case of bituminous dust, in order to produce the same explosive effect. To burn this comparatively dense cloud of anthracite dust would require an unusually hot and lasting flame and an oxygen supply far above what can be obtained in any mine, under ordinary conditions.

JOHN VERNER,
Former State Mine Inspector.

Chariton, Iowa.

Weak Links in Coal Mining

Letter No. 1—I was interested in reading the article on this subject, COAL AGE, May 9, p. 756, as it calls to mind another weak link in the operation of coal mines that the writer has failed to mention. I refer to the misuse and reckless handling of mine motors by motormen in the mines. Motormen, as a class, like mule drivers, are a fearless and often reckless type of men. The spirit that mostly animates these fellows often leads them to a misuse of the electrical power and unduly overloads the motor, especially in starting a heavy trip when great caution should be used. In making the run to the shaft bottom, they often exceed the speed limit, causing cars to jump the track and even endangering their own lives by taking a sharp curve too fast or when passing a known piece of bad track.

The mine electric locomotive, unlike a railway engine, has a low center of gravity, which gives the motorman greater confidence, and he takes the curve at too high a speed, forgetting that the great strain thrown on the rails may cause them to spread and derail the trip.

The greatest trouble, however, arises from the tendency of motormen to use little or no caution in starting a trip of loaded cars. A careful man will sand the rail before

taking the slack out of his train. This puts the motor on a sanded rail before the full load is started and enables the motorman, by working the controller, to operate the locomotive to the best advantage, giving the motor more or less current according as the wheels hold the rail or slip.

Too often, a careless motorman will turn on the full current before slack is taken in the attempt to jerk the slack out of the train, which he believes will start the load better. Having started the load in this manner, he will often sit quiet and control the speed of the train by use of the motor brakes. If the wheels slip, he applies the motor brake to overcome the difficulty, instead of regulating the current, loosening them again to gain speed.

It seems hard to accuse competent men of such practice, but too often I have witnessed the trick while hidden from sight in the gob. I have frequently surprised a motorman in the act.

Many mines using electric haulage are troubled with excessive repair bills when there is no apparent reason for the breakage of axles, wheel flanges and other parts. The reason for these unnecessary breakages would often be discovered if the person in charge would make frequent trips of inspection in the mine, at times when he is not expected to be there. If a broken axle shows no flaw in the fracture and there is no defect visible in its mounting, the trouble is either due to an unwarranted strain caused by such practices as I have mentioned, or, which is possible, there may be too much lateral motion across the track, which causes the motor frame to bump hard against the hub of the wheel, producing, finally, "fatigue" or crystallization in the metal. In mining practice, the wear and tear on the locomotive, due to this cause, are apt to be great, under the best conditions, owing to frequent change in the level of the track, which causes the locomotive to swing from side to side with great frequency. Such a side swing, at a high speed, results in a solid, heavy hammer-blow on the axle. Where there is much end-play in the journal, collars or washers should be used to take up this play. I have seen several cases where the journal box was worn clear through next to the wheel hub and allowed the oil to ooze out of the bearing. The same cause results in broken wheel flanges also.

ASSISTANT SUPERINTENDENT.

Double-Neck Rooms

A recent reference in COAL AGE calls to mind a good practice that I observed in the Alabama coal field, about a year ago, which I desire to commend.

The coal seam, in the mine in question, was about four feet in thickness and dipped at an angle of about 8 or 10 deg. with the horizontal. The rooms were turned straight up the pitch and driven with a width of about forty feet. Each room had two necks or openings, with a pillar stump between them. The waste resulting from the partings or clay seams, which occurred in the coal, was used to build a solid wall along each roadway. The entire space between the two roadways, from floor to roof, was filled with the waste of the seam, extending from the entry stump at the mouth of the room, to within about 5 ft. of the face.

A canvas sheet was hung across the entry between the two room-necks; and the air current thus carried up to the face of the room swept the gas away as fast as it was generated. By this method, all the dirt was stored in the mine, where it belonged, and was not hauled to the surface, which saved a considerable expense. Moreover the method served to aid the ventilation of the rooms. This system could be used to great advantage in other coal seams that present like conditions. It has the advantage of being automatic, and with proper attention from the mine foreman and fireboss, no accumulation of gas can occur in the rooms.

J. J. RUTLEDGE.

McAlester, Okla.

The Mine Foreman

Letter No. 7—The discussion, in COAL AGE, of the somewhat anomalous position of the mine foreman in the coal-mining industry has been interesting. The question is one of such vital importance to all mine foremen that it should receive serious consideration. It is to be hoped that, by thus drawing attention to certain prevailing features, this discussion may be the means of improving conditions and giving to honest mine foremen a greater degree of prestige, security and justice than is accorded them under the present system and statutory laws.

It is quite generally acknowledged that the mine foreman today occupies an onerous position. In most cases, he is held to a strict accounting by three masters—the state law, his employers and the miners, for whose safety he is responsible. Let us consider each of these in order.

First. In most coal-mining states the mine foreman is held legally responsible for the safe operation of the mine in compliance with the requirements of the mining law. In some cases, these requirements place him in a very difficult situation. For example, the bituminous mining law of Pennsylvania (Art. 4) reads as follows:

> The mine foreman shall have full charge of all the inside workings and of the persons employed therein, in order that all of the provisions of this act, so far as they relate to his duties, shall be complied with and the regulations prescribed for each class of workmen under his charge carried out in the strictest manner possible. * * *
>
> When the mine workings become so extensive that the mine foreman is unable personally to carry out the requirements of this act pertaining to his duties, he shall have the right to employ a sufficient number of competent persons to act as his assistants, who shall act under his instructions in carrying out the provisions of this act. * * *
>
> The mine foreman shall notify the superintendent in writing, whenever, in his opinion, the mine is becoming dangerous through the lack of ample ventilation * * * or from any other cause, etc.

The foreman is further required to remove all dangers found or reported to him as existing in the mine, or withdraw the men working therein. Consider the dilemma the mine foreman must face when his reports do not meet with the approval of the superintendent. As foreman, he is liable to prosecution by the state inspector, for a violation of the law, if he fails to see that all its requirements are fulfilled. As was remarked incidentally by a state mining official, at the time of the Harwick mine disaster, Jan. 25, 1904, "the foreman is certainly between the devil and deep sea."

The question may well be asked: Can a mine foreman be conscientious and, at the same time, be assured of his position, under these conditions? Any prevarication

will render him liable to prosecution, in the event of serious consequences. On the other hand, the law provides no redress for loss of position through the faithful performance of his obligation to the state; it considers no extenuating circumstances as an excuse for any violation of its mandates. The mine foreman may have used every moral suasion in his power to secure compliance of the company who employs him, with the requirements of the law; but the law takes no cognizance of such fact. It holds the unfortunate foreman legally responsible for any nonconformity to legal requirements in the operation of the mine in his charge.

Second. By his employer, the mine foreman is regarded in the light of a "coal-getter." He is held responsible by him for the daily output of coal and the cost of its production. On this basis, it would naturally be supposed that the foreman's practical knowledge would be worthy of the first consideration; but how often are his suggestions and requests set aside, in respect to even minor details dictated by his more intimate acquaintance with the actual practical need.

The superintendent's eye is ever on the cost sheet, and while this is a very important item and is indisputably his province and duty, it often transpires that a too prolific use of the pruning knife may prove unwise economy. But the mine foreman is still required to produce the goods and, in many cases, it is not only a case of "making bricks without straw," but the hands of the foreman are practically tied by other curtailments that render him virtually helpless. Of course, the foreman "need not submit to these conditions"; he is at liberty to quit, but how often is he in a position to do so?

Third. In respect to the third master—the miner—little need be said, as the relations between the foreman and his men are too well known to need further comment.

In closing, I would ask: Is it justice to make the mine foreman responsible for affairs over which he has no control, except by jeopardizing the position he holds? A solution to this question (which justice to a large class of faithful, conscientious foremen demands) might be found, as was suggested in COAL AGE some time ago (Vol. 1, pp. 190 and 717), in reference to the fireboss, by making the mine foreman a state official. Under present conditions, the mine foreman has neither social standing nor professional prestige. In some respects, he is debarred from full association with the miners whom he employs, while his rank seldom insures recognition by his superiors. The situation certainly needs to be carefully studied, with a view to improving present conditions.

I. C. PARFITT.

Jerome, Penn.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Example—An air current of 60,000 cu.ft. per min. is passing in an airway 8x10 ft. in section, to a point 1500 ft. distant from the foot of the downcast shaft, where it divides naturally between the following four airways or splits:

Split A, 5 × 6 *ft.*, 900 *ft. long*
Split B, 6 × 6 *ft.*, 825 *ft. long*
Split C, 4 × 6 *ft.*, 840 *ft. long*
Split D, 4 × 5 *ft.*, 720 *ft. long*

What is the quantity of air passing in each split; and what will be the water-gage reading for the entire mine and power on the air, at the foot of the downcast shaft?

Solution—Since the water gage is required in this case, the relative potential values cannot be used; but, instead, the part potential value (omitting k) is found for the main airway and for each split separately; thus, taking the length of the main airway including the return as 2 × 1500 = 3000 ft.:

Main airway, $a = 80;\ o = 36;\ l = 3000;\ X_1 = 80\sqrt{\frac{80}{3000 \times 36}} = 2.177$

Split A, $a = 30;\ o = 22;\ l = 900;\ X_a = 30\sqrt{\frac{30}{900 \times 22}} = 1.168$

Split B, $a = 36;\ o = 24;\ l = 825;\ X_b = 36\sqrt{\frac{36}{825 \times 24}} = 1.531$

Split C, $a = 24;\ o = 20;\ l = 840;\ X_c = 24\sqrt{\frac{24}{840 \times 20}} = 0.907$

Split D, $a = 20;\ o = 18;\ l = 720;\ X_d = 20\sqrt{\frac{20}{720 \times 18}} = 0.786$

The general split potential (X_{∞}) is equal to the sum of the potentials for the four splits; thus,

$$X_{\infty} = \Sigma X_{abcd} = 4.392$$

The quantity of air that will pass in each of these splits is proportional to the corresponding split potential, assuming that no regulators are employed but all the airways are free and unobstructed. The natural division of the air between the four splits is therefore calculated in the usual manner, as follows:

Split A, $q_a = 60{,}000\frac{1.168}{4.392} = 15{,}950$ *cu.ft. per min.*

Split B, $q_b = 60{,}000\frac{1.531}{4.392} = 20{,}920$ *cu.ft. per min.*

Split C, $q_c = 60{,}000\frac{0.907}{4.392} = 12{,}390$ *cu.ft. per min.*

Split D, $q_d = 60{,}000\frac{0.786}{4.392} = 10{,}740$ *cu.ft. per min.*

Total circulation, 60,000 *cu.ft. per min.*

The Coal Age Pocket Book

In order to find the water-gage reading at the foot of the downcast shaft, for this circulation, it is necessary to calculate the general mine potential X_0 by combining, in tandem, the main-airway potential (X_1) and the general split potential (X_{∞}) previously found, using the formula

Mine water gage, $w.g. = \frac{kQ^2}{5.2}\Sigma\left(\frac{1}{X^2_p}\right)$

Substituting the values previously found,

Main airway, $\frac{1}{X^2_1} = \frac{1}{2.177^2} = 0.2109$

Split section, $\frac{1}{X^2_{\infty}} = \frac{1}{4.392^2} = 0.0518$

Sum of values, $\Sigma\,(1/X^2_p)$ 0.2627

Finally, substituting this value in the above formula for finding the mine water gage,

$$w.g. = \frac{0.00000002 \times 60{,}000^2 \times 0.2627}{5.2} = 3.64\ in.$$

In like manner, the power on the air, at the foot of the shaft is calculated by the formula

Power on the air, $H = \frac{kQ^3}{33{,}000}\Sigma\left(\frac{1}{X^2_p}\right) = \frac{0.00000002 \times 60{,}000^3 \times 0.2627}{33{,}000} = 34.39\ hp.$

Increase of Quantity Due to Splitting—The quantity of air in circulation is proportional to the general mine potential or, in other words, the quantity is always equal to the mine-potential ratio; the power potential being used for a constant power, and the pressure potential for a constant pressure; always remembering, however, that the cube of the power potential is equal to the square of the pressure potential. Denoting the original quantity of air in circulation, by Q_1 and the original mine potentials for power and pressure by Xu_1 and Xp_1, respectively; and designating these factors after splitting, by Q_2, Xu_2 and Xp_2, respectively, gives the following formulas:

Power constant, $Q_2 = Q_1\frac{X_{u2}}{X_{u1}};\ \text{or}\ Q_2 = Q_1\sqrt[3]{\left(\frac{X_{p2}}{X_{p1}}\right)^2}$

Pressure constant, $Q_2 = Q_1\frac{X_{p2}}{X_{p1}};\ \text{or}\ Q_2 = Q_1\sqrt{\left(\frac{X_{u2}}{X_{u1}}\right)^3}$

An illustration of the use of these formulas is to be found in the solution of the first example under Secondary Splitting, on a previous page. In that example, the power remained constant before and after splitting the current. The pressure potential was used, which before splitting was $Xp_1 = 0.6708$, and after splitting, $Xp_2 = 0.8554$:

Hence, $Q_2 = Q_1\sqrt[3]{\left(\frac{X_{p2}}{X_{p1}}\right)^2} = 120{,}000\sqrt[3]{\left(\frac{0.8554}{0.6708}\right)^2} = 141{,}100$ *cu.ft. per min.*

Inquiries of General Interest

Study Question--Ventilation

The following question, which appeared in one of the recent examinations in British Columbia, has excited a great deal of interest. We have been studying the question carefully and would very much appreciate an answer in COAL AGE. The question assumes that, with a constant power, the circulation is to be increased by dividing the air into three separate currents. It is as follows:

Suppose that a given power circulates 75,000 cu.ft. of air per minute through a certain airway, in a continuous current; and it is decided to divide the air into three splits as follows:

Split A, 6×6 ft., 5000 ft. long;
Split B, 5×6 ft., 4500 ft. long;
Split C, 6×7 ft., 4000 ft. long.

Calculate the quantity of air that will pass in each split, assuming that the power on the air remains unchanged.

DAVID MURRAY.

Blairmore, Alta., Canada.

The first step in the solution of this question is to find the power that will circulate 75,000 cu.ft. of air per minute in the given airways, in a continuous current or a "tandem" circulation.

The area (a), perimeter (o) and length (l) of these three airways or sections are, respectively,;

Split A, $a = 36$; $o = 24$; $l = 5000$;
Split B, $a = 30$; $o = 22$; $l = 4500$;
Split C, $a = 42$; $o = 26$; $l = 4000$.

The part potential values of the airways are then found as follows:

Split A,

$$X_{p_1} = 36\sqrt{\frac{36}{5000 \times 24}} = 36\sqrt{0.000300} = 0.6235$$

Split B,

$$X_{p_2} = 30\sqrt{\frac{30}{4500 \times 22}} = 30\sqrt{0.000303} = 0.5222$$

Split C,

$$X_{p_3} = 42\sqrt{\frac{42}{4000 \times 26}} = 42\sqrt{0.000404} = 0.8440$$

Sum of part potentials, ΣX_p 1.9897

Setting aside this value of the sum of the part potentials for use, later, in the calculation of the split circulation, we next find the reciprocal of the squares of each of the above potential values and take their sum for the calculation of the power in the tandem circulation. Thus,

$$1/X^2p_1 = 1/0.6235^2 = 2.5721$$
$$1/X^2p_2 = 1/0.5222^2 = 3.6668$$
$$1/X^2p_3 = 1/0.8440^2 = 1.4037$$

Sum of tandem values, $\Sigma\,(1/Xp^2)$ 7.6426

The general formulas for calculating the power on the air from the mine-pressure potential, for tandem and split circulations, respectively, are as follows:

Tandem circulation, $U = kQ_1^3\,\Sigma\left(\frac{1}{Xp^2}\right)$

Split circulation, $U = kQ_2^3\left(\frac{1}{\Sigma Xp}\right)^2$

The power on the air can, now, be calculated by substituting the necessary potential values in the first of these two formulas; and, then, by substituting this result for U, in the second formula, the total quantity of air in circulation in the splits can be calculated. The distribution of this total quantity between the three splits can then be calculated in the usual manner.

Much time and labor in calculation, however, is saved by equating the two equations given above, which is possible because the power on the air remains constant. Doing this and then canceling the common factors and solving with respect to Q_2 gives, for finding the total quantity of air circulated by the same power, in the splits, the following formula:

$$Q_2 = Q_1\sqrt[3]{(\Sigma Xp)^2\,\Sigma\,(1/Xp^2)}$$

The total quantity of air circulating in the splits, as found by this formula, is then,

$$Q_2 = 75{,}000\sqrt[3]{1.9897^2 \times 7.6426} = 233{,}710\ cu.ft.\ per\ min.$$

The distribution of this air between the three splits can then be calculated in the usual manner. A shorter method still, however, is to calculate the quantity of air passing in each of the several splits directly, by use of the following formula:

$$q_1 = Xp_1 Q_1\sqrt[3]{\Sigma\,(1/Xp^2) \div \Sigma Xp}$$

For example, substituting, in turn, the respective potential values, previously found, and making $Q = 75{,}000$, the quantity of air passing in each of the three given splits, under a constant power, is as follows:

Split A,

$$q_1 = 0.6235 \times 75{,}000\sqrt[3]{\frac{7.6426}{1.9897}} = 73{,}240\ cu.ft.\ per\ min.$$

Split B,

$$q_2 = 0.5222 \times 75{,}000\sqrt[3]{\frac{7.6426}{1.9897}} = 61{,}340\ cu.ft.\ per\ min.$$

Split C,

$$q_3 = 0.8440 \times 75{,}000\sqrt[3]{\frac{7.6426}{1.9897}} = 99{,}130\ cu.ft.\ per\ min.$$

Total circulation, 233,710 cu.ft. per min.

This is an extremely difficult question for an examination question, because the method of its solution is not generally understood. Many students of mine ventilation, will, no doubt, prefer to work this example by the customary long and tedious process of calculating the power on the air in the first circulation, using the coefficient of friction $k = 0.00000002$; and then, by the use of the same coefficient, find what quantity of air the same power will circulate in the splits. The last two formulas eliminate k and shorten the solution.

Examination Questions

Pennsylvania Bituminous Mine Foremen's Examination, May 5 and 6, 1914

(Continued from last issue)

Ques. 7—(a) What is a permissible explosive? (b) What conditions make their use necessary in a mine? (c) What charge limit has been established by the U. S. Bureau of Mines, for such explosives?

Ans.—(a) Miners' Circular No. 6, of the Federal Bureau of Mines, p. 8, defines a permissible explosive as one that is in all respects similar to the sample that passed certain tests made by the U. S. Bureau of Mines, and when used in accordance with the conditions prescribed by that bureau.

(b) The presence of gas in sufficient quantity to be detected on an ordinary safety lamp, in a dry and dusty mine, makes the use of a permissible explosive advisable, if not absolutely necessary to avoid the danger of an explosion being produced by the flame of black powder so commonly used for blasting coal.

(c) The charge limit for a permissible explosive, as stated in the fourth condition of its use, on p. 9, of Miners' Circular No. 6, is 1½ lb. (680 grams); and this must be properly tamped with clay or other noncombustible stemming.

Ques. 8—What are the legal requirements as to cut-throughs in rooms, and what supplies should be kept at the face of working places?

Ans.—Art. 9, Sec. 3, of the bituminous (Penn.) mine law, requires that cut-throughs shall be made in all room pillars, at such distances apart as the judgment of the inspector may deem requisite, not more than 35 nor less than 16 yd., for the purpose of ventilation. The law provides that every miner shall order all the props, cap-pieces and other timbers required to keep his place in safe condition, at least one day in advance. It is important to keep a good supply of such timbers and cap-pieces constantly on hand, ready for use when required.

Ques. 9—What provision should be made for safety on haulage roads, and what appliances should be used in connection with the different mechanical systems of haulage, including the hoisting equipment?

Ans.—The bituminous (Penn.) mine law, Art. 4, Sec. 8, provides that all entries hereafter driven shall have a clear space of 2½ ft. between the side of the car and the rib of the entry, continued throughout on one side of the entry, provided the roof will permit such a width. On other haulage roads, the law requires that shelter holes 2½ ft. deep and 4 ft. wide shall be cut in the rib on one side of the entry, at distances apart not exceeding 30 yd., where animal haulage is employed, and not exceeding 15 yd. where the hauling is performed by machinery. Such shelter holes must be kept whitewashed and free of all obstruction. They are not required on entries where rooms are turned off on one side of the road, at intervals not greater than the distances mentioned in the law.

Art. 3, Sec. 6, provides that a safety catch, or other safety device, be attached to the rear end of the rear car of full trips that are to be hoisted up slopes; also, that suitable signals be placed on the rear end of the rear car of all trips hauled in the mine by locomotives of any kind. Art. 6, Sec. 4, provides that where the main intake airway is used for mechanical haulage, a separate traveling way shall be provided or the employees shall be hauled in and out of the mine at the beginning and end of each shift.

Art. 6 provides for stairways on an angle not to exceed 45 deg. and equipped with handrails, in all shafts less than 100 ft. in depth. Art. 7 provides for the lowering and hoisting of employees by means of machinery, in shafts exceeding 100 ft. in depth, except where the second opening is a drift or slope. In such mines, if the second opening is a shaft, the same must be provided with a stairway, as described in Sec. 6. Sec. 8 provides that employees shall be lowered and hoisted from the mine, at the beginning and end of each shift, at a speed not to exceed 6 miles per hour, in all slopes exceeding 15 deg. inclination and 1000 ft. in length. The same provision is made for slopes whose average inclination is from 5 to 15 deg. when the length exceeds 3000 ft., except where a separate traveling way is provided, when the hoisting of employees is optional, provided the angle of inclination does not exceed 20 deg.

Art. 8 provides for the installment of suitable signal apparatus and communication by speaking tube or by telephone, between the top and the bottom of every shaft or slope where persons or material are lowered or hoisted. It is also provided that every cage for lowering or hoisting men shall be equipped with handrails at the sides or overhead, and with chain, bar or gate at ends of cage, and a sufficient covering overhead to protect persons thereon; also, safety catches to be tested every two months, and a record of each test sent to the inspector and recorded in ink in a book at the office.

The hoisting rope shall be attached securely to the sides of the winding drum, which must be provided with flanges having a clearance of not less than 4 in. after all the rope is wound on the drum. An adequate brake must be attached to each drum and an indicator provided to show position of cage in shaft; also, an efficient safety device to prevent overwinding. All shafts shall be provided with safety gates at the top and intermediate landings.

Secs. 2 and 3 provide for the strength of coupling chains, bridle chains, ropes and links required in the hoisting equipment. All machinery (Sec. 4) must be properly fenced with a suitable guardrail. The number of persons that may be hoisted (Sec. 5) at one time shall be determined by the mine inspector and posted in a conspicuous place; the speed of hoisting not to exceed 900 ft. per min. Art. 4, Sec. 21, provides for the use of safety blocks, safety switches, drop logs or other device, at the top of all slopes and shafts, to prevent cars from running into the opening.

Coal and Coke News

Washington, D. C.

As a result of the constant agitation during the past two or three sessions of Congress for the establishment of mining experiment and mine safety stations practically identical bills providing for the creation of a number of such stations have been reported to the Senate and House by the mining committees of those bodies.

It is believed that the bill will be adopted before the expiration of the present Congress. Under its terms there would be 10 mining-experiment stations in public-land states and 15 safety stations on the rescue cars designed to carry out the educational work of the Bureau of Mines with reference to accident prevention, as well as to afford facilities for the actual relief of those suffering from mine accidents. In addition the provision is made for the operation of the 8 mine-rescue cars now in commission, upon a new basis.

The committee in making its report to the House says that the bill has been prepared with considerable care and that it is not based upon the plans or wishes of any one person or organization, but has been drawn up as the result of a series of conferences among mine owners, operators, miners, engineers and surgeons from different parts of the country.

Conditions showing the need for this legislation are stated and much is made of the reduction in the number of men employed in the different metal-mining industries in the public-land states. The average number of employees, it is pointed out in the metal-mining and metallurgical industries in Colorado, for instance, for the four-year period 1900-1903 was 36,189. In the period 1908-1911 this number was reduced to 22,560.

In the opinion of the committee something is the matter with mine development, and it says in its report:

Among the causes of this lagging behind of mine development are the following: (a) The exhaustion now under way of the more easily discovered and richer ore deposits and the fact that other similar deposits are not now being discovered to such an extent as to replace those now being worked as they become exhausted; (b) the absence of known methods through the use of which many existing low-grade ore deposits can be profitably worked; (c) the wasteful methods now followed in many of the mining and metallurgical operations, which, while in many cases still bring temporary profits to mine operators, are reducing the national wealth in a manner which can be remedied only by the discovery and use of more efficient methods of treatment.

No one likes to estimate the money value of a human life, but at times it becomes necessary to do this, especially in working out the economics of compensation acts. It is a reasonable estimate that during the past 10 years more than 30,000 men have been killed and more than 100,000 seriously injured in connection with the accidents in the mining industries of this country.

It is impossible to estimate the number who have suffered from unhealthful conditions in many metal-mining, tunneling, quarrying, metallurgical and other mineral-industry plants. It is impossible to estimate the number of men with health shattered through these conditions who have had to give up their work years before their natural time or the number of dependents who have suffered thereby.

If it be assumed that each human life is valued at $3000, it will be seen that the deaths alone in the mines have cost in 10 years $90,000,000.

If each of the 100,000 seriously injured lost 20 days at $3 per day, a reasonable assumption, this represents $6,000,000 lost from this cause.

It is important from both the humanitarian and economic standpoints that the investigations by the national Government with a view to better safeguarding the lives of the men connected with the more hazardous branches of the mining industry should be conducted as thoroughly and as rapidly as the work can be done effectively, in order that improvements may be inaugurated without delay and to the fullest possible extent.

It is equally important that after the inquiries and investigations have been coducted and reasonable conclusions formed that information should be disseminated promptly and effectively among the miners and those who manage the mines.

The Leasing System in Alaska

Complying with a Senate resolution, a document relating to the leasing of coal lands in foreign countries by T. P. McDonald has been published by the Government Printing Office. This document reviews the situation of the purchase system for coal lands in the United States and the experience in leasing coal lands here and abroad. The general tenor of the document is in favor of leasing and at the close the following statement is made:

The history of the coal-mining industry in all these countries operating exclusively under the leasing system proves that the investment of the coal-mine operator is far safer than under our system of a wide distribution of ownership and the keen competition that is inevitable under our present laws.

The title to the coal land being vested in the Government, it is thereby able to prevent overdevelopment and overproduction, which overproduction in turn produces destructive competition. Under this system the Government will only lease sufficient coal land to supply the existing market and provide for its effective extension and will be able to protect the coal operator against destructive competition. Under such a law, there is no question but the capital to develop Alaska coal lands will be available.

The experience of the coal producers in our great bituminous fields for the past 20 years demonstrates the necessity of some power to prevent the destructive competition that has so demoralized coal-mining investments during that time. In Australia, New Zealand and Nova Scotia the price of coal at the pit mouth during the past 20 years has ranged from $1.75 to $2.25 per ton, while in our great bituminous districts the price of coal at pit mouth has ranged from 90c. to $1.11 per ton. We are exhausting our great fields of high-grade fuel at almost actual cost of production.

Here are the figures taken from the report of the United States Geological Survey for 1911, for the states mentioned, showing the tonnage and selling price at mine:

States	Tons	Price At Mine
Illinois	53,679,118	$1.11
Indiana	14,201,355	1.08
Pennsylvania	144,754,163	1.01
Ohio	30,759,986	1.03
West Virginia	59,531,580	0.90

These figures illustrate the evil inherent in a wide distribution of ownership of coal lands. It results in such keen competition that the profits of the operator are reduced to the minimum, and where mining conditions are at all adverse are often extinguished.

The leasing system for Alaska, to encourage the development of the coal-mining industry, should provide that the coal producers may combine to fix a reasonable selling price for their coal. Possibly it should provide that such agreed price should, after a proper showing, be approved by the Alaska Development Board. Certainly some provision should be made to protect the investor from ruinous competition, either by permitting a selling price to be fixed by mutual agreement between the operators, as is done in other countries operating under lease, or the Government should protect the operator by limiting the number of leases in any particular field, so that a market may be assured for a reasonable tonnage. Some inducement must be extended to the operator with capital to justify him in developing those coal fields.

HARRISBURG, PENN.

The Supreme Court on May 23, in an opinion handed down by Justice Elkins, affirmed the Luzerne County Court in the 1913 assessment made by the Board of County Assessors which was attacked by the Delaware, Lackawanna & Western R.R. Co. The lower court held that equity had no jurisdiction and that the question of valuation should come up on appeal. An appeal is now pending in the lower court, which will have to be disposed of before the valuation question is finally settled.

The attack upon the assessment was brought by the Lackawanna company against the Luzerne County Board of Assessors, Plymouth Township. Had the court held that equity had jurisdiction, the question would tie up the taxes in all municipalities of the county.

The company objected to paying a special tax levied in Plymouth Township, claiming that the assessment was illegally made. The attack of the coal company was not merely to evade paying the tax in the township, but to test the validity of the county assessment, which increased the valuation many millions of dollars, the coal land being almost doubled in assessed value. The company claimed the assessment was illegal, because it was a blanket one and that the per-foot-acre method was used: also that land was assessed in bulk, the noncontiguous coal land being assessed and bulked together. One of the chief contentions, also, was that the subassessors did not make the assessment.

The company asked the lower court to grant an injunction, restraining the tax collector of Plymouth Township from collecting the tax complained of.

The Embarrassment of Industrial Railroads

The Public Service Commission on May 21 and 22 took up several new phases of the Industrial R.R. situation when it heard testimony from several steel companies and the Philadelphia, Bethlehem & New England R.R., which alleges that

before Apr. 15, 1914, it participated in through rates and division on all traffic except coal and coke.

The Interstate Commerce Commission has ruled differently from the State Commission, in the case of the Union and Monongahela Connecting railroads in the Pittsburgh district, which adds no small amount of interest to these hearings.

The state commission has followed the commission of New York in ordering the railways to continue their allowances to short industrial lines, which allowances in most cases have been declared by the Interstate Commerce Commission to be exorbitant and illegal, and which, so far as concerns the United States Steel Corporation and a few other large plants, have been discontinued on interstate traffic.

The apparent conflict between the views of the Federal and the state authorities on this matter is being closely watched by the bituminous operators. The essential point is the reasonableness of the compensation for the service of the industrial roads, and the Interstate Commerce Commission itself has postponed judgment in many cases. Evidently there is a long legal contest ahead, for not only the confusion of state and Federal authorities, but also that incident to all complicated freight-rate puzzles seems to afflict this controversy in a marked degree. The state is, however, committed irrevocably to the duty of making all transportation rates everywhere reasonable and just.

PENNSYLVANIA

Anthracite

Plymouth—The strike inaugurated on May 16 at Nottingham No. 15 colliery, of the Lehigh & Wilkes-Barre Coal Co. has been settled, and work has been resumed. The miners quit on account of the discharge of two drivers for violating the rule of the company in riding mules underground.

The settlement in the Red Ash vein Gaylord colliery, Kingston Coal Co. continues, but every effort is being put forth to counteract its effect. Timbers of large size are being placed, as well as concrete pillars. Thus far, surface property has not been affected. Work at the breaker, however, has been suspended until further notice.

Mocanaqua—The fire, which caused considerable excitement at the West Coal Co.'s mine at this place, has been conquered after some hard fighting. It was caused by a slight explosion of gas, and a number of men had a narrow escape from being burned.

Larksville—The second cave in the surface of Luzerne Ave. within two weeks occurred on May 23, and residents of the vicinity are somewhat alarmed. This last cave was caused by working in No. 2 colliery of the Kingston Coal Co. The large water main running through the town burst, causing the residents considerable inconvenience from lack of water.

Locust Gap—The employees of the Locust Mountain Coal Co., some 15,000 men and boys, on May 22, struck because of the discharge of two commiteemen of the United Mine Workers of America and through dissatisfaction in the way the men are compelled to register daily on a new time clock.

Bituminous

Altoona—In an amicable proceeding begun by the state against the Alton Coal Co., a decree in quo warranto has been handed down by the Dauphin County Court, in which it was set forth that the company, because it is no longer doing business, be ousted of its charter privileges.

Connellsville—It is stated that, during the week ended May 21, three thousand coke ovens in the Connellsville region were blown out; 2200 of these were owned by the H. C. Frick Coke Co., a subsidiary of the United States Steel Corporation. Production throughout the region declined 17,000 tons, and it was reported that coke for delivery the second half of the year was being sold at a recession from the prevailing price of $2.

WEST VIRGINIA

Moundsville—Following an examination of the mines in this vicinity, deputy state-mine inspectors have ordered that the working forces of the Parr's Run and Panama mines be reduced to 20 men, owing to the fact that the air shafts are not equipped with air gages. It is said that the whole plant of the Mound mine was ordered closed down, pending compliance with state laws.

Charleston—The records of the State Mining Department just published by Earle A. Henry, chief inspector, show that in the month of April there were 31 fatal accidents in the coal mines of West Virginia, being a gain of one over the previous month. The deaths resulting from the explosion in Mine No. 5 at Eccles are not considered in the regular casualty list. In this disaster there were 180 deaths, which brings the total up to 211 for the month.

Colliers—The striking miners at Colliers, where several riots have occurred, held a parade recently and marched about the streets of the village. Contrary to expectations, no disorder was noted. The mine at this place is working, about 50 men being employed, and is furnishing sufficient coal to fill orders.

Fairmont—The West Virginia State Federation of Labor brought its seventh annual convention to a close May 21 by adopting a resolution asking that Governor Hatfield appoint a committee to revise the mining laws of the state. Charleston was chosen as the place for the next meeting.

Panther—The first car of coal to be shipped from the Panther Coal Co. was sent out on May 20. All the directors of the company, as well as some of their relatives and friends were present. This car was said to be one of the finest in appearance ever sent from this region.

ALABAMA

Birmingham—The Black Diamond Coal Mining Co., with offices in the Jefferson County Bank Building of Birmingham, will develop a new mine at Benoit, Ala. in Walker County. The mine will be operated electrically, and the company expects to install shortly motors, coal cutters, and a 150-kw. direct connected generator.

Russellville—The No. 7 washery of the Sloss-Sheffield Steel & Iron Co. at Russellville was put into operation on May 15. This is one of the two new washers which have just been built at a cost of about $125,000. The other new one No. 6 washer was put into operation about the last of April.

KENTUCKY

Lexington—Announcement has been recently made that after a year's negotiation a deal has been consummated by which the East Jelico Mining Co. takes over all holdings of the East Jelico Coal Co. in Bell and Knox counties comprising 2800 acres of coal and timber land. The consideration paid was $300,000 in cash. The present output of the mines is 1100 tons daily, and it is proposed to acquire, lease and develop new mining properties in that section of the state.

Morganfield—Local opinion is that the projected amalgamation of coal operations of Union County is about to be realized. A party of representatives of an English syndicate which is said to be interested in the project, has just paid a visit to the county and followed up the reports of the engineers as to the land and the mines. The chief engineer, who is 72 years of age, is as vigorous as a man of half his years.

Madisonville—Ten of the coal companies operating in this county have been fined a total of $750 on their pleas in abatement to indictments charging that they polluted streams with copperas water from the mines. Fines were assessed without trial and the cases will be appealed.

Some twelve of the families of the striking miners of the Kingston Coal Co., at White City, have been evicted from their homes by the company. Fears that the miners would resist proved groundless.

OHIO

New Philadelphia—Leases have been closed by the Goshen Coal Co. to the Horger-Heldt Coal Co., the East Goshen Coal Co., and the Midvale Coal Co., by which the latter named concerns take over three separate coal properties. These leases provide for the payment of 6c. per ton mine run royalty, and each company must mine at least 30,000 tons yearly.

Columbus—The new mine rescue car purchased by the Ohio Commission some time ago, has arrived and is being equipped. It is an old Pullman furnished with a hospital and kitchen and will be placed in service when Ohio mines resume operation.

It is announced by Ohio operators who are backing the litigation, to have the new mine-run law declared unconstitutional that the case will be carried to the U. S. Supreme Court. Since the decision of the Federal Courts of Toledo refusing an injunction asked for by the operators, the only course is an appeal, and it is the intention to fight the case through the highest tribunal.

At the close of a conference between miners' representatives and coal operators in the office of Governor Cox, on May 22, it was announced that the operators and representatives of 45,000 idle miners in Ohio had agreed to meet in a mine-wage conference on June 2.

Toledo—A decision handed down from the U. S. Federal Court on May 19 upholds the constitutionality of the mine-run law. This measure became effective May 20, and will be enforced as soon as the mines resume operations.

Martins Ferry—Officials and members of the 12th district executive board of the United Mine Workers of America re-

cently began paying the first benefit since the strike was declared May 1. These benefits will amount to approximately $90,000 per week.

Canal Dover—The Goshen Coal Co., of Cleveland, the largest operator in Tuscarawas County, retires from the field on account of the anti-screen law. Its properties will be leased to local parties.

INDIANA

Terre Haute—The average work in this field is now only about two days per week and several of the larger mines are idle. The Bunsen mine, one of the costliest plants in the state, is shut down indefinitely. It is believed that there is some strengthening of the demand for steam coal and that this will improve from now on. As yet there has been no material increase in the output of Indiana coal because of the strike in Ohio, but should this continue some weeks there must be a larger demand for the Indiana product.

ILLINOIS

Wasson—John Kay, County Mine Inspector of Saline County, recently made an investigation of Wasson mine, and found the drum on the hoisting engine in a dangerous condition. The miners refused to go to work until the defective drum has been replaced, and, as a consequence, the mine will be idle for about three weeks. John Kelley, Vice-President of the 7th Sub-District, was called on, but sustained the action of the men.

Murphysboro—The two Murphysboro mines of the Big Muddy Coal & Iron Co., with head offces in St. Louis, recently resumed operations, after having been closed since Mar. 31. These two mines employ about 500 men.

Chicago—The O'Gara Coal Co., in nolo contendere proceedings recently accepted a fine of $5000 in two cases which remained of the Federal suit based on the shipment of coal from the Illinois field in Saline County to the East under preferred rates.

East St. Louis—With the settlement of the controversy between the coal miners and operators of Illinois a number of mines have reopened and coal is commencing to move once more. This settlement is of great importance to the Chicago & Alton and other coal-carrying railroads which depend upon the mines for a large proportion of their freight traffic. With the suspension of the mines the freight business dropped to the lowest degree reported in many years, with a corresponding decrease in forces of train, engine and yard men.

The Vandalia R.R. Co. was recently found guilty of granting a rebate of approximately $36,400 to the Lumaghi Coal Co. in the United States district court of East St. Louis. Attorneys for the railroad filed a motion for a new trial. The specific offence was that the road borrowed $260,000 and lent it to the coal company at 2 per cent. interest. The difference between this rate and the ordinary rate of interest was considered as a rebate by the Government attorney. In return for the loan the coal company is alleged to have promised to ship its coal over the Vandalia road, giving that company an income of about $182,000 a year as freight revenue.

Urbana—The senior class in mining engineering at the University of Illinois has recently returned from a trip of inspection, including the cement quarries, underground mines and manufacturing plants near Oglesby, Ill. The longwall mines near LaSalle were also visited and the geology of the region studied. The party also visited the steel works in South Chicago and Gary, Ind., and various plants in Chicago, where mining machinery is made, and thoroughly inspected the accounting systems of some of the large coal companies, whose offices are in Chicago.

MISSOURI

Kansas City—The Fidelity Trust Co. of Kansas City, purchased the stocks and bonds of the Osage Coal & Mining Co., and the Great Western Coal & Coke Co., at a sale on May 19. This stock was held by the Fidelity company as collateral on loans aggregating $866,300.

A meeting will be held in Kansas City early in June for the purpose of renewing the agreement between miners and operators in districts Nos. 14, 21 and 25, comprising the coal fields of Missouri, Kansas and Arkansas. The various districts and the Southwestern Interstate Coal Operators Association have already appointed scale committees.

IOWA

Mason City—The Iowa State Manufacturers Association in its annual convention at Mason City, appointed a committee to attend future meetings of operators and miners and there present the views of the association as laymen.

ARKANSAS

Ft. Smith—Charging wholesale violation of the mining laws, Mrs. J. B. Harry, of Hereford, recently filed suit against the Mammoth Vein Mining Co. and subsidiaries, as the result of the death of her husband, a shotfirer. The amount asked is $32,626 being the largest ever claimed in Arkansas in a similar case.

OKLAHOMA

Oklahoma City—All the coal mines and wholesale dealers in the state are ordered to sell coal to farmers' unions, lodges and all other organizations at the same prices charged local dealers for like quantity and quality of fuel, in an order issued by the Oklahoma Corporation Commission. This mandate becomes effective in June. The commission holds that the Oklahoma Anti-Trust Law applies to the coal operators and dealers, requiring them to sell without discrimination to organizations, as well as to local dealers when money for payment is deposited in a bank.

NEW MEXICO

Santa Fé—If present plans are carried out, New Mexico will soon have a state-owned coal mine, producing fuel for use at the capital and executive mansions, at the penitentiary and the state school for the deaf and dumb. On a section of state-owned land was discovered a vein of coal, which, it is believed, can be easily worked by drifting. It is proposed at once to develop this deposit with convict labor. A tipple, buildings, etc., together with a camp, will be established and mining carried on systematically under the supervision of experts.

COLORADO

Denver—The members of the coal consumers legislative league are circulating petitions for the initiating of an amendment empowering the state to mine and sell coal in competition with private operators. This measure if adopted will reserve to the state all the rights beneath the surface of all state lands whether leased or sold. It makes some provision for the creation of workmen's insurance funds, and also authorizes the sale of $500,000 in bonds as the initial capital for the equipment of the proposed state coal mines.

PERSONALS

J. W. Jeffrey, a son of J. E. Jeffrey, founder of the Jeffrey Mfg. Co. has been made vice-president of the concern.

H. V. Croll has been appointed sales manager for the American Concentrator Co., with main office at Springfield, Ohio. Mr. Croll has been located with the above company at its Philadelphia office for the past two years.

A. H. Wood, of Petros, Tenn., has decided to go into consulting engineering in the coal field. A long experience and study of the economic posibilities of the southern Appalachian coal field, from West Virginia to Alabama, should admirably fit him for this kind of work.

John M. Roan, formerly state safety superintendent, through a reorganization of the Mining Department of the Ohio Industrial Commission, becomes Chief of the Mining Department, and J. C. Davies, the former incumbent, becomes his first assistant. The new chief has had a varied experience in the coal business.

W. J. Richards, president of the Philadelphia & Reading Coal & Iron Co., on May 21, was elected president of the five subsidiaries of the Reading system, succeeding the late Geo. F. Baer. These subsidiaries are: The Delaware Coal Co., the Locust Gap Improvement Co., the Preston Coal & Improvement Co., the Tremont Coal Co. and the Fulton Coal Co. These properties are all operated by the Philadelphia & Reading Coal & Iron Co.

CONSTRUCTION NEWS

Cairnbrook, Penn.—It is understood that the Loyalhanna Coal & Coke Co. will shortly build a superintendent's house and a number of miners' houses. This work is to be begun as soon as possible.

Slemp, Ky.—The Leatherwood Coal Co. has been organized by A. C. Cornett and others with a capital stock of $40,000, and will develop an area of about 2000 acres on Leatherwood Creek. A short branch from the Louisville & Nashville will be built into the property, and the development work is to start at once.

Toledo, Ohio—Contractor George Mercer, of Bowling Green, Ohio, has started work on a new coal yard for Samuel Davis on the Terminal R.R. at Elm and Utica Sts. The yard will be 400x160 ft., and will be equipped with the latest machinery for handling coal. According to the contract, it is to be finished in 90 days, and will be the largest yard in Toledo.

Whitesburg, Ky.—The Slemp Consolidated Coal Co. has purchased a large boundary of coal land from the Letcher County Coal & Improvement Co. in Letcher County, and will open the property for early development. It will be necessary to build two short branches of the Louisville & Nashville R.R. in order to make these developments. Thousands of dollars will be expended in this work.

Kittanning, Penn.—It has just been announced that the giving of a mortgage for $4,500,000 by the Shawmut interests is to enable the company to extend the Pittsburgh & Shawmut R.R. from Kittanning to Freeport in the Allegheny Valley. Work has already been begun. Several new mines will be opened as the railroad reaches convenient points in the district, and at Freeport connection will be made with the Pennsylvania R.R. The extension enables the Shawmut to ship on the river southward. The road extension will be finished this season, a distance of about 20 miles.

NEW INCORPORATIONS

Pittsburg, Kan.—The J. J. Stephenson & Sons Coal & Mining Co., of Pittsburg, has been organized with a capital stock of $25,000.

Roosevelt, Ky.—The Wolf Coal Trading Co. has been incorporated with a capital of $10,000. W. H. Soper, C. H. Whitlaw and T. C. Louks are the incorporators.

Beech Creek, Ky.—The Kirk Coal Co. has been incorporated in this county with a capital of $10,000. The incorporators are L. Z. Kirkpatrick, H. L. Kirkpatrick and C. Kirkpatrick.

Owensboro, Ky.—The W. F. Overstreet Coal Co., recently filed articles of incorporation in the office of the County Clerk. The capital stock is fixed at $2000, divided into 40 shares of $50 each.

Fairmont, W. Va.—The Price Coal Co., the Manitoba Coal Co. and the Ferndale Coal Co., incorporated under the laws of West Virginia, have dissolved. C. E. Hutchison, of Fairmont, was president.

Terre Haute, Ind.—The Indiana-Hocking Coal Co. has been organized with a capital stock of $5000, for the purpose of mining coal. The directors are Walter Bledsoe, Earle Shagley and A. T. Bennett.

Huntington, W. Va.—The Seakay Coal Co. has been organized to operate mines in Logan County. It has an authorized capital of $50,000, and its incorporators are F. D. Clifford, E. M. Jackson, C. F. Boyers, C. M. Roehrig and O. B. Casco, all of Huntington.

Kansas City, Mo.—The Farmers' Fuel Co. has filed articles of incorporation, the capitalization being placed at $62,500. The incorporators are H. C. Snider, V. K. Tuggle, J. H. Bovard and others. This firm will take over a mine at Higginsville, Mo., which has been operated by receivers for the defunct Farmers' Coal Co.

INDUSTRIAL NEWS

Birmingham, Ala.—The suit between Dosenbach & Son, of St. Louis, holders of $67,500 of the bonds of the bankrupt De Soto Mining and Development Co., and R. A. Porter, trustee, was decided in favor of Dosenbach & Son by the referee in bankruptcy on May 21.

Dante, Va.—The Clinchfield Coal Corporation will shortly place in operation in its mines a number of new General Electric mining locomotives, comprising three 5-ton, seven 6-ton, and five 16-ton machines. All of these motors will be 48-in. gage, and built for a 250-volt circuit.

Albany, N. Y.—The up-State Public Service Commission recently refused to allow the New York Central Ry. to substitute coal for oil as fuel on the trains running through the Adirondack forest reserve. The use of oil was ordered originally because of the danger of sparks from coal causing forest fires.

Montgomery, Ala.—Consideration of citations to all Alabama railroads to show cause why the State Railroad Commission should not order a general revision in rates on coal from the mining districts to all points in the state has been postponed until June 22. This order was issued at the request of complainants from several cities.

Pittsburgh, Penn.—The banquet of the Mine Inspector's Institute of the United States of America will be held at the Monongahela House, Pittsburgh, Wednesday evening, June 10, 1914, at 7 o'clock. After the dinner a number of prominent speakers will address the assembly on important mining topics. Good music will also he rendered.

Baltimore, Md.—Stockholders of the Elkhorn Fuel Co. were recently notified of their rights subject to allottment to subscribe to the unsold preferred and common shares of the Elkhorn Mining Corporation, which has leased from the first named company 20,000 acres of coal land in the Elkhorn field of Kentucky, which is now being developed.

Frackville, Penn.—The State Highway Department in its interpretation of the state law has ruled that the cave-in along the state road to Frackville will have to be repaired by the coal company which operates its plant near there, as it was the workings of this company Thorn & Neal by name that caused the cave-in along the road mentioned.

Cleveland, Ohio—Railroads entering Cleveland are storing up thousands of tons of coal just outside the city limit. This is being done so that the roads will not be affected by any shortage of fuel if the operators keep the mines closed or the miners continue their strike. The Lake Shore R.R. alone is unloading from 20 to 30 carloads of coal each day.

Birmingham, Ala.—The Tennessee Coal, Iron & R.R. Co. has received an order for 5000 tons of steam coal for one of the United States war vessels for delivery through Pensacola. This coal will be shipped within a few days. It is probable that a standing order will be placed with this company for delivery through Pensacola, Mobile, New Orleans and Galveston.

Des Moines, Ia.—On May 19 the Christey Box Car Loader Co. shipped the largest box-car loader in its history. This machine was consigned to the Northwestern Fuel Co., at Superior, Wis., for use on the coal docks. Coal is transferred from lake freighters into hoppers or bins by clam-shell buckets, from whence it is fed by this box-car loader into box cars. The machine is capable of handling 3000 tons per day.

Washington, D. C.—According to the U. S. Geological Survey, all records for the production of coke in the United States were broken in 1913 when the total output was 46,311,369 short tons valued at $128,951,430. Last year's production exceeded that of 1912 by 2,327,000 short tons. Of the total output in 1913, 33,596,669 short tons were made in beehive ovens, while 12,714,700 short tons were made in retort or byproduct ovens.

New Orleans, La.—Options have been renewed on yard property held here by Pittsburgh and Kentucky companies. This land is being held awaiting possible business expension after the opening of the Panama Canal. It is announced that plans in regard to this venture have not taken form as yet. There is reason to think, however, that this will be made a point of distribution for cargoes for the west coast of both North and South America.

London, England—The steam collier "Turret Hill" was recently sunk in the North Sea, owing to the shifting of her cargo. The chief engineer who was picked up by a passing steamer said that the vessel turned turtle, going over so rapidly that there was no chance to launch a boat. The captain was also rescued by another vessel, after he had clung for several hours to a lifebuoy. The remainder of the crew numbering 12 are believed to have been drowned.

Louisville, Ky.—The North Jellico Coal Co. will shortly install considerable new electric equipment at Woodbine and Pineville, Ky. The equipment in the station includes a 500-kw. Curtis turbo-generator with a 7-kw. exciter, two 200-kw. rotary converters, three 65-kv.a. transformers, and a switchboard. There will also be installed in the mine five 6-ton electric mining electromotives. The contract for all of the electrical equipment above mentioned has been placed with the General Electric Co.

Whitesburg, Ky.—Since the recent visit of a party of 60 capitalists, bankers, railroad men, and coal operators through the coalfields of Boone's Fork and Elkhorn Creek, in this county, new development work has been announced besides vast increases in the plant of the Consolidation Coal Co., the Elkhorn Mining Corporation, and the Mineral Fuel Co., in which much capital will be expended. It is said that new stock was taken by the financiers in the old operating companies, and that arrangements were practically perfected for the opening of other plants.

Coal Trade Reviews

General Review

Anthracite gradually slowing down. Bituminous demand less than output, but there are indications of a stronger undertone. Much surplus coal still in evidence. Lake trade proving a sharp disappointment.

The anthracite market is being maintained with some difficulty. Full-time operations continue the rule with the large companies, all of which rounded out the current month with plenty of orders for the prepared grades still on hand. Individuals, however, are offering concessions all along the line with the possible exception of stove coal which is in moderately short supply. The steam grades are particularly long, and are being stocked heavily. Dealers generally are seeking business aggressively. The market is firmest at down east New England points, and in the Western all-rail trade.

The bituminous demand has still failed to catch up with the supply, even under the heavily curtailed production. Large demurrage bills are accumulating at tidewater, and producers who have persisted in shipping down on consignment received a severe setback during the week; some important tonnages have been negotiated at less than enough to cover freight charges alone. But even in the face of the many adverse conditions, there are well informed and conservative observers who see indications of a stronger undertone, and are of the opinion that the trade is gradually shaking out the uncertainties of the past two months and getting down to a normal basis.

Moderate concessions on both contracts and spot business, together with a small consumption and a light demand in all directions, particularly in the lake trade, are the predominating features of the Pittsburgh market. Junction and terminal points seem to be less congested, and operators are apparently restricting shipments of consignment coal, but it is generally agreed by all that the consumer is in firm control of the situation.

The two months' complete shutdown in Ohio is beginning to develop a strained situation as regards both the employer and employee, particularly the latter, and vigorous actions toward a settlement are now under way. As regards the market situation, the effects have been nil. Stocks generally are lasting longer than was anticipated, while brokers are filling their contract obligations with higher grade West Virginia fuel, but at lower figures than the Ohio product. As a result of the excessive stocks at the upper lake ports, together with an almost complete absence of the vessels, the lake business is proving a sharp disappointment to the trade. River points have all been heavily stocked during the recent high-water stage. Concessions on the regular circular, involving small tonnages, are reported in Hampton Roads where the movement continues at about the average, though confined mostly to contracts.

The Southern markets are reported rather strong, May shipments showing a decided increase. Some slight improvement is also noted in the Middle Western fields, due to larger requisitions on railroad contracts, and an increased steam demand.

EASTERN MARKET

BOSTON

Delivered price for Pocahontas and New River very weak. Pennsylvania demand practically nothing. Anthracite remains quiet with shippers soliciting orders. Marine freights continue low.

Bituminous—At Hampton Roads there is a large accumulation of New River and Pocahontas. The $2.85 f.o.b. price has not been openly shaded on f.o.b. sales but there can be no doubt that the return on cars at Mystic Wharf do not net back anything like that figure. The consumers all over New England have not only ample stocks but in many cases more water power than they can use with the result that even contract demand is extremely light. In some cases the fear of a light fall business is another deterent to the taking on of summer coal. Pennsylvanias, which are largely dependent on the condition of the Southern coal market, are naturally light in demand.

Marine Freights remain low, due to the record dispatch prevailing at all loading ports and to the light tidewater business. The usual rate, Hampton Roads to Boston, is 60c. but large bottoms can be had at 55 cents.

Anthracite—The companies are soliciting orders for everything but stove size. The May circular continues to be maintained in this section.

Bituminous prices at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*.....	$0.90@1.50	$1.20@1.65	$1.67@1.77	
Philadelphia*.....	2.15@2.75	2.45@2.90	2.92@3.02	
New York*.....	2.45@3.05	2.75@3.20	3.22@3.32	
Baltimore*.....	.....	.....	2.85@2.95	
Hampton Roads*.	.....	.....	.....	$2.80@2.85
Boston†.....	.....	.....	.....	3.40@3.70
Providence†.....	.....	.....	.....	3.50@3.78

* F.o.b. †On cars.

NEW YORK

Bituminous shippers of consignment coal receive a severe setback, but a more hopeful feeling prevails. Concessions obtainable on all anthracite grades except stove coal. But large companies report plentiful orders.

Bituminous—Soft-coal operators who persisted in shipping coal to tidewater without specific orders, were taught a severe lesson during the past week. Stocks are very heavy in all directions, one company reporting some 200 tons on demurrage at Port Reading. Many of the large consumers are said to have all the way from one to three or four months' supplies on hand, although the fact that there was rather more inquiry than usual during the week indicates that others are beginning to run short. The generally depressed condition of the market has been further accentuated by an unusually poor demand for steamship fuel for the time being; this business is generally erratic, but has been consistently hanging around the low point for the past two weeks or more.

On the bull side of the market there are well informed and conservative observers who believe they see indications of better conditions. There seems to be no tangible evidence of such, aside from the fact as already mentioned, that there have been a few more inquiries; but it is nevertheless a fact that some members of the trade are assuming a more hopeful attitude over the future.

About 750 tons of Cambria County, Penn., coal was offered during the week at $1.70 alongside, or 5c. less than the freight, while sales have been negotiated on the basis of 60 to 65 cents f.o.b. mine on distress coal, with the sellers believing that they had obtained a good bargain. However, the nominal market continues on the same basis as before, as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The large hard-coalers report that they are still behind on the prepared grades and that a great many orders will be carried over into next month. The steam grades are generally reported easy, with many of the companies putting them back into storage.

But with the individuals, conditions are radically different. No premiums whatever are to be had, and stove coal is the only grade selling at the full circular. Of the other

prepared grades. egg is selling at 15c. off the circular, with chestnut heavy at 20c. off, and pea in long supply, at 25 to 30c. less than circular quotations.

In the steam department, low-grade buckwheat can scarcely be moved at any figure, while off-quality rice, which was in good demand a few weeks ago, is also beginning to feel the effects of the heavy pressure. The individuals are beginning to curtail shipments of barley to tidewater, but the off grades are still selling at low figures; the high grades continue active at the full circular, though occasional odd lots on demurrage are selling at a concession of 30c. The better qualities of buckwheat are hardly moving at 10 to 15c. off the circular, and individuals are holding tonnages on boats awaiting a better price.

We quote the New York hard-coal market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.70	$4.55@4.70	$4.65	$4.50@4.65
Egg	4.95	4.85@4.95	4.90	4.75@4.90
Stove	4.95	4.95@4.95	4.90	4.90@4.90
Chestnut	5.20	5.00@5.20	5.15	4.95@5.15
Pea	3.55	3.40@3.55	3.45@3.50	3.20@3.45
Buckwheat	2.80	2.65@2.80	2.50@2.75	2.10@2.75
Rice	2.30	2.25@2.30	2.00@2.25	1.70@2.25
Barley	1.80	1.55@1.80	1.70@1.75	1.20@1.70

PHILADELPHIA

Prospects not good for anthracite trade in June. Curtailed mining anticipated. Retail trade very inactive. Bituminous situation still disappointing, with little or no improvement in the outlook.

Anthracite—The month of June is not likely to hold much in the way of extensive trade, for the anthracite business. Outside of New England, where the market is still normal, all other sections of the country seem to be on the verge of a slump. Curtailed mining is freely predicted. The local retail market is far from being satisfactory. Solicitations by the dealers meet with the response that the taking on of coal into cellars will be postponed until the fall. In fact, it is doubtful if retailers ever went after business as diligently as has been the case this year, but their efforts have been generally abortive.

As previously indicated, this is undoubtedly due to the industrial inactivity. The lack of cash to buy does not appeal to the average dealer, and he prefers to wait for the business later, rather than run the chance of losing not only the fuel, but the investment also. The bright spot in the situation is the New England market. The large fleets of barges trading to this terrieory, still continue to be well taken care of, filling orders, which embrace all sizes from broken to chestnut, with the heaviest demand on stove. Eliminating this feature, the market is dull and while there is no cessation of operations as yet, it seems likely to come in the near future. The usual advance of 10c. per ton will become effective on the first of June, making tidewater prices on that date as follows:

	Circular	Individual
Broken	$4.45	$4.45
Egg	4.70	4.60
Stove	4.70	4.70 @ 4.80
Chestnut	4.85	4.95
Pea	3.25	

Bituminous—The bituminous situation holds out even less hope than anthracite. It is going from bad to worse. Even with curtailed mining in many districts, the demand does not catch up with the supply, and prices have a tendency to sag. Contracts are being suspended, and large demurrage bills are accumulating at tidewater, with coal selling at ruinous prices, in some cases netting little more than the freight.

BALTIMORE

Foreign movement holds well and anthracite men believe that the next month will see a fair business. Bituminous as whole has experienced the worst week of the summer.

The past week has been the worst of the present flat spell, little or no new business developing. In the mining regions of western Maryland, West Virginia and western Pennsylvania the same tale is told of more coal on hand than can be disposed of, even with a curtailed production. Hope of a demand from the Lakes is bolstering up the West Virginia trade, for there is little business east on other than existing contracts. Slack is a sort of shuttle-cock of the trade, and sells variously, at from 50 to 65c. Three-quarter gas ranged between 80 and 90c. and steam coals at from 85 to 95c. Little change was noted in the Pennsylvania situation where producers are holding better coals for improved market conditions. Medium and low-grade fuels sell variously at from 95c. to $1.15.

That Baltimore is coming in for more of the foreign business is indicated in the large number of vessel charters being announced for June loading. Most of these will coal at the Curtis Bay pier of the Baltimore & Ohio R.R. The action of Congress in authorizing the deepening of the water approaches in Curtis Bay will mean another large pier there in the near future, the Baltimore & Ohio having announced their intention of erecting one in such an event.

While the May anthracite trade was less than in some former years, with a number of dealers, the hard-coal men are expecting a healthy June demand.

CENTRAL STATES

PITTSBURGH

Consumption small and demand light in all directions, particularly in the Lake trade. Substantial concessions made on new contracts. Coke eased off still further and now at the lowest point for some time.

Bituminous—There has been no increase in coal production in the past week, following the increase reported a week ago, when our estimate was that the Pittsburgh district was operating at 50 to 60% of capacity. A closer estimate would probably be 50 to 55%. The chief cause of the low rate is the small demand for the lake trade and the light demand in near-by territory, by railroads and manufacturing interests. The existence of stocks in consumers' hands is an influence, but now a relatively small one, as the stocks are fairly well liquidated. The actual consumption of coal is small.

The stocks accumulated by consumers months ago, in anticipation of a mining suspension, have been having this important effect, that they have very largely enabled consumers to postpone the making of annual contracts. Without stocks, there would have been wholesale renewal of contracts which expired Apr. 1; as it is, the bulk of the contracts are still unclosed, although two months of the new twelve-month have passed.

In such contracting as has occurred, regular prices have usually been cut, in the case of contracts at all desirable, and there are rumors that in extreme instances the cutting has been as much as about 20c. a ton for mine-run. For prompt shipment there has likewise been cutting. It is impossible to quote a definite market, but in general it can be stated that the bulk of the coal is realizing 10@20c. under the nominal price, except on slack, in which the concessions average nearer to 5@10c. The nominal prices remain: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

Connellsville Coke—The market has grown very soft. One or two aggressive sellers have gone forth to book contracts for furnace coke for delivery after June 1, and to close such business they have had to shade the $2 price by at least 15c., and possibly by 25c. in some instances. The operators who were openly committed to the $2 figure have not openly receded, but they are making no effort to sell and may revise their figure later when furnaces are forced to close. The leading foundry-coke producers have reduced their nominal asking price from $2.75 to $2.65, as some foundry coke of fairly good grade has been going for weeks at $2.50 and less. The market is quotable as follows: Prompt furnace, $1.80@1.90; contract furnace, $1.85@2; prompt and contract foundry, $2.35@2.65, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 16 at 294,715 tons, a decrease of 17,385 tons, and shipments at 275,830 tons, a decrease of 15,336 tons. Production appears to have exceeded shipments by 18,885 tons, making a total excess in the past eight weeks of no less than 84,860 tons, according to the "Courier" figures.

BUFFALO

Some cleaning up of bituminous on track, but not sufficient to improve the demand. Mines mostly running at a slow rate. Railroads not making contracts. Coke still inactive and anthracite quiet.

Bituminous—There is little stir in the trade, though it looks as if the operators and jobbers were more cautious about shipping unsold coal. Some of the terminal and junction points are less badly congested, but there is still excess coal everywhere. Some of the smaller mine owners and sales agents are hopeless; they say that it is impossible to do business at a profit and they are making little effort to go on. As a rule all the mines in the Allegheny Valley are running on part time, mostly because they have some contracts to take care of and they do not want to go out of business entirely. Buffalo is about as steady a consumer of bituminous as any point in this territory and it must be taken care of.

Some of the operators, not so well posted as they might be, are insisting on sales and shipping their output forward whether it is disposed of or not. With the market off so long, when there has been reason for expecting something better, it is hard to realize that the consumer is again in control of prices and is going to remain so for an indefinite time. The failure of bituminous coal to move by lake has intensified the dullness.

There is no real change in the condition of the bituminous market. Some mines are getting low prices, especially where the coal is not of the best or the sales organization is incomplete. Others claim that they are getting full prices, which are $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes about 25c. lower than Pittsburgh.

Coke—The market for all grades of coke is still as dull as ever, some dealers hardly being willing to discuss it. Prices rule on the basis of $4.50 for best 72-hr. Connellsville foundry, as formerly.

Anthracite—There is a fair demand, the lake trade keeping up better than was indicated early in the month, the week's shipment being 121,000 tons. A few cargoes that were loaded last winter are still here, because the vessel is unable to find a fair amount of business. All branches of the lake trade are very dull.

There is some life to the Western all-rail trade and some shipping agents are short of supply, on account of a better tide-water trade. Locally the demand is very slack. Independent anthracite is not coming this way at all liberally and all jobbers are short.

TOLEDO

Lake trade dull as a result of the large stocks in the Northwest and the lack of return cargoes. Unfavorable decision on the screen law creates additional uncertainties among the operating interests.

There is still an absence of demand from both steam and domestic consumers and lake shipments are light. A few boats are loading for up-lake ports but the great quantity of coal left at the docks last winter and the lack of return cargoes makes the probability of much more fuel going up at this time, questionable.

The decision of the District court, upholding the constitutionality of the Green anti-screen law, has caused a great set back and operators in this section are very doubtful of the consequences. A stay of execution for fifteen days was, however, granted so that the case can be appealed to the appellate court. The case will be carried up and until a decision is rendered business will probably remain at practically a standstill. There are operators in this section who claim that if the decision stands it will put their companies entirely out of business.

COLUMBUS

Miners' officials declare a strike, dating from May 2 and benefits will be paid.. Governor Cox issues a call for a conference of operators and miners. Ohio mine-run law declared constitutional.

All Ohio miners are still idle and will continue so for some time. Arrangements have been concluded for a conference of operators and miners to be held June 2 when an effort will be made to fix a new wage scale. This was brought about by the intervention of Governor Cox who invited the operators to his office for an informal discussion of the situation.

In the meantime the miners' officials, in order to releive the distress among idle miners, called a strike in Ohio, dating from May 2 and strike benefits at the rate of $3 weekly will be paid. For the time being only two weeks will be advanced as the treasury is much depleted. Enginemen and caretakers were not called out.

There is some increase in the demand for steam grades but the shipments from West Virginia and Kentucky are taking care of this. Because of the general business depression manufacturing plants have not been using so much fuel and the surplus stocks are lasting longer than was originally believed possible.

There is a slight increase in the demand for domestic grades but dealers have been able to take care of this from their surplus stocks. Some of the larger householders have shown a disposition to stock up earlier than usual and there is every indication of higher levels as the present situation will result in a depletion of stocks in every quarter.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.45@$1.35		$1.50@$1.40	$1.40@$1.35
¾-inch	1.30@ 1.25	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.25@ 1.20		1.30@ 1.25	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.15@ 1.10
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.75@ 0.70
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.65@ 0.60

CLEVELAND

Although reserve stocks are rapidly disappearing the market fails to improve. Many plants are closed down temporarily. Lake trade is slowing up and freights have advanced on some smaller cargoes.

The wholesale market is again at a lower level, due largely to the lack of an outlet for Pennsylvania and West Virginia coals, which are being offered at low prices. A large number of manufacturies have used up their storage coal, but are buying little because they are working either part time or not at all. Brokers and operators who have contracts to supply No. 8 Ohio coal are filling orders with Fairmount gas and making more than they could were they selling No. 8. Fairmount slack can be bought to sell at $1.70 but brokers have been forced to meet Yourgiogheny slack offerings at $1.65 on track here. There is little demand for run-of-mine and three-quarter sizes. The general dullness of business in this vicinity is the real cause of the poor coal market.

Pocahontas operators are still hard pressed to sell slack. High-grade slack has been offered at $1 and what would ordinarily be a good grade of coal and readily acceptable is selling at even less. The buyers are extremely particular with the result rejections are more frequent than they have been in the last year.

Lake Trade—The lake shippers have taken so much coal at some of the upper docks they are forced to shut down on shipments. Splint, Youghiogheny and Pocahontas have gone up the lakes in large quantities and the docks did not have much space in the first place. The Pittsburgh Coal Co. has announced that it will contract for its vessel requirements in the next week or ten days.

Large ships are having difficulty finding cargoes. Vessels carrying 7000 to 10,000 tons are freely offered and coal shippers cannot possibly care for them until the dock space is cleared. On cargoes of less than 7000 tons, car service is being paid because boats cannot be readily obtained; 40c a ton, 10c. above the rate, was offered to get a boat to load coal paying car service. Offers of 37½c. were freely made on small cargoes. These smaller boats cannot break even hauling coal to Lake Michigan light as some of the larger boats are able to do.

From the way the season is opening there is every reason to believe there will be a rush of business this fall. Coal will be needed toward the latter part of the season and a slow start in the lake trade always results in a rush before the close. Coal shippers will have to pay some extra freight to get their coal before the end of 1914.

The market for spot and shipment coal is nearly the same quotations being as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.05		
Lump, 1¼-in.		$2.35	
Lump, ¾-in.		2.25	$2.00@$2.05
Mine run	2.60	2.10	1.95
Egg	3.05		
Nut		2.10@2.15	
Slack	2.20@2.35	1.65@1.70	1.65@ 1.70

CINCINNATI

No perceptible improvement, although the domestic movement is steady. Light demand for steam grades is still a feature, while inability to get boats at the lake ports is holding up the movement in that direction.

A few optimistic members of the trade believe they detect a change for the better but this seems to be without any real foundation. The slow lake movement, which usually absorbes a large tonnage at this season, is a depressing factor of large importance.

Operators report that while there is little or no difficulty in getting all the cars needed at the mines, it is impossible in most cases to move coal further than the lake docks, as there are no boats available. Many steamers which have taken on cargo of coal out have tied up on the return trip, refusing to load coal again on account of the inability to obtain return cargoes.

River coal is plentiful, the favorable stage of the Ohio having given Pittsburgh operators ample opportunity to move large tows down. In fact, this and other points on the Ohio are now so well stocked that shipments are likely to be substantially reduced, even with the usual prospect of low water in the near future. A dull market in nearly every department continues.

DETROIT

Steam market practically dead and the effects of the general suspension are becoming more evident. Anthracite normal.

Bituminous—The effects of the slump in general business and the depression in all parts of the country are becoming more and more evident in the coal business. The fact that

the Ohio mines have now been idle for two full months together with partial curtailment in the other mining districts without in the least creating any shortage in the market is significant of the trend of conditions. The steam market is practically dead, with slack down to 35c., while domestic trade is, if anything, even worse. Pocahontas, egg and lump appear to be only grades in any demand at all.

Anthracite—The customary activity has prevailed in hard coal and if anything a little larger tonnage than usual has been moved. The demand still centers on stove coal and the line trade has improved with indications for still more business, as the summer advances.

HAMPTON ROADS

Shipments during week fair. Demand light on all grades. Some coal being dumped for government use.

The movement from Hampton Roads has been fairly good. There have been some days during the week when little work was done at any of the piers but at other times they were all working to full capacity so that on an average the dumpings show up fair.

The demand for spot New River and Pocahontas run-of-mine has been somewhat light with few large parcels reported sold. A greater part of the shipments moving have been on contracts. It is impossible to say at what price spot sales have been made but it is understood that some of the smaller suppliers have made some slight cut in order to move accumulated tonnage. There is practically no inquiry at all for high volatile coals and although some small cargoes have moved this has also been on contract going to the New England market.

Foreign cargoes have been shipped to Naples, Genoa, Montevideo, Trieste, La Plata, Port Spain and Havana. In addition to foreign and coastwise shipments, the government has loaded some more coal into colliers for use in Mexican waters and it is expected that during the next few days two foreign steamers will take government cargoes for the naval stations on the Pacific Coast.

LOUISVILLE

Increased demand for domestic coal. Settlement of the differences between the operators and the miners in the western Kentucky field has little effect on the situation.

The demand for steam sizes is practically nonexistant, according to operators and dealers with connections in both divisions of the Kentucky field. The railroads, which have been laying in coal for the sole purpose of relieving the congestion at the mines, are overstocked at all their coaling stations. Occasionally the renewal of a contract at a slightly reduced rate is noted though for the most part the operators are holding out for their regular prices.

Mines in the eastern Kentucky field are working on an average of three days a week, while there are no definite figures available as regards western Kentucky operations. Prices continue without change, though the operators are said to be looking forward to an improvement in the demand which will enable them to put an advance into effect.

SOUTHERN AND MIDDLE-WESTERN

BIRMINGHAM

Better feeling in the coal market than for several months. Lump coal more active and demand for steam grades better. Pig iron seems to be improving, but coke is quiet.

The market on lump coal is gradually improving. It is the usual custom for the retail yards to place their orders for summer and fall delivery when the spring prices go into effect, but the majority of them failed to do so, believing that they would be able to buy at their own prices later on during the summer. However, recent developments indicate that business is going to be good and that there will be no reduction in the regular prices, so the retailers are beginning to come into the market. May deliveries will show a substantial increase over April.

While the steam business is not all that it could be, still, the general opinion is that within the next 30 days the situation will be normal, and the mines will be running to their usual capacity. Manufacturers of pig iron are more optimistic regarding the future.

NEW ORLEANS

Sales are below normal despite extra business resulting from the presence of the fleet in Gulf waters. Interior demand is very light. New yards along canal makes city delivery cheaper.

Coal sales are much below normal. Some sales are being made to cotton gins and other plants but retail dealers in the towns and cities are not stocking up as yet. Owing to the scant offerings of ocean freight the number of commercial vessels making this port is smaller than usual and as a result less coal is being taken on the water front. The presence of a number of refugee vessels and government transports has resulted in some business but practically no coal is being shipped to Mexico. Business with other Latin American countries, at no time large, is normal.

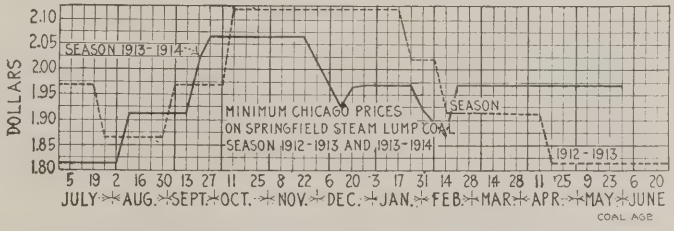
Negotiations are in progress for yard room along the New Basin Canal which will allow the landing of coal in the heart of the city from barges, and should effect some reduction in the cost of handling

Prices are being demoralized by the concessions that all companies are making to get business. Local dealers were disappointed in not getting the navy yard business. Government colliers now are replenishing the stock there with coal from Norfolk.

CHICAGO

Chicago coal market continues dull. The closing of a few railroad contracts and a slight gain in the demand for steam coal the only relieving factors. Anthracite trade suffering from money shortage. Unusually dull conditions prevail in smokeless coal and furnace and foundry coke.

The dull situation has been partially relieved by the completion of a few contracts by railroads and a slight increase in the call for steam coal. A small buying movement in screenings just keeps the price firm at what it has been for several weeks.



A shortage of money has caused a lack of interest in anthracite coal and resulted in weakening of the steam coal prices. It is usually customary for the anthracite consumers to purchase their coal in April or May to obtain the discount figures, but as a result of the present financial stringency, they are holding off.

A large number of dealers, who realize the position of smokeless coal among discriminating buyers, have been coming into the smokeless market with lower grades which analyze from 28 to 30 per cent. volatile matter. These coals are selling at from ninety cents to a dollar a ton on the track but this has had no material effect upon the real high grade smokeless, of which there have been few sales recently. Because of the continued dullness in the iron and steel trade, the same inactivity prevails in foundry and furnace coke. There is a little improvement in the demand for byproduct coke for domestic use.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump.....	$2.07	$2.30@2.40	$2.12	
Steam lump.....	1.97		1.97	
Egg.....		2.30@2.40		$3.65
Mine-run.....	1.87	2.15@2.25	1.87	3.05@3.30
Screenings.....	1.77	1.95	1.67	

Coke—Connellsville and Wise County, $5@5.25; by-product egg, stove and nut, $4.45; gas house, $4.25.

ST. LOUIS

Coöperative and railroad-owned mines cutting prices and creating a weak market. Some further price reductions have been recorded.

During last season somebody was making money on different kinds of coal, but right now it seems to be a losing proposition on everything. In the Standard field the cooperative mines are the cause of all the trouble in one way, while the mines owned by the coal carrying railroads are the cause in another way. Both are a detriment to the independent operator, and keep the market continually below the cost of production.

The Government contract for the federal buildings, went to the Polar Wave this week, at $2.12 delivered wagon-load lots, guaranteed to develop an exceptionally high B.t.u. value, on Standard lump coal. Figuring 92c. for hauling and fright, this leaves $1.20. Franklin County coal is selling as low as $1 and $1.05 for the screened sizes, while Carterville is going at from $1.10 to $1.25. Both the Carterville and the Standard screenings market have fallen off some, the former selling at 75 and 85c. and the latter at 65 to 70c.

Independent and off-grade anthracite, is being offered as low as 38c. off the May circular. One of the relieving features to the anthracite trade has been the cancellation of the through rates in connection with the St. L. T. & E., which is owned by coal mining interests and also by St. Louis retailers. This company had about 28c. allowance from the Clover Leaf and connections, and had unlimited time at East St. Louis on their coal. They were thus able to cut the price whenever they felt so disposed, and nobody else could meet the competition. The St. Louis Coal Traffic Bureau accomplished something in this way.

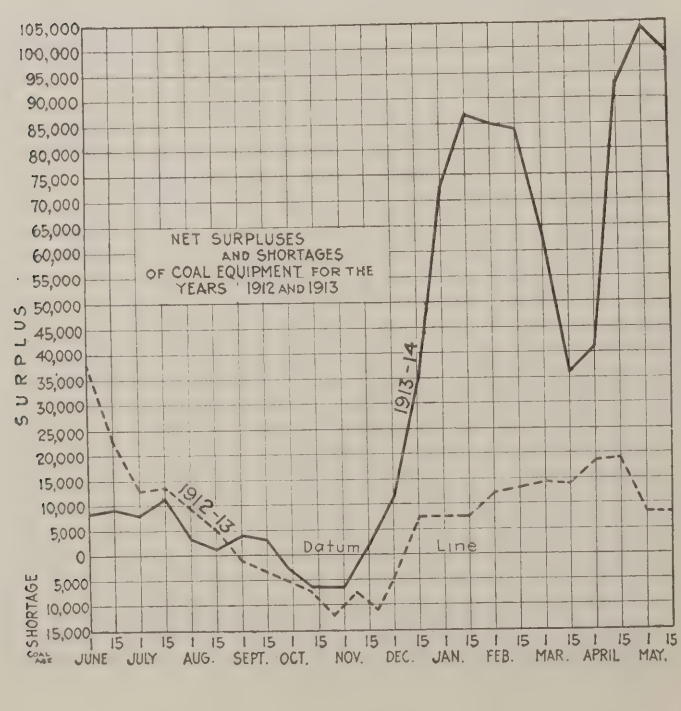
Coke and smokeless are moving slow, and the retail trade is extremely dull.

KANSAS CITY

Wheat prospects helping the coal situation. Brisk bookings for June and July delivery reported. Mines showing tendency to extend operations.

Prospects for one of the largest wheatcrops in years have had a favorable effect on the coal situation. Wheat cutting will begin early in June and threshing will follow a fortnight later. Sales offices are devoting their efforts largely to selling farmers for June and July delivery, and the situation is much improved as a result. The tendency in some quarters to cut under the circular has about disappeared with the brisker demand, and the mines are extending operations. The worst of the summer lethargy is believed to be over, as demand from other sources will prevent extreme quietude in the late summer.

PRODUCTION AND TRANSPORTATION STATISTICS



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended May 1, as follows:

	Surplus	Shortage	Net*
New England Lines	1,409	0	**1,409**

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during February, March and April of the current year in short tons:

	February	March	April
Pocahontas Field	942,477	1,161,793	1,156,670
Tug River District	204,074	246,490	221,344
Thacker District	198,228	274,786	232,181
Kenova District	71,401	88,616	96,116
Clinch Valley District	152,769	153,704	156,502
Other N. & W., Territory	3,694	2,741	2,827
Total N. & W. Fields	1,572,643	1,928,130	1,865,640
Williamson & Pond Creek R.R.	26,314	43,865	79,828
All other railroads	67,518	140,123	171,818
Grand total	1,666,475	2,112,118	2,117,286

Distribution of shipments for April was:

	Shipped	Tipple	Total
Pocahontas	1,066,583	16,336	1,082,919
Tug River	219,221	2,123	221,344
Thacker	222,770	9,411	232,181
Kenova	87,884	8,232	96,116
Total	1,596,458	36,102	1,632,560

Shipments of coke, entirely from the Pocahontas field amounted to 64,340 tons.

The following is the destination of shipments for April and the first four months in short tons:

	April		Four Months	
Coal	1913	1914	1913	1914
Tidewater, foreign	147,917	188,413	535,211	617,18
Tidewater, coastwise	326,920	323,280	1,300,671	1,315,14
Domestic	1,068,383	1,605,493	5,401,914	5,929,36
Coke				
Tidewater, foreign	6,950	.....	16,984	1
Domestic	122,845	2,204,204	7,816,249	8,265,29
Total	1,672,845	2,204,204	7,816,249	8,265,29

FOREIGN MARKETS

GREAT BRITAIN

May 15—The inquiry is limited, and, with supplies increasing, the tendency of values is easy. Quotations are approximately as follows:

Best Welsh steam	$4.62	Best Monmouthshires	$4.
Best seconds	4.38	Seconds	3.
Seconds	4.14	Best Cardiff smalls	2.
Best dry coals	4.20	Seconds	2.

The prices for Cardiff coals are f.o.b. Cardiff, Penarth o Barry, while those for Monmouthshire descriptions are n f.o.b. Newport; both exclusive of wharfage, and for cash 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry $4.80@5.52; furnace, $4.08@4.56.

COAL SECURITIES

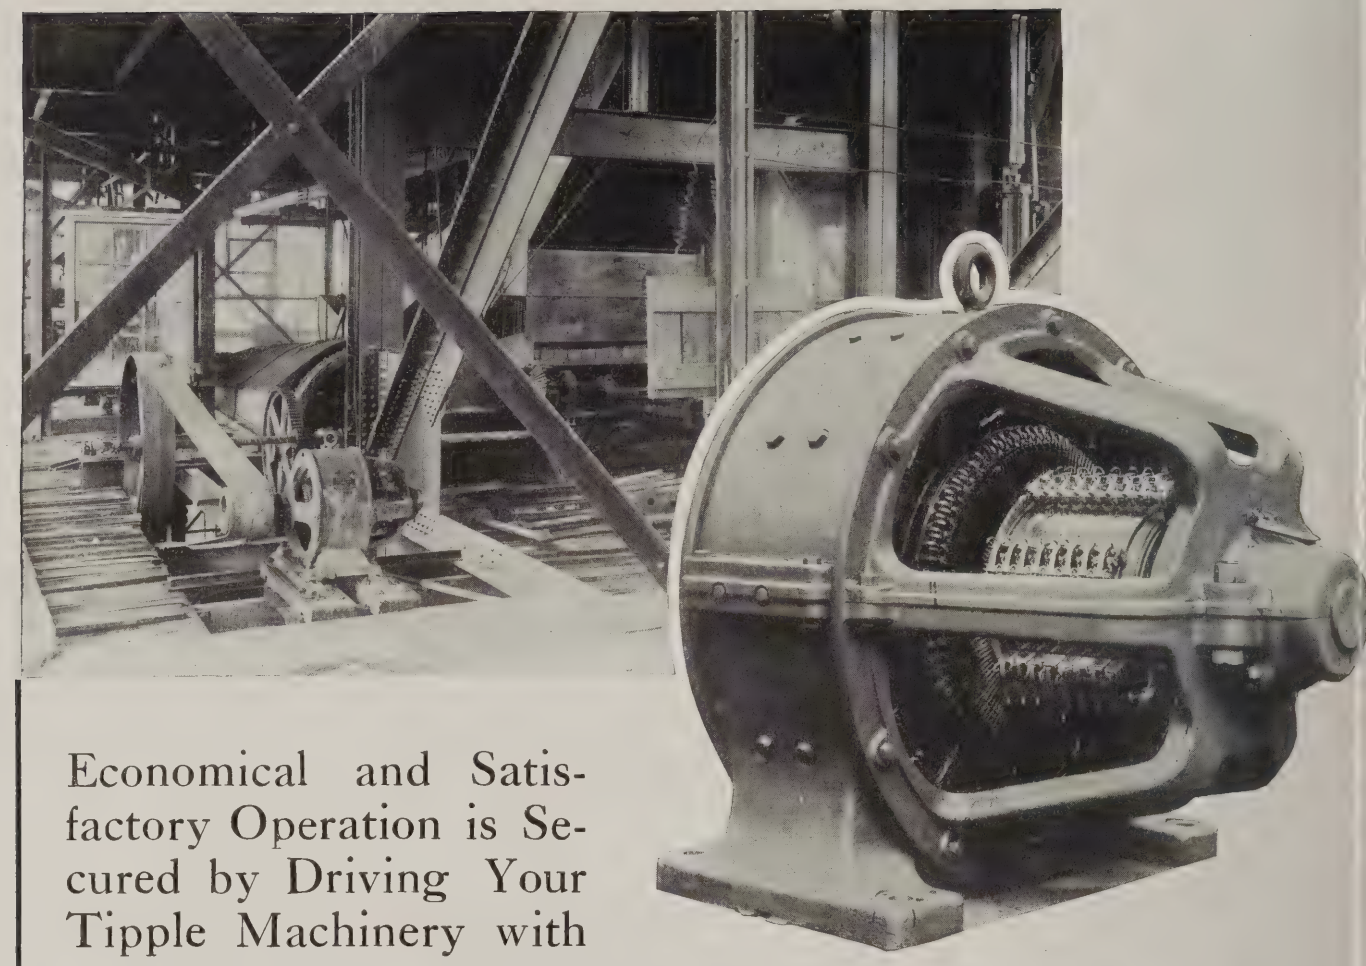
"Cost of breakdowns cannot be measured by cost of the broken parts"

The repair of breakdowns on a locomotive with plain bearinged armature shaft may run as high as $60 a month. But even this is an absolutely inadequate gauge of the loss caused by such breakdowns.



When a locomotive goes wrong on the job, the whole routine of the mine may be queered for the day, movement of coal stopped, trips of loaded cars stalled, men hopelessly waiting, disgusted,—for empties.

Equipment of the armature shafts of mine locomotives with HESS-BRIGHT Bearings is vitally important because such equipment eliminates the chief causes of locomotive failure.

Insist on HESS-BRIGHT for your Armature Shafts.

The Hess-Bright Manufacturing Co.
Philadelphia, Pa.

HESS-BRIGHT
HB DWF
BALL BEARINGS

Economical and Satisfactory Operation is Secured by Driving Your Tipple Machinery with

Westinghouse Electric Motors

These motors are especially suitable for driving tipple machinery. They are remarkably simple in construction with few parts, all of which are readily accessible.

The following are a few of their important features:

Electrical Characteristics:

High efficiency at all loads. This means low operating costs.

Sparkless commutation over wide range of load. This means continuous operation under severe conditions.

Low operating temperatures, and ample overload capacity.

Mechanical Characteristics:

Light weight with great strength.

Bearings are dust proof and cool running, insuring reliable service. They have liberal bearing area and are flooded with oil whenever the motor operates.

Write to the nearest office listed here for full information regarding these motors.

The Great National Antidote For Stagnation

The Weekly Ad-Talk Page

It is interesting to consider the wide application of advertising in these days.

Only a few years ago it was considered an extraordinary and rather a dangerous thing for a church to advertise. And yet today church advertising is regarded as commonplace.

Advertising is used in almost every field of work.

Probably you, yourself, can remember political candidates elected to office because of judicious appeals in the newspapers or on the billboards.

Money is raised for charity by advertising.

Cities advertise in order to increase their population, to draw factories, shops, manufacturing plants of various kinds.

Whole primitive districts of the great Northwest have been turned into thriving communities by means of the advertising of the Canadian railroads.

Advertising is one of the most powerful of modern institutions. It is our great national antidote for stagnation.

Advertising is a goad—in its lexicon there's no such word as "quit."

It forces the whole manufacturing world to keep on the jump—to do new things—to evolve new ideas—to better quality—to make honest prices.

To those who conscientiously use advertising as a salesman, it brings great business returns.

To those who "read, mark and inwardly digest" advertising, it gives the power and ability to buy widely, reasonably and profitably.

The rule must work both ways, or it won't work either.

"A good article, good advertising, good results for the buyer"—that's the formula and you can't supply a "bad" for any one of those three "goods" and get away with it!

Cultivate your acquaintance with the ads in Coal Age—they are put there for your benefit.

The Wonderful Dream

By Berton Braley

Written expressly for Coal Age

WEARY with project and plan and scheme
The Manager slept and dreamed a dream
Of a noble Stranger who bade him, "Come,
And I'll show you a mine that is GOING SOME!"
So away they flew through the ambient air
Till they came to a spot exceeding fair,
And there they gazed on a handsome mine
Where everything seemed to gleam and shine,
Where hoist, compressor and breaker too
Were big and busy and neat and new,
And all the workers, with smiling faces,
Were doing their best in their proper places.

Into the deep shaft's yawning crater
They dropped in a cage like an elevator,
And through the whole mine's great extent
The Manager and the Stranger went.

THE air was bracing and pure and cool,
There wasn't a sign of a horse or mule,
(Electric motors performed the work
Which they had done in the dark and murk)
Each miner toiled with a right good will,
His cars stood ready for him to fill,
There was no hurry, no heat and haste,
No useless waiting, no fret, no waste,
The miners toiled with a skill most deft
And when they were through there was no coal left.
The guide explained as they went their way
That the miners lived to be old and gray
And died at ninety or more, he said,
With the sorrowing family round the bed!

He added, "this is a fact, I vow,
"There's never a strike or a labor row!"
The Manager wiped his throbbing brow,
"Say, where is this mine?" he loudly cried,
"In Heaven, of course" returned the Guide!

THE Manager woke and from bed he sprung
For the telephone bell had loudly rung,
He put the instrument to his ear,
And this is the message he had to hear,
"Hello, hello! The pumps are clogged,
The lower workings are water-logged,
And the hoist is broke and the fan won't go,
And the breaker's stopped—'cause the steam's too low,
And the shaft is filling with mud and muck,
And—hey, hello there! The men have struck!"

What Is to Become of the Anthracite Coal Industry?

By Eli T. Conner*

SYNOPSIS—Some interesting history concerning coal mining in the anthracite fields of Pennsylvania Conditions prior to present agreements and causes that led up to understandings between the big railroad interests. Labor troubles in 1900 and 1902 and adoption of sliding wage scales. If the railroads must part with their coal holdings, it is suggested that the industry be governed by a board of commissioners.

The dissolution of trusts or supposed trusts controlling many important lines of business, which state and national laws or legislators demand, naturally prompts the question: What is to be done with the pieces when a long established enterprise is broken up? Should the persistent efforts to disrupt the so called "Anthracite Coal Trust" prove successful, and the present owners of over 90 per cent. of the mines and lands in that region, the railroad companies, be compelled to relinquish their coal holdings, how shall the anthracite business be conducted?

The present owners, who are struggling to maintain a position that has taken years to attain, together with untold millions of dollars capital, could hardly be expected at the present time to consider any plans under such an eventuality, but it seems to me that the effects of such dissolution, should it take place, ought to be pointed out, in the public interest, as well as for the protection of the invested capital, and the interests of the employees; and that the coal remaining shall be conserved to the utmost possible extent.

Causes That Led Up to the Present System

Intelligent consideration of this important subject can only be given in the light of the past experiences in the anthracite region. It is, therefore, necessary to review as briefly as possible, the history of the development of the industry and the causes that led up to the system that now prevails.

Aside from the question of freight rates on coal, which has no part in this discussion, a correct understanding of the conditions will reveal that great benefits to all interested, including the general public, have followed the inauguration of the present regime.

The advocates of a return to "the good old times of unrestrained competition," should recall its baleful effects upon all kinds of industry, individual employees and property, during the three decades from 1865 to 1895.

It only requires consideration of one prime instance to illustrate the point desired—the transportation system. During the period mentioned, the fiercest and most unscrupulous competition in rates, rebates, and every other form of warfare known to experts of that destructive period, was the rule, resulting in wrecks of system after system, with receiverships and re-organizations with their attendant waste of resources; the physical deterioration of property, and the destruction of the equities of security holders.

*Consulting engineer, Stephen Girard Bldg., Philadelphia, Penn.

This competition, aided sometimes by the assent of state authorities, was the main reason for the abandonment and destruction of the systems of inland waterways and canals. Canals were said to be out of date, and truly, were unprofitable, but it is now fully recognized that it was a serious mistake to destroy the improvements that had been so popular and useful during the first half of the 19th century.

What happened in transportation affairs was duplicated in nearly all other lines of industry, and particularly was this the case in the production and marketing of anthracite coal, which is the subject of this paper.

Inefficiency in Mining Irreparable Waste

The effects of the chaotic conditions in transportation affairs were serious, though not irreparable; but in mines, it is quite a different thing, for here, unless the highest grades of efficiency and care are constantly exercised, great and irreparable waste of an incomparable natural resource results.

It will be interesting to trace the history of the anthracite industry from 1865; after the artificial stimulation of the war period, until 1895, when the lowest depths of despair were plumbed by those whose capital and interests were involved. During this period, when the annual output of anthracite coal increased from about ten million tons to forty-six and one-half million tons, almost unrestricted competition in every department of the industry, but particularly in the market, prevailed.

Efforts were made at various times by many interests to arrive at uniformity in operating methods and market prices, but these attempts nearly always failed.

Most of the mines developed prior to 1871 were owned by individual operators, the conspicuous exceptions to this rule being the Delaware & Hudson Canal Co., the D., L. & W. R.R. Co., the Pennsylvania Coal Co., and the Lehigh Coal & Navigation Co.

The demoralization was so great during much of this period and the failures of operations so frequent, that it was almost impossible to interest capital in such a hazardous business; but meantime the great value of anthracite coal as the ideal domestic fuel, as well as its value as natural coke for the manufacture of pig iron, was more and more appreciated by the consuming public, as indicated by the steady annual increase in production. The growing inability of individual operators to continue the fight for exstence, partly due to the fact that the cheaply mined coal above water level was exhausted, but more to the fierce competition in the markets which reduced the prices realized below the profit line, coupled with the imperative necessity to assure all the coal for transportation that was possible, practically forced upon the railroad companies the necessity to buy and operate coal mines themselves.

All of the railroads serving the anthracite region from the early days of its exploitation had been more or less intimately connected with the mining industry, but about 1871 the Phila. and Reading R.R. Co. adopted the policy

of buying nearly everything in the way of operating collieries and undeveloped coal lands naturally tributary to its lines.

This action by the Reading R.R. was stimulated by the invasion of its territory by the Pennsylvania and the Lehigh Valley roads, all striving to assure their position in the transportation of this profitable freight. This enabled many individual operators who had been on the verge of bankruptcy to get back part of their capital, and others to reap considerable profit, but it transferred the burden to other capitalists, who were unable to carry it, as instanced the years when the Reading R.R. was in receivers' hands, the Central R.R., of N. J., receiverships, the many years when the Lehigh Valley R.R. failed to earn dividends, and others that need not be mentioned.

The individual operator in most cases held his property under lease for a term of years, the minimum term, usually being 15 years and the maximum 30 years. These leases always provide that a certain rate of royalty per ton of coal sold shall be paid to the landlord, and that a minimum amount shall be paid, whether any coal is sold or not. Generally, the minimum clause is not particularly burdensome, but in times of dull business or shortage of railroad cars, or when production is curtailed for other reasons, the advance payments on this account mount up to considerable sums, and are a serious drain on working capital, when the margin of profit is as small as it was during a large part of the period under consideration.

Taylor Breaker of D. L. & W. R.R. Co., Taylor, Penn.

The necessity to mine enough coal to meet the minimum requirements of leases was a contributing cause of the unbusinesslike policy so long prevailing in the marketing of anthracite coal.

Competition Was Disastrous

The effects of the fierce competition in the anthracite industry were most severe in the Southern or Schuylkill field, on account of the greater cost of production due to the excessive contortion of the coal measures, and the generally steep pitches prevailing, and also to the softness and friability of the coal, resulting in a smaller yield of domestic sizes; as compared with the northern field, where the measures are generally flat or on gentle pitches, and the coal is of a strong tough nature. By reason of these natural advantages, the growth of the industry in the northern field was very rapid and operations there have generally been more successful than in the southern region, consequently individual operators were able to hang on longer here than elsewhere.

Purchase of Mines by Railroads Did Not Correct Greatest Evil

The acquisition by the railroad companies of most of the mines did not correct the greatest evil of the industry—unreasonable competition, resulting in unremunerative prices for the product, because for years each transportation interest was struggling to increase the amount annually hauled to market, in order to be able to claim a larger percentage of the output of the whole region, and thus the market was generally glutted, with the inevitable result that the buyer dictated the price. During this period of chaotic mismanagement, it was no un-

usual thing to see large blocks of prime anthracite coal sold at tidewater points at auction, the prices realized sometimes being but little above the freight.

It was the custom for the general sales agents to meet occasionally, ostensibly to exchange views for the mutual benefit of their respective companies, and the advancement of the industry, but the general result of these meetings was that many of those making the usual "gentleman's agreement," immediately tried to take advantage of his fellows to book all the business possible, not by the superiority of his salesmanship, but by cutting prices.

If such foolish and improvident practices as have been described had resulted only in the financial loss to those engaged in the warfare, it would not have been so serious; it would have been only a question of the length of the pocketbooks of the combatants; but this is the least of the damage.

In order to keep the cost of production down to the lowest possible figure, the operators were compelled to resort to measures that were a disgrace to intelligent mining men. Thus, they developed only the thickest beds of coal, and frequently extracted only the bright clear glassy coal, leaving benches of equally as good fuel, and thinner beds, oftentimes in such condition that the coal was hopelessly lost for all time.

These reprehensible practices were not through ignorance upon the part of the owners and managers, because a majority of the original stock of coal-mining men came from England, Scotland and Wales where, speaking generally, methods of mining prevail that result in the maximum yield of coal from each acre of land. The late Jos. S. Harris estimated the average marketable yield in the anthracite region as 33⅓ per cent. of the original content. This has since been increased in various ways, but the loss of good coal is still very large.

Destructive Mining Methods

These destructive methods were only tolerated as a matter of grim necessity, because everybody else was doing it, and each mining company in order to live at all must of necessity follow suit. This intolerable waste of such an invaluable resource was fully recognized by all far-sighted mining men, and great and commendable efforts were made to correct it, but with very indifferent success.

It was appreciated that the situation and conditions surrounding the anthracite coal industry of Pennsylvania made it almost imperative, in order to correct the known errors in mining and marketing methods, and to properly conserve the remaining coal, to bring about in some way a combination of the many divergent interests; in other words, to effect what nature evidently intended, a harmonious unity of the whole region.

The first genuine effort in this direction was made by A. A. McLeod, president of the P. & R. R.R., in 1892-3, when he succeeded in leasing the C. R.R. of N.J., and the Lehigh Valley R.R. He also brought out what was known as the 60 per cent. contract, which was offered to, and accepted by most of the individual operators. This contract provided that the railroad company or its subsidiary coal company would buy the output of the individual operator's mine, paying therefore 60 per cent. of the price realized for the sale of the coal at tidewater points. The immediate result of the measures instituted by McLeod was a steadying effect in the market. Anthracite coal for a time ceased to be a football, at the mercy of anybody who felt like kicking it, and became a stable article of commerce at a fair price to the consumer and a reasonable profit to the producer. Unfortunately, for the proper conservation of the coal in the ground and for the operator who had his money invested, the McLeod system did not last long, as he was ousted in 1894 and the old methods of cutthroat competion again prevailed, so that the year 1895 was the most disastrous in the history of the industry.

Employees Were Made to Suffer

The operator was not by any means the only sufferer by reason of the conditions described. The employees were made to bear their share of the general distress, and in some instances, more than their share. The old Workingman's Benevolent Association, known as the W. B. A. which had helped the miners for a time to extort reasonable wages from the employers, broke up on account of internal dissensions in 1875, and for a long period the employees were unable to organize for their mutual protection. During the life of the W. B. A., most of the employees of the whole anthracite region were organized, which forced the operators to come together for mutual defense.

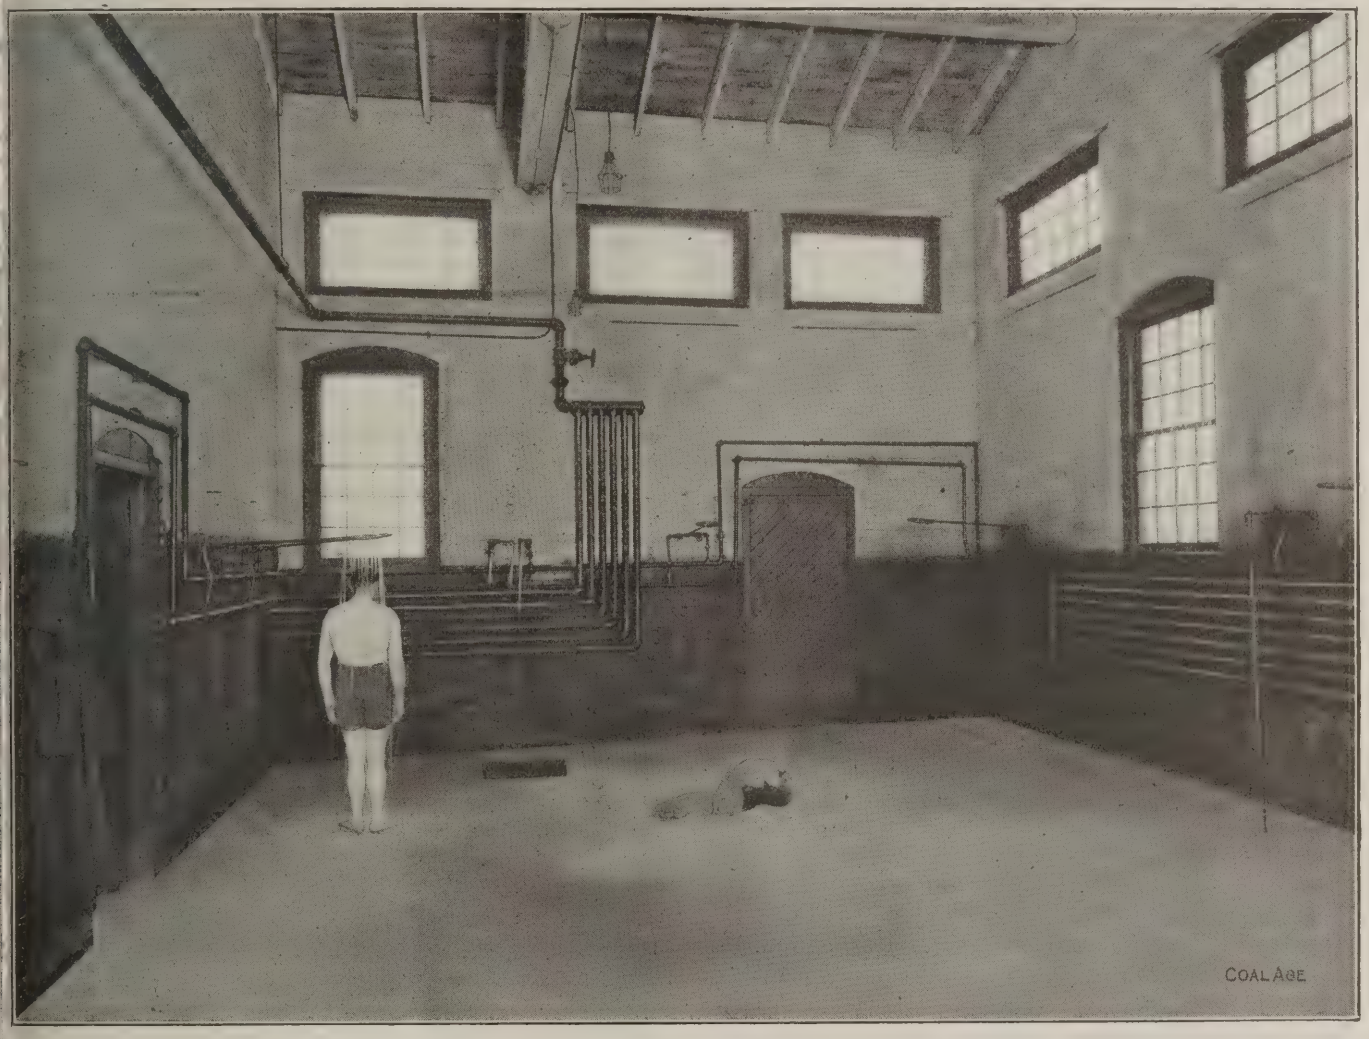
The operators' organization was inharmonious and less effective than it should have been; the northern members, particularly those in the Lackawanna region, breaking away from the other members and making agreements with the organized miners that could not be accepted by the southern operators, on account of the widely different natural conditions.

Many of the working methods adopted during the life of the W. B. A. became standard, and governed the compensation of employees after the disruption of the union. The most important of these was what was known as the "sliding scale" which provided that the rates of wages paid should be a certain percentage of the prices realized at tidewater. This system was in vogue in the southern field and to some extent in the Lehigh region, but not in the northern field.

Employers Took Unfair Advantage

The disbandonment of the W. B. A. left the employees at the mercy of the employers with the usual result of unrestrained power in the hands of any body of owners. In order to cut down the operating costs, many unfair advantages were taken of the mine workers. This was made easier by the large influx of laborers from Hungary and other countries of southern Europe, which began about 1881 and continued until the whole complexion of the operating force at most of the mines was changed, so that by 1895-98, 50 to 60 per cent. of the mine employees were of this class.

It is not fair to call these immigrants ignorant and undesirable acquisitions, as most of them were young and vigorous workmen and many of them could read and write in their own language. The fact that they knew no English, and that they came from countries where laborers' compensation is pitifully small, was taken advantage of by the anthracite operators, and in many cases they were paid less than standard wages, and used to break down the average that had been established by years of effort, and by numerous strikes and lockouts.



Another iniquity that was enforced by the operators, because they had the power, was in compelling the miners to purchase from the company powder and other mine supplies at exorbitant profits—powder that cost the operator $1.00 per 25-lb. keg was sold to the miner at $2.25 to $2.75 per keg. The individual operators also reaped large profits from their company stores; in many instances, compelling the employees to patronize these "pluck me" institutions, under penalty of losing their jobs, and as there was usually a plentiful supply of labor it was a serious matter for a man to be discharged. The company store abuse and the extortionate prices for powder and supplies have long since been corrected.

The powder extortion was enforced in the northern and Lehigh regions, but in the southern field, where the P. & R. Coal & Iron Co. is the dominant factor, it was sold at a moderate profit. This company also deserves credit for a generally more strict observance of agreements than many others.

The disastrous year of 1895 and the remembrance of the satisfactory conditions prevailing during the McLeod regime brought home forcibly to all mining companies the absolute necessity of some kind of combination or community of interest. Efforts were made in this direction, but were frustrated by the usual jealousies between the railroad-owned mining companies, generally called the "Big Companies." The individual operators were always at a disadvantage in competition with the big companies, who could afford to produce coal at a loss and depend upon the freight profit to even up, while the individual must earn enough during the life of his lease to repay his capital outlay, and as much more as possible to make his profit.

Independent Operators Combine

In the hopes of improving their condition, a majority of the individual operators, controlling a substantial tonnage, formed a corporation for the purpose of building their own railroad from the northern coal field to tide water. A route was selected, surveys made, and they even bought a large consignment of steel rails. This movement was headed by an aggressive and successful firm in the northern field who operated six or seven collieries of large capacity. The aggressive tactics of the individual operators' association and the threatened further competition in transportation of anthracite coal alarmed the financial backers of the several railroad companies, and overtures were made which, it is said, contemplated the purchase by the combined railroad companies of nearly all of the individual holdings. The result of this offer was the sale of the Simpson & Watkins Collieries to a corporation known as the Temple Iron Co. This concern was backed by five of the anthracite railroad companies. This sale stopped the construction of the inde-

Showers in Miners' Wash House, Storrs Mine of D., L. & W. R.R. Co.

pendent railroad, and the Temple Iron Co. has ever since been regarded as the instrument through which the "coal trust" has controlled the business.

The directors of the Temple Iron Co. were the presidents of several of the principal anthracite railroads. This sale broke up the individual operators' association, but as there were still some resourceful and successful operators whose properties had not been absorbed by the so-called trust, the business was by no means a monopoly. The Pennsylvania Coal Co. owned valuable mines and 70 miles of railroad, known as the Erie & Wyoming Valley R.R., from the mines to a connection with the Erie R.R. at Hawley. This company, together with the late Edw. L. Fuller, of Scranton, at that time controlling the Seneca Coal Co., and others, obtained an option on the abandoned Delaware & Hudson Canal from Honesdale to Rondout, on the Hudson River. It was proposed extending the E. & W. V. R.R. to the Hudson by building on the old canal site.

This threatened invasion of the transportation field by another competitor forced the financial interests to buy the Pennsylvania Coal Co., and its railroad, for the enormous sum of $27,000,000, and turn it over to the Erie R.R. for about $30,000,000.

Gradually other individual holdings were bought in by the railroad companies, between 1895 and 1900. Many complaints were made by the mine employees relative to their wages, and occasional local strikes were inaugurated, but as the men had no organization, no substantial concessions were made.

Labor Troubles Commence

In 1897 the dissatisfaction became so great in the Lehigh region that striking employees at Audenried and McAdoo marched in a large body to other mines and compelled the men to join them. This marching continued for several days until finally on Sept. 10, 1897, a large body of marchers approached Lattimer. They were met by the sheriff of the county with a posse. They were ordered to disperse, but did not do so, when they were fired upon by the posse and 16 men were killed and others wounded.

This lamentable affair ended the strike, but it did not allay the discontent of the men, who continued to agitate their grievances, and gradually locals of the United Mine Workers of America were secretly organized. In 1900 the U. M. W., at a convention in Indianapolis, ordered all anthracite mine workers to quit work.

The managers of the coal companies had laughed at the pretensions of this soft-coal union, believing that such a small percentage of the anthracite employees were members that no attention would be paid to a strike order, so that they were much surprised on Sept. 17, when practically all the men failed to report for duty. The whole region was tied up. The operators believed that it was only a question of a short time when they would win, but did not reckon with the political situation. Mark Hanna, who was conducting the campaign for President McKinley's second election, feared that unless the strike were settled it might cause the defeat of the Republican candidate. He therefore went to J. P. Morgan and laid the matter before him. Financial interests could not brook the possibility of a change in administration at that time, so the anthracite railroad presidents were ordered to settle. The coal companies were thus compelled to open negotiations with John Mitchell and his advisers for a settlement of the strike.

Two Views of New Office Building of Lehigh Valley Coal Co., in Wilkes-Barre, Penn.

The settlement was based on a 10 per cent. advance in wages, part of which, so far as the mines were concerned, was made up by a reduction in the price of powder.

The Strike in 1902.

The men demanded other things that were not conceded, but they had gained a substantial victory, much more than the pecuniary advantage, and had succeeded in organizing the whole region, so that when their demands were refused in the spring of 1902, the call to strike was obeyed. This strike lasted until fall, and was settled by the intervention of President Roosevelt, who with the consent of the contending parties, appointed the Anthracite Strike Commission. The award of that commission has been the basis governing the relations between employers and men ever since.

The 1900 and 1902 strikes compelled the operators to get together and to work in harmony, and as a result they established the market value of anthracite coal on a more stable basis than ever in the history of the industry. Besides this advantage, the conditions prevailing for the past dozen years have made it possible to pu

nto effect at the mines measures of conservation that ıave resulted in a much better yield of coal from a given area of ground worked over; to institute safety neasures for the protection of the employees, and to gen-rally elevate the standards of business methods far above ıny thing before attempted. Most of the credit for this atisfactory state of affairs is due to the late George F. Baer, president of the Philadelphia & Reading Co.

This rather lengthy rehearsal of the salient features of an industry that bears a most important part in the welfare of over one-third of the inhabitants of the United States, is for the purpose of emphasizing in the strongest possible manner the statement, that under no circumstances should it be permitted to fall back into the conditions prevailing prior to 1900.

It appears inevitable that the railroads must absolutely get out of the business of mining coal. When their mining enterprises are separated from them, a plan to manage the production and distribution of anthracite coal that will embrace practically the whole region should be adopted; in short, it should be a benevolent monopoly, directed by a supreme trustee, or board of trustees, acting in the public interest. Government ownership, which has been talked of by some legislators, would be extreme folly, for a business requiring the special training necessary to properly handle it, such as this, should under no circumstances be allowed to fall into the hands of politicians.

Price of Coal to Consumer Will Not Be Reduced

The hope of many that a severance of the relations between the railroad companies and their mining interests will result in a material reduction of the price of anthracite coal to the consumer is not likely to be realized. It is well known that many mines controlled by the railroad companies do not earn profits at all commensurate with the investment therein, and others are operated at an actual loss. Such operations when placed upon their own resources must either obtain more money for the output, or be abandoned. Therefore, should the freight rate for hauling anthracite coal to market be reduced, the amount of such reduction, or a considerable part of it, will probably be added to the price of the coal at the mine.

The permanent closing of any number of the mines now unprofitable or near that point, would be a calamity, for the present demand for anthracite coal is very nearly equal to the capacity of the whole region. The capacity cannot be greatly increased.

The suggestions made in this article, that the industry as a whole should be directed by a board of trustees or commissioners, is made at this time with a view to stimulating discussion of the subject. Of course, such a plan could only be made effective with the consent and coöperation of all parties interested. The plan might be modeled somewhat on the lines laid down for the conduct of the affairs of subsidiary corporations of the New York, New Haven & Hartford R.R., although the magnitude and importance of the anthracite industry far exceeds those New England enterprises.

Duties of Proposed Commission.

It is tentatively suggested that a governing body such as indicated might be charged with the following duties:

A.—The full and complete carrying out of the agreements between employers and men.

B.—The observance of all the legitimate obligations of the several mining companies to their security and stockholders. Each company, of course, must stand on its own foundation.

C.—The output of the mines would naturally flow to market over existing transportation lines, but the commission should be empowered to direct the same to the best interest of the several mining companies, and the proper supply of fuel to the public.

D.—The commission should be empowered to fix the price at which coal should be sold to consumers after due consideration of all the factors that should justly govern.

In this connection the testimony of the late George F. Baer, president of the P. & R. R.R., in the case of the United States vs. Reading Co., the Phila. & Reading Co. et al., in 1909, is illuminating. The testimony of Mr. Baer is as follows:

> The result is that coal can be produced in the Wyoming region, where they have no serious water problems and where the veins are nearly flat, and where they are not so thick, and, therefore, less mine timber is required, at from 40 to 50c. a ton cheaper than we can. . . We, therefore, must fix a price on coal that will enable us to operate our mines, and the other regions naturally get the benefit of it. There is a natural law on that subject which has been stated by all writers on political economy. For the purpose of accuracy, I have formulated it: "The price of the entire supply of anything necessary for a community will be regulated by the cost of production of that portion of the necessary supply which is produced at the greatest expense." Anderson, Malthus, Ricardo, Smith and everybody since have practically laid down that rule, and it is a law of common sense illustrated in various ways. Here are two farms. They may be side by side; one can grow wheat to the extent of 20 bu. to the acre, the other 30, but there will be no difference in the price of the wheat. If the price of anthracite coal were fixed so as not to yield a profit to our coal and iron company, the result would be that the mines would stop for a short time, and the price of coal would necessarily go up, because the withdrawal of 30 per cent. of any commodity would naturally affect the price, and the final result would be that, the price advancing, our mines would resume operations again. Therefore, it is the general custom of the other companies, I believe, to follow our circular. We fix the best price we can get, and the Wyoming region and the people that can produce coal cheaper than we do necessarily follow our price, because it would be foolish for them to undertake to cut it when there is a market for the reasonable output of existing mines, taking it year in and year out. (Transcript of Record, Supreme Court of the United States, October term, 1911, No. 477, Vol. V, p. 1176.)

E.—Power should also be vested in the commission to prevent undue waste of coal by improper mining methods.

F.—The commission should be empowered to require uniform methods of accounting by all of the mining companies.

Coal Production During 1913 in the German Empire

The total German coal production in metric tons was 191,511,000; lignite was 87,116,000, and briquettes, 7,964,000. This output shows an increased production over that of the year previous of 10.39 per cent. in coal and 5.80 per cent. in lignite.

Germany exported in 1913, 34,573,000 tons of coal and 6,411,000 tons of lignite.

In this connection it may be remarked that the German Empire has become a formidable competitor of Great Britain in the exportation of coal and coke.

New Power Developments of the D., L. & W. Coal Co.

By H. M. Warren*

SYNOPSIS—This company has recently installed a large power plant at Nanticoke, Penn., containing 4000-kw. turbo-generators using superheated steam. An exhaust-steam turbine unit, supplied with a Rateau regenerator and a cooling tower, located at Kingston, operates in multiple with the above plant.

In 1905, the Delaware, Lackawanna & Western R.R. Co. constructed near the town of Nanticoke, Penn., an electrical generating station containing three 303-hp. Babcock & Wilcox boilers, and three 500-kw. vertical Curtis turbines, generating current at 4150 volts, 3 phase, 60 cycles.

The station was built large enough, however, so that later two additional boilers and two additional turbines were added, making a total capacity of 2500 kw. The load on this plant gradually increased until the station became much overloaded.

About two years ago it was decided to increase the capacity of this plant, and as the new mining developments in this section will require a constantly increasing amount of electrical power, it was considered advisable to design the addition to accommodate turbines of large capacity. The addition is now constructed and contains two 4000-kw. Allis-Chalmers turbines, each having a maximum capacity of 6000 kw. The boiler plant is arranged to accommodate 20 Babcock & Wilcox 303-hp. boilers, set in batteries of two boilers each. At the present time, however, only eight boilers are installed, although the foundations are completed for the entire number.

Fig. 1 is an exterior view, showing the addition to this plant, the old installation being seen in the rear. It will be noted that the turbine room proper is inclosed by a temporary wall at the end, the general design being such that additional generator capacity can be installed by extending the generator room as designed, providing the necessary increase in boiler capacity in a building or buildings constructed at right angles to the original boiler room.

Fuel Is Delivered in Railroad Cars

Fuel is delivered in railroad cars directly over the coal bunkers, from which it runs by gravity through vertical pipes to the boiler room, where it is hand-fired to the boilers. As the fuel used is locally known as No. 2 Barley, a size smaller than Barley, or No. 3 Buckwheat, it contains a considerable amount of very fine material, causing large quantities of dust, and in designing the boiler plant, particular attention was given to so arrange the settings, ashpits and main flues, that this large volume of material could be flushed from these various points by means of water into the ash cars. This is an important point, for if provisions were not properly made to handle this dust, the expense of removing it or the consequent inefficiency of operation if it were allowed to accumulate, would be objectionable from an operating point of view.

Referring to Fig. 2, showing a section through the boiler plant, the general arrangement will be noted. The dust referred to is flushed from the ash pit, and the space back of the bridge-wall, through the two pipes shown in the section, into the ash car.

The grates are of the stationary pinhole type, having about 4½ per cent. air space. In cleaning these, the ash is pulled forward and allowed to drop through removable

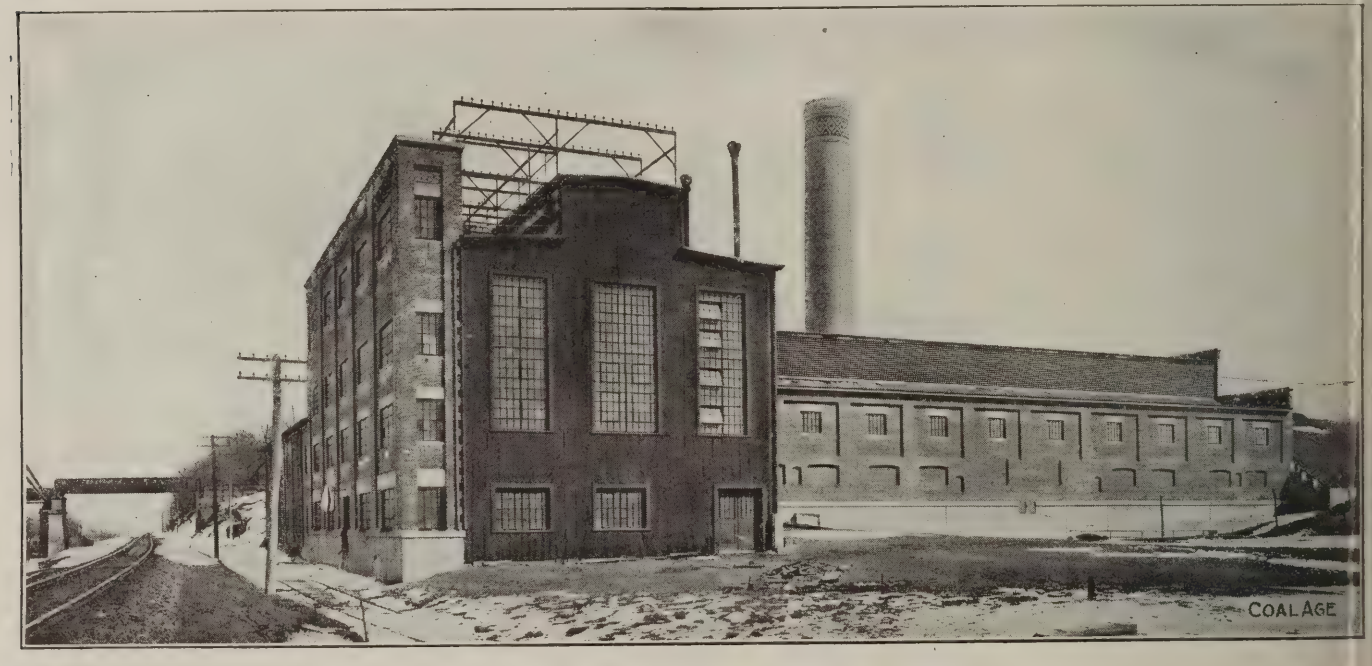


Fig. 1. Exterior View of Power-Plant Addition

*Electrical engineer, Delaware, Lackawanna & Western R.R. Co., Scranton, Penn.

ad plates into the ash car as shown. Thus there is no cumulation in the ash pit proper, except such fine dust may work through the grates. This is actually a comratively small amount.

As forced draft is used, it is important that the ash t be kept tight, to prevent air leakage; and to take care this situation a 4-in. wall consisting of a single course brick is built from the foundation vertically to the ont end of the grates and back of the dead plate. As a sult, the ash pit is always practically air tight, and l trouble is avoided due to any air leaking out through iat would normally be the ash-pit doors.

As only eight boilers are installed at present, only the ain flue required to serve them and the two additional ilers that will be installed later on this side of the ant, was built. The flue on the opposite side of the ant will be constructed when required.

Referring to Fig. 4, the general arrangement of the ain flue and stack is shown. The bottom of the flue pitched toward the stack from either end and the enre conduit is lined with glazed hollow tile. This marial was used because of the heat to be withstood, and e fact that water will be used for flushing out the ist.

When cleaning the flue, water is introduced through ie or more cleaning doors located in the building wall xt to the flue, the material running out to the point the center of the plant to an opening in the ain floor. From this point, it runs through a pipe ider the boiler foundation into the ash pit, where it is livered into the ash car.

The ash-pit floor is pitched so as to drain to five ctangular sumps. These are covered with cast-iron atings and are connected together near the top by tile pe. The material in suspension can settle in these nks, but the water is allowed to run free, discharging ially through an overflow pipe to the outside. The mps can be cleaned as occasion requires.

The steel ash cars are provided with roller bearings d arranged for side dumping. After being loaded they e pushed by hand to the turntable shown and from ere to a point just outside of the building, at the curved rtion of the track. From this point they are hauled an incline by means of a small steam-driven hoist, lo-ted at the elevation of the fuel track. The ash is at e present time dumped, from this elevation, to form a l that can at some later date be used for additional el tracks which may be required if a new boiler plant tion is built. Later on, it is proposed to load the ash to railroad cars for final disposition.

The boilers, rated at 303 hp. each, are set in batteries two. The grates are 11 ft. 6 in. wide, 8 ft. deep, and ve a total area of 92 sq.ft. The ratio of heating surce to grate area is 33 to 1.

Superheated Steam Is Used

Each boiler is equipped with a B. & W. superheater, signed to give 150 deg. superheat. As the temperature the superheated steam increases as the boiler is forced, e number of boilers actually using forced draft, at any ne during the day, is varied, depending upon the load, d in this manner the temperature of the superheated am is kept practically constant regardless of power quirements.

The usual boiler-plant auxiliaries, such as blast fans for producing the forced draft, boiler feed-water heater, and feed-water pumps, are located in the turbine room instead of in the boiler room, this having been considered desirable as the turbine room is naturally cleaner, and in addition all the machinery is in this way placed under the supervision of the operating engineers.

Two Jeffrey single-inlet blast fans, each 9 ft. in diameter and 3 ft. 6 in. wide, are located at one end of the ash tunnel, see Fig. 4. These deliver air to the two air tunnels from which it reaches the ash pits, being controlled by dampers in the bridge wall.

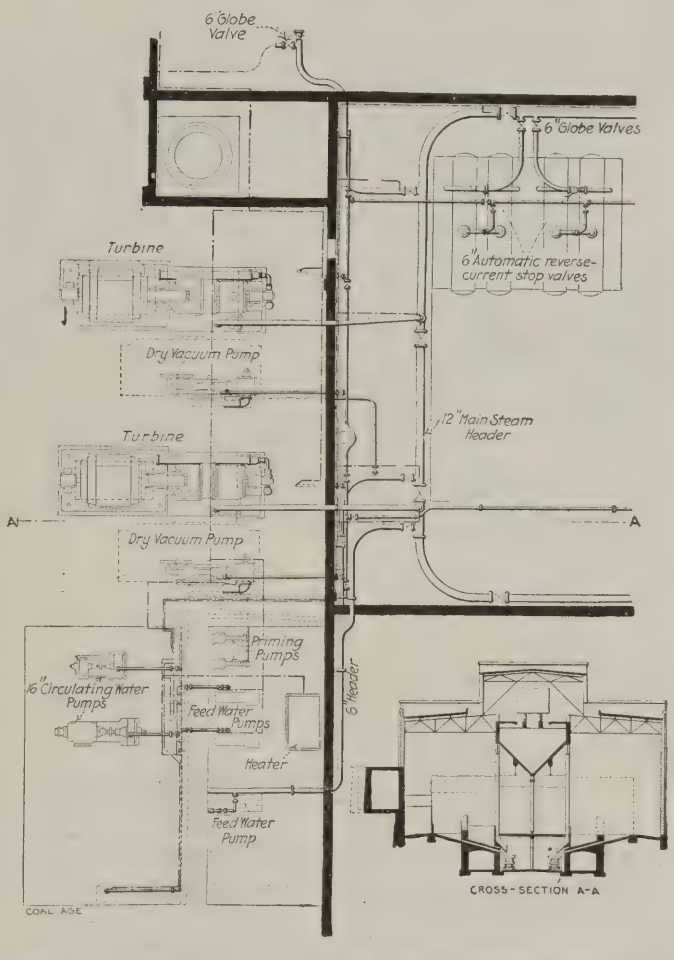

Fig. 2. Part Plan of Plant and Section through Boiler House

With the blast fans located in the ash tunnel, as shown, all the air used for the forced draft must be drawn through this tunnel. This insures a supply of good air at all times in the tunnel, eliminating any danger of the ashmen being overcome by gas.

In the summer time the air entering the tunnel will come through the opening in the side of the foundation wall through which the ash cars are taken; also through the doors at the foot of two stairways that lead from the firing-floor level into the ash pit. In the winter time, however, in order to avoid freezing in the ash tunnel, most of the air will be taken through the doors leading from the stairways with the opening of the ash track to the outside air partially or entirely closed.

The stack, which was built by the M. W. Kellogg Co., is 12 ft. in diameter, 125 ft. in height, from the top of grates, built up of hollow radial brick with an expansion

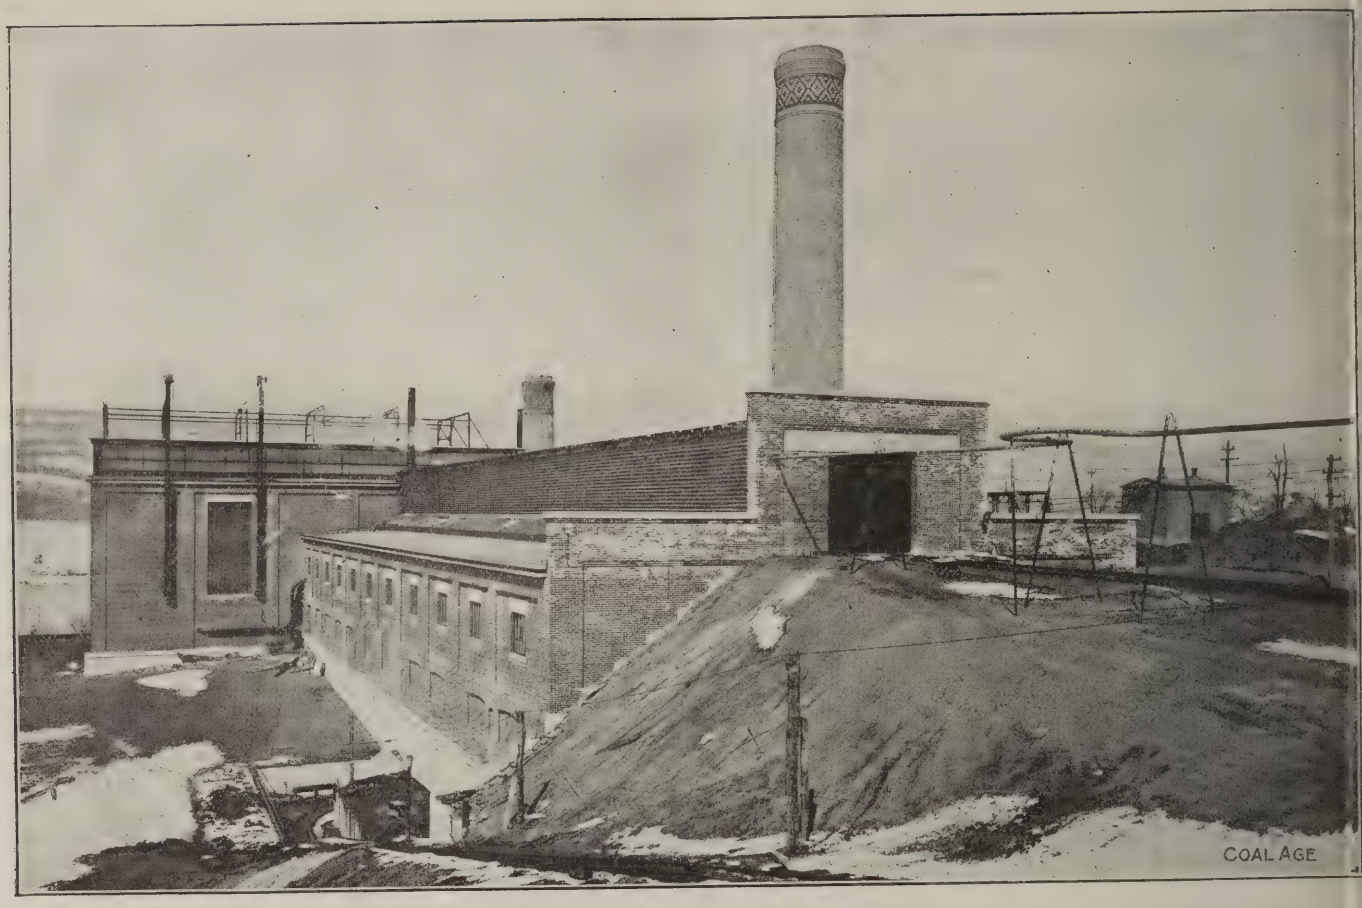

FIG. 3. VIEW OF BOILER AND POWER PLANT, SHOWING LOUVERS, SKYLIGHTS AND ASH-CAR INCLINE

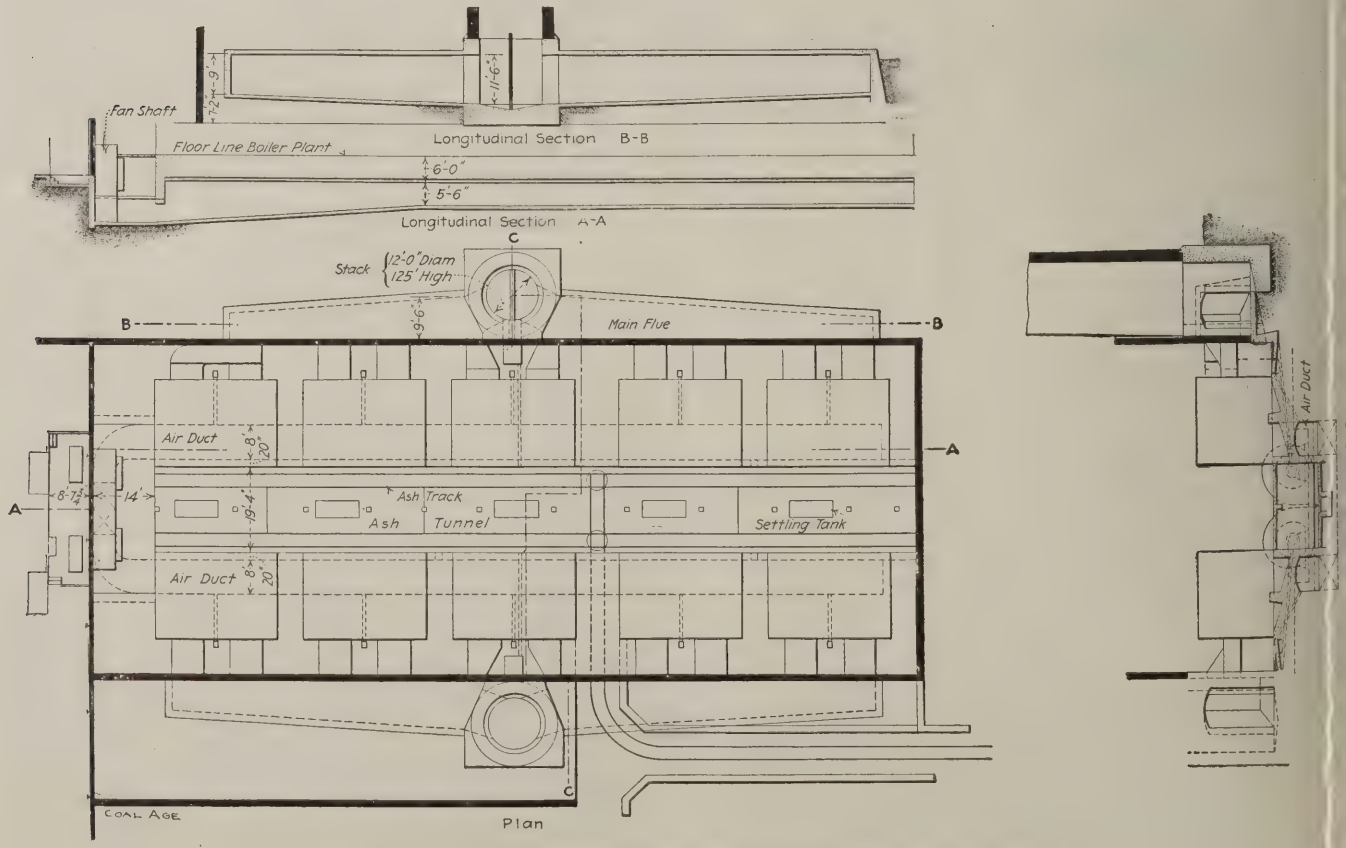

FIG. 4. ARRANGEMENT OF FLUES, AIR DUCTS AND STACKS

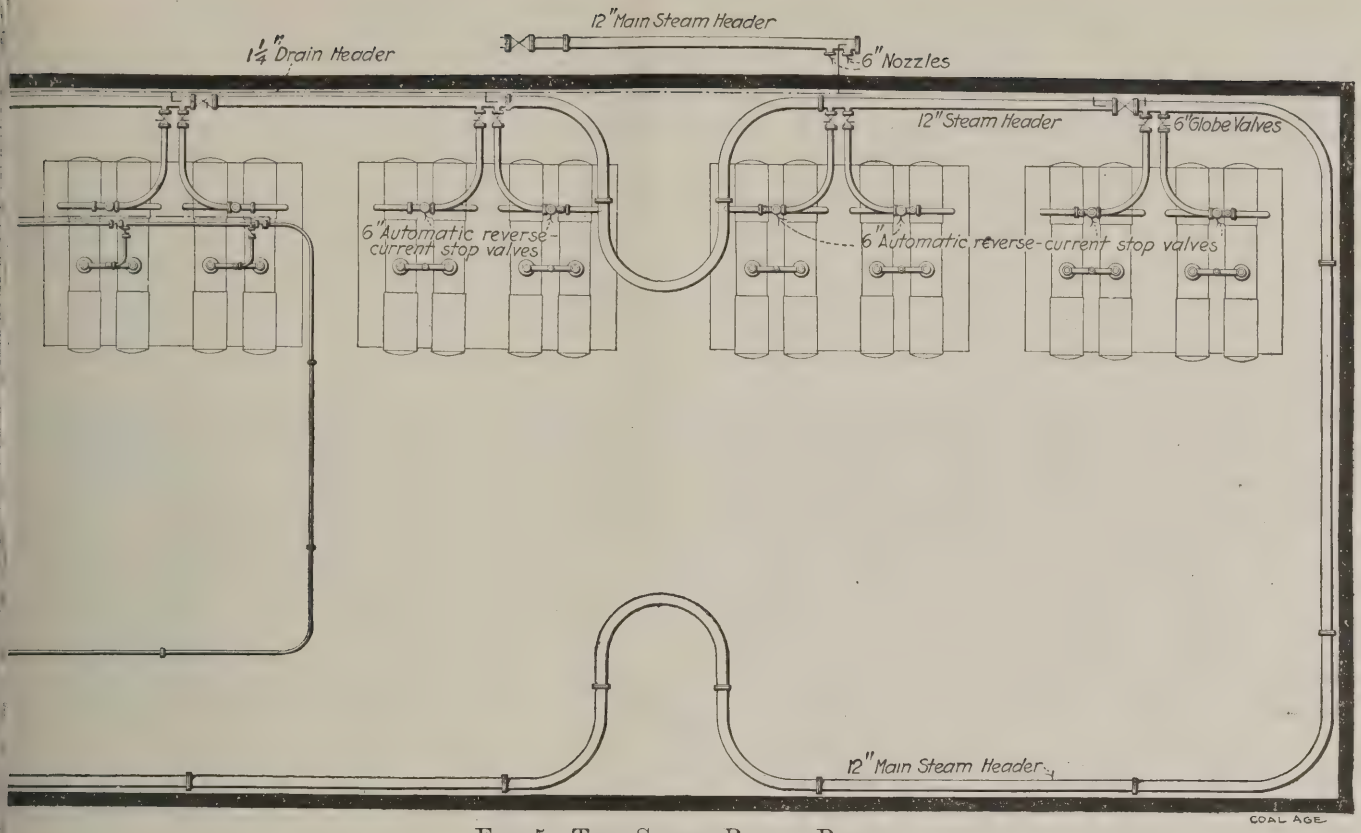

FIG. 5. THE STEAM-PIPING PLAN

ining wall extending on the inside for 30 ft.; a vertical partition rising from the base of the stack to a point 5 ft. above the flue opening insures proper draft conditions, in the event of only a portion of the boilers being used. This stack is protected by lightning rods of the usual construction.

In Fig. 3, note the incline up which the ash cars are drawn to the fuel-track level. In order to insure a free ventilation of the boiler room, louvers are extended the entire distance of the monitor. These are made of monel metal, in order to avoid any trouble due to action of the gases that might escape from the firing room.

In addition to the windows in the side of the boiler room, light is provided by a wire-glass skylight running the entire length of the boiler plant on each side of the monitor, extending on an incline from the bottom of the louvers to the main roof, as shown in the photograph.

As ashes were used for a considerable portion of the main fill on which the fuel cars are handled, and as there was a possibility of these taking fire, rock and clay were first dumped against the retaining-wall at the end of the building, for a considerable distance in order to eliminate any chance of fire injuring this wall, and as the main flue was built of concrete, although lined with hollow glazed tile, it was protected in the same manner before leveling off the ground with ashes.

A Loop Piping System Is Employed

The final arrangement of the high-pressure steam main is such that it forms a loop around the interior of the

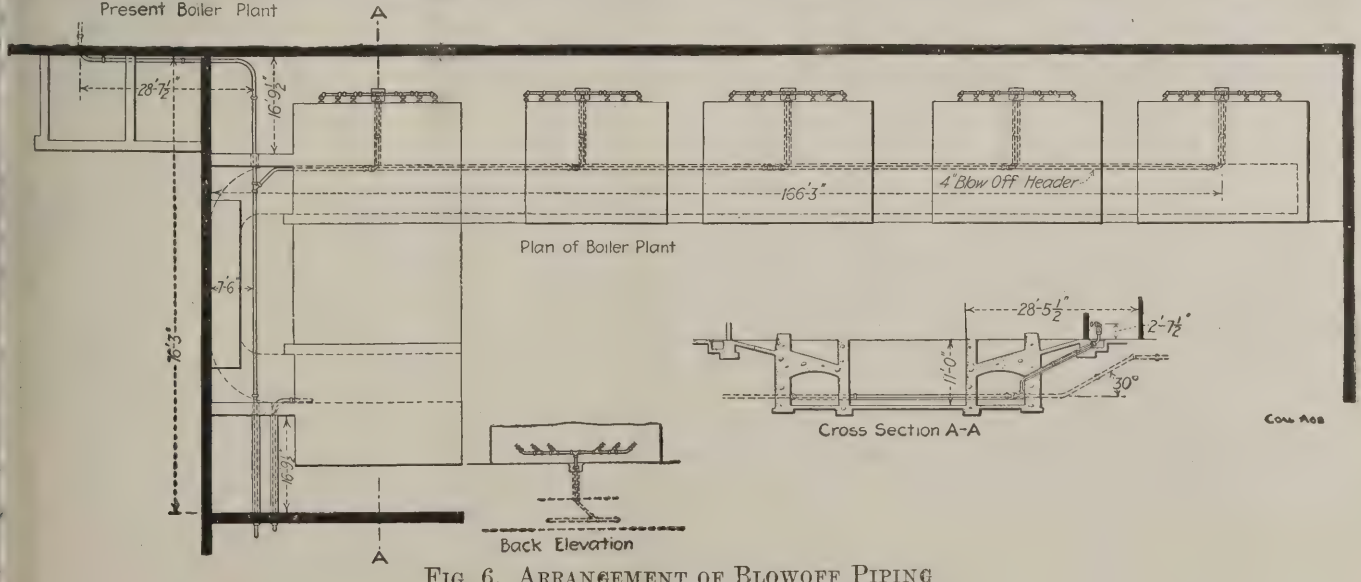

FIG. 6. ARRANGEMENT OF BLOWOFF PIPING

boiler plant, running back of the boilers and being supported from the building wall on brackets. As only eight boilers are installed at present, the loop is not completed and ends with the eighth boiler. It is also blanked off where the branch leads into the turbine room for supplying steam to the circulating pumps.

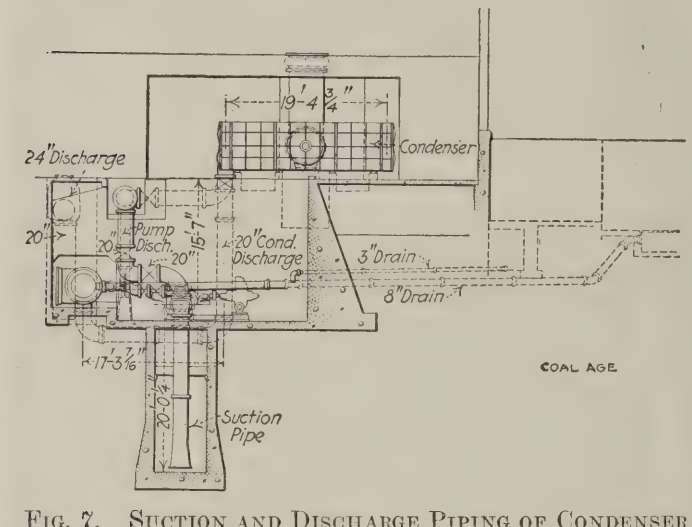

FIG. 7. SUCTION AND DISCHARGE PIPING OF CONDENSER

Each boiler is connected to the main through a non return valve placed on the boiler outlet and a stop valv where the boiler lead enters the main. These two valve insure absolute safety when a boiler is cut out for in spection.

All high-pressure piping is made up of standard full weight pipe, provided with reinforced Vanstone joints Where the size of pipe is too small to permit this joint the flanges are welded. Fittings are avoided as much a possible by the use of welded nozzles, therefore eliminat ing a large number of joints. On the superheated steam lines where it is necessary to use any fittings, they ar made of cast steel. The valves were manufactured b the New Bedford Valve Co. and those used on the super heated-steam lines have cast-steel bodies, nickel-bronz seats and disks and nickel-steel stems.

As it was not considered advisable to use the high-tem perature superheated steam on the blast-fan engines, ro tative dry-vacuum pumps, priming pumps, and servic pumps, the 4-in. high-pressure main is connected to fou boilers to provide dry saturated steam for these units.

The boiler feed line extends from the feed pump in the turbine room through the boiler room, return ing in the form of a loop. This is a cast-iron line except where bends occur to provide for expansion These are made of wrought-iron pipe, with welde flanges. Each boiler is equipped with a high- an low-water alarm and a "Watch-dog" automatic feed regu lator.

Blowoff piping is arranged, as shown in Fig. 6, t consist of steel pipe with welded flanges, and cast-stee fittings where required. All joints are male and femal to prevent any possible chance for gaskets blowing ou while the pipe is in operation. The blow-off connection for each battery of boilers are led to a common pipe a shown, this passes through a pipe laid in the concret foundation of the boiler to the air duct, where it con nects to the main blow-off pipe. This leads out throug the building to a blow-off tank.

TWO 4000-KW. TURBINES ARE INSTALLED

The turbine room contains two Allis-Chalmers Mfg Co.'s high-pressure steam turbines, operating at 180 r.p.m., having a normal rated capacity of 4000 kw. an a maximum of 6000 kw. These are each connected to 13,500-sq.ft. rectangular horizontal-flow surface conden ser having 1-in. tubes. The condensate of each machin is pumped out by a two-stage turbine-driven centrifuga

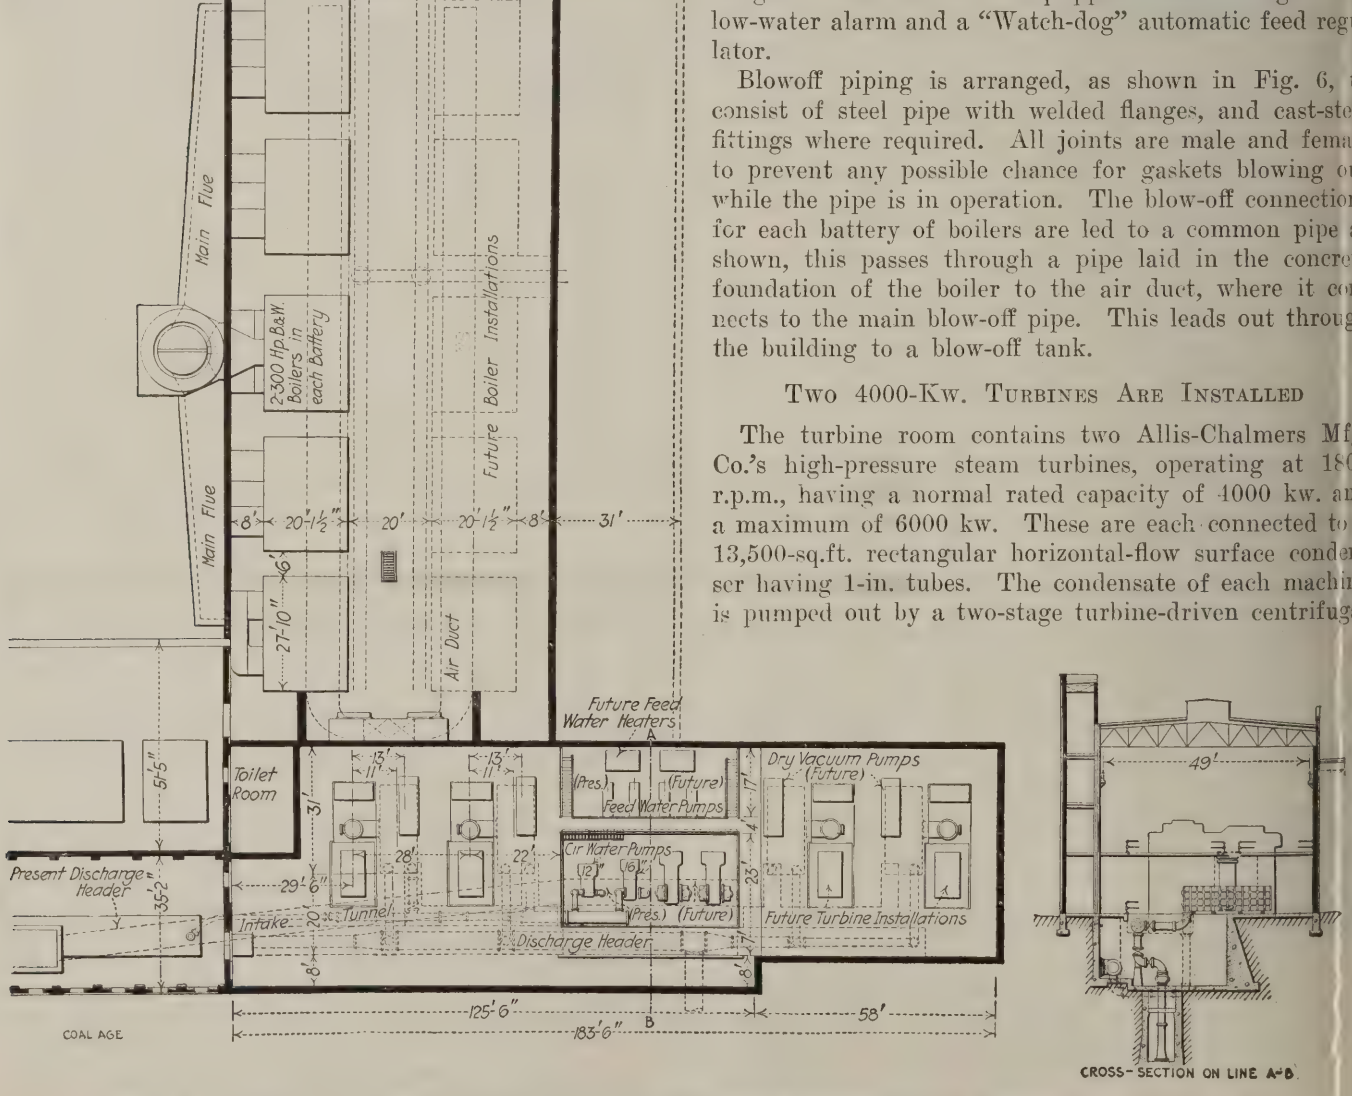

FIG. 8. GENERAL LAYOUT OF ENTIRE PLANT, SHOWING PROVISION FOR FUTURE INSTALLATIONS

pump, designed to deliver against a head of 30 ft. to the feed-water heater. Each condenser equipment is also served by a 12x30x18-in. horizontal single-phase rotative dry-vacuum pump.

The circulating pumps consist of an 8000-gal. per min. bi-impeller centrifugal pump driven by a noncondensing steam turbine and a 4000-gal. per min. single-impeller centrifugal pump similarly driven. The condensers, with their auxiliary equipment, were furnished by the Alberger Pump & Condenser Company.

The condensing water is taken from the Susquehanna River, which flows parallel to the power plant and about 200 ft. distant. At the old plant at Nanticoke, there was provided a vertical shaft in the turbine room connected to the river by a tunnel. This tunnel was partitioned in the center, one side acting as an intake for the water, and the other, as the discharge.

On account of the additional amount of water required for future service, it was decided to use this tunnel entirely as an intake, discharging the circulating water to the river through a 48-in. cast-iron pipe.

As the Susquehanna River rises about 22 ft. in the wet season, it is necessary to either use vertical pumps, placing the driving turbine or motor above the high-water mark, or to provide a practically water-tight pit. The latter scheme was employed in the addition, a large shaft being sunk in the rock and connected to the bottom of the old shaft by means of a rock tunnel. In this excavation and at the proper elevation, a heavy concrete floor was provided, on which rest the turbine-driven circulating pumps, at such an elevation that they will lift the water without difficulty when the river is at its lowest point, the floor being sufficiently impervious to exclude practically all the water when the river is high.

A Water Seal Is Formed

In order to reduce power required to handle the circulating water to the lowest possible amount, the connections are such that after the water passes through the condensers, it is piped downward to a point below the level of the 48-in. discharge line so as to form a seal and in this way obtain the advantage of the vacuum due to water dropping this distance. This works out satisfactorily in practice, and at times the advantage obtained has been such as to produce 13 in. of vacuum at the top of the condenser—thus reducing the average effective head of the circulating pump about 14½ ft. See Fig. 7.

There are three boiler-feed pumps, two being Alberger centrifugal pumps, each having a capacity of 250 gal. per min. against a pressure of 165 lb., each driven by a Kerr steam turbine; the third is a 5-in. 3-stage Alberger centrifugal pump having a capacity of 500 gal. per min., and driven by an Alberger Curtis turbine.

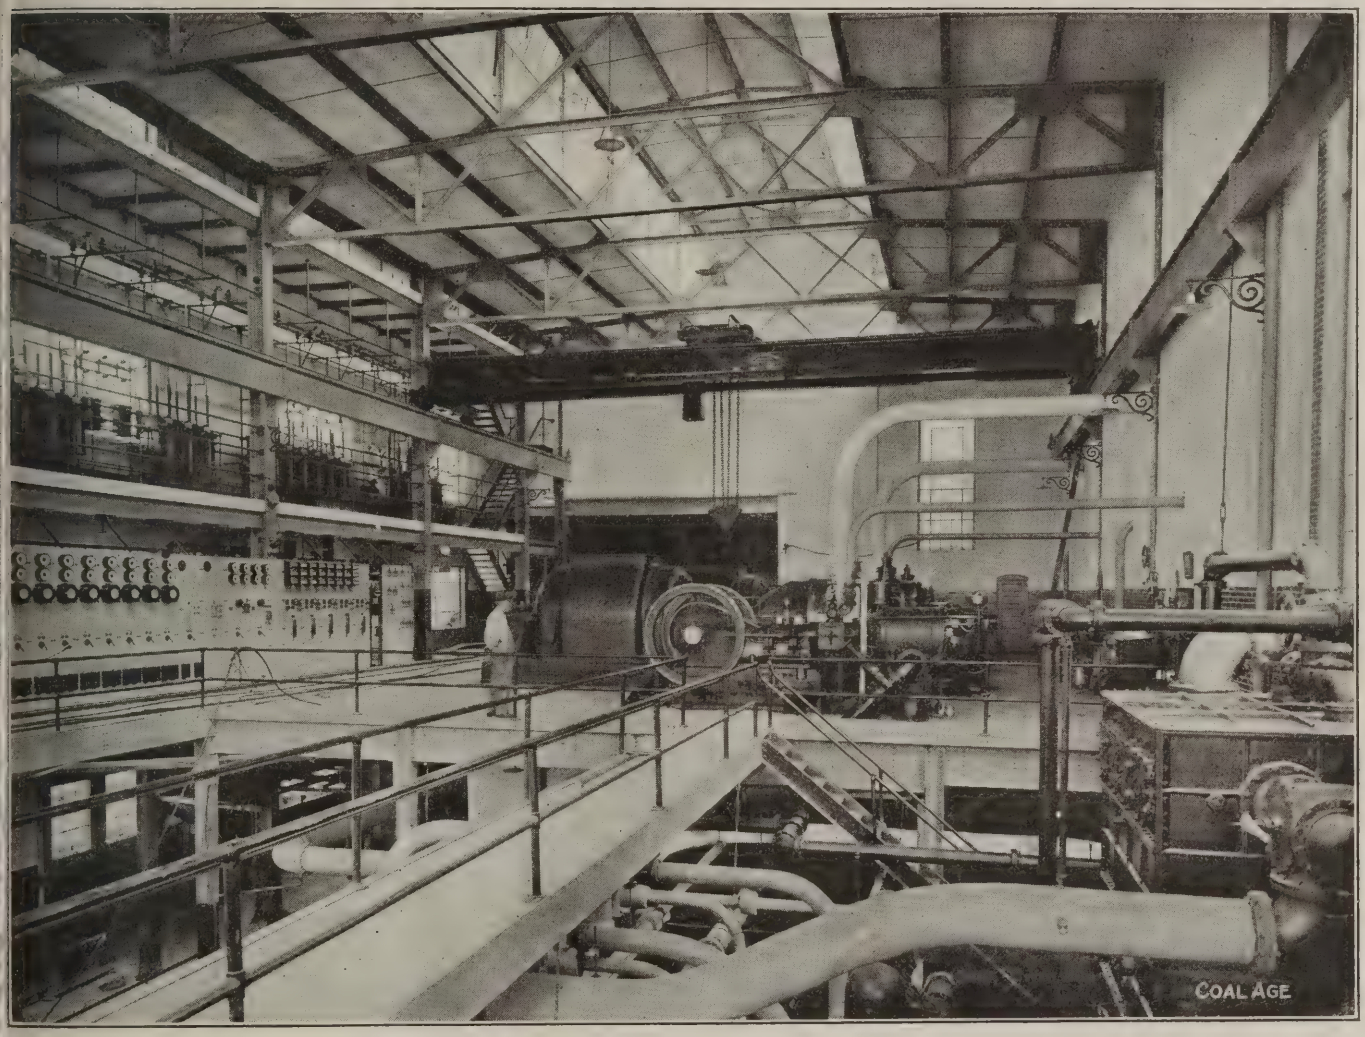

Fig. 9. Interior of Turbine Plant

To provide a constant head of water available for the sealing glands of the turbines, a steel tank is located at one end and at the top of the switchboard gallery. To this, water is piped from a high-pressure water-supply line, the pumping plant of which is also located at this power plant, and also from the service pump located in the shaft. Float valves placed in this tank control the flow of water from these lines, thus insuring a constant supply at all times and at a uniform head, eliminating the possibility of losing the vacuum on the turbines due to a failure of water for the sealing glands.

It will be noted that all of the auxiliaries are steam rather than motor driven, and all of the turbine-driven auxiliaries are supplied with superheated steam. The exhaust from all is led through the exhaust piping to a 6000-hp. Cochrane feed-water heater. Arrangements

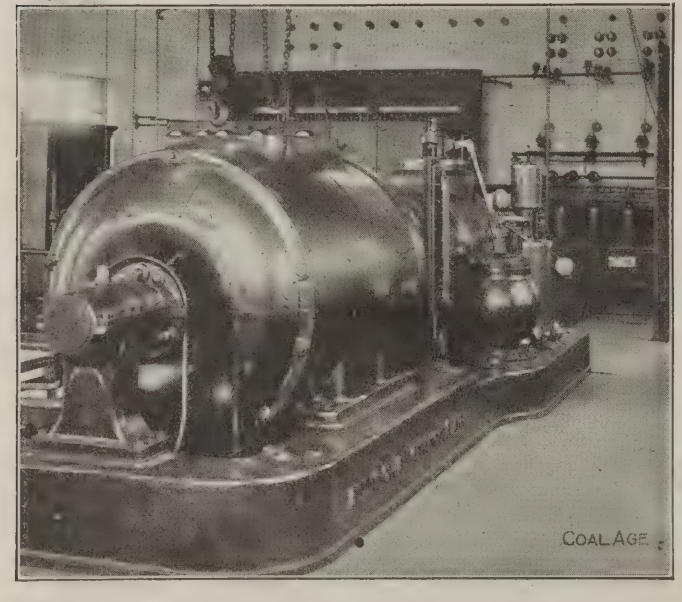

FIG. 10. ONE THOUSAND-KILOWATT, LOW-PRESSURE TURBINE UNIT

have been made so that an additional 6000-hp. heater can be placed alongside the present one, at some future date.

A 20-ton hand-operated traveling crane is available for handling all the equipment, except the two Ridgway (11x16-in.) blast-fan engines and the condensers. To facilitate the removal of tubes and cleaning of condensers, I-beams are supported from the steel work of the turbine floor, and located in front of the condenser heads, so that by means of an ordinary chain hoist and trolley on the I-beam, these heads can be easily handled.

THE OPERATING SWITCHBOARD IS ON THE TURBINE FLOOR

From the photograph, Fig. 9, showing the interior of the power plant, the general arrangement of the switchboard and high-tension switches can be seen. The operating board is placed on the turbine-room floor, for easy access of the watch engineer. The new portion of the board, with its oil switches and current and potential transformers, choke coils, and instruments, was furnished by the Westinghouse Electric & Manufacturing Co. The old portion of the board, shown near the right-hand end of photograph, furnished by the General Electric Co., was formerly in the old station and has recently been moved, so that all the switchboard panels will be together.

High-tension oil switches are of the remote-control solenoid-operated type and, as will be noted, are placed on the gallery above the operating board. In this manner, all high-tension current is kept away from the operator and confined to the high-tension switch gallery and the gallery above, in which are placed the choke coils, and lightning arresters, with their disconnecting switches.

The direct-current power required for operating the high-tension switches and overload relays, is furnished by a set of lead storage batteries, consisting of 60 cells, having a capacity of 80 ampere-hours. These cells are charged by a small motor-generator set. They also furnish power to an emergency lighting circuit, in case the turbines should, for any reason, fail. In this event, a switch automatically connects the battery referred to, to a lighting circuit in the boiler room and one in the turbine room.

This plant supplies electric power to the Truesdale, Bliss, Auchincloss, Avondale, Loomis and Woodward Col-

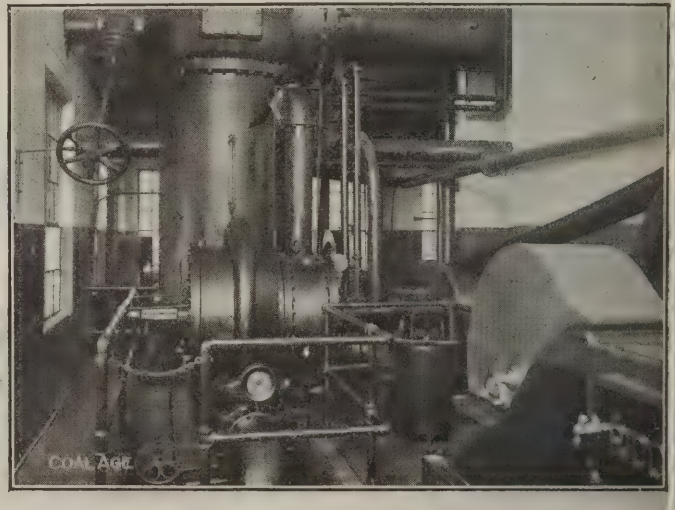

FIG. 11. LE BLANC CONDENSER, BELT DRIVEN FROM A RIDGWAY ENGINE

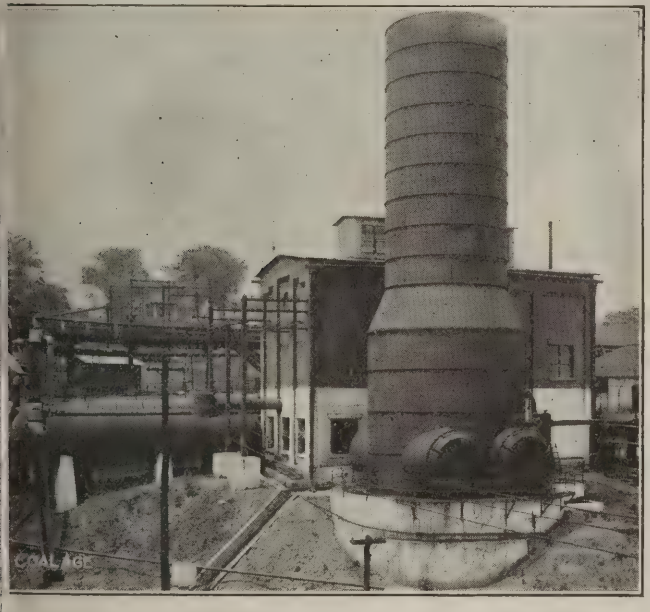
lieries. Because of the distance to the Woodward colliery and the fact that this line will eventually be extended still farther, the voltage of this circuit is stepped up from 4150 to 16,000 volts. At the Woodward colliery, and operating in multiple with the Nanticoke plant, is a 1000-kw. Allis-Chalmers exhaust-steam turbine.

EXHAUST-STEAM TURBINE PLANT, WOODWARD COLLIERY, KINGSTON, PENN.



This exhaust-steam turbine, Fig. 10, draws steam from the various engines about the colliery, such as those driving mine-ventilating fans, breakers, generators and hoists. There is available about 20,000 lb. of steam per hour from engines that operate at practically a constant load, and in addition to this, there is an extremely variable quantity of steam from the hoisting engines, which averages about 20,000 lb. per hour, making a total of 40,000 lb.; but because of the variations due to the hoisting engines, the exhaust steam is first taken through a Rateau regenerator. This is about 40 ft. long, 6 ft. 6 in. in diameter, and contains about 40 tons of water.

From the regenerator the steam passes through a large Sweet separator next to the turbine. A Le Blanc condenser, Fig. 11, together with its air pump, is driven by a belt from a four-valve Ridgway engine, which also drives

he exciter. As no adequate supply of condensing water as available, it was necessary to use artificial cooling. The water after it leaves the condenser is accordingly umped direct to the top of a Henry R. Worthington ombined forced- and natural-draft cooling tower, see ig. 12.

Because of the necessity of using a cooling tower, it is nportant that the condenser be as efficient as possible in rder to keep down the amount of circulating water re- uired, or, in other words, it was advantageous to employ condenser equipment which would operate at a temper- ure very close to the theoretical. This would not only ep down the amount of water circulated, but would so deliver the same through the cooling tower at the ighest possible temperature under the given conditions. his, in turn, would tend to make the cooling tower ore efficient.

Ordinarily, the Le Blanc condenser would have been riven by a steam turbine, but because of the large nount of power required to operate the condenser equip- ent when delivering water to the cooling tower, the uantity of steam taken by an outfit using a turbine ive, was considered excessive. For this reason, a belted

G. 12. Exterior View of Woodward Plant, Show- ing Cooling Tower and Regenerator

uipment was used, with the result that the steam con- mption required to do this work was about half what would have been with the turbine. With the engine ive, considering the fact that the exhaust from this ma- ine passes through the low-pressure turbine, the ef- iency of this unit, as will be readily seen, is extremely gh.

The cooling tower, being of the natural- and forced- aft type, is equipped with four fans which are driven a vertical Troy engine. Under actual operating con- ions, with the barometer normally at 29.2 in., the cuum on the turbine is from 26 to 28 in., depending on e outside temperature—the vacuum in all cases cor- ponding closely to that theoretically possible, consider- g the temperature of the injection water and the ight of the barometer.

This turbine unit delivers power at 4150 volts, 3-phase, cycles, and as before stated, operates in multiple with the Nanticoke plant, but because of the transmission line having a higher voltage, transformers are installed at this plant to step up the potential. One feeder, how- ever, runs direct to the colliery substation inside the mines, at 4150 volts.

As this turbine can only run at such times as exhaust steam is available, the normal operation is for about 10 hours each working day. The output averages about 8300 kw.-hr. per day, about two-thirds of which is used at this colliery, the remainder being transmitted back to the Nanticoke plant.

As there is a steam plant at this colliery, operating during the day at about 3500 boiler-hp., the necessary boiler feed water is taken from the discharge of the con- densers at the low-pressure plant, and an equivalent amount made up into the cooling tower basin from water mains. This materially assists in keeping down the tem- perature of the injection water.

The Oldest Mine in Anthracite Regions

The Lehigh Coal & Navigation Co.'s No. 1 Tunnel at Nesquehoning, Penn., which was originally known as the Room (Rhume) Run Tunnel, is undoubtedly the oldest anthracite mine tunnel in operation. The exact date of opening is not positively known, but is presumed to be 1830. The Room Run Railroad, built to carry the coal from this tunnel to Coalport, was constructed in 1831, and the tunnel had unquestionably cut some of the veins prior to this date.

"Statistics of Coal," by R. C. Taylor, published in 1855, states that 334,929 tons of coal were secured from this tunnel in the year 1837, and that eight seams were being worked in 1847.

This tunnel has been in continuous operation since its opening, the present daily output being about 1300 tons. Coal will likely be brought out through the tunnel for a period 30 years longer.

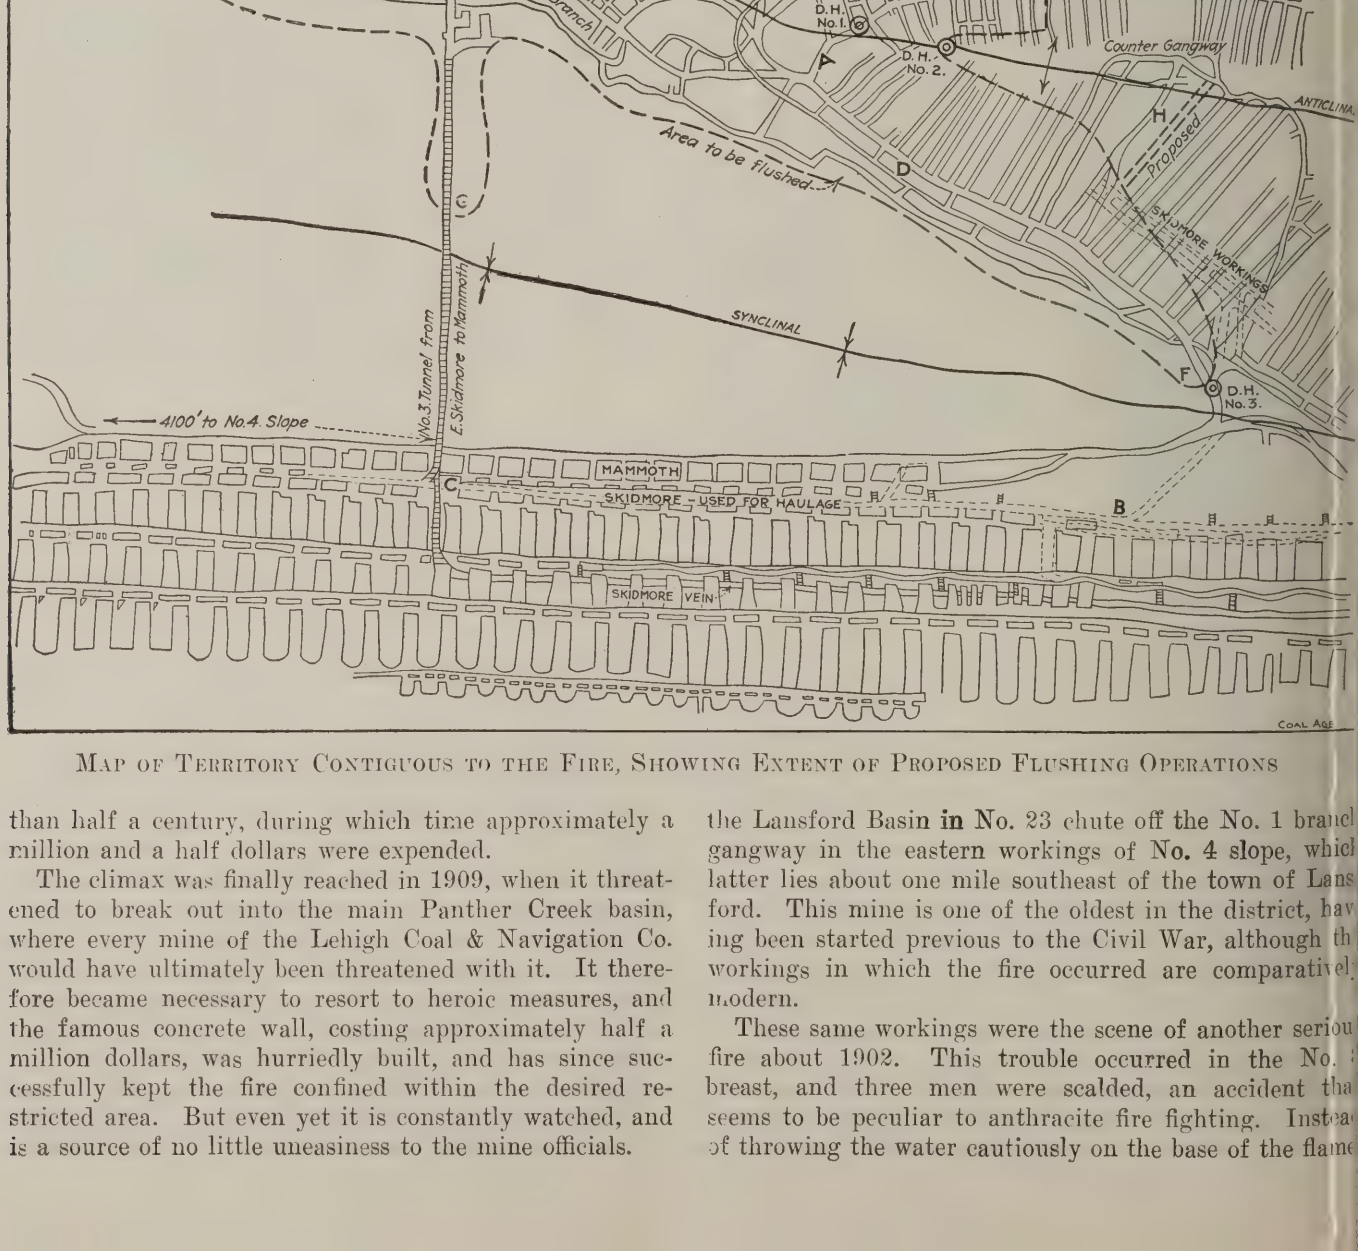
Engineers' Society of Western Pennsylvania

On Friday, May 29, the society organized a metallur- gical and mining section. A paper on the "Progressive Alteration of Coals of the Northern Appalachian Fields" was read by David White, chief geologist, U. S. Geologi- cal Survey, Washington, D. C.

The society visits today, Saturday, June 6, the works of the Keystone Coal & Coke Co., near Greensburg, in- specting a modern coal washer and Belgian coke ovens at the Huron mine and a large electric rope haulage at the Crow's Nest workings.

Interesting Articles Next Week

The June 13 issue of Coal Age will contain a number of articles of much value to all coal-mining men. One article will suggest that reinforced-concrete mine timber- ing has advantages over steel and wood. Another will deal with the engineering methods of the Lehigh Valley Coal Co. A third article will describe a new steam hoist- ing engine. Other subjects covered will be "A Novel Lining for Shafts," "Reliability of Electric Signals in Mines," etc.



The New Mine Fire in the Panther Creek Valley

By A. T. Shurick

SYNOPSIS—A brief description of the new fire at the Lehigh Coal & Navigation Co.'s operations. The fire was practically beyond control before discovered, and will be sealed off, and the workings flushed. Extensive preparations for carrying this out are under way, including the construction of two miles of standard-gage railroad.

Any mention of a mine fire in the Panther Creek Valley must inevitably convey thoughts of the disastrous Summit Hill fire, the largest in the history of the mining industry of this country, if not the world. This historical conflagration stubbornly resisted every effort to extinguish it, made at intermittent intervals, for more than half a century, during which time approximately a million and a half dollars were expended.

The climax was finally reached in 1909, when it threatened to break out into the main Panther Creek basin, where every mine of the Lehigh Coal & Navigation Co. would have ultimately been threatened with it. It therefore became necessary to resort to heroic measures, and the famous concrete wall, costing approximately half a million dollars, was hurriedly built, and has since successfully kept the fire confined within the desired restricted area. But even yet it is constantly watched, and is a source of no little uneasiness to the mine officials.

Map of Territory Contiguous to the Fire, Showing Extent of Proposed Flushing Operations

Some Other Mine Fires in This District

While the new fire is not in any way connected with the old original Summit Hill conflagration, it is none the less interesting to note that the present trouble is in the hands of engineers who have had a great deal of experience along this line. It might be added further that the bituminous engineer has little conception of what an anthracite mine fire in the Mammoth Vein means. The physical conditions of operations in this vein are such that large areas are mined, which are practically inaccessible for either inspection or survey, and it was in such a place as this that the new fire originated.

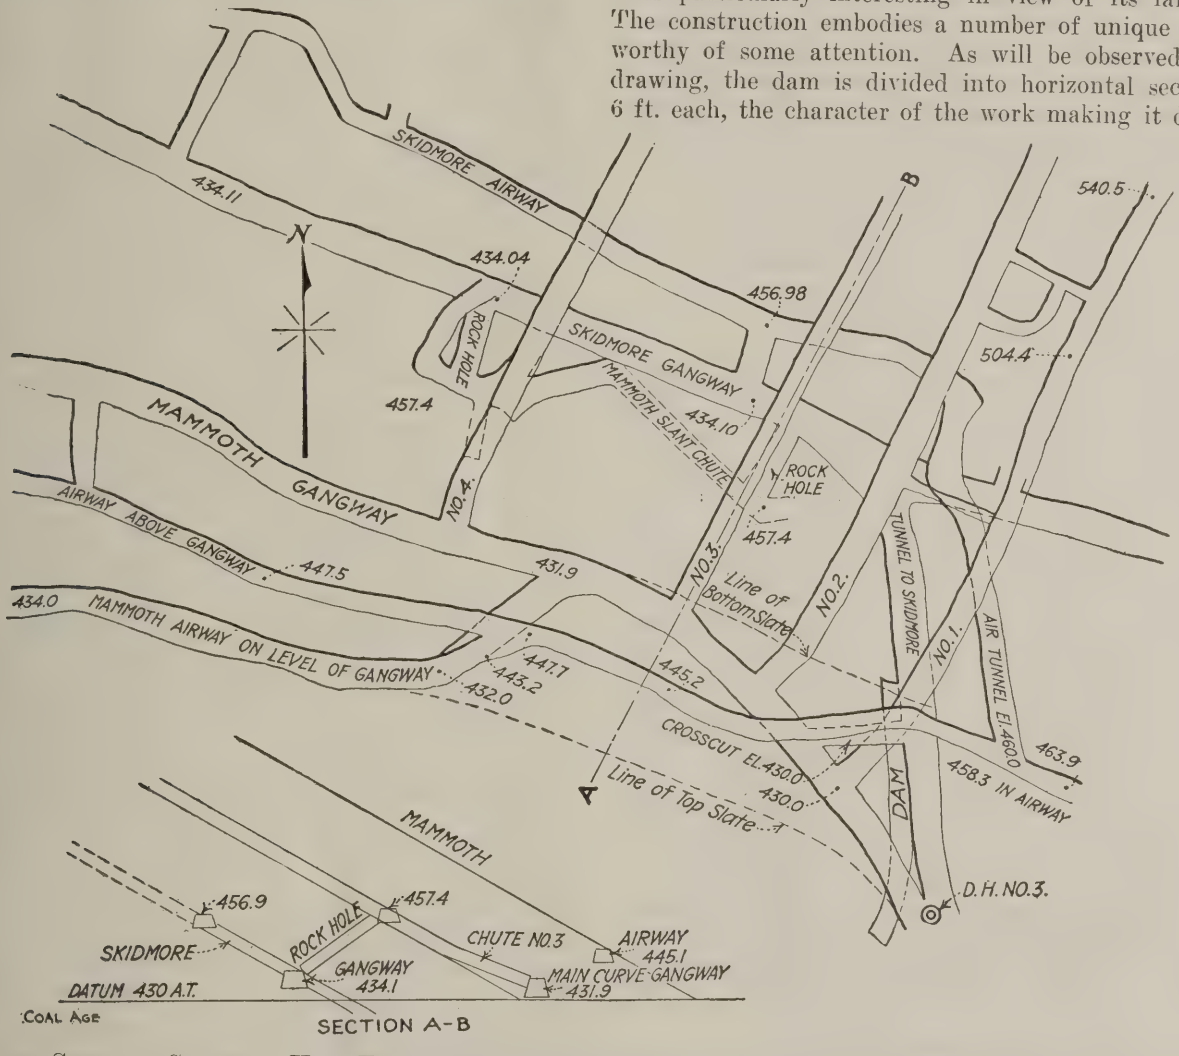
The fire occurred at the point *A* on the south side of the Lansford Basin in No. 23 chute off the No. 1 branch gangway in the eastern workings of No. 4 slope, which latter lies about one mile southeast of the town of Lansford. This mine is one of the oldest in the district, having been started previous to the Civil War, although the workings in which the fire occurred are comparatively modern.

These same workings were the scene of another serious fire about 1902. This trouble occurred in the No. breast, and three men were scalded, an accident that seems to be peculiar to anthracite fire fighting. Instead of throwing the water cautiously on the base of the flame

it was played recklessly on the main portion of the fire, with the result mentioned.

Origin of the Present Fire

The workings in which the present fire occurred had been standing idle for about three months, pending improvements and changes in the ventilating system, and were only again being reopened. It is therefore impossible to say just how long the fire had been burning; it may have been smouldering for some time and made rapid headway when the ventilation was restored.



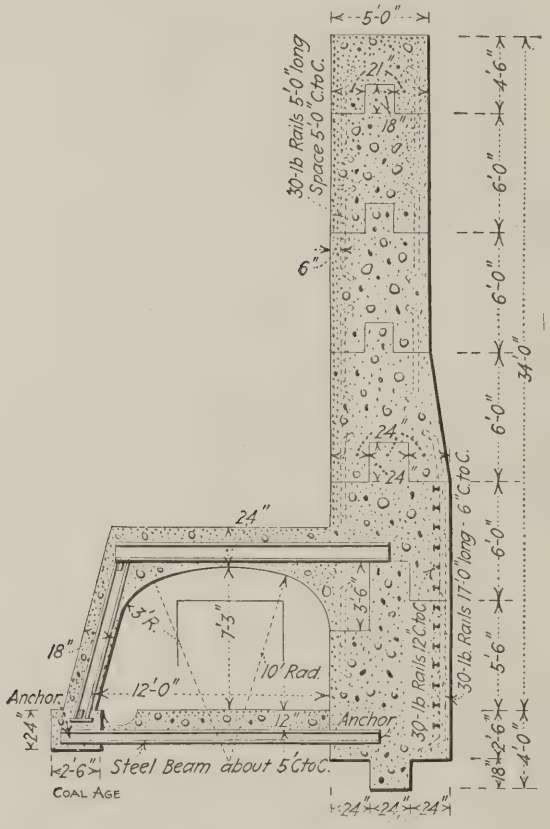
The fire was discovered on Saturday, May 2, and an attempt was made to put it out with an ordinary fire hose. A 2½-in. line was laid in toward the fire, but before it was reached a number of men were overcome and it was necessary to lay the last four lengths with the aid of Draeger helmets, which proved very effective. A second fire line was then established from a pump located at the No. 3 Tunnel from the Mammoth Vein to the Skidmore at the point *C*, noted on the map; 800 ft. of hose was laid through the tunnel, and 750 ft. through the airway and gangway of the Mammoth Vein up to the fire. On Monday, May 4, at 8 p.m., both the fire lines were pouring water on the blaze.

It had become evident by this time that the fire would be exceedingly difficult to handle, and after a conference with the state mine inspectors it was decided to seal it off. Temporary stoppings were accordingly put in on the No. 1 gangway on the Mammoth Vein at the point *D* and also at the point *E* at the connection of the No. 3 North Tunnel with the Mammoth Vein workings. It was at the same time decided to put in concrete dams at the point *F* in the Mammoth Vein workings, and *G* about half way through the No. 3 North Tunnel.

Elaborate Dam Construction

Detail drawings of these dams are shown herewith, and it will be noted that the one designed for use at the point *F* is particularly interesting in view of its large size. The construction embodies a number of unique features worthy of some attention. As will be observed by the drawing, the dam is divided into horizontal sections of 6 ft. each, the character of the work making it desirable to lay each of these sections separately. To secure a firm joint between the different sections, a concrete key about 18x24 in. is provided, together with reinforcements projecting from the top of one section into the base of the next one above.

Since the structure acts as an actual dam only for about 10 ft. of its height, reinforcements against heavy pressure are provided only at this point, as will be noted in the drawing. It will also be observed that it is the intention to concrete the adjoining gangway in which it is proposed to intersperse steel supports between the existing timber sets, which will either be removed or left in, as may seem the most desirable when the concreting begins.

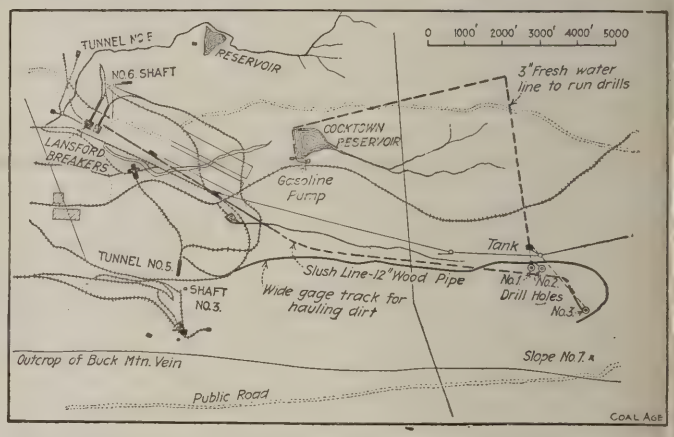


Plan and Section, Showing How Flushing Operations Will Be Conducted from the No. 3 Drill Hole through the Skidmore Vein

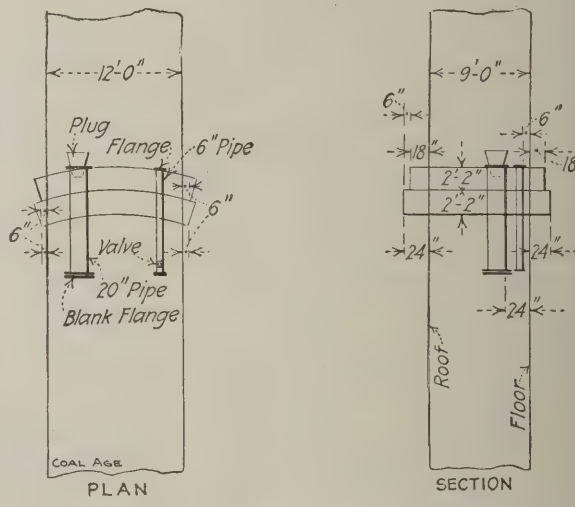
The second dam in the No. 3 North Tunnel is relatively small as compared with the one just described, and embodies no unusual features. Provisions will, of course, be made in both dams for obtaining the temperatures behind the structures, together with samples of the gas and any other data that may be necessary.

The Drill Holes

The complete inaccessibility of the fire has, of course, made it necessary for the company to resort to flushing through drill holes from the surface. It is planned to use only three holes, and it is believed that, together with the underground openings, it will be possible to reach all of the affected area. The holes are to be located as shown on the accompanying drawings at Nos. 1, 2 and 3. Nos. 1 and 2 will be 8-in. holes about 800 ft. deep, and No. 3 will be 10-in. in diameter and 890 ft. deep.



The Main Dam Located at "F"



Referring again to the accompanying map, it will be noted that the holes Nos. 1 and 2 are located in the highest portion of the fire territory. It is believed that the flushing material will run out into at least all of the area in the immediate vicinity which is essentially in the center of the fire zone. The area between the large dam at *F* and the fire will be filled through drill hole No. 3. As will be observed, this hole lies outside of the sealed off area, and is therefore accessible under ground. Material from this hole will be conducted by direct pipe connections from the bottom of the hole in through the Skidmore Vein and then by rock tunnels, driven at an angle of 35 deg. up into the Mammoth Vein. A cross-section of these proposed tunnels, and the general location of them, will be found in the accompanying drawings.

Surface Plants

No figures regarding the amount of material that will be required are available but it is obvious that there will be sufficient needed to justify the installation of the most economical methods available. In the accompanying drawing, a rough map of the proposed surface installation is given. It will be observed that this involves the construction of two miles of standard-gage railroad. The

Surface Installations for Flushing and Drilling Operations

Dam in the No. 3 North Tunnel

curvature and grade of this line will be comparatively heavy, but the construction will not involve much work amounting to little more than barely surfacing the track except for one short stretch where there is a moderate fill in breaking away from the main line.

The material to be flushed will be hauled over this line and washed down the holes by the flush water from the Lansford breaker. The water line from the breaker to the drill hole will be 7600 ft. long, and made up of 14-in. wood pipe, together with whatever miscellaneous pipe is available. This water will be handled by a 42x20x72 single-acting pump manufactured in the local shops; it has a capacity of 1500 gal. per min., and will be working under a 230-ft. head. As will be observed on the drawing, a fresh-water line is provided to supply the drills.

Boilers left full of water while out of service often suffer from external corrosion because the cold surfaces condense the vapor in the air and corrosion is rapid, especially in the presence of the sulphur compounds in soot.—Bromley in "Power."

The Colorado Strike

SYNOPSIS—Further light is being obtained by the public regarding the strike in Colorado. The Industrial Relations Committee has heard a lurid account from Mrs. M. H. Thomas and Mrs. Jolly, a detailed rebuttal of the major part of their charges from Major Boughton and a painfully neurotic plea from Judge Lindsey. Meantime the latter has been unsparingly condemned by local chambers of commerce and others. On the whole it seems that an end of the whole agitation will come if the army of the United States removes all men without occupation who are strikers from the zone of trouble.

The Industrial Relations Committee received a visit on May 27 from Mrs. M. Scott, president of the Women's Trade Union League, who brought with her Mrs. P. Jolly and Mrs. M. H. Thomas, the two women who had accompanied Judge Lindsey to New York City and Washington. Mrs. J. Borden Harriman moved that the women be heard.

Mrs. Jolly testified to the excellent relations existing between militia and "strikers" early in the strike. Apparently this changed when a search was made for arms and ammunition. She declared that the miners' families were forbidden with oaths to go to the post office and that in December, when there was deep snow on the ground they were ordered to leave their tents. When a woman with a sick child in her arms tried to return a revolver was placed at her head.

Probably the report of Major-General Chase throws a clearer light on this event, if Mrs. Jolly's statement refers to the Forbes camp in which Chase declares there were no women and children. Mrs. Jolly declared she pinned red crosses over her white dress and wanted to intercede but "all I got was a bullet through the heel of my shoe."

It is needless after having published the report of Major E. J. Boughton for us to rehearse his testimony. Judge Lindsey spent much of his time denouncing John D. Rockefeller and his Colorado aides. He stated:

"The new feudalism, which deliberately refuses personal relations is only a new and novel system of suicide. The President of the United States should prevent it as a policeman seizes the poor devil who is trying to leap into the river."

The court martial of H. E. Linderfelt has been completed and John Lawson, of the United Mine Workers of America, has testified. As we suspected, Lawson showed himself rather a correct than an interesting witness. He aids and abets rather than violates the law by direct action. He did not try to get to the camp at Ludlow until some time after the fight had begun as he was at Trinidad when he learned of the shooting. He did not succeed in entering the colony, and he left it after a few hours, before the fire took place.

USED A WHITE FLAG TO PROTECT HIM AS HE TRIED TO JOIN HIMSELF TO THE ENEMY

With John Boralich, the union chauffer, and Peter Gorman, he had taken an automobile to go into the colony. He pinned a handkerchief on the front of the automobile and tried under cover of this flag to get among the tents. He was in the same condition as a man who tried to run a blockade under the white flag.

We will grant him that his purpose may have been peaceable and not belligerent, but nevertheless he could not complain if he came under fire. Had he approached, not the camp, but the militia with his white flag, the situation would have been wholly different. In fact the strikers by their own testimony have used the white flag as a means of obtaining improper ends and consequently can hardly claim for it any inviolability. Lawson declared he had no guns in his automobile.

HOISTED A WHITE FLAG TO AID IN ESCAPE

The court has returned its verdict. It is thought that it has stated among other things that Premo Larese was killed while attempting to escape with a horse and buggy from the tent colony under the protection of a white flag. He was called upon to halt and he opened fire with a revolver. It may be true that some men were foolish enough to believe that any act not directly belligerent could be performed with immunity under the white flag, but it is intended to be used for surrender or parley and its use for other purposes needs mutual agreement.

THE MILITIA IS ONLY GUILTY OF TECHNICAL ERRORS

It is further understood that the court finds that the soldiers did not know that there were any women and children remaining in the colony after the battle started, that the 11 children and two women were suffocated by exhaustion of oxygen from the atmosphere within the narow confines of the cave, that all were dead before the fire started and that the Snyder boy was shot in the forehead by a bullet from the guns of the strikers north of the colony when the child ran outside during the battle. Carlo Costa, they are said to declare, was killed at the sandhills by the Colorado & Southeastern R.R. tracks in a battle against the state troops.

It is also said that Sergeant Patrick N. Cullen is criticized for failing to give safe conduct to Louis Tikas and that Privates F. M. Mason and Dan Pacheco are condemned for not living up to the articles of war which require that a guard shall protect a prisoner with his own life if need be.

The people of Colorado generally are much stirred at the condemnation of the militia and with reason. Governor Ammons writing to L. C. Paddock of the Boulder "Daily Camera," says that for almost six months as many as 40 stations were maintained scattered over a territory greater in extent than some states without killing a single "striker."

SECRET ORDERS DEFEND MILITIA

The Ancient and Accepted Scottish Rite Freemasons at Denver, Colo., have adopted a strong endorsement of the militia and framed a defense of its martyrs while recognizing that "in this insurrection, as in all actual warfare, there may have been cases of wrong by individual members of the National Guard of Colorado."

The Junior Order of United American Mechanics, Kensington Council No. 16, Denver, Colo., has also made a strong report defending the state government, its militia and its citizens. It calls attention to several important facts and only fear of repetition keeps us from detailing them. It tells how the militia at Ludlow after the battle, despite the fact that their pay was months in arrears, collected $18 for the suffering women and children. It defends the militia from cowardice and says that there were from 400 to 800 men in the Ludlow attack and only 34 men to meet that mob of blood-thirsty foreign anarchists. What wonder we may add that a roughly collected body of men, mine guards, company men and mine workers, white and black, came down from Aguilar to defend the devoted company of militia thus in danger of extermination.

The Kensington Council likewise states: "The tent colony was purposely so located as to command an unobstructed view of the railway depot near at hand where working men were obliged to get on and off the trains. The conduct of the strikers during the winter was such that it was necessary to send a detail of soldiers to meet every train in order to protect the nonunion men from physical violence."

THOSE WHO WANTED TO WORK WERE IMPRISONED

No man wishing to leave the colony and go to work could do so except under guard of the state troops and during the winter over a hundred men were in this way taken from the tent colony under military guard at their own request.

On Apr. 20, a detail of men was sent in the usual manner to rescue a man who had called for help to get away. This time the man was not given up. Then followed the Ludlow battle which we need not again describe.

Hardly less forceful was the defense of the Cañon City Chamber of Commerce. The respectable citizens of Colorado are certainly beginning to take an interest in politics and are sweeping aside those who have used the vote for the defense of disorder.

OVER A HUNDRED EX-SOLDIERS AT LUDLOW

Speaking at Greely, Colo. Adjutant General Chase said of the Ludlow colonists, "I feel a great compassion for those men. They are ignorant foreigners. To my knowledge, 120 were trained soldiers, fresh from fighting in the Balkans and in Bulgaria. One thousand persons were in that tent colony, 700 men and about 300 women. The troops went to Trinidad in an impartial frame of mind to establish peace and order and it was done under the most trying conditions and the work will ever reflect credit on these students, school teachers, merchants, doctors and lawyers—these men who have been called gunmen.

In eight months the strike has cost from $10,000,000 to $12,000,000. This includes $700,000 expended for the state militia, $6,925,000 spent by the United Mine Workers of America and the millions lost by the operators. The total

tonnage for the first three months of 1914 was 2,817,675 tons against 3,638,436 for the same period a year ago, a decline of 22.5 per cent. only.

THE UNION BURDEN

But Lawson states that 8500 men are on strike, that is, we suppose, are on the payroll of the union. The burden of the strike is immense to that organization and it owes a vote of thanks to the U. S. Army for preventing all the army of unemployed and "won't works" from feinting a desire to work for the companies and getting the financial assistance of the union thereafter.

ATTACK ON U. S. TROOPS

The militia secured peace for six months, and also, by the way, 1947 guns acording to Adjutant General Chase. It is doubted whether the U. S. troops will do much better. At the village of Segundo in Los Animas County, near the southern state line, a U. S. soldier on May 26 had to dodge a missile thrown from the window of a scale house. He was also fired at and returned the fire. More than 20 shots were then fired on the military patrol from a hillside overlooking the camp by the gunmen of the "strikers." There has been much picketing and eight men who had been working at Sopris were prevented from boarding an interurban car for that place.

William Diamond, of the United Mine Workers of America, has announced that a number of eastern organizers will be brought into Colorado from the East. Col. Locket, of the U. S. Army, is considering whether this will be allowed.

THE LEGISLATIVE COMMITTEE

The legislative mediation committee, so called, is in doubt whether it is empowered to do any more than investigate and has finally decided that it will make an investigation and how it will be done. Senators Pierson and Stephan go to Routt County, Representatives Smedley and Wright to Boulder and Weld counties, and Senator Burris and Representative Fincher to the southern coal fields. This decision was reached May 27. It is thought the trips will take about a week or 10 days.

It is not necessary to specify in detail the action of the grand jury at Trinidad and Cañon City in the indictment of the men who were engaged in attacking the mines at Forbes and Chandler. One hundred men were indicted for the latter offense.

PROFIT SHARING AND SOCIALISM

Brilliant suggestions for ending the strike are that the Union shall open mines and operate them, making them absolutely safe and surrounding them with dwellings of a superior order. The profits can be divided among the working men who will be stockholders. The Union was urged to do this by Governor Ammons long ago, but no reply was made to his proposal. The experiments made in Wyoming by workingmen who opened mines, and perhaps in Colorado also, do not hold out much assurance of success.

The Coal Consumers' Legislative League desires to meet the problem with an amendment to the constitution by which the state board of land commissioners may open mines, extract and sell coal, paying 10c. into the school fund and another 10c. toward the amortization of the debt incurred, the bonds not to exceed $500,000.

FORBES MINE PERMITTED TO RESUME

The Forbes mine resumed operations May 25 with 95 men who were working there before the attack was made on that operation Apr. 29. On that date, the tipple, mine office and other buildings were burned and nine persons killed. The commander of the troops in that locality does not object to the mines reopening, provided no new men are brought in to replace those murdered and driven away by force of arms. Benignity supreme!

More Anthracite Articles to Come

We have been able to print only a part of the anthracite articles that were submitted by our contributors for publication in our issue this week. Other interesting matter relative to hard-coal mining will apear next week, and in succeeding numbers of Coal Age. We are sure our readers will find the articles of Messrs. Conner and Warren so interesting and instructive that they will not find fault with us for devoting so much space to them.

Gas in Anthracite Mines

By W. D. Owens.*

In connection with anthracite mining, I want to call attention to a fact that it seems to me is much overlooked, or to which proper credit is not commonly given. We often hear the statement made that there is generally more gas in bituminous coal mines than is to be found in anthracite workings.

I believe that this idea, which is contrary to my own experience, can be attributed largely to the teaching of geologists and scientists that anthracite was originally in a state similar to that of bituminous coal; and that, for a long period of time, these deposits were subjected to the modifying influences of great heat and pressure. The inference is natural that this great heat, which suggests to one's mind a condition similar to what might exist in the vicinity of a volcano, would drive all the gases out of the coal in the same manner that we know the gases are driven off from bituminous coal by heat.

Another fact hard to understand is how it happens that anthracite contains, on the average, only about one-half the amount of ash usually found in bituminous coal. It would seem that if anthracite was formed from bituminous coal by the action of great heat, not only would the gases be driven from the coal, but the percentage of ash in the anthracite might be expected to be much higher than that in bituminous coal.

From these well-established facts of science, it seems difficult to understand or explain the presence of so large a quantity of gas as is found in many anthracite districts. I have had a wide experience in the mining of many different grades of coal, in different parts of the world. For 20 years, I was engaged in mining coal in Wales, in the Bryndu colliery, Kenffig, South Wales, which was considered a very gaseous mine. The coal was entirely bituminous, and the Gribbwr seam was considered the best coal to be obtained in the British Isles, for coking purposes. Following this, I worked in the Morva colliery, near Aberavon, where the coal was of the same quality; and, later, in the Park colliery, Britoin Ferry, South Wales. The coal here was also bituminous, but the seams were thinner and on a heavy pitch. Again, I was employed in the Bwllva colliery, Aberdare, where the coal was semibituminous and worked on the longwall system. I worked for a time in the celebrated Ferndale colliery, where 181 men were killed, in the last explosion in that mine; and, again, in collieries in the upper end of the Rhondda Valley. Practically all of these mines were gaseous mines.

Coming to this country at the age of 31, my experience has since been confined to the mining of anthracite coal. As far as I have been able to discover, the mines of the anthracite valley, particularly those of the Wyoming Valley, Luzerne County, Penn., extending from a point near Pittston to Nanticoke, contained more gas than I ever saw in any bituminous or semibituminous mine. I recall an instance of 21 years ago, where the volume of air circulating in the mine was 181,000 cu.ft. per min., and a test with the Davy lamp, at the foot of the upcast shaft, gave a cap from ¼ to ⅜ in. on a ¼-in. flame. When it is remembered that a ¼-in. cap on a flame of the same height indicates about 2 per cent.

*Div. Supt., The Lehigh Valley Coal Co., Wilkes-Barre, Penn.

of gas in the current, it is readily seen that this mine was generating between 3000 and 4000 cu.ft. of gas per min.

The above is only one of many similar cases existing in the mines about Wilkes-Barre. There are many mines here circulating nearly 500,000 cu.ft. of air per min., and I doubt if similar conditions, in respect to gas, can be shown in any bituminous mine, in this country or elsewhere. I know that the same conditions do not hold in all anthracite beds, for the anthracite mines of Wales had little gas, at least as far as the development had gone at the time I was there. If bituminous workings can show more gas generated in the mines than that just mentioned in regard to anthracite mines, I would personally much appreciate learning the facts.

❖

An Interesting Anthracite Development

One of the most interesting small developments, at present going on in the anthracite region, is to be found a short distance above Wilkes-Barre. Here, the Delaware, Lackawanna & Western R.R. Co. is developing a small tract, about 130 acres, of isolated coal land.

Hoisting in the two shafts above mentioned will be accomplished by means of steam hoisting engines, which will be duplicates of each other. Ventilation will be secured through two duplicate fans of the narrow-vane type.

It is not at the mine itself, however, that the chief interest in this development centers, but in the fact that the coal will not be prepared in the vicinity of the shaft. The entire output of this mine will be hauled approximately two miles and preparation made at the Pettebone breaker.

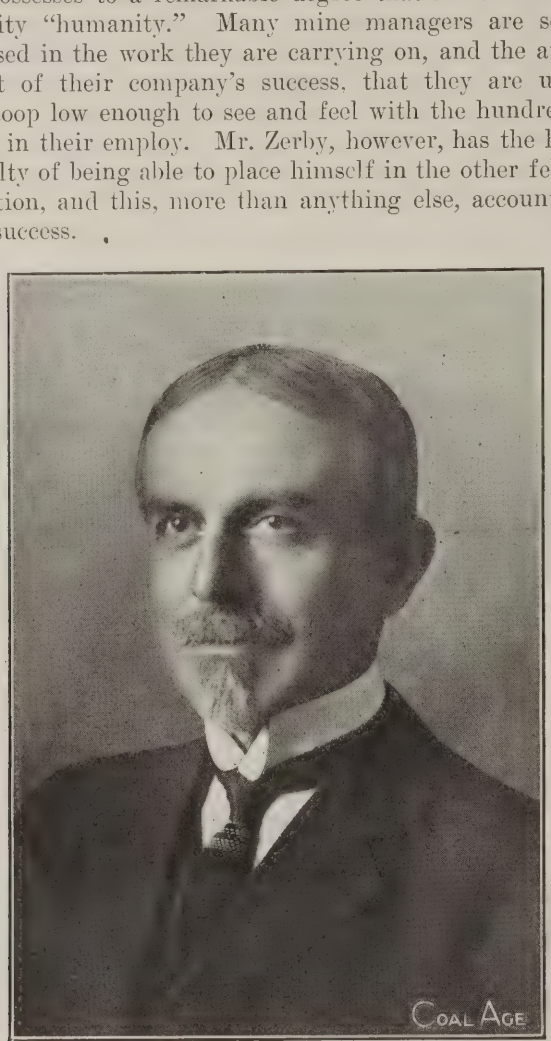
The tramroad connecting the mine with the breaker presents many engineering difficulties. Considerable grading has had to be done and at least five bridges varying in length from those sufficiently long to carry the track over streets and street-car lines to one which spans the Susquehanna River must be traversed. A steel trestle several hundred feet in length is employed to carry the track across a small brook and the low flat lands upon either side of it. Another bridge spans six tracks of the Lehigh Valley Railroad.

Across the Susquehanna River the tramroad will be carried on arms from the trusses of the old Wilkes-Barre & Eastern R.R. (now the Delaware & Hudson) bridge.

TEMPORARY HEAD WORKS AT THE SHAFTS AND ONE OF THE BRIDGES SPANNING A STREET AND TROLLEY LINE

STEEL TRESTLE ACROSS BROOK AND FLAT, AND THE BRIDGE ACROSS THE SUSQUEHANNA RIVER WITH THE PETTEBONE BREAKER IN THE DISTANCE

Two shafts are being sunk upon this property, one for hoisting the coal and the other as an air shaft. The latter contains two cage compartments for the accommodation of men and material, one airway and a compartment for pipes and electric conductors. At the present time, these shafts are down to a depth of about 630 ft. The hoist shaft will eventually be continued to 1150 ft., while the air shaft will only be driven as far as the Baltimore seam, and the lower measures reached therefrom by means of slopes.



Although this bridge is an old structure much repair work was necessary to put it in shape for operation. Beyond the river proper, a considerable length of steel trestling is required before the road reaches the Pettebone breaker.

Although in many places in the coal fields the product of the mine must be hauled long distances before being placed in railroad cars, it is seldom indeed that such hauls present so many engineering problems and difficulties as does the one just described.

Who's Who in Coal Mining

Frederick E. Zerby

One of the most interesting men in the anthracite field is Fred Zerby, general manager of the Kingston Coal Co., Kingston, Penn. He is rich in original ideas, and in spite of his love of precision and insistence on details, he possesses to a remarkable degree that most admirable quality "humanity." Many mine managers are so engrossed in the work they are carrying on, and the attainment of their company's success, that they are unable to stoop low enough to see and feel with the hundreds of men in their employ. Mr. Zerby, however, has the happy faculty of being able to place himself in the other fellow's position, and this, more than anything else, accounts for his success.

FREDERICK E. ZERBY

Standing less than 5 ft. 7 in., stockily and proportionately built, with keen black eyes looking out from under heavy brows, Fred Zerby appears to be just what he actually is—a bundle of nerves—a dynamo of human energy. He is a tireless worker and an enthusiastic student of mining.

Mr. Zerby can be persuaded to talk about almost anything except himself; however, it is a fact that his first important experience in mining was secured with the Lehigh Valley Coal Co., where he was appointed superintendent of mines in the Hazleton division. Later he was transferred to Wilkes-Barre, and became superintendent of the same company's Wyoming division. When the late Robert Mercur died, the Kingston Coal Co., looking about for a suitable man to manage their collieries, settled upon Mr. Zerby, offering him the position, which he finally accepted.

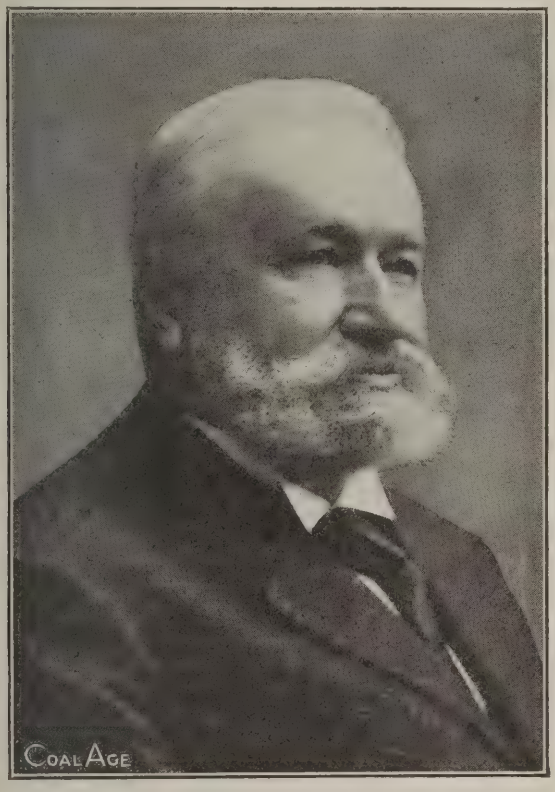
The Kingston company, with several collieries in Edwardsville and one in Plymouth, under Mr. Zerby's supervision has become one of the most successful of the independent mining concerns. In his work of bettering conditions for his employees, he has erected modern homes to replace shanties formerly occupied by many of the Kingston miners. Culm banks have been removed, and in their place he has put in splendidly equipped playgrounds. Night schools have been established for the young and old, and a company band has been organized for musical entertainment. Libraries have been created and hospitals erected.

All of these improvements have been made at the company's expense, therefore it is not hard to understand why the miners of the Edwardsville section speak of Fred Zerby as the best general manager the Kingston Coal Co. ever had. It is doubtful if any mining concern in the anthracite field can boast a more loyal army of workmen than the corporation at present managed by Mr. Zerby.

John C. Haddock

We have all heard so much about self-made men that any writer using the expression must feel some trepidation. However, if there is any merit in a man's advance toward success over serious obstacles, and without the aid of helping hands, John Haddock is surely worthy of mention.

As an independent operator and president of the Plymouth Coal Co., he is reckoned as a force throughout the mining districts of the Pennsylvania anthracite field. Few men possess more dogged determination and are less compromising in battle than Mr. Haddock.



Not many men in his employ, even if younger in years, can stand the pace he sets in his business life. His work is his recreation. In summer or winter, early and late he will be found toiling away, without any apparent relaxation from the strain of his labors. Mr. Haddock was born in the north of Ireland, County Longsford, 1850. When an infant in arms, he was brought by his parents to the shores of America, and for 11 years lived in Lenox, Mass.

His first job was that of an errand boy for a commercial house in Newport, R. I. His salary was $2 per week. After 18 months of this work, he became a clerk in a wholesale grocery store and held this position for one year. Then came a chance for him to connect himself with the wholesale and retail coal business, and in 187[illegible] he was sent to Fall River, Mass., to take charge of a coal business in that town. In 1874 he went to New York to become manager of Meeker & Dean, wholesale coal dealers.

In 1877, Mr. Haddock decided to set out for himself and one year later he took over the lease of the Dodson mine at Plymouth, Penn. He successfully operated this

colliery until 1882, when he branched out and, with Charles S. Steel as partner, took over the lease of the Black Diamond mine in Luzerne, Penn., consolidating this latter property with the Plymouth colliery to form the Plymouth Coal Co.

As early as 1890, he started an agitation for the regulation of the supply of coal cars. He discussed the matter with many of the big railroads, and not feeling satisfied with conditions as they stood, he asserted public-

JOHN C. HADDOCK

ly that the railroads were discriminating against the independent operators. His contention was that the discrimination was not only a hardship on the smaller operators, but on the men who worked for them.

He then began a systematic study of this big question, and while his attack for improved conditions was directed only at the D., L. & W. Co., the contest was really one of far-reaching effect.

As a result of this fight, led by Mr. Haddock and several other independent coal men in the anthracite field, discrimination on the part of the coal railroads against the small operators apparently ceased, and the little fellows were given equal rights in the matter of coal transportation and the distribution of cars.

And Mr. Haddock's entire attention has not been devoted exclusively to purely corporation matters, forgetting the men who have made possible his success. It was through the instrumentality of his personal efforts that the Plymouth Coal Co. established a tax on its own coal to create a benefit fund for employees, made dependent on the company through mine accidents.

The boiler and the furnace are twin brothers, but they must be regarded as independent units and their efficiency separately considered. Though the boiler may be perfect, the furnace may be most inefficient. In fact, it usually is, as it is generally erected by ordinary bricklayers who are not superintended by specialists.

Industrial Peace Increases Efficiency of Miners

With the coming of industrial peace in the anthracite region of Pennsylvania has come greater efficiency among the miners and more production of coal per man. With the greater efficiency has come increased earning power, as the miners are paid for the coal they produce.

When the breakers are not running it is useless for the miners to cut coal, so the only way to arrive at a right and just estimate of their efficiency is to divide the annual output of the mines by the product of the number of miners employed and the number of breaker days. The result of this calculation, based on the figures in the last Report of the Bureau of Mines, is as follows:

Year	No. of Miners Employed	Average No. of Days Worked	Total Miners' Working Days	Output in Tons	Average Production Per Miner Per Day
1901	37,804	195	7,371,780	59,905,951	8.13
1902	36,392	116	4,221,472	36,911,549	8.74
1903	36,823	211	7,769,653	67,171,951	8.64
1904	39,848	213	8,487,624	65,709,258	7.74
1905	42,078	208	8,752,224	70,220,554	8.02
1906	41,801	206	8,611,006	64,410,277	7.48
1907	43,035	227	9,768,945	76,836,082	7.86
1908	44,340	211	9,355,740	74,592,181	7.97
1909	44,675	205	9,158,375	71,628,422	7.82
1910	43,651	212	9,254,012	74,717,852	8.07
1911	45,324	234	10,605,816	81,176,050	7.65
1912	44,696	220	9,833,120	84,426,869	8.58

Thus the miners are producing nearly as much coal per man per day as they were a decade ago, when the veins were larger and the mining easier. Owing to the suspension in the summer of 1912, the number of working days that year was less than in the previous year. In spite of this fact and the fact that fewer miners were employed, the production increased from 81,176,050 to 84,426,869 tons, and the average production per miner per day increased by nearly a ton. This implies an increase in efficiency of over 40,000 tons a day, and is a strong argument in favor of industrial peace, which benefits employer and employee alike.

Few Accidents in the Smokeless Mines

The records of the West Virginia State Mining Department, which have just been made public by Earl A. Henry, chief inspector, show that in the month of April there were 31 fatal accidents in the coal mines of West Virginia. This is a gain over the previous month.

The deaths resulting from the explosion in mine No. 5, at Eccles, West Virginia, are considered apart from the regular casualty list of the month because a disaster like that at Eccles always stands out by itself. In the Eccles mine there were 180 deaths, and this brings the total up to 211 for the month. Of the 31 deaths in the state, only seven occurred in those counties where smokeless coal, for which West Virginia is celebrated, is mined.

A classification of the list shows that 16 of the 31 were due to carelessness on the part of the miners, and these miners paid with their lives for the violation of the state mining laws and rules governing their particular mines. Of the 31 deaths, 20 were due to falls of coal and slate; five were caused by mine cars; two to electrocution; one by mining machine and four for miscellaneous causes. Of those under this latter classification, one man was kicked to death by a mule, another was crushed by a lump of coal falling off a railroad car at the tipple, and a third fell from a scaffold.

Editorials

The Strikes of 1902 and 1914

We prefer not to discuss a man with political affiliations like Colonel Roosevelt and we would urgently contend that coal has nothing to do with politics, if politics would cease meddling with coal. But it will not.

The public, rarely surprised at any action of Colonel Roosevelt, was temporarily taken aback at his declaration made recently in the suit of A. D. Wales against John Mitchell and the United Mine Workers of America, that he had proposed to create a pretext and invade the State of Pennsylvania with the United States Army.

It was all arranged, he said, that he was to give word to Matthew S. Quay and that not overscrupulous politician was to notify Governor Stone, who in his turn was to declare that he could not maintain order, and then the invasion was to take place.

Now order was being maintained and a declaration on Stone's part that it was not would have been little other than treasonable. That Roosevelt could so contrive and acknowledge his contrivance is evidence that he has a Machiavellian hand even if his intentions are of the best. Roosevelt's declaration was that he intended to send Major-General Schofield to seize the mines and operate them, ordering him to ignore the writs, injunctions or legal papers of any court and take his orders solely from the President.

Conditions are changing extremely fast, and to illustrate the change of sentiment, we recall an incident in the life of another man who later became President. He has been regarded as the personification of energy like Roosevelt but his actions were very different.

The President to whom we refer was Andrew Jackson. The war with Great Britain was barely at an end and General Jackson had reason for doubting whether peace had been consummated. A man named Louaillier had been tried in the civil courts for being a spy and had been acquitted. Andrew Jackson held him by martial law and expelled Judge Hall, who issued a writ of habeas corpus for Louaillier from the city of New Orleans, ordering him not to return till notice was properly posted or until the enemy had left the coast. The report of peace was, however, confirmed the following morning and Jackson revoked the martial law and freed his prisoner.

The judge returned and summoned Jackson before him and fined him $1000 and would have been mobbed by friends of the defendant had not Jackson intervened. The future President paid his fine, which in view of his services to the nation was not accompanied by an order for his imprisonment. The threat of Roosevelt in peace is in sharp contrast with Jackson's readiness to acknowledge the civil courts even in war.

Why did Roosevelt take so extreme a position? Because the business of the nation was severely crippled by the want of coal. The services of the coal operators and coal workers are so important that the people feel those services cannot be discontinued for any extended time.

Because the coal operator has put his money into a service of the people of more than ordinary value, his rights and his profits must be curtailed. There is no honor in serving the public. Only those whose work can be dispensed with are free from the continued harrying of the press and the man on the street. Their profits may be unrighteous, especially if the concerns are small. their dealings may be arbitrary, their product may be inferior, nevertheless, the public has nothing to say. But the coal and transportation businesses are not of that class. Because these industries really serve, therefore they must be eternally chidden.

It is remarkable how few are the millionaires in the coal business, and those you see are perhaps as little a part of the trade as the vultures which prey on the combatants are a part of a Mexican battle. These few rich coal barons have made their money not in producing coal but in leasing and selling coal lands and promoting corporations. Those operators who have money have usually made it in some side line and lost money in coal. Several are in the banking business and many were well-to-do before they learned how unsafe an investment productive development of coal land always proves.

It is interesting to note how the public has been prepared to connect the Colorado situation with Roosevelt's proposed action in the anthracite strike of 1902. In that strike, disorder was to be only the excuse; need for coal was the real cause. In Colorado, the actuating motive would be or will be disorder, for no shortage of coal exists.

The crime which is now in commission is not a coal dearth but a shortage of market. We would suggest that Major-General Leonard Wood be required to take charge of all the idle coal-consuming plants so that the coal operators may be furnished with work. Especially those manufacturers might be made to operate their factories who whimpered so childishly when the strike was in progress. This suggestion, made in jest, is not less logical than that proposed by the ex-President.

Explosibility of Coal Dust

It is seldom that readers are interested in controversies between editors, especially if the argument is based on intentional misrepresentation. Recently we were criticized for publishing a few statements from the findings of the Explosions in Mines Committee of Great Britain. An attempt was made to credit COAL AGE with the authorship of conclusions that resulted from the British experiments. It is the business of a paper to give all the news, providing the source is reliable. To question the competency or responsibility of Messrs. Cunynghame, Redmayne, Desborough, Dixon and Blackett is to insult the intelligence of coal-mining people everywhere.

Anyone interested in the question of the explosibility of anthracite dust will be interested in reading the remarks of Mr. Verner on p. 897 of COAL AGE last week. He emphasizes a point that has only been overlooked by

ıe careless reader; namely, that "*the inflammation of ust* and the *violence of the explosion* are two different ropositions."

Everyone knows that anthracite dust is difficult to in- ame; therefore, the freedom of anthracite mines from ust explosions.

Bearing on this subject, we will *quote* another part of a eport of the same British committee referred to above. hey say:

The idea seems to have been prevalent that the percentage f volatile constituents that a particular coal dust contains a direct measure of the explosive properties of that dust. The explanation usually given for this assumption is that ıe gases derived by distillation of the dust by the source of gnition are the real agents in propagating combustion. Ac- ording to this view, distillation of inflammable gas must first ake place, and it is that gas mixing with air that forms the explosive mixture." Hence it is concluded that any dust hich yields only a small proportion of inflammable gas on eating, or from which the gases are driven off with diffi- ulty, should give only moderate explosive effects; and a ust that yields no gas at all should, according to this view, e incapable of propagating explosion.

Neither of these two assumptions is upheld by experiment. coal dust containing 18 per cent. of "volatile matter" caused a explosion as violent as one containing 35 per cent., whilst ood charcoal produced an explosion as great, or even greater.

In our view there is nothing to conflict with the belief that oal dust, when suspended in a sufficiently finely divided state air, acts somewhat like a "coarse" gas, the aggregate of olecules contained in the one particle of dust corresponding the single molecule that takes part in an explosion of a ombustible gas and air, the heat energy necessary for propa- ation of explosion being derived from combustion of each ust particle as a whole without any appreciable preliminary istillation of gas therefrom In other words, heated oxygen olecules coming into collision with the combustible dust rticles form highly-heated carbon dioxide and steam mole- ules, which in turn transfer their energy, directly or in- irectly, to other oxygen molecules and unburnt dust particles nd so propagate the flame

According to this view, any finely-divided dust that is apable of being burnt is capable of propagating explosion.

Many considerations favor this opinion. The rapidity with hich explosive combustion (as distinct from inflammation) propagated in coal dust and air mixtures is hardly com- atible with the notion that distillation of gas must neces- arily first take place, and that it is the heat-energy derived om the combustion of that gas which is chiefly responsible r the explosive effects. Such a distillation requires an ppreciable time and absorbs energy.

All the foregoing is interesting, and coming from men ho are leaders of thought—so far as coal mining is con- rned—is worthy of careful consideration. It might be ell for the Bureau of Mines to pursue experiments along ıe lines naturally suggested by the eminent British en- neers.

It seems unnecessary to suggest that the conclusions ted are not original with us, and are neither indorsed r denied by COAL AGE. They are open to discussion id further investigation. We also apologize if we have nnecessarily wasted a word of valuable space in a seem- g reply to our critics. At least, we will not use our ink print veiled insinuations and self-emulation. Honesty, odesty and manners are as becoming in a paper as in individual.

A Matter of Names

What a thing is named, it often becomes and we nnot afford to disregard the importance of care in menclature. We have for a long time labored hard find names to fit the Colorado situation and cannot y that we have been markedly successful.

To begin with, can we call the difficulty in Colorado "strike?" James Dalrymple, the state coal-mine inspector, who is a union man and strongly in favor of the miners in all their clashes with the coal companies, who would, we think, be the first to resent any suggestion that he is not a labor sympathizer, states that in the first three months of 1914 there were an average of 10,149 miners working in Colorado mines compared with 14,035 for the same period in 1913, and that there were in September of last year, when the strike was called, 12,346 men. Thus the companies have lost, balancing losses with gains, since the strike was called, only about 18 per cent. of the men, though for a while, in October, 1913, the number of men employed fell to 7,696.

But even more have we felt troubled about calling the Ludlow men and the persons who created the reign of terror in Colorado, "strikers." It is certain that many of those men had never worked in the Colorado mines, perhaps were not mine workers at all, and some who were miners were not employed in Colorado when the strike commenced. In the Ludlow colony, we are told, 120 men were Balkan soldiers, fresh from the war.

It was only on July 16, 1913, that the Roumanians took the field against the Bulgarians in Europe and that the Greeks routed the Bulgars near the frontier. On the 20th of that month, Adrianople was retaken by the Turks. Not until Sept. 15 did Turkey and Bulgaria agree on the frontier question. The disbanding of the troops in all the Balkan states was quite slow.

We mention these facts to show that the large number of Greeks, Bulgars, Serbs and Montenegrins who went over to take part in the war must have returned with others of their compatriots after the strike and some of them were undoubtedly induced by the union to refrain from work and to war for the strikers.

We do not blame the union for hiring these men, if only they had not armed them: it was a good play on their part to agree to keep these men in idleness by strike pay and to endeavor to keep this and other labor from the mines. Had it been done without violence, no one could object. But it is wrong to regard these men as strikers, and the United States Army recognizes that fact by keeping them out of Ludlow. In very truth it might be more correct to term them the gunmen of the strikers, as it is correct also so to designate those outsiders who, scenting battle from afar, like Mother Jones and some Wyoming undesirables, came in of their own accord to aid in the fray.

And again the Ludlow battle, variously termed a "massacre" and an attack on a camp, was really rather a rout of the so-called strikers' forces following an attack on the militia.

These definitive statements are necessary that the reader may understand the Colorado situation, which has been beclouded to some extent by both parties. The operators have not desired to acknowledge unnecessarily the presence of mine guards and mine employees with the militia at Ludlow for fear of a misapprehension of the causes which demanded the employment of the former and rendered natural the action of the latter. On the other hand, the miners did not wish to admit that the Ludlow camp was full of gunmen and non-strikers, was in fact a perfect Alsatia for men of undesirable character.

The opponents of the coal companies have used language which cannot fail to befog the issue and the purpose of this editorial is reached if the difficulties involved in making a precise statement are made manifest.

Sociological Department

The Edwardsville Improvements

By Special Correspondence

Social inequality has everywhere, the wide world over, been the mother of discontent. It has been the unspanned abyss, which, perhaps as much as any single thing, has driven capital and labor apart. There has been a constant movement on the part of deep thinking and big-hearted men to bring capital and labor in closer relationship. And the effort has been a success in no small degree.

Students of the social question long ago discovered that one of the chief obstacles to overcome was to convince the laboring man that he was an important part in the machinery by which the world operates. This has been no easy task, for as a matter of fact the man who has lived by the sweat of his brow and whose existence has been very much of the hand-to-mouth order has been slow to appreciate that he was placed on earth with an object in view. It has been difficult, even in communities where social conditions were of the very best, to make the toiler realize that best results could only be obtained when he coöperated with capital, that the success and happiness of everyone depended in part on the work he did and how that work was done.

On the other hand, the world has had its rich and arrogant men, its industrial rulers who could see in their less fortunate brothers nothing but a duty to serve. There have been men high in the ranks of the industrial world who refused to come half way or even start the journey which would bring employer and employee in better and more brotherly relationship.

No industrial field of the universe has offered better conditions for a study of the social problem than the anthracite coal fields of Pennsylvania. And there the work is still in an experimental stage—yet so highly developed that its success is not for a moment doubted. Many of the coal-mining leaders—captains of industry in their line—have in late years made a deep and serious study of social conditions in the heart of the hard coal fields. And the transformation they have wrought is little short of wonderful.

The Old Edwardsville

Edwardsville, Luzerne County, Penn., is a community of about 7000 people, situated not far from Wilkes-Barre.

Eight years ago Edwardsville and much of the surrounding territory was a dirt speck on the coal map of Pennsylvania. Civic pride had never been fostered and in fact little considered. One out of every twenty-five property owners was his own gardener and landscape artist. The rest were mere human beings content to live in fairly clean environments with little hope or desire of ever making their village more than a mining "patch." The greater part of the male inhabitants found employment in the mines of the Kingston Coal Co., an independent concern, which operates four shafts, a few slopes and several tunnels in Edwardsville and surrounding territory.

Dust from the large breakers which this company owned spread over the entire town, giving it a grim and ugly coloring. Huge culm banks reared themselves in the midst of the village and behind and along the sides of these sprung up whitewashed "patches" in which miners and their families made their homes. There

Recreations Center and Modern Houses Built by Kingston Coal Co., to Reclaim a Waste Area, at Edwardsville, Penn.

Playground No. 1, on Main Street, Built and Maintained by the Kingston Coal Co., at Edwardsville, Penn.

ere no lawns nor shade trees. The yards of the tenants ere the grazing grounds of goats and about anything se that cared to run loose. Coal company property as used for junk heaps and all the refuse of the towns ıd the company was dumped on it.

The aim of the company was to produce as much ıal as possible without regard to sanitation or comfort. idewalks, trees and lawns were unknown things and the eed for them still unfelt. There was no attempt to pro- de sanitary conditions either in the town or on com- ıny property.

The colliery boss was invariably the czar of the town— bigger man than the burgess or any of the borough ficials. Employee and employer were far apart and the orkmen had not learned their responsibility for the ınditions existing. The gap between labor and capital as then very wide.

The New Town

But that was eight years ago. Today conditions are much changed, because there came in the town one man who believed that social inequality was the cause of great discontent, and, in fact, great suffering in the community which several thousand miners called their home. That was Frederick E. Zerby, who, small in stature, has a large conception of his opportunities and duties. Eight years ago he became general manager of the company and in that short period of eight years the town of Edwardsville has been wonderfully transformed, and today is fast becoming a town of beauty—no more an eyesore on the landscape of the Wyoming Valley.

There has been method and system to everything that Mr. Zerby has done. It took him a year or so to surround himself with a corps of workers who could assimilate his ideas and work out to perfection the plans he

Showing Equipment of Playgrounds, at Edwardsville

had in view. For a time it was slow, tedious work. When he set about his task the miners of his company regarded him as just another of the company officials who had come to rule over them—another official who had come to guard the coffers of the company and see that not a dollar of the company's money was spent imprudently.

Frederick E. Zerby is perhaps one of the most socialistic captains of the mines in the anthracite field. He justly and wisely thinks that a part of the dividends earned by the toilers should be returned to them in the bettering of their conditions and to make their lives happier. At the outset Mr. Zerby had a fight on his hands. The men did not understand him and the prying loose of money from the treasury of the company did not please the financiers. But he won out in both cases. He convinced the men to whom he was responsible that they were entitled to a fair and generous dividend on the money they had invested, and he likewise was able to make them see that by bringing employer and employee into closer relationship both sides would fare better.

Not many months elapsed before the name Zerby began to be a household word, and his bigness of heart, his concern of others, began to make itself felt. The men who had regarded high officials of the company as bosses were forced to see that in Mr. Zerby they had another type of man.

Cleaning Up the Company Town

His first attention was directed to company property. He ordered a general cleanup, and in a short time the land in close proximity to the coal breakers began to take on a respectable appearance. Here and there little patches of lawn were sown and shade trees were set out and it was startling to the people of the town what wonderful things nature can do with a little help and a little encouragement. Then came the awakening of a civic pride, and men and women joined hands with the Kingston Coal Co. in a thorough cleanup. This good work has gone on incessantly ever since that time.

Improved conditions about the collieries made the men understand that they were appreciated after all. Mr. Zerby mingled with them, got some of their ideas and systematically began to make the people in general understand that he was not their boss but their friend. And a neglected people are quick to catch any such idea. Their comprehension of his motives began the bridging of the chasm of social inequality.

Playgrounds

Finally Mr. Zerby got help from his backers in the company and sent a force of men to a company plot in the center of Edwardsville to transform it into a park. For days and weeks a force of men were kept at this place. Old fences and shanties which had marred the view were razed and the ground was nicely leveled. Concrete walks and walls began to make their appearance. Gradually hand-ball courts, swings, band-stands, fountains, settees and other equipment were erected. When the improvements were all made, Zerby called the townsfolk together, dedicated the playground and turned it over to the miners, their families and friends for the use of their children.

Three dozen or more whitewashed shanties that men had called homes were his next objects of attack, and they were torn down one by one until only the foundations were left. The Kingston Coal Co. then erected neat and cozy little homes, with some modern improvements and back and front porches. The rent for these was made the same as had been paid for the shanties which preceded them.

Employees' Bath-House

Operating Room, Miners' Hospital

No. 4 Colliery of the Kingston Coal Co., at Edwardsville, Penn.

But this was not all. Playgrounds were constructed in other sections by the company, and wherever there were waste spots of ground, flower beds and lawns were planted.

Sidewalks and Garbage Disposal

Civic pride had been awakened and everyone joined in the movement. Mr. Zerby donated about 5 ft. of the property of the company to the borough for sidewalks and enclosed the company possessions with neatly built and well painted fences so that the grim appearance which had clung to the coal breaker and its surroundings began to disappear. The company provided Edwardsville with a free system of garbage disposal. Several teams and wagons were purchased, drivers supplied, and headquarters opened. The Kingston Coal Co. removes refuse or garbage from any residence in the borough on a request from the property owner.

This system of garbage disposal was another means of nurturing civic pride and the people soon realized that health conditions were the best when refuse was not allowed to accumulate.

Bath Houses and Lunch Rooms

The Kingston Coal Co. spent thousands of dollars in the establishment of inside and outside hospitals, and in building washhouse and lunch rooms for the men. All new buildings erected on the company's property are of concrete and steel construction and are absolutely fireproof. At the No. 4 colliery there is one washroom with 36 bath tubs, a dozen wash bowls and shower baths of the latest design, and this improvement has been much appreciated. Such employees as do not have homes with bathrooms find the company bathhouse a means of saving themselves and their wives and families much labor. Steel lockers have been provided. A man is engaged to keep the bathhouse in order.

Library

Edwardsville had no public library, but the Kingston Coal Co. has set apart one of the best of the company's buildings and arranged reading rooms and study halls in it. Several thousand books have been purchased and the leading magazines and industrial journals are found on the tables. The use of the library is free. The same building is used as a night school, where young and old men attend special classes. Teachers are provided by the company.

Entertainment

The company has organized a band among its employees and supplied them with instruments. A capable instructor has been provided and the band goes from one playground to another to entertain the village folk and the children. A glee club has also been formed which enlivens the playgrounds with vocal music. An expensive Victrola or a Wurtlizer is placed in each playground and while the children enjoy themselves, the older folk are entertained by music to their liking.

Public improvement is still going on at the company's expense. New playgrounds are being mapped out and garden spots are yet to be provided for some of the surrounding towns.

Mr. Zerby has provided one of the best hospitals in the northeastern part of Pennsylvania for his men. Its equipment is so complete that it is more advantageous to perform operations there than to delay operating till a public hospital can be reached. And in fact that was the purpose in building it. The desire was to prevent the injured men from being taken a long distance to a hospital in an ambulance. The company has its own surgeons and does its own surgical work.

As another means of giving back to the men some of the money they have earned, Mr. Zerby, this spring, purchased fruit trees and presented them to the men and women of the town. The company has planted shade trees all over the town, both near its own property and that of others, and the borough in a few years will be a bower of beauty in the summertime.

The coal dust which swept over the town in years past is no more to be seen. Improved devices have made the breaker dustless and the large, black buildings that were reared for the preparation of coal no longer detract from the town's beauty.

In the short space of eight years men and women have been lifted from a low level to the plane of equality. The men know Zerby and Zerby knows the men. They are on close, intimate terms. They understand each other. It has not been necessary for Zerby to state that a good part of the surplus money earned by the men has come back to them. The men and their families understand and they appreciate.

Showing Site on Which No. 1 Playgroun Was Built at Edwardsville

And does it pay? While almost every other coal company has been troubled with petty strikes and trouble, the Kingston Coal Co. has been free of such trouble. One short strike, which was speedily adjusted, is all that has occurred in the eight years. When the mine workers have a grievance they go to Mr. Zerby as a friend and not as a boss. They talk over their troubles with him and they know that he stands with them if their claims are just.

What Mr. Zerby has done here can be done elsewhere, for this experiment proves that there is a common ground for labor and capital. He is entitled to much credit, and the men who labor with him are fully entitled to their share of praise. They are faithful, steadfast and loyal. Every man in the Zerby organization is a master of the position he holds. Valuable service is rendered by each and all, but in the entire corps there is no harder worker, more loyal man than E. L. Solomon, private secretary to Mr. Zerby.

Use the utmost care when handling explosives near electricity as a tiny spark falling on, or a small current passing through powder is all that is necessary to produce an explosion.

Legal Department

Recent Decisions

By A. L. H. STREET*

False Mercantile Report as Libel—It is actionable libel for a mercantile agency to issue a false report that a corporation has been sued for an amount in excess of its working capital. (Idaho Supreme Court, Pacific Packing Co. vs. Bradstreet Co., 139 Pacific Reporter 1007.)

Pollution of Streams—An owner of land along a stream is not entitled to an award of damages because of slight inconvenience resulting from discoloration of the water or deposit of coal or débris therein in the operation of a coal washer upstream. (Atlantic Supreme Court, Parsons vs. Tennessee Coal, Iron & R.R. Co., 64 Southern Reporter 591.)

Payment for Coal Furnished Public Contractor—Coal and wood used by a public contractor in generating power in ditching work constitutes "material furnished" in the execution of his contract, within the meaning of a bond given by him to secure payment for such material. (Minnesota Supreme Court, Fay vs. Bankers' Surety Co., 146 Northwestern Reporter 359.)

Employer's Duty to Mine Timbermen—A mine owner's duty to timber up mine roofs to make them safe for his employees does not extend to men engaged to do that particular work, since the very nature of their work involves an unsafe condition. (Kentucky Court of Appeals, Williamson's Administrator vs. Blue Grass Fluorspar Co., 160 Southwestern Reporter 920.)

Excessive Recovery for Personal Injury—A verdict for $12,000, for injury to a coal miner is excessive, and should be reduced to $7000, although the action of his right-knee joint was permanently impaired and one of his ribs was loosened in such way as to cause acute congestion of the left lung. (Missouri Supreme Court, Domineck vs. Western Coal & Mining Co., 164 Southwestern Reporter 567.)

Risk Not Assumed by Miner—A mine motorman did not assume the risk of being injured by collision with timbers projecting from another motor, which stood unprotected in an unlighted entry, if he did not know of the presence of such motor at that point and it was not customary to leave cars standing there. (Virginia Supreme Court of Appeals, Stonega Coke & Coal Co. vs. Williams, 80 Southeastern Reporter 100.)

Employee's Duty to Take Notice of Obvious Defects—A mine employee cannot recover for injury resulting from an obvious defect in such simple appliances as harness worn by a mule which he drives, since in such case he has as good, if not better, opportunity than his employer to know of any danger resulting from such condition. (Kentucky Court of Appeals, Pickergill vs. Nelson Creek Coal Co., 160 Southwestern Reporter 936.)

Effect of Bankruptcy on Attachment Liens—On a coal and coke company being adjudged a bankrupt all attachments against its property levied during the previous four months are defeated, except as against a bona fide purchaser of the property under an attachment, and except that an attachment lien may be preserved for the benefit of the estate. (United States District Court, Western District of Kentucky; In re Alabama Coal & Coke Co.; 210 Federal Reporter 940.)

Assumption of Fellow Servant's Negligence—Under the laws of Colorado a coal miner killed by being crushed in a haulway between cars and a wall did not assume the risk of negligence of fellow employees, if he used due care for his own safety. Three thousand five hundred dollars was not excessive recovery for the death, it appearing that decedent was industrious and a man of good habits. (Colorado Court of Appeals, National Fuel Co. vs. Maccia, 139 Pacific Reporter 22.)

When Coke Plant Constitutes an Abatable Nuisance—Persons who reside in the neighborhood of a coke manufacturing plant are entitled to maintain a suit to enjoin its operation in such manner that smoke is almost incessantly emitted from the ovens, dust is created handling soft coal and coke, and sleep is disturbed at night by continual noises. But a mere temporary inconvenience is not subject to redress. (New Jersey Court of Chancery, Kroecker vs. Camden Coke Co., 88 Atlantic Reporter 955.)

Scope of Employer's Indemnity Policy—A policy indemnifying a coal company against claims arising out of injuries to its employees, extended to a man whose name was on the books of the company and who was subject to the orders of the company's general foreman, though he worked under the immediate direction of a sub-boss and his wages were paid according to the amount of coal mined by the sub-boss and the men under him. (Kentucky Court of Appeals, Employers' Indemnity Company vs. Kelly Coal Company, 160 Southwestern Reporter 914.)

Damages Recoverable by Parent for Child's Death—Under the Iowa laws a parent suing a coal company for death of a minor son killed through negligence attributable to the company, is entitled to recover for loss of the child's services and expenses incurred on account of the accident, including expenses for a suitable burial. The amount recoverable for loss of services is measurable by the present worth of the child's probable earnings up to the time he would have become of age, less the probable cost of clothing, maintenance, etc. (Iowa Supreme Court, Carnego vs. Crescent Coal Co., 146 Northwestern Reporter 38.)

Responsibility of Initial Carrier of Shipments—According to a recent decision of the Kansas Supreme Court, the provision of the Carmack Amendment to the Hepburn Act which makes a railway company that receives a shipment for transportation to a point on another road in another state liable for loss occurring on the connecting lines, does not create liability on the part of the initial carrier for loss arising after the shipment has arrived at its destination and is constructively in the hands of the delivering carrier as warehouseman, as where the consignee fails to remove the shipment within a reasonable time after being given notice of its arrival.

Injury Caused by Fleet of Coal Barges—In a suit against a coal company for injury to a Mississippi river wharf and wharf boat at Memphis, caused by a fleet of heavily loaded coal barges in a collision resulting from inability of the towing boats to hold the barges, the jury was warranted in finding that the company was guilty of actionable negligence, although the current of the river was running fast and a heavy fog covered the river; it appearing that the fleet could have been tied up or separated at a point a mile or two up the river. (United States Circuit Court of Appeals, Sixth Circuit; Monongahela River Consol. Coal & Coke Co. vs. River & Rail Storage Co.; 210 Federal Reporter 611.)

When Favoritism By Carrier Constitutes Unlawful Discrimination—It constitutes unlawful discrimination for a railway company to allow one interstate shipper several months' credit for freight charges, pursuant to a previous contract, if other shippers in similar circumstances are required to make payment monthly and to give bond securing the same. The fact of discrimination is not affected because the favored shipper pays interest on the amounts due from him, nor because the shippers discriminated against have not demanded that the same privilege be extended to them, if they did not know that the discrimination existed. (United States Circuit Court of Appeals, Sixth Circuit; Hocking Valley Ry. Co. vs. United States; 210 Federal Reporter 735.)

Right to Rescind Coal-Sales Contract—Damages Recoverable for Breach—When a buyer of coal fails to pay for deliveries at the times provided for by the contract of sale, the seller is entitled to rescind the contract and to refuse to make further deliveries. But, if the seller waives this right of recision, and makes further shipments, notwithstanding the buyer fails to make payments promptly, notice that the contract will thereafter be strictly enforced must be given by the seller before he will be permitted to take advantage of the buyer's failure to make subsequent payments promptly. The damages recoverable for breach of a contract to deliver coal f.o.b. mines are measurable by the excess of the market value of the coal at the mines above the contract price. (Maryland Court of Appeals, Sullivan vs. Boswell, 89 Atlantic Reporter 940.)

Discussion By Readers

The Safety Boss in Coal Mining

Some time ago, C. H. Nesbitt, chief mine inspector f Alabama, suggested the employment of a safety boss n coal mines, in a paper entitled The Value of a Safety nspector and Instructor for Each Coal Mine, COAL AGE, Vol. 4, p. 206. This was followed by an interesting dis- ussion, pp. 318, 509, 743, 827, 912 and 987, under the eneral title Education and Training of Mining Men.

Many valuable points were brought out in this dis- ussion; but, in only one of the letters submitted—that f Thomas Hogarth, p. 912, was reference made to the mployment in mines, of a large number of men wholly nacquainted with mining. To quote Mr. Hogarth, 'Shiploads of men who have never seen the inside of a nine are being landed in New York every week, and hese men come in large numbers to the mining districts nd are put to work in the mines."

There is a vast difference in the workmen of today and hose of 25 years ago. While it must be admitted that rom 80 to 90 per cent. of the men working in our mines oday are foreigners; and, further, that at least 40 per ent. of that number cannot speak or understand the English language, I believe that it is not the green oreigner who heads the list of those injured in the mines. On the contrary, the majority of those injured by avoid- ble mine accidents belong to that class of foreign labor who have worked in the mines from one to five years and ave come to think that they know more than the mine oreman or any of his assistants. Such men become in- lependent and saucy when instructed how to arrange for heir own safety. Their customary reply is: "Me know," 'Me dig coal one year," "two years," "three years"; "Me take care of meself," "He no come down," "Me shoot him lown," and many other similar expressions; but the fact remains that they are not capable of caring for them- selves.

I am not opposed to the foreigner, but am strongly pposed to the employment of ignorant workmen in mines, whether they be foreigners or Americans. Such men should never be allowed to work as miners, since, through their ignorance of the principles of mining, they may bring disaster to themselves and their fellow work- ers. I want to say, emphatically, teach all miners the principles of mining; teach them how to set props, how to sprag coal, how to mine and shoot coal, before permitting them to work as miners. Only experienced miners who have worked a long time in rooms and entries should be permitted to work on pillars.

I fully indorse the suggestion of Mr. Nesbitt, to which I have referred, that there should be employed at every mine, a man whose duty should be to spend all his time in the working places, observing closely the practices of the miners, and instructing them how to cut and mine their coal, set sprags and timbers, place their shots, charge and fire their holes, take down loose top; and, above all, to keep their working places clean, tidy and safe.

This man should be known as the "Safety boss." He should have authority in all matters relating to the safe performance of work in the rooms and other working places of the mine. His sole duty should be the protection of the mine workers against both official neglect or the carelessness or ignorance of the workmen themselves. The safety boss should have the power to suspend any workman who, in his judgment, is not making an effort to comply with the law. The safety boss should act in harmony with but not be subject to the mine foreman. Just how many places could be handled by one safety boss would have to be determined by experiment.

The mine foreman, assistant foremen, safety bosses and miners should all be thoroughly posted on the requirements of the state mining law and the mine regulations.

A good idea would be to have the mine rules printed in the various languages, on cards, which should be given to each miner when he is employed. The cards should also be hung in conspicuous places near the mine. I would further suggest the following rules.

1. When undermining coal, set sprags every 7 ft., whether or not there is danger of the coal falling.
2. When you have fired a blast wait at least 5 min. before going to see what the shot has done.
3. Do not charge any hole but especially a rock hole with both dynamite and powder.
4. Always set a temporary prop whenever you are about to knock out another prop.
5. Don't imagine because you have never been hurt that it is impossible for you to get hurt.
6. Never stand a prop further away from the working face than is permitted by the mine rules.
7. Always reset any timber that has been dislodged by a blast, before you begin to mine or load coal.
8. Whenever you chance to notice a piece of loose coal, slate or rock while on the way out of the mine, promptly notify the mine foreman.

It would be the duty of the mine foreman to see that these rules and suggestions were strictly enforced; and this, in my opinion, would greatly reduce accidents due to falls of coal, slate or rock.

JOSEPH NORTHOVER, Assistant Foreman,
Berwind-White Coal Mining Co.
Seanor, Penn.

Safety or Refuge Chambers in Mines

Letter No. 5—I have read with great interest the recent contributions to COAL AGE, relating to Safety or Refuge Chambers in Mines. The discussion calls to mind a letter on this subject, written by Jesse K. Johnston, May 10, 1910. The letter was addressed to Hon. John K. Tener, then a member of the House of Representatives and now Governor of Pennsylvania. Mr. Johnston was at the time superintendent of the Charleroi Coal Works of the Pittsburgh Plate Glass Co.

The letter, from which I submit a few extracts, was made a part of the Congressional Record of the 61st Congress; and, besides giving a large number of instances of mine explosions, in many of which, lives would have been saved had refuge chambers been available, described, in detail, a plan that was then about to be executed in the Charleroi mine, when suddenly interrupted by the destruction of the tipple by fire and the subsequent abandonment of the mine. I wish that space would permit of the publication of the entire letter, but beg to quote the following allusions to the need of refuge chambers in mines, as of particular interest in this discussion:

* * * How to get results from miners, who have no faith in science and, by ignorance, disregard precautions and safeguards and become chance takers for greed of gain, is a difficult problem for every mine manager.

I know from personal experience that the introduction of permissible explosives, systems of spraying, taking exhaust steam into the intake airways to increase the moisture in the air during the winter months and other precautions, meet with much opposition on the part of mine workers.

In every coal mine, conditions exist that may lead to an explosion or a mine fire. While we cannot hope for the entire removal of these dangers, yet by the practical application of the results of scientific study, coupled with the eternal vigilance of mine officials, the maintenance of strict discipline and the enforcement of rules and regulations, the dangers may be minimized. * * *

It is a significant fact that from Apr. 13, 1876, to Apr. 22, 1910, in this country alone, 49 mine disasters occurred during the summer months, resulting in the loss of 1300 lives. For the same period, during the winter months, there occurred in this country alone, 111 mine disasters, resulting in a loss of 3500 lives, making a total sacrifice of 4800 lives in 34 years. These figures only include mine disasters in this country, in which five or more persons were killed.

In addition to the present safeguards, I wish to offer another, having for its purpose the preservation of life, following a mine disaster. I base my suggestion on the evidence gained from miners rescued and from investigations giving conclusive evidence that miners have traveled from 1000 to 2000 ft. in the mine, after the first shock of the explosion and before being overcome by poisonous gases. * * *

My suggestion of live-saving stations underground, connected with the surface by boreholes is not new; the idea has been advocated for years. * * *

I know a great many mine managers will say at first thought, that the cost of these underground stations is prohibitive; but I have just let a contract for three 6-in. boreholes, at the rate of $1 per ft., for a depth of 300 ft. Consider, for a moment, a mine property of 1000 acres in coal that will yield 8000 tons to the acre; and compare the revenue to be derived from the mining of this coal, with the cost of sinking, say three boreholes and the instalment of the same number of underground life-saving stations. This cost will be found such a small fractional part, per ton of coal mined, as to fully justify the installation; and the outlay can generally be saved by cutting off some other expense that is less needed. * * *

An actual test made on a 6-in. borehole, 300 ft. in depth, showed a velocity of the air passing up the hole, of 2000 ft. per min. (nearly 400 cu.ft. per min.). In the recent Cherry mine disaster (Nov. 13, 1909), 21 men were rescued one week after the mine fire started; from an atmosphere in which there seems to have been upward of 5 per cent. of carbon dioxide and in which lamps would not burn. It is reasonable to conclude that if several underground life-saving stations, with boreholes to the working seams, had been previously installed at the Cherry mine, a number of the entombed miners could have reached these stations and a supply of fresh air and plenty of food could have been delivered from the surface. * * *

The letter continues to give a large number of similar instances of the possibility of saving human life by the previous installation of suitable refuge chambers, and, to my mind, is an emphatic indorsement in their favor.

V. L. Henry, Mining Engineer,
Creighton Coal Works.

Creighton, Penn.

Educating the Public

Under this same heading, Mine Inspector, in Coal Age, May 2, p. 714, says, "A striking example of the inefficiency of state ownership of mines, mentioned by Prof. Henry Louis, in an address before the Newcastle-upon-Tyne Economic Society, is that of the Wonthaggi mine owned by the Victoria government," and previous to this Mine Inspector says, "In any enterprise, whether individual or corporate, labor and capital combine through their energy, skill and financial resources to supply a product for the public in a satisfactory manner."

The *Saturday Evening Post,* under date of May 16, and under title of "The Vortex," says, "You cannot get joy out of work unless it is a sort of personal service. Unless you own your job in some sort of permanent way, you will not sing over it. My grandfather was a shoemaker and he always sang as he cobbled. My father went into a factory and he never sang. He got crusty and short over his work."

Without another comment, I believe the two quotations, coupled as they are above, would accomplish my purpose, which is to start readers thinking along constructive lines. However, as nothing stimulates thought so much as the opportunity to criticize another's thoughts, ideas or suggestions, I will offer a few ideas, hoping for such criticism.

Mine Inspector has quoted the inefficiency of state ownership of mines where it has been tried. In referring to this question, I do not wish to convey the idea that I commend either state ownership or the present form of government in the United States. Both leave room for considerable improvement; but, is it not possible through the failure of both of these plans to devise an efficient ownership wherein the public would share directly and not in the present indirect way in which there is always a doubt that the laborer is really sharing at all? Let us not be reactionary, but let us be constructively progressive.

Has the combination of labor and capital been of the participants' own free will and accord? Has it been efficient? Is it not possible to devise a system whereby the combination could become a work of joy on the part of both capital and labor? Mr. Ford seems to have at least made a start in this direction. If the news report is to be credited, the increased efficiency since the inauguration of the profit-sharing plan, in the Ford Motor Car works, is 40 per cent. Could not Mr. Ford's system be revised and applied to coal mining? I believe it possible.

We who have been in the business of mining bituminous coal, in the United States, east of the Mississippi River, know the enormous profits in coal mining, with properly equipped mines, when taken as a whole; that is to say, the profits of mining plus the profits of stores and rents. We also know the heart-breaking worries of the manager who tries to squeeze out profits from poorly equipped mines, which are so frequently over-capitalized by the over-zealous promoter.

Though some of the larger coal-mining corporations are clearly producing splendid profits, I firmly believe that the personal efficiency of the employees of the best of these companies can be increased at least 10 per cent. by some profit-sharing plan.

Mining Engineer.

———, Ky.

The Eccles Explosion

The map of Eccles No. 5, the mine which recently was the scene of a disastrous explosion, COAL AGE, May 23, p. 848, leads me to offer a few remarks on the dangerous conditions existing at that mine. A mine of this size should be worked on the long-wall-plane system, with triple entries. In fact, no other system should be considered and the exclusive use of safety lamps should be required. More splits and overcasts will, of course, be needed, but if such precautions were adopted, explosions would involve a smaller area and destroy fewer lives.

As can be seen on the map referred to above, the air entering the first right of the southern section of the mine travels, from the first to the last, through 8 entries, running up one heading and down the other, until it reaches No. 6 shaft. Now, suppose that 8 men, one in each of these headings fired a shot apiece; the quantity of coal thus shot down might release enough gas to raise the percentage of gas in those places, to the danger point. This firedamp might be ignited by a solid shot fired in the last place through which the air traveled.

The "flies" used in the mines are dangerous to men and mules and are not desirable. It is better to provide an excess of ventilation that would produce a sufficient circulation of air in the rooms, rather than depend on the use of curtains. This explosion was quite general and seems to suggest, though it does not prove the fact that the mine, which was kept well watered, had a dangerous percentage of gas present not in one portion only but throughout the workings.

I have traveled over a large part of West Virginia in the last 8 months and am afraid there is evidence that the compensation act, by distributing the blame, is decreasing the sense of personal liability. The burden of accidents, which formerly rested on those who owned the mines where they occurred, is now spread among all operators of mines; and the sense that the burden is not on the corporation but on the whole industry in the state makes some managers and foremen careless.

I visited a place in West Virginia recently and was told by one of the daymen that last August he had ordered posts to set under some bad roof. These were not supplied, and in January of this year when the men went to work, the slate had fallen and the mine was stopped for a day to clean up. The mine foreman at this place knew something about electricity and he retained his position because of this knowledge and not because his practice in coal mining was sufficient to justify his retention.

SAMPSON SMITH.

Mineral, W. Va.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Proportion—A proportion, in arithmetic, is the expression of equality between two or more ratios of different kinds. A proportion may be either simple or compound.

Simple Proportion—A simple proportion is one in which both couplets are simple ratios. For example, in reference to mine airways, one airway may have twice the sectional area of another airway; the area of the first being, say 24 sq.ft. and that of the second 48 sq.ft. The ratio of these areas or the **area ratio** is 24: 48 or 1: 2.

It is evident that, for the same velocity of the air current, the quantity of air passing in the first airway will be one-half that in the second airway; the first circulation being, say 10,000 cu.ft. per min., the second will be twice that quantity of air, or 20,000 cu.ft. per min. The ratio of these quantities or the **quantity ratio** is then 10,000: 20,000, or 1: 2, as before.

The ratios just shown, though of different kind, are equal and may be written as two ratios with the sign of equality between them; thus,

$$\frac{48}{24} = \frac{20{,}000}{10{,}000};$$

or as a proportion; thus,

$$24 : 48 :: 10{,}000 : 20{,}000.$$

Instead of the sign of equality (=) used above, it is more common to write a proportion with a double colon (::) separating the two couplets or ratios; thus,

$$24 : 48 = 10{,}000 : 20\,000$$

The above is a simple proportion, because it expresses the equality of two simple ratios.

Compound Proportion—A compound proportion is one in which one or both couplets are compound ratios. To illustrate this case, suppose that both the sectional area and the velocity of the air current are different in two airways. It is evident that the quantity of air passing in each airway will vary in the same ratio as the area and velocity, respectively.

For example, assume, as previously, that 10,000 cu.ft. of air is passing in the first airway, which has an area of 24 sq.ft. The same velocity of the air current will produce 20,000 cu.ft. per min. in the second airway, which has an area of 48 sq.ft. But if the velocity in the second airway is increased, it is evident that the quantity of air will be increased in the same ratio. If the velocity in the second airway is, say three times that in the first, the quantity of air passing will be $3 \times 20{,}000 = 60{,}000$ cu.ft. per min.

In this case the area ratio is 1: 2; the velocity ratio, 1: 3; and the quantity ratio is the product of these two ratios or 1: 6. This is expressed as a compound ratio thus,

$$10{,}000 : 60{,}000 :: \begin{matrix} 1 & : & 2 \\ 1 & : & 3 \end{matrix}$$

or finally by multiplying together the terms of the compound ratio to obtain a simple ratio, the proportion is

$$10{,}000 : 60{,}000 :: 1 : 6.$$

The Coal Age Pocket Book

A compound proportion may have any number of simple ratios in either one or both couplets; but the proportion can always be reduced to a simple form by multiplying together the similar terms in each couplet.

Direct Proportion—Proportion is mostly used to compare similar terms or factors, in respect to two states, conditions, or things. A direct proportion is one in which the order of comparison is the same in each couplet or ratio.

For example, in comparing the circulation in two airways of the same section but different length; other things being equal, the pressure producing the circulation varies directly as the length of the airway. In this case, the proportion is direct; because,

$$1st\ pressure : 2nd\ pressure :: 1st\ length : 2nd\ length$$

The ratios in this proportion are each **direct ratios,** because the order of comparison is the same in each.

Indirect or Inverse Proportion—It frequently happens that, as one factor increases, another decreases in the same ratio. In that case, the resulting proportion is indirect; and the second couplet is an **inverse ratio,** because the order of comparison is reversed.

For example, for a constant velocity of the air current, in two airways having equal rubbing surface, the pressure per square foot varies inversely as the sectional area of the airway, which is expressed by an indirect proportion, as follows:

$$1st\ pressure : 2nd\ pressure :: 2nd\ area : 1st\ area$$

The second couplet in this proportion is an **inverse ratio,** because the order of comparison is reversed.

Terms—The first term of a ratio is called the "antecedent" and the second the "consequent."

In every proportion, there are four terms. The first and fourth terms are called the "extremes" and the second and third the "means." The product of the extremes is always equal to the product of the means.

Simple proportion is often called the "Rule of Three," because it contains three known terms, as **a, b, c;** and one unknown term, which is designated by **x.**

The relation of these four terms and the various operations possible in proportion, are best shown by the following simple formulas:

$$a : b :: c : x$$

$$ax = bc$$

$$x = \frac{bc}{a}$$

$$a + b : b :: c + x : x$$

$$a - b : b :: c - x : x$$

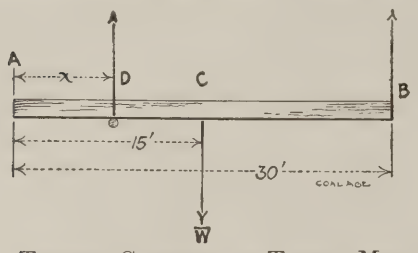
In any proportion the means can be reversed; thus,

$$a : c :: b : x$$

In the solution of problems involving a proportion, either simple or compound, much time and labor is saved by writing the several ratios as fractions and canceling factors common to both numerator and denominator, which simplifies the work.

Inquiries of General Interest

A Problem in Mechanics



Kindly answer the following question to settle a little controversy. The question is as follows:

A stick, 30 ft. in length and of uniform weight and cross-section throughout, is carried by three men. How far from one end of the stick must a cross-pole be placed so that each of the two men holding this pole will carry the same weight as the third man lifting the other end?

X.

Hopedale, Ohio.

This is a simple problem in mechanics and is readily solved by the principle of moments. The stick *AB*, in the accompanying figure, being uniform in cross-section, its center of gravity is at the middle point *C* or 15 ft. from either end; and the weight *W* of the stick acts downward through this center of gravity as indicated by the arrow.

TIMBER CARRIED BY THREE MEN

In the solution, the center of moments may be taken at any point along its length; but, for simplicity, assume the center of moments is at the end *B* of the stick, which is carried by the one man. Then, since the weight of the stick is *W* and two-thirds of this weight is carred by two men on the crosspole at *D*, calling the distance of this pole from the end $AD = x$, we have, by the principle of moments,

$$\begin{aligned} \tfrac{2}{3} W\ (30 - x) &= 15\ W \\ 20 - \tfrac{2}{3} x &= 15 \\ \tfrac{2}{3} x &= 20 - 15 = 5 \\ x &= \tfrac{3}{2} \times 5 = 7\tfrac{1}{2} \text{ ft.} \end{aligned}$$

Therefore, the cross-pole between the two men should be 7.5 ft. from one end, so that each of these men will bear an equal weight with the third man at the other end of the stick.

A Longwall Proposition

I am much interested in the future of longwall methods for mining coal, and have read with pleasure and profit the discussion on this subject, in recent issues of COAL AGE. At the present time, I have a proposition that I would like to bring before the readers of the paper, in order to get their opinion as to whether the conditions given are favorable to longwall work.

Briefly stated, the conditions are as follows: The mine is a drift mine, with an average thickness of overburden of say, 300 ft. The coal is of a fair average quality; the seam has generally little or no inclination, and a uniform thickness of 36 in., with a fireclay bottom and a slate roof. The fireclay is hard when first exposed, but softens somewhat in contact with air and water. The bottom has a tendency to heave slowly in narrow work; but this heaving is a little more rapid in the rooms. It has, however, given us no trouble in working the rooms, except where a squeeze has started. In such cases, I have known the bottom to heave in the rooms 3 in. in a single day. Ordinarily, the bottom will not heave over 6 in. during the life of a room.

The roof slate is hard, so hard that it must be shot down, although it does not require heavy shooting to do this. Our greatest difficulty lies in the fact that the slate is overlaid with a hard "sulphur binder," which will not break and is the real cause of the frequent occurrences of squeeze or creep. We have lost considerable territory owing to this cause.

Our method of working has been to drive all entries on the double-entry system, turning the rooms off the cross-entries. Each room is driven with a 100-ft. face, there being three roadways to each room. The rooms are driven 150 ft. deep and are all posted on 4-ft. centers, to within 12 ft. of the face. Six inches of bottom is taken up on the roads in the rooms, in order to give sufficient headroom to take the cars to the face. The rooms generally fail by the roof slate caving to a height of from 4 to 10 ft., up to the "sulphur binder," which we have found it impossible to break.

When a squeeze takes place, the roof generally remains firm, but the coal is forced out into the entry and the bottom heaves rapidly, as I have stated. So strong is the overlying "sulphur binder," that I have known the rooms to be worked out for a distance of 600 ft. along the entry and to a depth of 150 ft., all the posts and room pillars having been drawn back. In all this area, the roof did not cave and the bottom heaved but 10 in.

What I particularly desire, is information in regard to the manner and cost of building packwalls, and an expression of opinion as to whether or not the conditions I have described are favorable to longwall work.

H. R. HARTSUFF, Supt.,
Beaver Coal & Coke Co.

Wampum, Penn.

[The manner of building packwalls and cribs, chocks, or cogs, in longwall work, as well as the general method of procedure, has been fully explained in the letters on Longwall Mining Methods, COAL AGE, Jan. 10, p. 99, and Feb. 21, p. 339. As the subject of longwall mining is growing in interest every day, we shall be glad to publish further suggestions relating to the mining of the coal in this particular seam.

The chief difficulty is encountered in the hard "sulphur binder," which correspondent states "will not break." Assuming that this rock will support the overburden without being broken, over a large area, say 50x200 yd., what measures should be adopted for the safe working of this seam, so as to insure the complete extraction of all pillar coal.—ED.]

Examination Questions

Anthracite Mine Foremen's and Assistant Mine Foremen's Examination Held at Pottsville, Penn., May 25, 26, 1914

Ques. 1—What are the qualifications for mine foreman and assistant mine foreman, to fully fit them for the position, and what are their duties?

Ans.—Candidates for the position of mine foreman or assistant mine foreman, in the anthracite district of Pennsylvania, are required by law to pass a satisfactory examination and to give satisfactory evidence of at least five years' practical experience as a miner, good conduct, capability and sobriety, before they can obtain a certificate from the examining board, qualifying them to hold that position in any mine in the state.

In addition to the legal requirements, the successful mine foreman must be intelligent, industrious, observing, a good judge of human nature and of what constitutes a day's work. He must be thoroughly acquainted with mining conditions and methods of working. Aside from their legal duties, both the mine foreman and his assistants must devote their entire time to the inspection of the working places in the mine and the oversight of the men. Their duties include the inspection of all the machinery and equipment employed in the operation of the mine.

Ques. 2—What practical experience have you had in the anthracite coal mines of Pennsylvania? State in what mines employed, the character of the mines and the nature and length of your service in each.

Ans.—This question is answered from the candidate's own experience.

Ques. 3—What duties does the law impose on the mine foreman and his assistants?

Ans.—The duties of the mine foreman, as described by the present anthracite mine law, are given mostly in Art. 2. The mine foreman has charge of all matters pertaining to ventilation; he must examine, at least once a week, all accessible parts of those abandoned portions of a mine in which explosive gases have been found. The mine foreman or assistant mine foreman must examine carefully, every morning, all working places, and traveling roads in the mine, before the men are allowed to enter. This examination must be made with a safety lamp, within three hours of the time for beginning work, and must be recorded in a book kept at the mine for the purpose. The person making the examination must mark plainly the date of same at the face of each working place examined.

Beside the daily morning examination, the mine foreman or his assistant must visit and examine carefully, at least each alternate day, every working place in the mine while the men are or should be at work in such place, and must give all necessary instructions for the safety of the men. The mine foreman or some other competent person designated by him must examine, at least once every day, all slopes, shafts, main roads, traveling ways, signal apparatus, pulleys and timbering, to ascertain that they are safe and in good working condition.

Ques. 4—On what scale does the law require the maps of a mine to be made, and how are the distances represented—horizontally or as measured on the various pitches?

Ans.—The anthracite mine law (Art. 3. Sec. 1) requires that an accurate map may be made of the workings of every coal mine, on a scale of 100 ft. to the inch. In general, mine maps are constructed on a horizontal plane of projection, all distances on the map being horizontal distances. The law requires that the map shall state, in degrees, the general inclination of the strata, together with any material deviation therefrom in portions of the workings. The map must also state the tidal elevation of the bottom of each shaft, slope, tunnel and gangway and other important points in the mine or on the surface, as required by the mine inspector of the district in which the mine is located.

Ques. 5—What are the conditions that should be taken into consideration in determining the width of breasts and pillars? Should these be of equal width, under all circumstances?

Ans.—The principal factors that determine the width of breasts and pillars in mine workings are the following: Depth of cover, as determining the roof pressure; thickness and inclination of the seam; character of the roof, floor and coal; the existence and condition of overlying or underlying seams of coal; and the existence of water or gas in the strata. No uniform or universal width of opening and pillar can be employed under all conditions as these vary widely.

Ques. 6—If the map shows a distance of 200 ft. between the gangway and the landline parallel to the gangway; how far can a breast be driven without crossing the line, where the pitch is 48 deg.?

Ans.—The length of the breast measured on the pitch, from the gangway to the landline is:

$$\frac{200}{cos\ 48^\circ} = \frac{200}{0.669} = 298.9\ ft.$$

Ques. 7—What is natural ventilation; and is such ventilation reliable for mining purposes? State why.

Ans.—The ventilation in a mine is said to be natural when the circulation of the air current throughout the mine is created and maintained by natural means or agencies; such, for example, as the formation of air columns in the shaft, or in the rise or dip workings; the action of a waterfall in a shaft; or surface winds deflected into the mine workings. The means last mentioned are seldom employed and, then, only when the conditions are exceptionally favorable. Natural ventilation is unreliable for mining purposes, owing to the constantly changing conditions that make the circulation of the air in the mine uncertain and not easily regulated to meet requirements in the workings.

Coal and Coke News

Washington, D. C.

It is believed that during the current session of Congress some action will be taken designed to create a more centralized government for Alaska or at all events to centralize the power of controlling that territory insofar as relates to industrial developments, in a smaller number of hands. It has been doubtful for a good while whether Congress could be spurred up to taking the necessary steps, but Secretary Lane with, it is understood, the approval of the President, is now exerting himself to get some attention for the matter and to secure the examination of bills which are pending for vesting the management of Alaskan affairs as he desires, in the Interior Department.

Attention has been attracted to a special report recently filed by Mr. Lane in which he recommends the appointment of "a development board" for Alaska, such board to have complete control of all affairs connected with natural resources and the development of the territory. The board would consist of three members with headquarters in Alaska and its function would be to carry on the work of the general land office, the road commission, the bureau of mines, the bureau of education, and the Secretary of the Interior.

Special stress is laid upon the work that would be done by the board in connection with the management of mines. Mr. Lane offers severe criticism regarding red tape in Alaska. He points out that at present each of at least a score of government bureaus in Washington have something to do with the government of Alaska, resulting in a vast amount of red tape and circumlocution in the administration of public affairs. He cites instances of delays of several years in the handling of uncomplicated land, and other matters which should have been disposed of.

"Our present system of government in Alaska, is heterologous," says the Secretary. "Instead of one government there are a number, interlocked, overlapped, cumbersome and confusing. Experience has demonstrated that efficient administration is best secured by centralizing responsibility and authority in the hands of a few men, who can be held to strict accountability for the results of their actions. The proposed development board for Alaska follows this modern and well tested plan for securing efficient administration."

The Tap-Line Cases

More and more importance is being attached to the decision of the Supreme Court in the tap-line cases handed down a few days ago. The growing opinion among lawyers is that the decision since it affects the relation of trunk lines and industrial roads will necessitate the Interstate Commerce Commission's revising its decision respecting the division of through rates between the trunk lines and the short industrial railroads owned by the United States Steel Corporation and the coal roads as well as by other concerns which are in like position. The effect would be to alter considerably the circumstances of transporting ores and coal.

What is considered the essential part of the opinion in the light of further study, is found in those paragraphs which have to do with the definition given by the commission to the tap lines. In discussing the question, "Are tap lines plant facilities or common carriers," the court says that it was insisted that the roads were not common carriers because most of their traffic was in their own items of production.

The final draft of the opinion as published, however, goes on to note that the conclusion already indicated above, "loses sight of the principle that the extent to which a railroad is used does not determine the fact whether it is or is not a common carrier. It is the right of the public to use the road's facilities and to demand use of it, rather than the extent of its business which is the real criterion determinative of its character. . . . . We think the commission exceeded its authority when it condemned these roads as a mere attempt to evade the law and secure rebates and preferences for themselves.

It is doubtless true as the commission amply shows in its full report and supplementary report in these cases that abuses exist in the conduct and practice of these lines and in their dealings with the carriers, which have resulted in unfair advantages to the owners of some tap lines and to discrimination against the owners of others.

Because we reached the conclusion that the tap lines involved in the appeals are common carriers and as such entitled to participation in joint rates with other common carriers, that determination falls far short of deciding, indeed does not at all decide, that the divisions of such joint rates may be made at the will of the carriers involved and without any authority of the commission to control them. . . . . If the divisions of joint rates are such as to amount to rebates or discriminations in favor of the owners of the tap lines, because of their disproportionate amount, in view of the service rendered, it is within the province of the commission to reduce the amount so that the tap line shall receive just compensation only for what it actually does."

The effect of the decision upon some of the revised rates on iron and steel, iron ore and coal will, it is expected, be direct and immediate, necessitating revision by the commission of the decisions it has handed down in a number of such cases within recent periods.

HARRISBURG, PENN.

Governor Tener, on May 27, made announcement of the Lake Erie and Ohio River Canal Commission, authorized by the last Legislature. The purpose of the board is to take up the preliminary work for the construction, if possible, of a ship canal from Pittsburgh to Lake Erie, through the Beaver and Mahoning Valleys. The members of the board were named as follows:

President, W. A. Magee, Pittsburgh; A. S. McSwigan, Pittsburgh; Col. Thomas W. Symons, Washington, D. C.; T. P. Sloan, Lock No. 4; and James A. Chambers.

The first duty of the board will be to have a survey made, the sum of $150,000 having been appropriated by the state for this work. The board has jurisdiction over the entire work and is given authority to appoint a secretary, a treasurer, a chief engineer and such other assistants as may be necessary. It is to make a report to the governor each year of the progress made. The governor has the right to remove any member. Each member is to furnish bond in the sum of $25,000 for the faithful performance of his duty. The president will receive a salary of $5000 per year and each member $4000 a year. The appointments take effect at once.

The sister states of Ohio and West Virginia last year enacted some unusual legislation conferring the right virtually of eminent domain upon the Canal Commission which the Commonwealth of Pennsylvania would organize. Thus the Pennsylvania board will supervise the whole project which now seems absolutely after long agitation to be beyond stoppage.

The Legislatures of West Virginia and Ohio authorized counties contiguous to the canal to bond themselves at elections for a pro rata amount of the $60,000,000 which it is estimated the big waterway will cost. This amount, however, is to cover the interest on the bonds until such period when the tolls on the traffic shall have provided for the annual installments of interest.

PENNSYLVANIA

Anthracite

Minersville — Anthony Bushing was killed and Anthony Koshokskie probably fatally injured in addition to being blinded by a premature dynamite blast in the Buck Ridge colliery on May 27. The men were hurled a long distance above a gangway.

Hazleton—Andrew Matti, vice-president of the United Mine Workers of the Hazleton district, was arrainged before an alderman on May 28, charged by the State Police, with disorderly conduct and inciting to riot at McAdoo. Matti was held under $500 bail. The case is the direct result of the Hazleton trolley strike. Matti had trouble with two of the strike breakers who had him arrested.

Failure to insulate a wire in the Harleigh mine of the Harleigh-Brookwood Coal Co. has cost that corporation $5325, which must be paid to Mrs. Bridget Gallagher for the death of her son who was killed from an electric shock.

Scranton—A number of outside employees at the West Ridge colliery of the Scranton Coal Co. went on strike recently complaining that they were not being paid the scheduled rate of wages.

The examination of candidates for mine foremen's and assistant mine foremen's certificates in the anthracite region of Pennsylvania which was previously announced to be held Apr. 15 and 16 and later postponed until the latter part of May was held May 23 and 26. An unusually large number of men took the examinations which were held at Scranton, Old Forge, Pottsville and other points.

Brinkerton—Declaring he recognized no law, but the law f God, William T. Fox, a miner, opened fire on four members f the State Constabulary on May 29, and was riddled with ullets by the troopers. Fox has previously shot F. C. Rob-ts, superintendent of the Fairmount Coal Co.

Lattimer Station—Employees of the Cranberry Colliery, of . Parddee & Co. on May 27, voted to continue the strike to rce six miners into the union. The statement was made at to collect dues of delinquents amounting to approxi-ately $16 the employees have lost by idleness wages aggre-ating about $21,000.

Maysville—During a storm on May 27, lightning wrecked e top of the Scott shaft and power plant, also the Richards d Hickory Ridge collieries, of the Susquehanna Coal Co., using operations to be suspended. A number of men had arrow escapes.

Tamaqua—Six miners were killed and two badly injured at e Mary D colliery on May 29 when the cage in which they ere riding to the surface turned turtle after it had gone) ft. past the landing where the men were supposed to sembark. One man jumped while the cage was several et in the air landing upon a beam and crushing his skull. he other five dropped 700 ft. into a sump at the bottom of e shaft. One man saved his life by catching a chain, hile another caught upon a projection and escaped with a oken leg. It is not known whether this accident was due to egligence or some mechanical defect.

Bituminous

Connellsville—When arraigned before a justice on inform-ion made by Inspector Alexander McCanch, Andy Pohts, a iner employed at the Black Diamond mine near Mononga-ela, entered a plea of guilty to violating the mining laws. e had refused to obey an order to place a post at a danger-us point in one of the rooms and was sentenced to pay the sts and a fine of $25.

It is reported that the Connellsville and lower Connellls-lle regions with 22,678 ovens in blast out of a total of 37,-5 are running at just 50 per cent. of rated capacity. Against is, however, is the assurance of some optimistic steel men at business is certain to improve especially if the railroad te case is favorably decided.

Washington—Another suit as a result of the explosion in e Cincinnati mine Apr. 23, 1913, was filed here May 25 hen Mrs. Mary Hager began action to recover $50,000 dam-es from the Monongahela River Consolidated Coal & Coke). for the death of her husband, Charles Hager. She alleges at the coal company was negligent and failed to comply ith a law providing for the safety of miners.

Brier Hill—Mine inspectors I. G. Roby, J. P. Walsh and . H. Howarth, together with a number of mine superintend-ts, foremen and pit bosses recently inspected the new auto-atic safety lock for mine cages invented and patented by . J. Phelan. This device has been in operation at the Brier ll works for some time past and has proven highly suc-ssful.

Rockwood—The Maher Coal & Coke Co., which was re-ntly organized, has reopened the old Shamrock mine and has ployed about 30 miners, but expects in the near future to ploy a much larger number and will ship from 150 to 200 ns of coal per day.

WEST VIRGINIA

Charleston—After the action of union representatives lling a strike of the miners in the Kanawha district, effec-e, Monday, June 1, represntatives of four large operators Paint Creek met Saturday with the officials of the United ne Workers, and effected a tentative working arangement, lependent of other mines in the district, under which the nes on Paint Creek will be continued in operation for the ne being. The Paint Creek Collieries Co., the largest of the ir companies, entered into an agreement carrying with it operation of the check-off, the only point in dispute, as as the district as a whole is concerned, and leaving to bitration later on a dispute over the wage contract in the int and gas seams. The Standard Splint and Gas Coal , the Imperial Colliery Co. and the Christian Colliery Co., o were also in the conference, have the same plan under nsideration, and will probably adopt it, it is understood, ile the National Bituminous Coal & Coke Co., operating at kdale, on Cabin Creek, is said to be willing to consider a e arrangement.

Wheeling—The city of Wheeling drilling for water re-ntly struck coal at a depth of 113 ft. This deposit appears be extensive, and so far as can be learned was never pre-usly known to exist. The well being drilled for water s abandoned as a dry hole.

KENTUCKY

Fleming—The Mineral Fuel Co., operating at Fleming, Haymond and Hemphill, on Potters Fork and Yount's Fork respectively, has changed its name to the Elk Horn Mining Corporation. Thomas S. Haymond continues as manager. New increases and extensions are also planned for the near future.

Lookout—The Rockhouse Coal Co. announces increases in its coal operations here and will increase from 50 to 75 cars per day.

Whitesburg—Five hundred or more miners have been added to the forces employed in the Jenkins and McRoberts fields, according to information received here. Most of the mines in this district are running to full capacity.

OHIO

Murray—A small coal mine has been opened near this place by the North Hocking Coal Co.

Steubenville—The fire in the Robert Hill mine which has burned for years recently spread to the Henry Wilson mine, compelling the suspension of operations in this development.

Martins Ferry—The Aetna-Standard mill mine and the Blockhouse mine have agreed to the 1914 wage scale contract calling for the miners' prices for mine run coal. These were the first contracts to be signed under the new wage scale demanded by the miners. The Aetna mill mine has been working under a provisional agreement for some time.

Coshocton—The Locust Grove Coal Co., of Coshocton, will be the first firm to be sued by the state for an award for injury to an employee because of failing to contribute to the Workmen's Compensation Fund of the state. John Smalley, an employee, met with an accident which laid him up for four weeks. Applying for workmen's compensation his employers were ordered by the State Industrial Commission to pay him $48. This the company refused to do, and the state will sue for this amount, plus a penalty of 50 per cent.

INDIANA

Indianapolis—The program for the annual meeting of the Michigan-Ohio-Indiana Coal Association, which will be held at Indianapolis, June 23 and 24, has been announced by Secretary B. F. Nigh, of Columbus. The program calls for long business sessions the two days of the convention with a varied entertainment program. The officers of the organization are urging all of the members and guests to attend the business sessions as a number of interesting addresses have been provided.

Evansville—C. N. Coupland, London, England, has been making trips from here into western and central Kentucky taking options on thousands of acres of coal lands. He says he represents a syndicate willing to spend $20,000,000 in Kentucky coal properties.

Jasonville—The Lattas Creek mine, employing 300 men, has resumed operations. The Bogle mine, northeast of here, is being dismantled and will be abandoned.

Linton—The Vandalia Coal Co. has started two more of its mines, employing 500 men.

ILLINOIS

Johnston City—The Cambria Coal Co., a shaft for which was sunk northwest of this place several years ago, is about to open up the property. J. L. Mitchell, of Coffeen, has the controlling interest, and it is understood the contracts will be let shortly for the equipment. Connections are anticipated with the Burlington, C. & E. I., Iron Mountain and Illinois Central.

Benton—The Middle Fork Coal Co., a new undertaking, is sinking a mine a few miles southeast of this place. It is understood the mine will have a capacity of 4000 tons a day, and the work of sinking the shatf is now in progress.

Marion—The work of raising the tipple of the West Virginia Coal Co. 10 ft., and building a superstructure is now under way.

Springfield—Owing to the failure of the special sub-committee to agree, the scale committee of the miners and operators of the Springfield district, on May 27, held a perfunctory session at the City Hall. The sub-committee is expected to formulate a tentative contract governing machine mining in the near future, after which a report will be made to the general committee.

Pekin—Following the action of several of the miners of the Champion Coal Co. in filing an involuntary petition in bankruptcy against the company, Judge Jesse Black has filed an answer in the United States Court. This asserts that the assets of the company exceed liabilities by $10,000, and that it is absolutely solvent, and if relieved from the court restrictions will proceed as a going concern.

MISSOURI

Kansas City—The annual meeting of the Southwestern Interstate Coal Operators' Association will be held at Kansas City on June 9. The joint meeting of the scale committees from the association and from the three districts affected will be held later in the same week, according to present intentions.

ARKANSAS

Fort Smith—A committee, appointed by the United Mine Workers, which inspected the nonunion mines in Johnson County, will report to a general conference of operators and union miners in Kansas City on June 10. It is understood that 12 coal mines in Arkansas and Oklahoma, employing about 3000 men are to be unionized if the plans as advocated here are successful. It is further understood that negotiations have been started with the Missouri, Kansas & Texas Ry. Co., relative to the reopening of its mines at Colgate, Okla., in which 800 miners were formerly employed.

Russellville—Two hundred miners recently went on strike at Russellville, giving as a reason the failure of the mining company to comply with the state mining laws, after it had been instructed to do so by state mine inspector, Thomas H. Shaw. Efforts will be made shortly to settle the strike.

OKLAHOMA

Okmulgee—Col. J. L. Peacock, while drilling for oil upon one of his holdings, recently struck a rich bed of coal at a depth of 1200 ft. This fuel is of excellent quality, and the deposit is several feet in thickness.

Owners and operators of coal mines in the segregated mineral belts of the Choctaw and Chickasaw nations after Aug. 1 next, upon the order of the Department of the Interior, and at the suggestion of the Bureau of Mines, will not be allowed to use any but permissible explosives in carrying on mining operations.

McAlester—A six-man team of coal miners from Savanna recently won the silver trophy cup offered by operators and miners in the McAlester field for the best showing in mine rescue work. Nine teams, in addition to two boys teams and one ladies team, were entered in this contest.

FOREIGN NEWS

Leeds, England—Eleven coal miners were killed and a numbers of others injured, May 30, by an explosion of gas in the Silkstone colliery at Wharncliffe. The accident occurred at a time when the full force of miners were not at work.

Sabinas, Mexico—Acting on what they declared were direct orders from General Carranza constitutionalist officials on May 27 confiscated five coal mines. These mines, owned by French and American capitalists, are the largest in Mexico. At constitutionalist headquarters, at Piedras, it was stated that these mines will be operated as public property.

PERSONALS

W. A. Lama, formerly traveling salesman for the Hocking-Domestic Coal Co., of Athens, Ohio, has accepted a similar position with the Hatton Brown Co., of Columbus.

George F. Hart, treasurer of the Guardian Savings & Trust Co., of Cleveland, it is reported has been appointed receiver of the Goshen Coal Co., of New Philadelphia, Ohio.

Colonel I. V. Dye for several years connected with the Coal & Coke Ry. as General Freight and Passenger Agent, has been appointed General Manager to succeed J. M. Smith resigned.

Willis T. Thomas has been appointed general superintendent of the Iowa District of the Consolidated Indiana Coal Co., with headquarters at Electra Mine near Melcher, Iowa, in full charge of the operation and maintenance of the property.

Andrew Leckie, who has for some time acted as superintendent of the Panther Coal Co., at Panther, W. Va., has resigned his position and accepted the agency for the McBee Powder Co., of Pittsburgh, for the southwestern portion of West Virginia.

Upon the application of S. A. McManigal, president, W. S. Courtright has been appointed receiver for the W. J. Hamilton Coal Co., of Columbus. Mr. Courtright was formerly president of the Union National Bank and was recently elected vice-president of the W. J. Hamilton Coal Co.

Frank C. Bevans, who has been superintendent of several mines in the Pittsburg, Kan., coal district, has been made manager of the city of Mulberry, the appointment effective June 1 Mr. Bevans will conduct the affairs of the town as he would a private business, and will have supervision over both the municipal electric light and water plants.

At the annual meeting of the South Wales Branch of the Association of Mining Electrical Engineers, Sydney, E. Walker was presented with a testimonial, in the shape of a handsome gold watch, by the members of the branch, "as a token of their esteem and respect," in connection with his presidency for the first four years of the Association's existence.

Following the resignation of Everett Drennen, as manager of the Elkhorn Division of the Consolidated Coal Co., the following promotions effective June 15 are announced; G. M. Gillette will become manager of the Elkhorn Division; Jonathan Jenkins is promoted to assistant manager of the Elkhorn Division; and Garner Fletcher becomes manager of Miller Creek Division, vice G. M. Gillette transferred.

Tim McDonough, mine guard at Irwin, Penn., recently dove down a 400-ft. mine shaft to the successful rescue of Tony Andy aged two, who accidently toppled into the shaft. After seizing the child McDonough after striking the side of the shaft finally got hold of the cable sliding down it to the top of the cage from whence he climbed to the landing. He sustained several broken ribs, a broken ankle and concussion about the entire body. The child he rescued was unharmed.

Trade Publications Received

Walter A. Zelnicker Supply Co., St. Louis, Mo. Bulletin No. 153, "Special Offerings and Other Used Material."

Borroughs, Wellcome & Co., London, Eng. "The Age of Speed;" 57 pp., 4x6½ in., illustrating Tabloid first-aid supplies.

Wilson-Snyder Centrifugal Pump Co., Pittsburgh, Penn. "Wilson-Snyder High Efficiency Centrifugal Pumps;" 40 pp. 6x9 in., with many illustrations and curves.

Keystone Lubricating Co., Philadelphia, Penn. "119" for Lubricating Mine Car Wheels. Folder of 8 pp., 3½x9 in., describing the use and advantage of "119" Keystone grease.

New York City—The Second International Exposition of Safety and Sanitation will be held Dec. 12 to 19, 1914, in the New Grand Central Palace, under the auspices of the American Museum of Safety, 29 West 39th St., this city.

CONSTRUCTION NEWS

Logansport, Penn.—The Shawmut Mining Co. is reported planning two new mines on the opposite side of the Allegheny River from Logansport. It is said that $800,000 will be expended in opening these properties.

Hamilton, Ohio—The Cincinnati, Hamilton & Dayton R.R. will soon begin the erection of large coal docks at Hamilton to be located on the site of the old round house which will be removed to a new location. The improvemnts at this point will mean an expenditure of $100,000.

Sandusky, Ohio—The large docks of the Pennsylvania R.R. Co., at this point are nearing completion and will be put in service soon. When the docks are completed the capacity of the loading machinery will be increased three-fold. A force of 400 men has been at work on the new docks.

Columbus, Ohio—The Essex Coal Co. of Columbus is opening two mines on the Kanawha & Michigan R.R. about a mile apart in the Pomeroy district. These mines will have a combined capacity of 3000 tons per day. About $150,000 is to be spent on improvements by the company which anticipates building about three miles of railroad.

Fairmont, W. Va.—To augment the power furnished the Monongahela Valley Traction Co., the Consolidation Coal Co. will shortly add to its central power plant a 1000-kw. gas engine unit. A contract for this equipment has been let and shipment of the machinery is guaranteed for Sept. 9. It is expected that the erection should be completed in the month of October.

Fleming, Ky.—The Pottersfork and Yount's Fork branches of the Louisville & Nashville R.R. into Haymond and Hemphill, new cities of the Elk Horn Mining Corporation, will

completed within a week and the shipping of coal begun on a considerable scale. Already nearly 200,000 tons of coal awaits the completion of these branches, while lively mining activities continue.

Floodwood, Ohio—Ground has been broken for the big central power station to be erected by the Ohio Electric Power Co. for the purpose of supplying electric current to the numerous coal mines in this section of the Hocking Valley district. It is expected that the plant will be in operation by late fall, so far as to be able to furnish current to a number of mines.

Scranton, Penn.—The contracts for the purchase of 750 new steel hoper coal cars that will cost $350,000, by the Delaware, Lackawanna & Western R.R. Co. were let on May 29. This order of coal cars is one of the largest ever placed by the Lackawanna. The American Car & Foundry Co., of Berwick, was awarded the contract for 400 of the new cars, while the Cambria Steel Co., of Johnstown, got the remainder of the order, 350 cars.

Duluth, Minn.—The Reiss Coal Co. is erecting a new unloading rig on its dock No. 1 at West Superior. This will be the second largest unloader on the lakes. Erected by the Heyl & Patterson Co. the rig will be 100 ft. high and will have a 450-ft. span handling an 8-ton clam shell bucket.

The United States Steel Corporation's unloading dock at Duluth will be widened 300 ft. this season and three more, Mead-Morrison rigs with 3-ton buckets will be installed. This extra dock capacity will take care of the coal supply for the steel plant at New Duluth.

The Great Northern Power Co. at Thompson, near Duluth, is installing more machinery and increasing its power by one unit, which will give this firm one-third greater power output. The application of electricity to almost all the large coal unloading docks in Duluth and Superior created the necessity for more power.

NEW INCORPORATIONS

Denison, Ohio—The capital stock of the Union Coal & Fire Clay Co. has been increased from $10,000 to $100,000.

Columbus, Ohio—The Maynard Coal Co. has filed amended articles of incorporation increasing its capital stock from $181,000 to $350,000.

Norfolk, Va.—The Norfolk & Chesapeake Coal Co. has been organized in West Virginia with a capital stock of $100,000. Tazewell Fitzgerald of Norfolk, Va., is statutory agent.

Columbus, Ohio—By a number of amendments filed by the Maynard Coal Co., of Columbus, with the Secretary of State the capitalization of the company has been increased from $200,000 to $350,000.

South Bend, Ind.—The I. S. C. Co., of South Bend has been organized with a capital stock of $20,000 for the purpose of coal mining. The directors are Thomas W. Slick, J. K. Glasgow, and W. A. Slick.

Toledo, Ohio—The Ohio Gas, Light & Coke Co. has been incorporated with a capital stock of $250,000 for the purpose of manufacturing gas. The incorporators are Joseph A. Sloan, J C. Vanderbroeck, B. A. Sloan, G. B. Orwig and L. A. Sloan.

Volga Post Office, W. Va.—The Little Mountain Coal Co., of Peel Tree, Barbour County, has been organized to mine and sell coal. The capital stock is $50,000 and the incorporators are B. C. Buffington, Albert Wostenholme, of Fall River, Mass., C. R. Lynch and E. P. Gosling, of Newport, R. I., and Robert A. Lynch, of Malden, Mass.

Lexington, Ky.—The Elmendorf Real Estate Co. was recently organized here. The incorporators are James B. Haggin, C. H. Berryman, James A. Todd and William F. Warren. The company is authorized to purchase and deal in coal, timber and mineral land, construct business houses, apartment houses, factories, warehouses and operate stores.

INDUSTRIAL NEWS

Duluth, Minn.—The Duluth office of the H. W. Johns-Manville Co. has been removed to larger quarters at No. 327 West First Street, in order to take care of its increased business.

Washington, D. C.—The Interstate Commerce Commission on May 27 declared that $1.85 per ton was a reasonable rate of freightage for coke from the Connellsville region in Pennsylvania to Buffalo.

Montgomery, Ala.—The Alabama Railroad Commission has postponed until June 22, the application of the Louisville & Nashville R.R. to be allowed to increase rates on coal to Decatur and New Decatur.

Toledo, Ohio—The General Western Sales Offices of the Pittsburgh-Buffalo Coal Co. will be moved to Toledo shortly. T. P. Jones, of Pittsburgh, Vice-President of the company, will be in charge of the local office.

Hamden, Ohio—The Elk Horn Coal Co., which is owned principally by C. K. Davis, of Detroit, has sold to a syndicate of Columbus men a tract of 902 acres of coal land near Hamden, which will be developed the coming summer.

Dayton, Ohio—The S. J. Patterson Pocahontas Coal Co., of Dayton, Ohio, which was incorporated recently with a capital of $75,000, has acquired a tract of 1200 acres of coal land in Mercer County, W. Va., which will be developed the coming summer.

Oklahoma City, Okla.—The Atchison, Topeka & Santa Fé has secured a five-year lease on the Oklahoma Central Ry., with the option of purchase for $2,000,000. The Oklahoma Central extends 130 miles through the Southern Oklahoma coal fields, and connects with the Santa Fé at Purcell, Okla.

Duluth, Minn.—Coal handlers employed by the Clarkson Coal & Dock Co. walked out on a strike for higher wages, May 23, but before afternoon most of the men returned to their jobs. Several agitators attempted to get the men to quit again, but were unsuccessful. The increase in pay demanded was not granted.

St. Paul, Minn.—The application of the Peabody Coal Co. of St. Louis to have the order modified under which the receivers of the Frisco system were authorized to rescind a coal contract made with the Peabody company was denied in the United States District Court May 23 by Judge Walter H. Sanborn. Exception was taken by L. O. Hawker, counsel for the coal company, and a formal appeal is in prospect.

London, Eng.—D. A. Thomas recently arriving in London on the "Lusitania", said that he had been asked by the big coal mining interests of the United States to formulate a scheme for developing their coal areas as economically as the Cambrian Trust, and that he plans to form a great United States coal trust, provided the Government does not interfere, which will reduce prices and make the United States a large coal supplying center to the world.

Toronto, Ont.—The Dominion Coal Co., of Sydney, N. S., having increased its shipping facilities intends to bring 2,000,000 tons of coal into Montreal this season or about 300,000 tons in excess of last year It has a charter list of 24 stemers with an aggregate tonnage of 168,000 and up to date has brought up 200,000 tons. One boat a day is being handled at the company's plant at Windmill Point and five boats per week at Hochelaga pier. Boats are also running with coal to Three Rivers and Quebec.

New York, N. Y.—The A. S. Cameron Steam Pump Works, 11 Broadway, New York, has opened branch offices and warehouses in the following cities: Birmingham, Ala., American Trust Bldg., H. M. Perry, mgr. Chicago, Ill., People's Gas Bldg., M. P. Frutchey, mgr. Cleveland, Ohio, Williamson Bldg., W A Armstrong, mgr Duluth, Minn., Providence Bldg., S. H. Hill, mgr. Houghton, Mich, Thos. F. Lynch, mgr. Knoxville, Tenn., Holston National Bank Bldg., L. F. Thompson, mgr Los Angeles, Calif., W. A. Townsend, mgr. Philadelphia, Penn., Arcade Bldg., Phil. Weiss, mgr. Pittsburgh, Penn., Farmers' Bank Bldg., W. B. Brendlinger, mgr. St. Louis, Mo., 300 N. Broadway, A. A. Bonsack, mgr. Seattle, Wash., Colman Bldg., R. W. Douglas, mgr.

Uniontown, Penn.—Pursuant to an order of the Court of Common Pleas of Fayette County, the Fayette Title & Trust Co., trustee under the mortgage of the Sunshine Coal & Coke Co., will offer for sale at public outcry, on Friday, June 12, 1914, at 1 o'clock p.m., on the premises at Lynn Station, the plant known as Cyrilla No. 5, and on Saturday, June 13, 1914, at 2 o'clock p.m., on the premises at Martin Station, the coke plant known as Francis No. 1. The first named plant consists of about 180 acres of Pittsburgh coal, 157 acres of surface, 142 beehive coke ovens, 23 blocks of double houses, 8 other houses, a store building, barn, tipple, engine house, engines, boilers, electrical equipment, 12 horses and mules, and all tools and appliances used in connection with the said plant. The second plant, or Francis No. 1, consists of about 120 acres of Pittsburgh coal, 330 acres of Sewickley coal, 475 acres of surface, 240 beehive coke ovens, 20 eight-room houses, two 10-room houses, two 12-room houses, 8 other houses, three shanties, store building, tipple and washer, brick boiler house, two 100-kw. generators, three 100-hp. boilers, two electric mining machines, two electric locomotives, etc.

Coal Trade Reviews

General Review

Anthracite opens the new month moderately active but will not be able to maintain the pace. Complete lethargy in bituminous.. One of the largest soft-coal corporations curtailing operations for the first time in its history. No improvement is in sight before fall.

The last of the month witnessed the customary spurt in anthracite coal, but as a rule the mines are not operating at all strong, and it is doubtful if they will be able to maintain a full-time basis through the current month. A rather insistent demand at tidewater indicates that the New England trade is still capable of absorbing considerable coal, but this is confined mostly to stove size and all other sections seem to be well supplied, so that there is not much real activity. May production was comparatively good, with delays reduced to a minimum. The steam sizes are being stocked by nearly all the companies.

The soft-coal market continues in the grip of a complete lethargy. The large consuming interests are still keeping stocks down to the smallest possible margin, and propositions on the part of the operators to contract on the same basis as last year, are not favorably received. While there have been some inquiries from consumers not yet closed, the effects have been so trifling as not to influence the general market in any way. Announcement of the fact that the Berwind White Co. is working under curtailed production for perhaps the first time in the history of the concern, is significant evidence of the trend of conditions in soft coal.

Contracting in the Pittsburgh district is below normal, consumers holding off because of their light requirements and the surplus stock on hand. Price cutting is being done on both prompt and contract business, although the cuts are not heavy. As a result of a slight improvement in lake shipping, there has been a moderate increase in operations which are probably now on a basis of 60 per cent. capacity. With the Ohio operators and miners in conference under the auspices of Governor Cox, the trade is marking time pending the results. The general impression prevails that the next ten days will see the labor situation definitely cleared up. Because of the general reluctance of dealers to stock up, trade conditions have failed to improve. Complications in the labor situation in the Kanawha district will ultimately have a beneficial effect, should the deadlock prove as complete as it now seems.

Conditions at Hampton Roads are somewhat duller in spite of a fair week's dumpings. There are only a few steamers awaiting cargo, while the accumulation in the local railroad yards is rather above normal, and there are now well defined rumors of concessions on the regular circular. As a rule, the market is moderately firm, due to a rather heavy demand from north of the Ohio River, which is having a steadying influence. In the Southern trade, buyers seem to have relinquished hope of a break in the market, and now appear ready to buy. A number of the Southern railroads will also be in the market shortly, and there is a general feeling of optomism throughout the trade. Operations in the Middlewestern field are on about half-time basis, and jobbers and retailers are pressing sales unusually hard.

EASTERN MARKET

BOSTON

New low prices at New England distributing points; market cargoes continue to arrive. Light movement of contract coal, spot demand practically nil, and quotations f.o.b. merely nominal. Georges Creek and Pennsylvania grades unchanged.

Bituminous—While some of the producing interests are trying to patch up the price situation on Pocahontas and New River alongside and on cars in this territory, their efforts are thus far barren of results. New low figures are heard this week at the various distributing points and yet coal continues to come forward without disposition orders in hand. Buyers who are following the market closely are waiting for still lower prices and admittedly the argument is mostly in their favor. It is understood that the Pocahontas field is operating only three days a week but apparently a stiffer curtailment will be required before the situation can improve.

The movement of Southern coals on contract is very light. The corporations and other large buyers are postponing their usual quotas and there is continued anxiety on the part of shippers who have steamers and barges under long-term charters. Meanwhile there has been no pronounced change in quotations f.o.b. Hampton Roads on the standard coals. The demand for spot shipment to New England, however, is practically nil and quotations f.o.b. are merely nominal.

Georges Creek and the Pennsylvania coals are without any new feature. Prices are held on about the season basis, the operators apparently realizing there is a market for only so much coal anyway and what is sold will command one price about as well as another. On the part of a few shippers there has developed an inclination lately to take business at delivered prices that are competitive with Pocahontas and New River and it is reported that some comprehensive orders have been closed in that way.

Anthracite—Deliveries in May were slower than was expected and a fair number of orders will go over to June. The mines are still on full time and some of the companies feel so confident of June business that they are unwilling as yet to release their transportation for freighting bituminous. Stove is still in shortest supply and the proportion in any one shipment is held within close limits.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.20@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.80@2.85
Boston†				3.35@3.63
Providence†				3.40@3.73

* F.o.b. †On cars.

NEW YORK

Cancellations on bituminous orders more numerous, but market is free of demurrage and consignment coal. Anthracite slowing down as the season advances and a restriction in production expected this month.

Bituminous—The soft-coal market continues monotonously dull and if anything a trifle more flat. It is simply a case of no business whatever, and the industry will do well to prepare for a continuance of lgiht conditions until preparations for the fall trade create an increased demand. If anything, cancellations have been more numerous during the week and operations have been still further curtailed about 40 to 50% probably being the average. One of the most significant features in the situation has been the development of the fact that one of the largest and most powerful bituminous companies in the country, which has never been known to curtail operations generally, has been forced by the slack conditions to reduce to four or five days a week.

But even in the face of all these discouraging conditions, operators are as determinedly and consistently adhering regular circulars as ever. It is also a notable fact that consignment coal has disappeared almost entirely from the market, and there are scarcely any more sales of demurrage coal now reported. It is not unlikely that the producers may ultimately benefit by the present indifference on the part of the buying and consuming interests It is a well known fact that the large corporations are working with stocks reduced to the smallest possible margin, and should they adhere to this policy through the summer the opening of the fall trade will witness a sharp rush for coal. Although scarcely any spot business is being negotiated, the prompt market still continues quotable on the same basis as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—Hard coal continues to slow down steadily but easily under the compelling influence of the advancing

n, the increasing price, and the pressure incident to the al retrenchment in all lines of industrial activity. While ime operations have so far been consistently maintained ie large companies, there are now definite signs of a ng up, and it is highly improbable that they will be to hold out through the current month. The holidays day of last week and Monday of this week, were gen- welcomed by the operators.

ove coal continues strongest, being in sharp demand at oints. In the all-rail trade both egg and stove are in demand. At tidewater egg is moving fairly well, al- h individuals are forced to sell at a sacrifice. Nut can- e moved at all. Pea is in weak demand, and operators voiding sending it down as much as possible. In the grades, buckwheat is as demoralized as ever, while the er grades of rice are almost as bad. Individual oper- who have no contracts for barley are dumping it on the bank rather than send it down to tide.

e now quote the New York hard-coal market, on which ew June circular is in effect, on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
	$4.80	$4.55@4.80	$4.75	$4.50@4.75
	5.05	4.95@5.05	5.00	4.85@5.00
	5.05	5.05	5.00	5.00
ut	5.30	5.10@5.30	5.25	5.00@5.25
	3.55@3.60	3.45@3.60	3.45@3.50	3.10@3.50
heat	2.80	2.60@2.80	2.50@2.75	2.10@2.75
	2.30	2.25@2.30	2.00@2.25	1.65@2.25
	1.80	1.60@1.80	1.70@1.75	1.30@1.75

PHILADELPHIA

nthracite market still lacks tone; mining continues full but demand for steam sizes is falling off. Slight im- ment noted in bituminous, but curtailed operations still rce.

nthracite—The first week in June finds this branch of the in fairly good condition. While there has been talk spension of mining, due to the preponderance of small operations continue as yet, and extra efforts are put to take care of the surplus. The New England market, ng from the demand at Tidewater, can still handle con- able coal, but the demand centers on stove coal. Chest- eems to be the disturbing factor. This has usually been led by diverting this size to the lakes, but it is doubtful her this policy can be carried out because of the large s in the Northwest.

ie month of May, as far as production is concerned, is to equal if not exceed, the tonnage of the correspond- period of last year, but it is doubtful if June shipments equal those of last year. An inducement in the way of isual discount seems to have small weight with the do- ic trade now. Retail dealers find, with but few excep- , that householders are postponing deliveries until later ie season, and this is naturally reflected in the whole- market. It is believed, before the month is out, that al suspensions will be necessary.

uotations at Tidewater are as follows:

	Circular	Individual
	$4.45	$4.45
	4.70	4.70
	4.70	4.80
ut	4.95	4.70 @ 4.85
	3.25	3.00

ituminous—There is some inquiry by establishments that not as yet closed their contracts, but are shopping id the market trying to secure some cheap coal. This had a tendency to tighten prices, but the difference is ig. A sale in sight, can usually secure coal at prices tiling for the last couple of months, and it is possible to e good bargains, by looking the market over carefully. ositions to close contracts at the same basis as last year, ot looked on with favor, and few large ones have been ed as yet.

BALTIMORE

he trade generally lacks vigor. Bituminous coal occa- lly offering at below cost. Export outlook continues ex- at. Anthracite slow but even.

here is a general absence of snap and vigor to the trade. minous coals are offering at times below the profit line, buyers undoubtedly have all the best of it. Quotations id largely upon the exigencies of the particular deal.

n forced sales in West Virginia the past week, slack was at from 45 to 55c. Three-quarter gas coal was weak, some sales around 80 and 85c. The West Virginia steam were freely offering at from 85 to 95c. The Pennsyl- situation on bituminous was a little steadier although was plenty of medium grade fuel to be had at from 95c. .10. Export coal was a strong feature straight through. ng May the total exports exceeded 83,000 tons, an increase out 9000 tons over the month previous. With the large number of charters already announced for June loading the May figures are expected to be exceeded.

In anthracite the supply is even, and a fair seasonal trade is being done although it does not come up to some previous years. Most dealers call conditions slow, but believe that the middle part of the summer will come well up to former seasons. An increase of 7c. per ton on inside the cape deliveries was announced to the trade here the present week. The new rate for deliveries in Baltimore Harbor and to points along the Patapsco River and Chesapeake Bay will be $1.42.

CENTRAL STATES

PITTSBURGH

Slight increase in production, the district operating at about 60% capacity. Considerable contracting at cut prices. Slack being stocked by leading interest. Connellsville coke dull with prices irregular. Shipments and production equal, after two months of production exceeding shipments.

Bituminous—There has been no improvement in the local demand for coal, but a slight increase has occurred in Lake shipments, so that mining operations have increased slightly, and may average a trifle in excess of 60%, taking the Pittsburgh district as a whole. One leading interest reports its operations at 85% as heavy as a year ago, when it was doing quite well. There is a moderate amount of contracting and some of the contracts are taken at materially lower figures than those expiring. On the whole, contracting has not been as active as a year ago, some buyers showing a tendency to hold off because their requirements are light and they still have some stocks. Some interests report that their contracts taken from the beginning of the year to date are substantially as heavy as the business done in the same period last year. For prompt coal regular list prices are cut more than on contracts, but there is cutting even in contracts for slack, which is usually supposed to hold to the full price in the case of twelvemonth contracts because the shipper has relatively little slack in the winter when there are no lake shipments. The Pittsburgh Coal Co. has long followed a practice of stocking slack during the lake-shipping season, and began doing so last week. Its attitude is that it will not shade the 90c. price on twelvemonth contracts for slack. Subject to some cutting on contracts and more on prompt lots we quote regular circular prices as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

Connellsville Coke—The market continues extremely quiet, considering that nearly all contracts expire at the end of this month, and in ordinary times there would now be a great deal of contracting for delivery beginning July. There are a few inquiries for both furnace and foundry coke, but concessions from the nominal market are so common that buyers have difficulty in making up their minds. The market stands substantially as follows: Prompt furnace, $1.80@1.90; contract furnace, $1.85@2; prompt foundry, $2.35@2.50; contract foundry, $2.35@2.65, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 23 at 257,630 tons, a decrease of 37,085 tons, and shipments at 276,072 tons, an increase of 242 tons. Shipments exceeded production apparently by 18,442 tons, the balance having been in the opposite direction for eight weeks previous, to the total amount of 84,860 tons.

BUFFALO

Much bituminous still in consumers' hands. Railroads likely to require more coal before long. Coke still quiet. Fair movement of anthracite.

Bituminous—There is some indication that the railroads will be in the market for more coal before long. The Grand Trunk is estimated to have a month's supply, but the Lackawanna has about used up its surplus, while the Lehigh Valley still has some, but no great amount. Some contracts are making, but as a rule the buyer asks that delivery be suspended for a month or so. All bituminous mines are obliged to run on short time, often not more than two or three days in a week. As a rule the operators are cautious, not allowing their output to exceed orders. There is complaint that buyers are not above throwing up purchases if they are offered demurrage coal at sacrifice prices.

Buffalo is taking a good amount of coal. The ore receipts by lake are fair for the season and the iron furnaces are practically all active. Canada is not absorbing a normal amount of coal and there are reports that pig iron is selling slower at other points than here. All private factories are running at a slow rate, but only a few of them are shut down.

Although dealers commonly report business dead, when asked if he has cut prices he is pretty sure to reply that he has not.

So long as certain of the bituminous dealers maintain that they are getting full prices for their coal, the circular will have to be given as the proper basis, no matter if it is well known that a great part of the coal is selling for less. Quotations will therefore be on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with slack no more active than sizes. Allegheny Valley prices are about 25c. lower, except slack, which sells on a par with most Pittsburgh slack.

Coke—There are still reports of furnaces in this district blowing out, so there can be no greater activity in the coke market and none is looked for at present. The pig iron product of Buffalo and neighboring furnaces is selling fairly well. Best 72-hr. Connellsville foundry coke sells at $4.50.

Anthracite—There is not much real activity to the trade, as the consumers, even in the country, are well supplied. A slight spurt took place on the rail lines at the close of the month as usual, though it was much smaller than the average. Shipments by lake are much smaller than the average, though the present showing is fair. Some winter-loaded cargoes are still here, as the vessels are not anxious to sail. Shipment for the week (six days) amounted to 125,000 tons.

TOLEDO

Increase in the lake movement and an improvement in the steam demand injects a better tone into the trade. Supplies still excessive, however, and prices ruling low.

There is more lake coal moving than for some weeks past. A number of large freighters have cleared this week, and others are now in the process of loading. There is plenty of coal in the yards and no scarcity is noticeable in any line save Pocahontas which is hard to get in nut and egg sizes. The usual 20c. advance on Pocahontas was announced June 1.

Outside of smokeless coal there is plenty of fuel on the Toledo market despite the fact that the Ohio mines have been closed for two months. It is generally believed that the mines will again be running by the middle of June. West Virginia coal is taking the place of southern Ohio grades. Outside of Pocahontas there has been no change in quotations and most concerns claim to be getting circular prices for what coal they sell.

Crop prospects in Ohio are unusually good and it is probable that there will be a heavy demand for threshing coal. Factories are running as usual and it would appear that the demand for steam coal must be large as soon as the supply purchased in anticipation of the strike runs out which must be soon. Domestic demand is light but it will soon be time for the laying in of anthracite at summer prices.

CINCINNATI

Market increasingly dull, with slower demand for domestic grades and a continued slackness in steam coal. Lower prices are indicated, although it is hoped that the West Virginia strike will shortly stimulate the market.

Contrary to the expectations, the market in this vicinity has failed decidedly to improve. Reports from the upper lakes indicate that while the docks are being slowly cleaned up, there is great difficulty in getting boats to handle shipments, as return cargo of ore cannot be had at this time. The domestic demand is threatening to slump off both here and throughout the state, reports being to the effect that dealers are inclined to delay stocking until later on. They are also hopeful of getting even lower prices than now offered, which in many cases are already below circular figures.

The strike in the Kanawha field is confidently expected to result in a marked stimulation, however, as it will cut off a large part of the present surplus, and make the entire market dependent upon a comparatively small part of the West Virginia and the eastern Kentucky fields, with what river coal is available. As this means a heavy reduction in the supply, the trade has every reason to hope for a stiff reaction shortly, probably during this week, if conditions are not changed.

COLUMBUS

Attention centered on conference of operators and miners. In the meantime practically all Ohio mines continue idle. Slight increase in the demand for coal in some sections.

Since Governor Cox has taken a hand in the mining suspension in Ohio, the conference of the operators and miners is expected to produce some tangible results. Miners in certain districts are more anxious than ever before to compromise and the same is true of the operators.

Miners in certain localities are not backing up their officers and open friction is reported. It is hinted that a compromise of a rate some place between 44c. and 49.64c., which is the figure insisted upon by miners for machine mined coal on the mine-run basis, may be effected.

There is a slight increase in the demand for coal, due to the depletion of surplus stocks. This is especially true of the larger steam users and as a result a considerable tonnage has been shipped into Ohio from West Virginia and Kentucky. Prices on these shipments have been very low, however. No a great deal of inconvenience has been caused up to date and none of the manufacturing plants have had to close.

There is also a better demand for domestic sizes, especially the fancy grades such as Pocahontas and splints. Some of the larger householders are laying in a good supply of fuel and dealers have had a fair trade for this season of the year. The lake trade shows no strength of consequence. Reports from the upper lake ports are that a considerable tonnage has been carried over from last season and as a result shipments to the Northwest via the lakes are not large.

A few of the smaller mines in the Pomeroy and Crooksville districts have resumed operations and signed up at the 49.64 scale. But these are not important and will have little bearing on wage scale negotiations.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.50@$1.40		$1.50@$1.40	$1.45@$1.
¾-inch	1.35@ 1.30	$1.20@$1.15	1.35@ 1.30	1.30@ 1.
Nut	1.30@ 1.25		1.25@ 1.20	1.25@ 1.
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.10@ 1.
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.80@ 0.
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.70@ 0.

CLEVELAND

Prices just holding their own at the low level. Reser supplies mostly used up, but the demand still off. The la trade quiet and damage at Duluth-Superior docks has r duced shipments.

The spot market shows little change and the range prices is about the same. Youghiogheny slack is selling track here at $1.60@1.65 and Fairmount gas slack the sam There is no demand for coarse coal. Storage stocks at t factories have been depleted in most instances, but the plan are not working to capacity and the demand is therefo dull.

The real interest in the Cleveland market centers on t joint conference of operators and miners at Columbus. seems likely a settlement of the Ohio strike will be ma shortly and the rate will probably be somewhere near t mine-run basis of western Pennsylvania. So far no contra ing of any consequence has been done for Ohio coals, and the season is well advanced, operators are getting anxious

Pocahontas operators and jobbers are quoting lump a egg at an advance of 10c. over May prices. They are r taking any more orders than they can help for prepared siz Slack is not readily disposed of and mine-run orders a scarce. The local market will not take much Pocahont until the latter part of this month when domestic deliver begin.

Lake Trade—Lake shippers are having no difficulty g ting all the boats they can use. The smaller type of vess was not equal to the demand a few weeks ago, but with t rush over, ship owners are willing to hold boats two or thr days to get coal cargoes. The lake trade has opened ve slowly, but a slow start usually results in a rush in the fa

A sudden gale last Monday toppled over several unloa ing machines at Duluth-Superior. The Northwestern Fu Co. was the hardest hit when its new dock was wrec Practically every dock at the head of the lakes suffered so damage and the entire Clarkson dock was put out of co mission. As a result of this damage, shipments amounti to nearly 750,000 tons will be deferred.

Shipment prices are as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.15		
Lump, 1¼-in.		$2.35	
Lump, ¾-in.		2.25	$2.10
Mine run	2.60	2.10	2.00
Egg	3.15		
Nut		2.15	
Slack	2.20@2.35	1.60	1.65

DETROIT

Business quiet but a more hopeful feeling prevails. Su plus stocks are being gradually exhausted and consumers a now looking for tonnage.

Bituminous—There is a noticeable change for the better the situation here. Not so much from actual sales as fr the general feeling that business is sure to improve short Inquiries are coming in from a great many steam coal co sumers which denotes that the buyers are beginning to not their supply is diminishing rapidly.

The supply of track coal is steadily becoming less,

ugh there is sufficient to satisfy all possible demands for ne time to come. The demand for slack has shown some provement and prices have been much better than for some eks. About the same conditions exist on the coarser steam ls, except that quotations are still off on mine-run and -in. lump. Should the Ohio mines remain closed for a few re weeks the general feeling is that prices on all grades of st Virginia and Kentucky coal will show an advance.

In the domestic trade, the situation has changed but little. wever, there have been some fair orders on 2-, 3- and 4-in. np and some egg. Some of the shippers report more suc- s in getting the dealers in the smaller towns to place lers; this is especially true of some of the large dealers, o figure that at current prices they are making good gains. The threshing season is not far away and some of s coal will move during July.

Anthracite—The anthracite business is still quiet in De- it, at least from shippers' end. There is, however, quite a ge amount being delivered, mostly to apartment houses l churches.

HAMPTON ROADS

Situation somewhat duller in spite of a fair week's dump- s. Few steamers waiting, accumulation on hand rather ge and there are well defined rumors of concessions on the cular.

While conditions at tidewater are not extra bright at the ne time there has been a fair amount of coal dumped dur- the week. The greater part has gone to the Northern ts with one large cargo loaded by the government into collier "Cyclops" for the fleet now in Mexico. The largest pment foreign was taken by the Italian S.S. "Vesuvio" for noa. Other foreign cargoes moved to Canal Zone, Naples, vana, Dakar, Venice, St. Thomas and Barbadoes.

In addition to New River and Pocahontas there has been ne shipments of high volatile to the New England market only one or two small cargoes and these it is understood re on contract. The accumulation of cars on the railway ds is somewhat above the average with little tonnage in stream waiting for berth.

Although there is no confirmation it is understood that ne sales are being made below regular circular the price some small parcels being cut to $2.70 or even a few cents s. As has been the case for some time the greater part of shipments moving have been by steam barge the schooner vement being fairly light.

LOUISVILLE, KY.

Large demand from north of the Ohio River has stimu- d the market. Most operators able to keep up operations ly steady. Prices steady.

An increased demand for domestic coals has greatly im- ved the situation in the eastern Kentucky field, though dullness continues in the western part of the state. ge shipments are being ordered daily for points north of Ohio River. Domestic coals continue sluggish in the tern part of the state, with a corresponding tightness of steam sizes and screenings. Industrial demand is not roving to any extent. Many of the operators are booked l ahead for later deliveries and are finding it possible to p operations going with a fair degree of regularity. The lement of the labor differences in the western part of the e does not appear to have had any effect on the market.

Prices show some advances on the domestic coals, those ch sold during May around $1.40 a ton, f.o.b. mines, hav- made about a ten-cent advance The steam sizes in the tern field show little change, though in the western dis- t pea and slack is quoted at from 40 to 50c. a ton and the and slack from 65 to 75 cents.

SOUTHERN AND MIDDLE-WESTERN

BIRMINGHAM

Navy business helps Alabama market. Coke somewhat nger and lump coal outlook more encouraging. Number Southern railroads will contract during June.

There is a general feeling of optimism among Alabama men. This is due in part to the fact that the Navy is rted to be in the market for a large amount of Pratt m coal and as soon as the order is placed the Blue Creek es will have to run full-time.

A two-year contract has been received from a New Or- s concern for a large tonnage of byproduct coke which been found to be superior in many ways to the old bee- hive product. A good tonnage of coke is also going to Western points.

As the retail dealers have not found the operators willing to cut prices on lump, it is expected they will soon begin to put in their summer stocks; a 10c. advance went into effect June 1 and another 10c. is scheduled for the first of July. A number of the Southern railroads let their annual fuel contracts during June and Alabama mines will receive a large share of this business.

INDIANAPOLIS

Mines on about half-time and trade at normal summer basis. Largest consumers in market again, but all the surplus coal not consumed yet. Retailers active in pushing summer sales.

Indiana mining conditions are not much changed. Here and there a mine is reopened, but this seems to be offset by more restricted operations at the plants which have been working. Production seems to be at about half capacity. Not all the stored coal is yet cleaned up, although a majority of the large consumers are in the market again. The wage troubles in this state are settled, except at the five strip mines, which employ about 200 men. This is a new element that has now to be considered, the business beginning to assume some importance. The mine workers association is recognizing these miners and will represent them in making a wage agreement.

Retailers all over the state are pushing sales unusually hard on the expectation that there will be a car shortage next fall and early winter. The movement to consumers' bins is perhaps a little more than normal for the season. In fact, the number of users of the domestic grades who buy their winter's supply in summer seems to grow year by year.

ST. LOUIS

Coöperative mines a disturbing feature in the middlewestern situation. Market generally dull and unsatisfactory.

Continued quietness covers the local situation. There is practically no coal moving, with the exception of a very small tonnage for steam, and this sells at anything but a profitable figure. Several of the mines in the 5th and 9th Districts are going on the coöperative basis.

The United Mine Workers seem unable to contract their mines in the 5th and 9th Districts, and the operators are making a proposition to the men to put the mines on a cooperative basis. The miners pay the operators so much a ton royalty in some instances, and so much per ton for the use of the property, and put the coal on the market at whatever figure it will bring. It is figured by some operators that the miners are producing coal for about 38 to 41c. a ton, whereas the scale is about 55c. This, of course, practically puts a quietus on any operations other than those on a coöperative basis, which is bringing about a demoralization in these districts.

At the present time nearly one-fourth of the mines in Williamson County are bankrupt, and according to rumor some of the operations in the Franklin County field are likely to follow.

There is a small tonnage of anthracite coming into the St. Louis market, and smokeless is also beginning to move in. Some outside coke has arrived during the past week, or ten days, but other than that the market is quiet.

The market is now quotable as follows:

	Carterville and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	.....	$1.20	$0.85 @ 0.90	$1.15
3-in. lump	.....	.....	1.25	.....	.....
6-in. lump	$1.20 @ 1.35	.....	1.30	1.00 @ 1.10	1.35
Lump and egg	1.85 @ 2.15	$2.00	.....	.....	1.15
No. 1 nut	1.20 @ 1.35	.....	.....	.....	.....
Screenings	0.80 @ 0.85	.....	.....	0.65 @ 0.70	0.75 @ 0.80
Mine-run	1.10 @ 1.20	.....	.....	0.80 @ 0.85	.....
No. 1 washed nut	1.50	2.25	1.50	.....	.....
No. 2 washed nut	1.40	.....	1.25	.....	.....
No. 3 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 4 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 5 washed nut	0.80 @ 0.85	.....	.....	.....	.....

The June circular at St. Louis will be as follows:

Anthracite—Chestnut, $8.20; egg and stove, $7.95; grate, $7.70; Arkansas semi-anthracite, $6.50.

West Virginias—Lump and egg, $5.50; nut, $5; mine-run, $4.75.

Illinois Coal—Carterville lump and egg, $3.25; Mt. Olive lump and egg, $2.75; Standard lump, $2.50.

KANSAS CITY

Movement of coal improved due to preparations for threshing wheat. Steam lines in good demand. Lump still weak, and moving slowly.

Preparations for harvesting big wheat crops in Kansas and Oklahoma has resulted in more snap to the coal trade

in Kansas City. Cutting already has begun and will continue for the next six weeks. Threshing will start up about June 15, and will lap over into July and August.

The movement into Kansas and Oklahoma is already showing improvement, though the bulk of the business will be handled in the next few weeks. Missouri threshermen are also buying coal, though Missouri products are so diversified that wheat is only one of a number of crops and coal demand is therefore lighter than in other states. Lump is still showing lethargy, and concessions are being made in order to move it.

PORTLAND, ORE.

Demand light as result of warm weather. Storage prices went into effect June 1, with reduction of 50c. per ton.

The market is exceedingly quiet and dealers are not looking for much activity till after summer prices go into effect. This will mean a reduction of 50c. per ton and it is expected that this will result in a considerable volume of business.

Whether or not the hope of lower fuel prices, as a result of the opening of traffic through the Panama Canal will deter consumers from placing orders early, is a question that only time will answer.

PRODUCTION AND TRANSPORTATION STATISTICS

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during March and the first three months of the last two years, in short tons:

	March		3 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	77,049	149,483	434,392	407,542
Chesapeake & Ohio[1]	309	945	2,167	3,051
Erie[3]	672,153	740,234	1,958,048	2,128,608
Pennsylvania[1 3]	741,209	1,086,344	2,743,504	2,706,391
Virginia[2 1]	166	43	311	102
Total 5 roads	1,490,886	1,977,049	5,138,422	5,245,694
Bituminous				
Baltimore & Ohio[1]	2,710,031	3,338,058	8,531,184	8,952,917
Buffalo, Roch. & P.[1 2]	766,576	923,513	2,293,627	2,495,420
Buffalo & Susq.[1 2]	155,706	150,187	450,064	432,926
Chesapeake & Ohio[1]	1,392,590	1,596,093	3,961,230	4,390,821
Erie[3]	61,538	6,096	184,852	28,203
Hunt. & Br'd T. Mt[1 2]	102,337	127,110	381,600	329,957
New York Central	770,165	918,706	2,443,985	2,492,765
Norfolk & Western[1 2]	1,751,158	2,112,118	5,694,576	5,744,407
Pennsylvania[1 3]	4,050,247	4,740,313	12,117,747	12,414,492
Pitts. & Lake Erie[1 2]	956,138	1,304,413	2,909,651	3,090,822
Pitts. Shaw. & North[1 2]	229,341	256,971	681,982	791,255
Virginia[1 2]	380,091	336,952	1,233,244	1,003,817
Western Maryland	271,286	285,601	760,985	751,045
Total 13 roads	13,597,204	16,096,131	41,644,727	42,918,847
Coke				
Baltimore & Ohio[1]	405,220	356,164	1,215,751	896,499
Buffalo, Roch. & P[1 2]	55,911	28,878	164,007	79,699
Buffalo & Susq.[1 2]	27,401	41,162	77,763	110,859

Pennsylvania[1 3]	1,247,451	1,027,339	3,756,325	2,700,237
Pitts. & Lake Erie[1 2]	612,095	521,626	1,859,847	1,341,139
Pitts. Shaw & North[1 2]	3,084	.....	9,292	.....
Virginian	.....	.....	.....	.....
Western Maryland	6,381	9,402	19,038	24,138
Total 10 roads	2,543,255	2,128,299	7,660,894	5,581,363

[1] Includes coal from connecting lines.
[2] Includes company's coal.
[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 292,179 short tons of bituminous coal during February, and 648,842 short tons during the two months.

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during March and April of this year and last year:

	March		April	
	1914	1913	1914	1913
Coal	3,173,972	2,538,039	2,131,812	2,516,367
Coke	356,164	405,220	343,862	400,317
Total	3,530,136	2,943,259	2,475,774	2,916,684

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for April and the four months of 1913 and 1914, in short tons:

	April		Four Months	
	1914	1913	1914	1913
Anthracite	1,070,562	930,592	3,776,953	3,674,096
Bituminous	3,699,928	3,796,432	16,114,420	15,914,179
Coke	916,369	1,230,979	3,616,606	4,987,304
Total	5,686,859	5,958,003	23,507,979	24,557579

VIRGINIAN RAILWAY

Total shipments of coal over this road for the month March was 336,552 tons as compared with 380,091 tons the same month last year.

COAL FREIGHT DECISIONS

I. C. C. No. 4762—Poehlman Bros. vs. Chicago, Milwaukee & St. Paul Ry.

Defendant's rate of 40c. per ton, applicable from Galewood, Ill., to Morton Grove, Ill., on interstate shipments of coal received from connecting lines at the former point not shown to be unduly discriminatory or prejudicial. The traffic involved is through traffic. The through rate is not drawn in question nor are the participating carriers made defendants. The Commission therefore declines to express any opinion upon the question of the reasonableness of the rate under attack. Complaint dismissed.

COAL SECURITIES

The following table gives the range of various active coal securities during the week ending May 30:

	Week's Range			Year's Range
Stocks	High	Low	Last	High

FOREIGN MARKETS

GREAT BRITAIN

May 22—The market has an improving tendency especially for June loading. Quotations are approximately as follow:

Best Welsh steam	$4.68	Best Monmouthshires	
Best seconds	4.44	Seconds	
Seconds	4.20	Best Cardiff smalls	
Best dry coals	4.20	Seconds	

The prices for Cardiff coals are f.o.b. Cardiff, Penarth, Barry, while those for Monmouthshire descriptions are f.o.b. Newport; both exclusive of wharfage, and for cash 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry $4.80@5.52; furnace, $4.08@4.56.

British Exports—The following is a comparative statement of British exports for April and the four months of the last two years, in long tons:

	April		4 Months	
	1913	1914	1913	1914
Anthracite	235,650	178,704	937,166	9
Steam	4,708,475	3,837,620	17,317,543	16,5
Gas	983,697	878,877	3,593,943	3,6
Household	146,273	82,798	581,727	4
Other sorts	276,774	236,019	1,159,499	1,0
Total	6,350,869	5,214,018	23,589,878	22,4
Coke	70,200	67,615	352,390	
Manufactured fuel	184,145	164,095	691,347	
Grand total	6,605,214	5,445,729	24,633,615	23,6
Bunker coal	1,795,946	1,624,282	6,747,177	6,0

What Users Say About the Bronze Sleeve Bearings Supplied on

Baldwin-Westinghouse

Electric Mine Locomotives

The modern bronze sleeve bearings with oil and waste lubrication used in the motors on Baldwin-Westinghouse Electric mine locomotives give such satisfactory life that many testimonials have come from satisfied users commenting upon this feature.

One large mining company in Arizona operating eight 15-ton locomotives for a period of two years advises that they never replaced an armature bearing and a careful test on one set of bearings at the end of two years showed the wear to be only .003 inch.

A company in Utah, which has had in operation four 18-ton locomotives since 1910, states that none of them have ever been out of service for repairs to the armature bearings and that all motors are still running with the original armature bearings. Some of these locomotives have operated three shifts a day for three years, handling 1250-ton miles per shift.

A very large mining company in Montana has had nine 3-ton locomotives with sleeve bearing motors in operation for three years working three shifts a day and all armatures are still in the original bearings.

Several large companies in Pennsylvania which have used all types of bearings prefer the modern bronze sleeve bearing.

These facts prove that bronze sleeve bearings satisfactorily meet the exacting demands of mine locomotive service.

Specify Baldwin-Westinghouse Barsteel Electric Mine Locomotives and you are assured of reliable operation.

Address either company for full information.

Ever Look At It This Way?

The Weekly Ad-Talk Page

"There's too much advertising here,"
The Reader grumbled, with a sneer,
"The other matter's good, no doubt,
But see how it is hedged about
With ads of engines, hoists and pumps,
Of locomotives, cars and dumps
And pipe and screens and fans and things
Until my poor head fairly rings!"

—He flung the magazine aside.
"Maybe you're right," his friend replied,
"And yet one article last week
Helped you to stop a serious leak
In haulage costs. You know that's true,
You told me of it, didn't you?
You nod!—well, let me tell you, flat,
'Twas advertising paid for that!

"Each week before you is unfurled
The news from all your special world
From North and South and East and West
The brightest talent and the best,
However high, however dear,
Is hired to fill these pages here
And—get this underneath your hat,
It's advertising pays for that!

"And here's a fact you ought to heed
The *ads themselves* are good to read,
They help to keep you up to date
And when you buy they guide you straight,
Spreading before your seeking eyes
A wide and varied merchandise
Of all materials you use—
The stuff is there—it's yours to choose!

"Somehow I think you're scarcely right
In cursing all the ads in sight!"

The Reader grinned with sheepish mien
—And then picked up his magazine!

COAL AGE

Vol. 5 NEW YORK, JUNE 13, 1914 No. 24

Undoubtedly one of the most overworked phrases in the English language to-day, is the one that reminds us of the "survival of the fittest." Please observe that we do not insinuate that the fittest do not survive; we simply wished to call attention to the fact that everybody seems to be telling everyone else that the fittest do survive.

Yes, the fittest do survive, but there are times and circumstances, when the fittest have survived, very much to their own sorrow.

A few weeks ago we had occasion to pay a visit to a vanishing mining town, which is even now a town, only by right of past remembrances.

Many years ago, it boasted the most prosperous mining community in the state, and it was not all boast, either. We, the scribe, happened to be the camp's mining engineer at that time, so we sort of know whereof we speak. But now—mostly a roosting place for bats—every house in the camp, save one, is deserted and tottering.

The one exception is occupied by the caretaker of the property. Lower seams that may be available some day make it desirable to keep the property intact, and so, to guard against squatters, the caretaker and his wife are retained. We found them working in their garden just back of their home; an old, weary couple, very much in harmony with all their surroundings.

Imagine our surprise when the old man fell on our neck, weeping, calling us by name.

Yes, it was Tobin (we will call him Tobin), the master mechanic of the camp in the good old days, now left high and dry, forgetting and forgotten.

Here's the story:

He was a good master mechanic, proud of his camp, and of his job; too proud in fact, which explains the tragedy. He became suspicious of his men, fearing constantly that they were trying to undermine him, scheming for his job. He changed men constantly, planning thus to outwit them.

He builded better than he knew. He succeeded so well that no one was ever able to displace him. But years slip by quickly and, while Tobin was so busy holding onto his job and watching the other fellows who appeared envious, he failed to realize that the camp's usefulness was rapidly coming to an end, and, naturally, he got out of touch with progress in his profession.

When the end came Tobin had still survived and there he remains to this day.

Thomas Moore moved the world to tears with "The Last Rose of Summer."

That's because his rose was symbolic of so many Tobins.

Reinforced Concrete as Adapted to Mine Timbering

By N. H. Rowland*

SYNOPSIS—Wood is unsuitable for mine timbering where permanency and non-combustibility are requisites. Under such circumstances, reinforced concrete appears to possess many advantages over steel, chief among which is its lesser cost.

The chief advantages of timber for underground mining operations have been its wide distribution with ease of access to place of use, its consequent cheapness, and the simplicity with which it can be framed and fitted to service.

With modern improvements in mining methods and the application of wider intelligence in the use of men and materials to promote the greatest efficiency in operation, and therewith the largest returns on capital investment from the minimum ultimate expenditure in construction and maintenance, there has come a keener appreciation of the fact that timber is not universally adapted to all the construction incident to mining operations, and that in many situations its use may be attended with large economic waste.

The laws of true efficiency in mining operations call for the prevention of waste both economic and human, and therefore demand for mine timbering economy of material, space and time; of material in order that each piece may do work up to its full capacity; of space for the prevention of useless and profitless excavation; of time needlessly spent in repairs and renewals on materials not truly adapted for mine timbering purposes. Some of the economic wastes involved in the use of wooden timbers for underground mining operations under conditions of loading or temperature wherein they cannot be expected to endure for more than a limited period of time are as follows:

1. Waste in sizes: The compressive strength of wood is much greater than its transverse strength, and under ordinary conditions there is absolutely no technical reason why the legs of the timber square set should be made the same size of the collar; the extra amount of material that goes into the legs is wasted, and means direct extra expense in the way of freight and handling.

2. Waste in framing and decay: The material cut away and lost in framing involves considerable waste, sometimes a part of the piece is injured, and the entire member rendered useless. Waste also occurs in the use of timbers under temperature conditions where decay and destruction by insect action are a matter of relatively short time. Ten per cent. of all the mine timber, according to the U. S. Dept. of Agriculture, is destroyed by insect action and 45% by decay. The enormous quantities of timber consumed in the mines and the necessity for the replacement of the entire equipment inside the workings of an anthracite mine in 12 to 18 months emphasize the unsuitability of wood for this purpose, and the economic waste involved by its use.

3. Waste by fire: Waste also occurs from the exposure of timber to situations where fires may be expected. The long line of disastrous mine fires calls attention to this ever present danger in coal mining operations, the necessity of continual vigilance for its prevention, and the importance of the use at recognized points of danger, of materials of construction that are fitted to reduce, if not to entirely avoid, the economic waste due to the use of wooden timbers in locations for which they are not in all respects adapted.

4. Waste from lack of re-use: Waste also occurs owing to the failure to draw or re-use the timbers of completed rooms, abandoned headings, etc. Under present conditions in this country, wooden props and gangway supports are seldom withdrawn and are usually utterly worthless when the time comes for their replacement. They form an excellent place for the origination of fires or their maintenance when once started. In England and on the Continent it is the custom to withdraw and re-use all the timber, and the prevention of waste by the use of material for props and gangway supports which is capable of repeated re-use has been thoroughly justified by ultimate economy in expenditure.

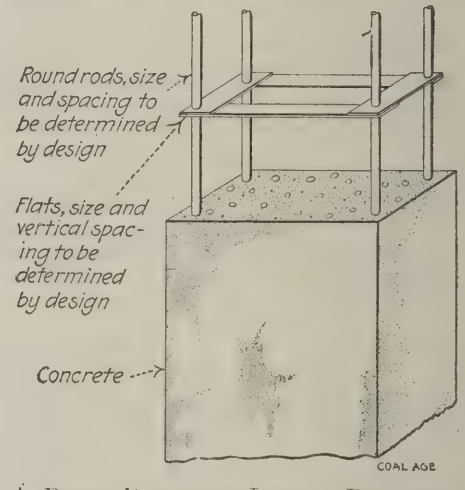

Fig. 1. A Prop Designed Like a Building Column

Substitutes for Wood

The rapid exhaustion of suitable timber for use in underground operations and the desirability of some substitute readily adapted to the requirements of mining, and economical in the total cost of production, which would eliminate the above mentioned wastes has led to the consideration of substitutes for timber. Every consideration which may be adduced for fire-proof construction above ground avails with even greater force for the elimination of inflammable materials, so far as possible, from underground structures. Fireproof buildings underground mean safety, and therewith reduction of expense in maintenance and replacement. Steel or reinforced concrete structures mean mine insurance.

The superiority of reinforced concrete to wood is due to the fact that it possesses all the latter's well known advantages with none of its disadvantages. The substitution of this material of greater strength and endur-

*50 Church St., New York.

ance for a similar one of less tenacity avoids, moreover, all those elements of economic waste to which timber is liable, entailing meanwhile less excavation, better ventilation, and greater permanency.

Wooden shapes which have proven themselves suitable for mine-timbering purposes can be exactly duplicated in reinforced concrete. A set of reinforced concrete gangway supports may alternate with wooden timbers; wood may be taken out and reinforced concrete put in its place, and vice versa.

Some highly successful applications of concrete construction, reinforced and plain, have already been made in mining operations. The advantages secured are noninflammability, the possibility of obtaining a large portion of the ingredients in close proximity to the mines themselves and the readiness with which concrete can be prepared to sustain either light or heavy stresses.

If there were no other reasons for the use of reinforced concrete in mines, the preservation of the vital parts of the operations from fire loss merits the most careful consideration, while another great advantage lies in its great strength and stiffness. In many cases its use in underground operations in mine timbering means decreased cost of production and therewith increased returns on capital investment. The theoretical conditions which prove this statement are just those which account for its extended use in the construction of bridges, buildings, etc., and which make truly economical its use in the building of mine structures above ground.

Many modern mines are using steel for supporting gangways, and satisfaction has attended these examples. Even where loads are not great and the fire hazard low, the use of metal in place of wood has been found a profitable investment on the basis of the ultimate economy in the expenditure, which results from low maintenance charges and infrequent renewals.

Steel Mine Timbers in Ohio

Extensive installations of this character are found in the 8th and 9th mining districts of Ohio; for instance, in the mines of the Roby Coal Co., at Adena. In the 35th Annual Report of the Chief Inspector of Mines of Ohio, page 430, it is stated:

> The mines have a very tender roof and at one time the haulways were considered the most dangerous in the district. . . . The main entry is now timbered with steel I-beams. . . . The management informs me that the cost of production is a great deal less than when they attempted to operate without properly timbering the haulways.

At Barton during 1909, the mines of the Youghiogheny and Ohio Coal Co. were likewise being timbered with steel I-beams in place of wood, eliminating the chance of accidents from falls of roof along the haulways, and the inspectors report that conditions have been thereby decidedly improved.

In the anthracite coal mining region there are to be found long stretches of steel-timbered gangways in the mines of the leading companies, particularly those of the Susquehanna Coal Co., and its subsidiaries, the Lehigh Valley Coal Co., etc.

Inasmuch as steel, however, is considerably more expensive than reinforced concrete, and as the latter possesses all the advantages of the former, it would appear that reinforced concrete would be well adapted to gangway timbering. Of course, it might be contended that on account of its low tensile strength and relatively high resistance to compression and crushing, that concrete would not be as suitable as steel, which has a high tensile strength, and is therefore fitted to carry large loads over wide spans with a minimum ratio of dead weight to external loading.

In most mines, however, the gangways are so driven that it is unnecessary to cover wide spans. If it were found necessary to meet such conditions, a more complicated system might have to be considered, and a few props could be so placed as to reduce the span while leaving the passages as unobstructed as possible.

It might also be claimed that concrete preparation calls for the employment of skilled labor, and that entirely satisfactory principles of design have not yet been finally determined.

Reinforced-concrete collars and props, however, in my opinion, can replace wooden construction fully and

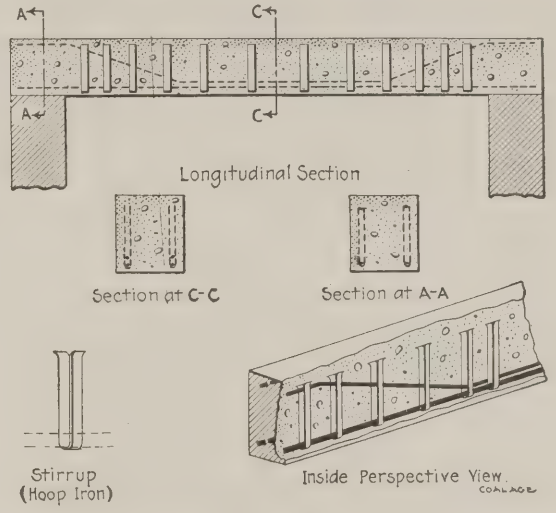

Fig. 2. Collars Are Reinforced Like Beams in Building Construction

satisfactorily, and with a systematic handling of the problem, at a considerably decreased cost from that of steel timbers. The extra amount of space necessary for erection over that required for steel is so small as to merit little consideration, since the excavation in roof, floor or side of the gangway would be little, if any greater.

Proper design for reinforced concrete used in mine timbering should be based on correct principles of engineering. Props could be planned according to the principles of columns used in the erection of buildings, as shown in Fig. 1, consisting of rods embedded in the concrete near the periphery. These are connected by means of ties, or flats, hoop iron or wire. Thus the radius of gyration is increased and the rods take care of the tensile stresses which occur from eccentric loading or from deflection of columns. The horizontal ties prevent the buckling of the rods and increase the strength of the concrete. They form a hooped column.

Local Conditions Determine Size of Members

The size and dimensions of these props or columns must be determined by the nature of the roof of the mine they have to support and on the height of the slope or entry wherein they will be used. Above ground it is possible to calculate the loading and the stresses involved with mathematical correctness, but underground there seem to be no well defined rules by which for example the

strength of square timber sets or props may be calculated.

Experience governs the use of wooden mine timbers in such conditions, and it is an easy matter for the engineer to design reinforced-concrete columns or props of equivalent strength so that there may be absolutely no waste of material. Where the strata is horizontal or approximately so, the loads are applied normal to the collar of the gangway support with a practically uniform distribution and produce therein bending moments with compressive stresses in the legs. The minimum amount of material is employed when the collar is exactly proportioned to the bending stresses encountered and each leg to the half load of the collar. Where the dip of the strata is great or where the ground is swelling, legs and collars may be called upon to take both bending and compressive stresses at the same time, and allowance must be made in the design for this joint action.

Regarding the construction of these reinforced-concrete members, inasmuch as suitable sand and gravel can be found in almost any locality, it would only be necessary to ship to the mine the steel and cement. The props and collars could be made in the quantities desired on the surface in close proximity to the mine.

The method of procedure followed would be along the

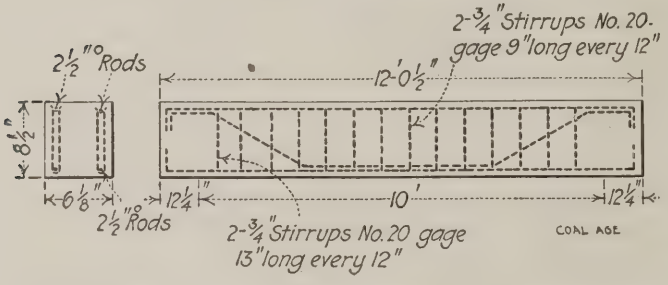

FIG. 3. DESIGN OF A BEAM TESTED TO DESTRUCTION

lines of that pursued in the manufacture of concrete telegraph poles, and the form work would be similar in construction. The lumber used for forms should be of either 1-, 1½- or 2-in. boards, securely braced by 3x3- or 4x4-in. braces, and bolted in order to prevent bulging. The greatest economy is secured by constructing the forms so that they can be used over and over again. Economy can also be gained by fastening form work together with the minimum amount of nailing.

After a number of props have been poured, they should be left to thoroughly set before removal from the forms, after which they may be transported to the desired location in the mine.

As shown in Fig. 2, the collars might be formed, similar to beams in building construction, the concrete being relied upon to resist the compressive stresses in the upper part of the beam, while the steel rods resist tension in the lower portion. These rods, however, should be of two kinds—straight and bent. The bent rods, besides taking their proportions of the direct tension and of the shear, receive any tensile stresses in the upper portion due to a negative moment over the support.

THE TEST OF A BEAM

Regarding the strength of these collars or beams, and the small quantity of steel employed in their construction, Fig. 3 shows the design of a beam made in the open air and not wetted after pouring. The forms were removed just before the tests were made at the end of 60 days. The beam remained in the open air during that time and was not moved until tested.

The following is a result of this test: Length of beam over-all 12 ft. ½ in., clear space 10 ft., breadth 6⅛ in., depth over-all 8½ in., depth to center of steel 7½ in., weight of beam 614 lb., mixture 1:2:4, compression strength, 60 days, 1747 lb. per sq.in.

Area of steel in tension.....	1.60% of cross-section of beam
Area of steel in compression..	0.80% of cross-section of beam
Total	2.40% of cross-section of beam

Load, Lb.	Deflection, In.	Remarks
1350	1/16	
2350	1/8	
3350	3/16	
4350	1/4	
5350	5/16	
6350	3/8	Faint hair cracks on either side of center, very faint
7350	1/2	
8350	13/32	
8650	7/16	Failure by concrete buckling, at top in center

The relative proportions of strength of reinforced concrete, steel and timber are based on the ordinary method of calculation, as shown in Figs. 4, 5 and 6, and the use of their equivalents produces much stronger and stiffer mine sets than the comparison would seem to indicate. Stiffness is as important as strength, and the spacing should be such as to compel the different sets to act together as a unit under any sudden stress or shock. Light designs with close spacing will therefore be preferable to heavy ones with wide spacing, the roof itself serving as a beam to distribute the load over two or more sets, whereas on wide spacing there is more danger of the roof falling in between the sets. The closer spacing also permits of much lighter lagging.

The prevention of economic losses in reinforced concrete requires the avoidance of waste in fabrication and simplicity in framing. The three-piece wooden timber set is simplicity itself; all that is necessary in erection is to cut the material to length, hew out notches in the collar, and put the three pieces in place. The reinforced concrete sets may also possess the same simplicity which enters largely into the cost of the structure.

The simplicity in construction is shown in the fact that the framing material may be bought at the mill, and the fabrication done by the company's own workmen on the ground. Conditions met with in mining operations may, however, require different arrangements, and the design must be made to suit the circumstances.

THE COSTS VARY WIDELY

Regarding the costs: Conditions in the mine as to sizes of timbers used, the nearness to a supply and the cost of lumber vary widely, and an infinite number of comparisons as to the relative costs of reinforced concrete, steel and wood could be instituted, results of which might not be of exact value. Under the present market conditions, the cost of steel in Pennsylvania is nearly three times the cost of wood used in the square timber sets, and the cost of reinforced concrete may be taken at about one and one-third times the cost of wood. In the first cost of the installation, therefore the advantage will lie with wood.

Where, however, a gangway has to be maintained over a number of years and the workings are in any way permanent, consideration should be given to the capitalized value of the material as compared with the first cost of the installation; and reinforced concrete will be found economical in most cases on the basis of ultimate cost by reason of its long life and endurance.

Taking as a basis of estimate the present price of structural steel at $1.405 per 100 lb. f.o.b. cars Pittsburgh, with the usual extras for workmanship, etc., a comparison of the relative costs of the form of gangway supports shown in Figs. 4, 5 and 6, is as follows:

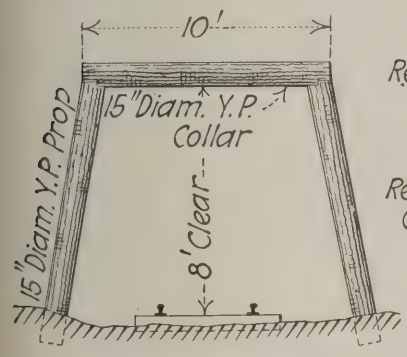
The cost of the timber sets, as shown in Fig. 4, was $7.50, erected. The cost of the steel sets, as shown in Fig. 6, would be $22, erected. If painted, the cost would be about $2 per ton additional. The cost of the reinforced-concrete set would be $10, erected.

Reckoning 6 per cent. compound interest, on the low assumption of 15 years life, the steel set at the end of this period will represent an investment of $52.72, and the reinforced concrete set $23.97. During the same length of time, based on past experience and on the present cost of timber, six wooden sets would be required at a capitalized value of about $100.

On this basis, the saving on the steel timbers can be set down as $47.28 per set, which means a saving per year of $3.15; on the reinforced concrete, the saving per set is $76.03, which amounts to a yearly saving of $5.07 over lumber, and over steel of $1.92 per year per set.

A reinforced-concrete design is shown in Fig. 7, and the above cost is figured as follows:

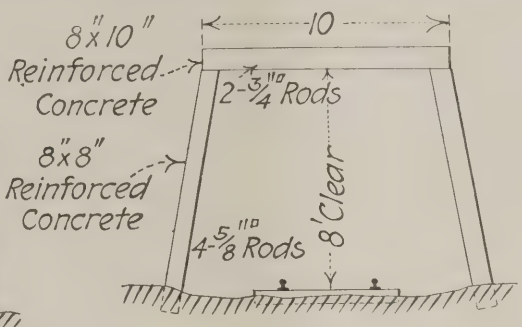
Steel rods, including stirrups, labor and material....	$2.25
Aggregates, sand, cement and stone, hauling, mixing concrete and placing, including foreman's wages...	3.28
*Forms, carpenter work, labor and material (assume forms used three times, equals one-third of $6.25, equals)	2.25
	$7.78
Transporting to mine and erecting (30% of $7.78)....	2.22
Total	$10.00



*This item includes removal and resetting of forms.

Regarding the handling, the following is a comparison of the weights per set: Timber 2200 lb., steel 650 lb., reinforced concrete 1800 lb. From these figures it will be seen that the advantage as regards weight lies with steel, but this handling would only figure in the cost of transportation from the surface in proximity to the drift, slope, or shaft mouth to the destination in the mine, and would not in any way, enter into freight charges, the transportation costs on the plain concrete material being considerably less than on the steel set. It will also be seen that concrete compares favorably in weight with lumber.

Noncombustible material has already demonstrated its usefulness in mines where explosions and fires have occurred. Reinforced concrete cannot support combustion, and the blowing down of a few sets by explosive action cannot occasion the caving in, and the heavy expense which comes as a result of the burning out of wooden timbers. Another item in favor of reinforced concrete is the possibility of its re-use. It can be taken out and reused many times, and its durability and economy due to its long life are large factors in the prevention of economic waste.



The assumptions above made in discussing relative costs of mine timber sets are believed to be extremely conservative, for the reason, first that steel mine timbers exposed to temperatures and moisture conditions existing in mines have been in use in this country without deterioration since 1897; and second, because English and Continental practice has given us records extending over a much longer period of time. The average life of steel props in Warwickshire, England, for instance, varies from 10 to 13 years as compared with three months for timber.

It may be reasonably assumed therefore, that reinforced-concrete sets will last as long as required in any one mine, however large the property and however long it is necessary to maintain the gangway or shaft. Furthermore, in three-piece gangway supports, as indicated in Fig. 5, complete fireproof protection is obtained.

Wildcat Financing in the Penn. Anthracite Regions

By A. T. Shurick

SYNOPSIS—Description of what appears to be a record-breaking coup in fraudulent mining enterprises. The scheme was greatly facilitated by the complicated geology, characteristic of the Pennsylvania anthracite fields, but had the investors taken the trouble to consult local engineers they would have been promptly informed as to the true status of the situation.

When Sheriff Heartneady, of Carbon County, Pennsylvania, attached the property of the Bloomingdale Valley Coal Co., on May 13, the curtain was rung up on the last act of the largest coal-mining swindle in the history of the United States. The scene of the play was not inappropriately laid on the very rim of one of the richest anthracite-bearing sections in the country and the cast includes one Ernest Fink, fluent and persuasive promoter and gullible investors, mostly from remote sections of the West.

Sections of the Coal Measures at and Adjacent to the Operations of the Bloomingdale Co.

The Promotion

It seems that Fink and his associates from New York acquired control of certain supposedly coal-bearing property contiguous to the operations of the Lehigh Coal & Navigation Co. in the Panther Creek Valley. Apparently two companies were formed to develop the properties, the funds to be acquired by bond issues. The first of these concerns, the Bloomingdale Valley Coal Co., put out an issue of two million dollars, the Elizabeth Trust Co. of New Jersey acting as trustee under the mortgage. The second section of the bond issue was made by the Eastern Pennsylvania Coal Co., of New York, with the Union Trust Co., also of New York, as the trustee under the mortgage. By trading upon the close proximity of their property to that of the Lehigh Coal & Navigation Co., together with the prestige and high financial standing of the latter concern, it is believed that practically the whole of both these bond issues were successfully placed.

Although it was generally known in the local mining circles that the properties in question were almost, if not completely, barren of coal, the unusual geology of the district was peculiarly advantageous to the purposes of the promoters. It is, therefore, not so surprising that presumably conservative investors were inveigled into the proposition.

For an obviously fraudulent enterprise, the anthracite industry has never before been the scene of one of such magnitude, and it is probably the largest in the history of the coal industry of this country. The previous most important operation of this kind in the hard-coal regions was that of the Black Diamond Co., which involved one million dollars. This concern acquired a small odd acreage lying between the Reading Co. on one side and the Lehigh Valley on the other. Announcing its intention of leasing the adjoining portions of land, sinking operations were started and a comparatively elaborate breaker constructed. Perhaps the most remarkable feature of this fiasco was its unusual longevity, operations being conducted more or less persistently for some five years. Little coal was found, and this, in addition to the limited acreage, brought the inevitable financial crash, and the entire holdings of the company were ultimately taken over by the Reading Co. for about $30,000.

The Inverted Dip

The Bloomingdale Valley Coal Co. acquired approximately one thousand acres of land, lying about two miles southwest of Lansford, in the vicinity of the Lehigh Coal

& Navigation Co.'s tunnel No. 11.* The two detailed sections in the accompanying figures show the geology of the district in this immediate vicinity. As will be observed, the geology is rather unusual in that the measures have been turned completely past the vertical, in such a manner that the outcrop is an inverted dip. To the casual observer, not familiar with the idiosyncrasies of the anthracite measures, there would be absolutely nothing to indicate that the coal outcropped on a reverse dip.

Apparently the promoters of the enterprise seized upon this condition to establish the claim that the seam dipped directly into their property. There is little or no excuse for a competent engineer to have been misled by these assertions. Even were his field observations of too cursory a nature to determine the real conditions, there are sufficient published data on this district to have at least made him suspicious of the true situation. In fact, had the investors consulted any of the local engineers, they would have been informed of the true condition of affairs

About the only actual development work done by the Bloomingdale company was the driving of the 240-ft. tunnel crosscutting the measures, apparently with the intention of tapping the Lykens Valley vein. A cross-section of the measures taken on the center line of this tunnel is shown in the accompanying illustration on the right. The exact location of the Lykens Valley vein at this point is more or less a matter of conjecture, but, according to other well established sections in this immediate vicinity, it certainly cannot vary materially from the location here shown.

Bloomingdale Property Barren

It will be observed in this section that it is highly doubtful if the Lykens Valley seam crosses the line into the Bloomingdale Co.'s property at all, and even though it should, it certainly will not be there in sufficient quantity to justify developing. It should also be remembered that the Lykens Valley marks the very bottom of the coal-bearing measures in this vicinity, which forms the conclusive proof that the Bloomingdale company's property is practically barren of coal. In fact, it might be remarked in general that no coal deposits of commercial importance have ever been found to the south of the Sharp Mountains, which form the crown of the sections in the accompanying drawings.

The section on the left is taken through the No. 11 Tunnel of the Lehigh Coal & Navigation Co., and is based on actual developments and surveys. It may, therefore, be assumed as a true exhibition of existing conditions. The section lies 1400 ft. to the east of the other shown at the right, and is at least typical of the conditions in this latter section.

While the No. 11 Tunnel was not driven out to the Lykens Valley vein itself, a horizontal drill hole was driven through to test the coal. This showed only 2 ft. 6 in. of coal, 6 in. of which was coal and slate, and the 2 ft. bone and slate. The shaft shown in the section also cut the Lykens Valley vein, which showed a thickness of only 3 ft., 1 ft. 6 in. of which was shelly, dirty coal, such as would produce rice and barley only, and the balance of 1 ft. 6 in. was a fair coal only.

It is thus evident from these last sections that even had the Bloomingdale company sufficient of the Lykens Valley vein to justify operations, the grade of the coal was such that it could not have been commercially mined in any event.

*For a detailed map of this district, see "Coal Age," Vol. 3, p. 724.

Notes on Surveying Methods in the Anthracite Regions

By Thomas Quinn†

SYNOPSIS—A brief sketch of the engineering methods of the Lehigh Valley Coal Co. Anthracite surveying methods vary considerably from those of the bituminous engineers and the suggestions offered herewith will be of interest to the soft-coal men.

As the methods used in the mining of anthracite coal differ from those in bituminous, so also do the methods used in surveying differ in the respective fields. Practices common in one field could not be used in the other. Where the veins are horizontal, entries and rooms should and are in most places driven on line while at other times where the coal occurs in pitching veins this is an impossibility. As local conditions govern the methods of mining, so also do they govern the system of surveying. The methods described herewith are those used by the Lehigh Valley Coal Co.

All survey work is, of course, based on the true meridian and the continuous vernier system of azimuth readings is used, south being taken as 0° 00′, west, north and east 90°, 180° and 270° respectively.

Field Operations

Stations are numbered continuously, each new station receiving the next higher number, regardless of its position in the mine. A small circle is painted around the spad and the station number is painted in a conspicuous place near-by, white lead being used for this purpose. All stations are carried in the roof except on rare oc-

†406 W. Poplar St., Harrisburg, Ill.

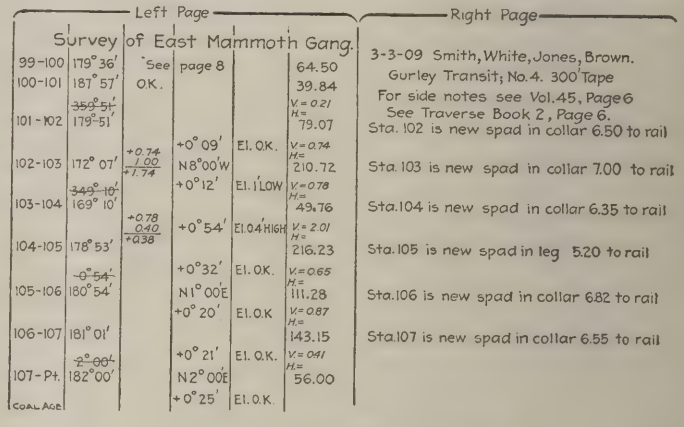
casions when conditions will not permit. A 300-ft. steel tape, graduated to every foot, is used, tenths and hundredths being obtained by the aid of a pocket tape.

In beginning a survey the azimuth of the stations started from is always checked by setting up at the next to last station. Should a different azimuth be found than recorded, the survey is followed back until stations are found whose azimuth corresponds with the notes. As a great many stations are set in timbers, it is not uncommon to find some that have been moved by the gradual settling of the roof.

The vertical angle is read on every sight and the elevation of the sight, above or below the height of instrument, is noted. The compass is read frequently as a check on the azimuth and all gangways and every fifth breast

Methods of Recording Breast Notes and Side Notes

are surveyed, the intermediate breasts being measured. A clinometer is used to get the dip of the vein, which is taken at each station; this with the section of the vein at the face is recorded in the sidenotes, as shown in the accompanying illustration.



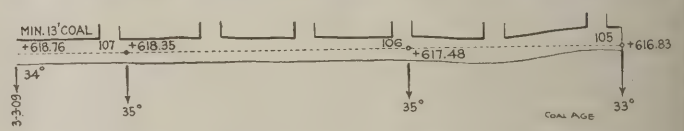
Horizontal distances and vertical heights are computed in the office and recorded in the transit notes in red ink, shown in the accompanying illustration in slanting letters. These data are then copied in the traverse book and the elevation and coördinate value of each station computed. Gurden's traverse tables are used in the latter computations and all work is carefully checked.

Levels are run with the transit when it is desirous to drive a gangway or tunnel on a special grade.

Mapping

A high-grade mounted paper is used for the maps and all surveys are plotted on a scale of 100 ft. to the inch. Coördinate lines are drawn dividing the map into 1000-ft. squares. As each station is plotted from its coördinate value, and checked with the protractor, the possibilities of errors in calculating and plotting are practically eliminated.

As many as eight overlying veins are worked at some mines and since a complete map showing all the veins would in many cases be very confusing, separate ones are made of each. Water colors are used on all maps and tracings, a different color being adopted for each vein. Rock work and buildings are outlined and cross hatched in black; on tracings this is done on the back



Transit Survey Notes

of the parchment. In places where the pillars have been removed the date is marked and the pillars cross hatched.

Tracings of each vein are sent to the mining engineer, state mine inspector and mine manager. The maps are all brought up to date every three months, this being the interval of time between postings. The state mine inspector's tracings are extended every six months in compliance with the state law.

The workings of the different veins may be compared by fitting one tracing over the other, which is done by making the corresponding coördinates on each tracing coincide. A separate map is made of the surface features and anything likely to be affected by the underground

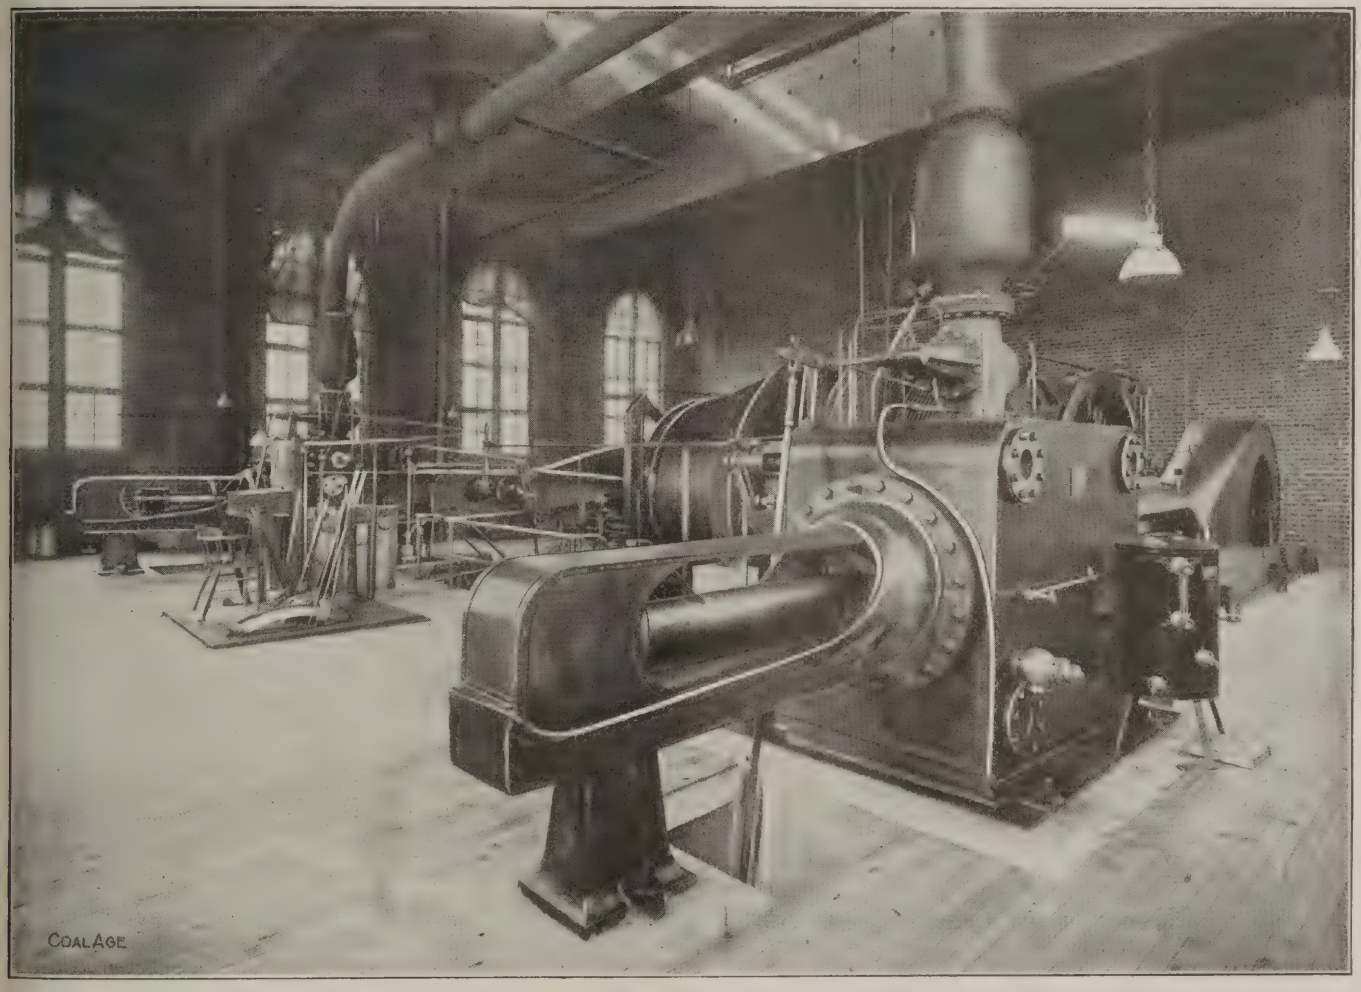
Side Notes in Adjoining Illustration, Plotted

workings is plotted on the mine map. Blueprints are made from the tracings for the use of the survey parties and company officials.

When any work is to be stopped or if it is desired to give instructions of any kind to the mine foreman, he must be notified by letter or the orders are not binding. After the letter is written it is copied in a special book kept for reference. A slip is sent with the letter to the foreman, who fills it out, noting the date of receipt, and it is then returned to the engineering department and filed. By following this system the responsibility for mistakes made cannot be shifted from the engineering department to the mine foreman or *vice versa*.

When a breast is finished the foreman fills out a slip

showing its location, number, when it was finished and total yardage paid on it. This is forwarded to the engineering department and a chainman is sent to check the measurement. His notes are kept in a special book from which the yardage is checked and the breasts plotted. If the vein has a regular pitch the dip is taken every 50 ft., this being the length of the chain used in measuring. Any irregularities in the vein are located and noted, and the measurements are reduced to horizontal distances and recorded as shown in the accompanying illustration. As all yardage on gangways must be measured from survey stations it is easy to check this work in the office.



Where the surface is removed from the coal the work is generally done by contract. As the contract calls for a certain sum to be paid per cubic yard, it is the work of the engineering department to estimate the amount of material taken out. Before a stripping is started, section lines are run from a base line outside of the land to be worked. These sections are generally 20 ft. apart, although this is governed entirely by the topography of the surface. Each month the portion of these sections that has been worked are rerun and plotted As the distance between the sections is known it is a simple matter to calculate the amount of surface removed. All scalings and computations are carefully computed, the planimeter being used as an additional check on the area of the cut at each section. As the total amount of material removed to date is calculated each month any previous errors in computations will be picked up

[It is hoped shortly to publish a detailed article on engineering practice in connection with stripping operations.—Ed.]

An Efficient Steam Hoisting Engine

Few steam hoisting engines produced within the past few years exceed in interest that built by the Vulcan Iron Works and installed at the Loomis colliery of the Delaware, Lackawana & Western R.R. Co. This hoist is driven by 34x48-in., first-motion, link-reversing, heavy-duty, Corliss type shaft hoisting engines.

The unit is provided with two conical drums tapering from 14 ft. to 10 ft. in diameter, each of which will coil 1300 ft. of 1½-in. rope in one layer. One drum is tight upon the shaft, while the other is loose to facilitate hoisting from different levels. The loose drum is made fast to the shaft by means of a clutch which grips a spider or clutch wheel.

The Engine as at Present Installed. Note the 1-In. Steam Supply Line

This clutch is so arranged that it cannot be released until the brake is set up hard on the drum. The engines are provided with a steam reversing gear and steam brakes, with auxiliary hand-operated brakes. The brakes themselves are of the post type with a parallel motion.

Double throttles are employed, the lower ones, or those just above the steam chests, being used under ordinary conditions, while the upper or central throttle may be employed in case of emergency.

As has been stated above, the valve-gear is of the Corliss type. This is built without a governor, the trip motion being connected with the throttle lever. The engines are brought up to speed in the course of the first two or three revolutions. The throttle lever is then thrown over to the limit of its travel, and the Corliss gear which has been previously adjusted to the load being handled regulates the cutoff and continues in operation until steam is shut off at the end of the hoist.

Some idea of the quality of material and workmanship put into this machine may be judged from the fact that the reverse links are case-hardened, while the cranks and crossheads are of steel castings. The machine is also provided with through piston rods and tail crossheads, as may be seen in the accompanying photograph.

The engine is constructed to hoist 100 one-car trips per hour. The depth of the shaft is 1050 ft., the weight of the cage is 13,000 lb., that of the empty car, 3000 lb. and the coal contained therein 8000 lb.

Two overwind preventers or governors are employed, one being placed upon each drum. Two Mason regulating valves are also placed upon the cylinders. These are employed in lowering materials. Should the throttle refuse to work, the steam pressure could be equalized by means of these valves and the cage stopped. They may also be used to govern the speed of the cage when coming into the foot of the shaft.

The building in which this engine is housed is of brick with a concrete roof, and measures approximately 48x50 ft. inside. An idea of the economy of the Corliss valve-gear, as applied to a hoisting engine, may be obtained from the fact that, at the present time, the steam piping from the boiler house to the hoisting plant is not complete, and the engine is now operated upon a 4-in. temporary line, the size of the steam throttles above the cylinders being 8 in. With this 4-in. temporary steam line, loaded cars are hoisted at the rate of one per minute.

Industrial Insurance by the Lehigh Coal & Navigation Co.

By A. T. Shurick

The solution of a method by which protection will be afforded equally to employers and employees in the event of industrial accidents is coming gradually, but steadily, into greater prominence. In fact, some of the most powerful corporations in the United States have taken the lead in this direction, as for instance, the Pennsylvania Railroad, which has materially broadened the scope of their insurance and beneficial fund propaganda in recent years, and the establishment of a like arrangement by the American Telephone & Telegraph Co. No doubt the disillusioned cynic will ascribe the adoption of these altruistic policies to the drastic anti-trust legislation being enacted by both the state and Federal governments, and the fact that many of these larger corporations are fighting for their very existence.

But, whatever the reason, all enlightened students of the subject are viewing the changed conditions with deep satisfaction. That the old system of endless litigation in the case of industrial accidents has proved not only ineffective in its results but enormously extravagant as well, is generally agreed by all. The baleful solicitor fo retainers in industrial accidents is too well known to re quire comment; much unnecessary litigation results fro his activities, throwing additional burdens upon the tax payers while it is a fact that the plaintiff receives bu a small proportion of the ultimate award for damage

While considerable publicity has been given to the re cent developments along this line, particularly as regard some of the large outside corporations already mentioned it is probably not generally known that equally altruisti policies have been in effect with some of the large coa corporations for more than a quarter of a century; a least such is the case with the Lehigh Coal & Navigatio Co., one of the largest of the hard-coal companies ope ating in eastern Pennsylvania. This concern has a bene ficial fund, mutually supported by the employers an employees, which has been in operation since 1884.

The L. C. & N. Co.'s Method

During this interval benefits aggregating $846,709.3 have been paid, while the administrating expenses hav amounted to only $29,168.02. It is particularly interest ing in this connection to note the small ratio of the ad ministrating expenditure to the benefits derived by th employees, these expenditures amounting to only abou 3½ per cent. Had these cases been carried into th courts, it is probable that this 3½ per cent. would repre sent more nearly the actual damages which the plainti ultimately received.

The fund is supported about equally by the compan and the employees, the former having contributed $428 813.93, and the latter $430,290.72 since the inception o the fund. The maximum cash balance ever accumulate occurred in 1893, and amounted to $46,935.72. In mor recent years the fund has apparently fallen into evil way a deficit ranging from $4000 to $23,000, showing durin the period from 1902 to 1907, and again during 191 1912 and 1913. However, this deficit which last yea amounted to only about $6000 is apparently more tha compensated for by certain securities, donated by th company in 1900, amounting to $25,000.

The rules of the fund provide that the Lehigh Coal & Navigation Co. donate eight mills per ton of commercia coal produced, while inside men contribute 0.8 of on per cent. of their earnings, and the outside men 0.4 o one per cent. provided, however, that no workman sha contribute more than $1 per month.

In event of injury resulting in inability to work fo one week or longer, the workman receives benefit amounting to one-half his customary wages, althoug such payments are limited to six months except under ex traordinary conditions. In case of a fatal accident, $ is contributed toward funeral expenses, and a sum equa to one-half of the victim's wages for 18 months from th date of the accident will be paid where there are near re atives. It is also provided that in no case shall the bene fits paid exceed $50 per month.

Adequate provisions are of course made providing fo the presentation of certificates from reputable medica men, as to the extent of the injury. The fund is admin istered by a board of trustees, composed of responsibl business men, and company officials, all of whom are ap pointed by the president of the company. Participatio in the fund on part of employees is not compulsory.

Economic Piping

The coal operator, like many another business man and manufacturer, is constantly striving to increase his output and diminish its expenses. In no department of mine operation is this perhaps more forcibly manifest than in the purchase of material and equipment. Here, as elsewhere, however, it is sometimes difficult to break away from precedent and the custom of past years.

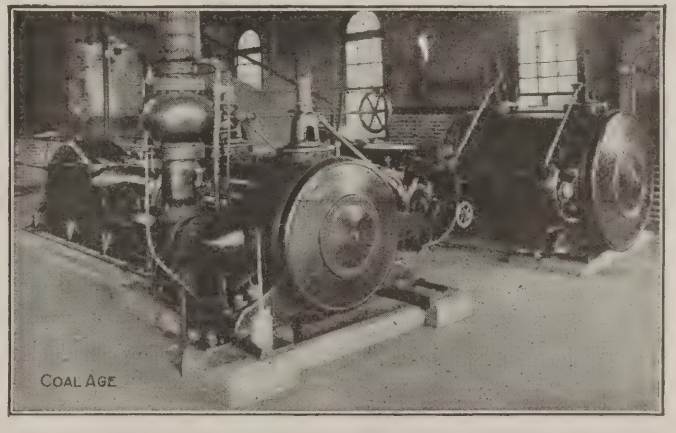
For the conveyance of fluids about the mine, particularly the mine water itself, ordinary iron or steel pipes deteriorate at a high rate of speed, due to the acidity of the water. Even if not attacked from the inside, if buried in soil, ashes, or mine refuse, ordinary piping frequently pits and decays from without, particularly if it is made the ground return of an electric system. Piping for these purposes must, therefore, either be of a heavy and comparatively inert material, such as cast iron, a nonconducting material, such as wood, or must be protected by an inert covering, such as coal tar.

The Abendroth & Root Co., 45 Broadway, New York City, have for some time furnished spiral riveted pipe to various collieries throughout the coal regions for the conveyance of water, air and exhaust steam. This pipe is constructed of a sheet which is wound spiral-

LIVE- AND EXHAUST-STEAM PIPES OF AN ANTHRACITE COLLIERY

ly, each separate turn lapping its neighbor by about 1 in., this joint being single riveted upon a comparatively short pitch. It will be readily seen that this gives an extremely strong construction for the weight of the metal employed, since the spiral seam acts precisely as does the metal wrapping of an armored hose, strengthening and stiffening the body of the pipe.

After this pipe is made up it is immersed in a bath of special asphalt coating and remains there until this material permeates the seams and pores of the metal, protecting the pipe both inside and out. This preservative forms a thick layer which will not crack or flake off and is capable of resisting hard handling. For conveying exhaust steam or hot liquids when the temperature exceeds 105° F., or for high-pressure air service, the pipe may be galvanized by immersion in pure molten zinc. This pipe is furnished in lengths of from 20 to 30 feet and this combined with the simplicity of its special connection, permits of considerable saving in installation expense, as skilled labor is not required to lay it satisfactorily.



Many mine operators are strongly in favor of using spiral riveted pipe for removing foul air from the workings in place of the old-style wooden-box arrangement. Although the first cost of this pipe is slightly higher than the wood sluices, there is considerable saving in the labor of installing riveted pipe, and, in addition, the upkeep expense of wooden conduits which require continuous repairing is eliminated.

The accompanying illustration shows a plant in the anthracite region using spiral riveted pipe to convey the exhaust from the fan engine to the feed-water heaters in the boiler plant. This pipe is the lower one seen in the photograph.

Pipe of this kind either galvanized or painted is extensively used throughout the anthracite region for the conveyance of exhaust steam, since for a given strength it is somewhat lighter in weight and consequently lower in price than ordinary piping.

A New Type of Breaker Engine

When the Kingston Coal Co. recently found itself in need of a new breaker engine, after careful consideration the Lentz engine was finally decided upon. The order for this machine was placed through the Erie City Iron

THE LENTZ ENGINE, SHOWING A PORTION OF THE VALVE-GEAR

Works, this purchase giving that company the American rights for the engine.

The size of the engine is 19½x32½x21 in.; the machine is cross compound and provided with poppet valves. The original patents for this type of engine were issued to Hugo Lentz, the first machine being built in 1899. Since that time over 4,000,000 hp. of this type of prime mover have been installed in Germany alone.

The engine is entirely inclosed and lubricated by the splash system. No elastic or metallic packing is employed, the valve stems being kept steam-tight by a system of labyrinth water-seal packing.

The engine in question develops 360 i.hp., and the balancing is so nearly perfect that it is possible to balance a nickel on edge upon any part of the engine casing. It is the first machine of this type ever installed in the anthracite region.

The flame in a boiler should not lap the tubes because flame only exists where there is incomplete combustion and the temperature of the gases should not be reduced by cooling surfaces till the gas is completely burned.

Electricity in Coal Mining

By David R. Shearer*

SYNOPSIS—This is the fourth article of the series on this subject and emphasizes the importance of care and forethought in preliminary work before actual power-plant construction is undertaken.

When a corporation or individual decides to open a mining operation it is taken for granted that the work will be done with the intent to make the proposition a paying investment. With this end in view careful tests are usually made and quite an amount of prospective work is done prior to regular construction. As a usual thing most of this preliminary work is done for the purpose of locating the mine shafts or drifts in the most convenient place relative to the seam of coal. The money thus spent is usually considered as an investment, and such it is, for the future economy of the mine depends to a great extent upon the location of the works relative to the coal bed.

In a similar manner, money spent in locating and designing a layout of machinery and mechanical mine accessories is usually well invested, for should some error be made by which an uneconomical operation or handling of material becomes necessary, a monetary drain throughout the entire life of the plant is entailed, unless an amount should be appropriated to make the necessary changes in the existing equipment. Thus, a dollar spent in careful design may mean many times that amount in annual savings.

Considering the matter from a business standpoint, no firm can afford to build permanently without carefully mapping out the whole plan and so designing the details entering into its construction that a maximum operating economy is assured. This statement, although pertinent to the general mine layout, applies particularly to the necessary electrical appliances, since faulty design here means either expensive changes or a continual operating and upkeep expense.

The first point to be decided upon with regard to the power plant is the most economical available source of energy. This, for a mine operation under ordinary circumstances, will be either water power or steam. If it is found possible to make an economical development of water power within a reasonable distance from the operation it will be well worth while to make a thorough investigation. In some instances if central-station power be available, it may be a matter of economy to purchase electric current and install a small substation in place of a power plant.

Frequently a coal producer overlooks the fact that he can sell the fuel he burns to supply his own power, and ship it at a profit, feeling, as he does, that his fuel costs are not worth considering. Instead of thus assuming certain cost relations for parts of the plant, the entire proposed design should be rigidly investigated and questioned as to future economy in the general operating scheme.

An Engineer Will Usually Be Required

This work will usually fall to the lot of some engineer and to it should be given the most painstaking attention. Few mine operators or owners have the technical training or engineering experience to work out logically the many details of a proposed installation. The field of the operator is to produce coal at the opening of the mine at a minimum cost with the equipment supplied. The province of the engineer, on the other hand, is to design the power plant and supervise the erection and installation of such machinery as may be necessary or advisable in order to secure a maximum production at a minimum operating expense.

We hear much of late regarding motion study in industrial enterprise, and though this method of securing economical production is often censured, there is no doubt that opportunity for realizing great gains in speed and economy by close attention to methods in handling the output exists in coal-mining work. The several parts forming the working equipment should operate as a unit each element supplemental to the others, and working with maximum economy under given conditions.

As the writer has previously noted, a mine has individuality, practically no two being alike as to location, general contour or natural resources. It is, therefore, of paramount importance that the details be carefully planned and every feature bearing upon the future operation of the development be carefully considered before the actual work of erecting the plant begins.

The power plant is an extremely important factor in the general layout, as from it is drawn electricity for haulage, for lights, and often for fans, pumps, mining machines, and in fact for all power necessary in or about the mine. Again the cost of operation of the electrical equipment is continuous month by month. It may, of course, vary considerably during periods of greater or lesser activity, but means just so much toward gross running expenses. We find frequently that power-plant operation costs bear a greater proportion to the entire operative expenses than any other item, labor excepted.

A mine owner or operator preparing to open a new property and invest his money as well as that of other stockholders without having a well defined plan and the assistance of competent engineers, is laying himself and his company open to a great danger—that of buying and installing unnecessary, inadequate or unsuitable machinery. Frequently, however, the danger is in another direction, that of securing cheap or shoddy equipment. At either extreme may be found trouble and expensive operation, not only from the operating costs themselves but from upkeep and repair expenses.

Too often a manager or superintendent is induced to purchase certain machines by some smooth-tongued salesman, who, of course, knows his own line better than any other, and naturally believes it to be the best, regardless of conditions to be met or previous operating experiences with the same machine. However, it is far better for the owner if the proper equipment can be determined upon in advance regardless of what the salesmen have to say concerning their various lines of accessories.

Another danger looms up in the way of the man seeking a cheap installation, that of taking advice from an

*Knoxville, Tenn.

untrained or a mine-operating engineer. There are many men in charge of mining power plants who are fully competent to do their work and can secure efficient operation from a suitably designed plant, but few of the number have had the diversified training along such lines as would enable them to adequately advise regarding a new installation, or the equipment of the plant with additional machinery made necessary by expansion. It is far preferable that an outside engineer, who by continually coming in contact with various conditions in different sections of the country becomes accustomed to reason logically and plan accurately, be called upon to design the original plans and superintend installation in all its details. The operation of an engine and generator is one thing; the wiring layout, switchboard design and line-loss calculations are other matters entirely.

The Kind of Prime Mover Is Important

The type of power to be used having been definitely decided upon, the next step to be determined is the particular kind of prime mover to be purchased, for upon this will be based the design of the remainder of the plant. If a waterwheel, shall it be a pelton, vertical, horizontal, or twin turbine, or some other type more suitable to that particular installation? If a steam-driven plant, what kind of engine shall be used, simple, corliss, compound or turbine? And what kind of boiler or boilers shall be employed, or which of the many makes of pumps and accessories? Shall the generator be a.c. or d.c., belted or direct-connected, high or low voltage? What switchboard equipment will be necessary for this particular plant? What accessories will add to economy or satisfactory operation?

All such questions come up and must be definitely settled. The failure to consider any one factor may detract from the economy of the complete plant, and it is upon the efficiency of production that we must depend for dividends. It is true that one may place almost any kind of layout in operation and may secure some sort of service from the equipment, but there might be other equipment from which it would be possible to secure a maximum efficiency, and it is that plant that should be installed.

First cost, though it looms large to a promoter, is not the final test of plant expense, but is merely a basis from which to start. A better method of calculating costs is to assume a certain useful life for the mine development, based on the report of mining engineers or those thoroughly acquainted with the territory and location of the coal seams, and install equipment which experience and careful calculation indicate to be the most economical over the assumed period of time as a whole. All the items of expense and of possible economy must be followed out to their conclusion and a design of the proposed plant should be drawn adapted to given conditions. If, after careful consideration, no weak points are found in the layout, it is taken for granted that the designs are suitable and the work may be commenced.

This is an age of specialization, and no man can expect to master the details of several branches of learning. Even were it poossible for him to do so, he could not gain experience in more than one pursuit at one time. Thus, the outside engineer fills a distinct and necessary place in the mining industry. It is the primary business of the mine owner to take the equipment as turned over to him and produce rapidly, economically and continually, but it falls to the engineer, electrical, mining, civil or mechanical, to carefully work out the multitudinous details to be accounted for and overcome the obstacles or mistakes that otherwise might be in evidence.

This is not written for the purpose of eulogizing the engineering profession, but to call attention to the fact that any mining power plant, or any other plant for that matter, requires for its design experience, knowledge, time and careful thought, if a maximum operating economy and a minimum upkeep expense are to be obtained.

D. A. Thomas at Home

The "Liverpool Journal of Commerce" under date of May 26 publishes the following interesting interview with the British coal baron, D. A. Thomas:

In regard to the enterprises of D. A. Thomas in the United States, very little of a definite nature can be stated. There is reason to believe, however, that the famous British "coal king" has substantially matured the basis of a remarkable organization for setting alive the exploitation of great coal-yielding areas on modern lines and under processes of administration which are the outcome of his personal experiences. This aspect of the projects of D. A. Thomas will probably lead in the course of a year or two to a complete revolution in the world's coal industry.

Transport Enterprises

On the subject of his journey D. A. Thomas accorded a special interview today to a representative of the "Journal of Commerce." Concerning the Canadian side of the matter he said:

"With regard to railway and other projects in Canada, my associates and myself have completed several important and definite arrangements. We have secured a franchise charter for the Pacific, Peace River and Athabasca Ry., and also for the Peace River Tramway & Navigating Co. The former will be capitalized to the extent of £3,200,000, with bonding privileges of £10,000 per mile. The latter concern will be capitalized at £200,000, with bonding privileges of £7000 per mile. We have organized and equipped half a dozen parties of engineers and others, who are about to proceed on a reconnaissance and track surveying in order to locate the coal lands, minerals, etc. This work will occupy them three or four months. Adequate financial provision has been made for the necessary work during the coming 12 months. These projects will ultimately cost large sums. I expect to be able to proceed with the Peace River Tramway next year. I may say that this project also provides for the construction of several shallow draft river and lake steamers. The railway will traverse a country lavishly endowed both agriculturally and minerally—millions of acres of land growing the finest wheat in the world, with large areas of coal lands and minerals and indications of various kinds of natural gas and oil

The Navy and Oil

"As oil is going to be one of the chief requisites of the navy, the discovery of oil in Canada will be highly important. It is possible, if not probable, that these projects will develop thousands of square miles and stimulate immigration. The significance of this will be so well understood in view of the fact that the government contemplate purchasing interests in the Persian Oil Syndicate. Of course, I do not know what supply will eventually be available, but the scientific investigations which have already been made show that the oilfield that we are about to tap will be undoubtedly the richest in the dominions of this empire."

Revolutionizing the World's Coal Industry

Mr. Thomas declined courteously, but firmly, to discuss any details concerning his projects in the United States. There is every reason to believe, however, that he has been consulted by enormous holders of colliery interests in the States to formulate a scheme by which the vast coal-yielding resources of that continent may be worked on economic lines such as prevail within the organization of the Cambrian Trust.

Mr. Thomas did not confirm or repudiate this suggestion when it was put to him. Information from reliable sources goes to indicate that during his visit he has received amalgamated offers to organize a dominant section of the United States coal areas and to put into force his masterly knowledge of the working conditions, and of export avenues. In a few years there is reason to believe that the crowning work of his life may possibly be, with the coöperation of American colliery owners, the establishment of a great United States coal combine which will, through the aegis of the Panama Canal, supply the Far East with the bulk of its coal. It is obvious that such a stupendous undertaking will revolutionize the coal industry of the world.

Since President Wilson has advocated the antitrust act, the formation of such a combine would appear to be a difficult proposition, but the importance which the United States attaches to Mr. Thomas' scheme has raised the consideraion of the important point as to the meaning of a trust.

We have reason to believe that the comprehensive combine which Mr. Thomas is invited to control will have as its cardinal feature the reduction of prices, and will, therefore, be claimed to be outside the spirit of the antitrust laws.

Mr. Thomas was reluctant to discuss this question, but we have good authority for believing that the United States Government has under consideration legislation which will permit of Mr. Thomas carrving through a project which will place the United States next to Great Britain as a coal supplying center, and will almost guarantee for it the trade of the Far East.

The West Virginia Coal Mining Institute

Special Correspondence

SYNOPSIS—The Institute met at Cumberland, Md., and discussed more fully than usual papers of more than usual merit. The question box was a source of much animated discussion. Owing, however, to Cumberland being at the edge of the West Virginia-Maryland field and a hard place to reach from the southern coal regions, the attendance was not as large as usual. The next meeting will be held in Huntingdon, W. Va.

The West Virginia Coal Mining Institute met in the city hall of Cumberland, Md., on the morning of June 2. An address of welcome by Major Thomas W. Koon, mayor of Cumberland, was followed by another on behalf of the chamber of commerce, delivered by Thomas Footer, its president. Responses were made by J. B. Hanford, general superintendent of the Elkins Coal & Coke Co., of Morgantown, W. Va., and W. E. Fohl, consulting engineer of Pittsburgh. Neil Robinson, the president, then followed with an address, in which he urged the members to read the technical press with assiduity, so as

The Cumberland City Hall Where the West Virginia Coal Mining Institute Met

to prepare themselves to meet all the developments of the industry.

A paper entitled "The Historical Side of the Georges Creek Coal Field" was then read by R. A. Walter, chief engineer of the Maryland division of the Consolidation Coal Co. The paper was discussed by Herman V. Hesse, general manager of the same division and W. P. Young, superintendent of inspections for the Consolidation Coal Co., residing at Somerset, Penn. The paper of Clarence Hall on "Explosives Used in Coal Mining," which appeared on the program, was not submitted and Mr. Hall was not present.

Animated Question-Box Session

In the afternoon, P. J. Brennan, superintendent of the Davis Coal & Coke Co., Thomas, W. Va., read a paper entitled "The Necessary Training for Mine Officials," and then the question box was opened. It resulted in a most animated controversy, in which John G. Smythe, chief engineer of the Consolidation Coal Co., took a leading part. W. E. Fohl, E. N. Zern, W. P. Young, E. B. Wilson and P. J. Brennan also made interesting remarks. The three main questions were:

1. Which is the safer mine—one that is fiery, so recognized and guarded by the use of safety lamps, permissible explosives, compressed air as a motive power, paid shot firers, effective methods of treating dust, rigid discipline, etc.—or a mine where gas is found occasionally at any part of the mine, or continuously at certain sections of the mine, and operated as a mine of lesser risk, preventive measures being used in proportion to the believed danger?
2. Should ventilation be based on a stated number of cubic feet per man and animal underground, as at present required by the mining laws, or should it in addition be based on the quantity of methane and carbon dioxide shown by analyses of return-air currents?
3. Which is the proper method of setting a post—the small or the large end up?

In the evening the moving pictures made in the mines of the U. S. Coal & Coke Co., at Gary, W. Va., were run off for the entertainment of the members. The film is a replica of that which has been so generally exhibited throughout the country, and is owned by the University of West Virginia, Morgantown, W. Va.

On the second day, a visit was made to the station where the Cumberland & Pennsylvania R.R. discharges the Georges Creek coal into the barges of the Canal Towage Co., plying between Cumberland and Georgetown, on the Chesapeake & Ohio Canal. The boats carry an average of 17 tons and are each hauled by 4 to 5 mules, taking about 9 days for the return trip. The boats are loaded from a trestle, the front end being first filled about half full; the rear end is then loaded and the front end is then backed so that the trimming load can be placed.

Second Day's Session

After this inspection the institute met again at the city hall and heard a paper read by George E. Sylvester, chief mine inspector of the State of Tennessee, followed by one on "What Shall Be Considered Maximum Recovery with Modern Methods of Mining Bituminous Coal?" by E. W. Hesse, assistant chief engineer, Fairmount division, Consolidation Coal Co. In the discussion which followed, W. E. Fohl explained that one of the real reasons why Ohio had an incomplete recovery was because the union insisted on a room not less than 25 ft. wide with a road passing up the middle. Such a condition, especially with any refuse in the coal to be stowed made recovery of the pillars impossible.

F. C. Benner, special secretary of the Industrial Department of the International Young Men's Christian Association Committee, then made a plea for the coöperation of the mine owners in his work.

The paper on "Sanitation and Simple Ways of Making It Effective," by Dr. Robert Douglas Roller, Jr., surgeon for the New River Collieries Co., Eccles, W. Va., was eminently practical and not a series of abstruse platitudes about the importance of prophylaxis. Doctor Roller said in the discussion that he had only found two cases of

hookworm in Eccles, and these two were in country people who did not work in the mines. He did not believe that the hookworm could germinate in the coal mines of America as long as they continue to be as shallow as they are today. In any event, the development would not be menacing for the larvæ would be hindered in their growth.

The president gave an interesting account of the sanitation he is effecting as receiver for the La Follette Coal, Iron & Ry. Co. Some of the houses of that company he found had a most unfavorable record for tuberculosis and every precaution to render them safe by fumigation and whitewashing within and without had been attempted and he felt confident that success had been attained. Water analyses should not only be taken during low water, when the inflow might be wholly from springs, but during rainy weather when the stream or spring is swelled by surface water.

The Most Recent Work on Explosions

In the afternoon, George S. Rice, chief mining engineer of the Bureau of Mines, described "Recent Experiments on Coal Dusts," in which he showed that while the vacuum after an explosion caused a return draft, a still more violent reversal of direction of violence arose from the culmination of pressure in the explosion at a point remote from its origin. When this maximum pressure was created, it was so much greater than preceeding pressures, that the air and solid objects were driven forcibly backward into the areas of lower pressure in the rear.

He also made some remarks on the disagreement between the results of the American and British bureaus relative to the action of anthracite dust. Mr. Rice's statement was carefully guarded, but it was evident that he believed that the variance in results arose from the difference in the anthracites here and abroad rather than in a variation in the methods of experimentation. The British authorities have declared that while inflammation proper is dependent on the volatility of the hydrocarbons in the coal dust, detonation of a carbonaceous dust is possible regardless of the presence of volatile constituents provided the powder is sufficiently free from inert material.

Mr. Rice introduced several drawings of concentrated Taffanel barriers, which were boxes of stone dust arranged to trip and be discharged by the revolution of a vane, which in turn is to be actuated by the explosive waves. All the dust is not discharged at once, the full violence of the explosion alone being able to dislodge the dust which remains.

The Best Stone Dust to Use

Mr. Rice advocates the use of limestone because it emits, on being heated, carbon dioxide, which stifles the flame. It is, he admits, heavier than shale dust, which fact militates against its use, and experiments have not as yet shown for it any appreciable superiority. However, shale dust often contains a large percentage of vegetal matter, and so is not entirely inert. The fact that limestone dust is already on the market and shale dust at the present time is not, makes the former the more desirable.

R. D. Hall was of the opinion that the heat of dissociation of shale and limestone dusts into clay and moisture, and lime and carbon dioxide, respectively, were far more important considerations than what was the end product. Shale dust contains, so to speak, "tabloid moisture," which, being driven out of combination, absorbs much heat in that action.

E. B. Wilson then read a paper on "The Adaptability of West Virginia Coal for Byproduct Coking," and A. D. Macfarlane, chief engineer of the La Follette Coal, Iron & Ry. Co. described "An Endless Rope System for an Inclined plane." These two papers were not much discussed, though it was remarked that the system of haulage described in the latter paper involved the leaving of cars on the plane at all times, during operation or idle periods, and that the rope had to be stopped whenever a trip was to be attached.

Neil Robinson, President W. Va. Coal Mining Institute.

No. 12, or the Old Borden Shaft, Consolidation Coal Co.

E. N. Zern, Secretary-Treasurer

The After-Dinner Speechmaking

In the evening a banquet was held at the Y. M. C. A. of the Baltimore & Ohio R.R. W. E. Fohl was toastmaster. Neil Robinson gave one of those carefully polished addresses for which he is well known. He was followed by A. Taylor Smith, a lawyer of Cumberland, and C. R. Jones, dean of engineering at the Morgantown University.

The latter compared the past with the present; the scholars of the past were secretive and moreover believed that knowledge should not be debased to practical ends, the men of the present believed in making public all that scientists discovered and valued all such knowledge for its practical bearings. The end of science was now not secrecy nor self-advancement, but social service.

R. D. Hall, associate editor of Coal Age, then followed with a regret that business conditions were making it

natural and even imperative that the operator and his employee should not live in the same towns. Living together, as in times when the difficulties of transit permitted no other course, assured the betterment of both, and gave to each a clearer realization of one another's nature and needs. He urged a consideration of this estrangement, which tended to break up the solidarity which should exist between capital and labor. To prevent absenteeism from having its natural effect in alienating capital from labor, and labor from capital, welfare work must be pursued with energy equal to that with which it is naturally prosecuted when employer and employee live side by side and know each other's natures and needs.

W. P. Young, superintendent of inspection of the Consolidation Coal Co., Somerset, Penn., spoke of his trip to Argentine and Brazil to convince the South Americans that the coal of the United States would really burn, in which, of course, he was quite successful. As his speech was a travelogue rather than a description of the coal business in those countries, there is no need to discuss it further.

The addresses so far given had been interesting yet a little prosy. It remained for the director of the Y. M. C. A., William C. Montignani, to liven up the spirits of the auditors with some excellent jokes and lively singing. In a half hour Mr. Montignani completely removed the solemnity from the occasion with his clever entertainment. The supper furnished was most creditable to the ladies who supplied it.

Visits to Surrounding Points of Interest

On Thursday the institute started, at 7 a.m., by street car, for Frostburg. Some of the members visited No. 1 and some No. 12 mine of the Consolidation Coal Co. The latter is the old Borden shaft. Some of the timber in these workings has been in place about 34 years, during 29 years of which it has been under water. Wherever it rose and receded in the shaft, the timber had rotted entirely away.

The old hoist, built by G. W. Snyder, of Pottsville, Penn., in 1872, is still in effective service and lowered the visitors in the mine. They walked from No. 12 underground to No. 3 mine, and inspected the Pittsburgh and Lower Sewickley (Lower Tyson) seams and returned to the surface by the pump shaft.

The afternoon was spent in automobile riding and in visiting local plants near Cumberland. The first inspected was that of the West Virginia Rail Co., where large railroad rails are rolled down to sizes ranging from 8 to 40 lb. per lineal yard.

Kind of Rails Rerolled

The rails purchased by a coal corporation are probably never tested; on the other hand, rarely is rail purchased by a railroad without test. Consequently, the product of the West Virginia Rail Co. is a tested rail. Of course, there are flaws even in such rail and the use of the steel in actual railroad use brings out these defects. If a rail has slivered or cracked, the rerolling process of the rail company makes its condition worse instead of better, and consequently all such rails are thrown out and sent to mills where they can be melted. The heat used by the company at Cumberland is enough for rolling but not for welding a break.

It is claimed by the company that the continued pounding of the railroad track makes the steel dense, and that its condition is further improved by the rolling in the mill, where it is reduced in weight per lineal yard from 60 to nearly 90 per cent. The rails brought into the mill are some of them bessemer, and some openhearth and a load ready for heating which stood on the track were old John Brown rails from Sheffield, England which are known never to have flaws and which were made by an undiscovered process. The material being thus mixed some of the rails must be of steel far superior to that out of which ordinary mine rail is made.

Process of Rerolling

All the rail is knicked and broken to the required lengths. All rail which is slivered, cracked or piped is cast out. The length cut off is a little more than enough to form a longer rail of the lighter weight desired. The short sections of rail thus obtained are placed one by one in a furnace, where they are heated by natural gas. When a new rail is put in at one end of the furnace, a ram is actuated which pushes the rails toward the other end and discharges a heated rail ready for the rollers.

The rail is passed through the rolls about 7 times and then is sorted carefully into first, seconds and rejects. If the rail being rerolled is badly defective, it will open out and refuse to pass through the rolls. Seconds are rails having a roughness on their edges. Otherwise they have no defects.

On the automobile trip to the country a heavy storm drenched the visitors, and most appropriately their entertainers, the chamber of commerce, took them and their soiled garments to Footers' Dye Works, which the institute members examined with much interest.

About 100 members attended the meeting. It may be stated that the institute attendance would have been larger and more representative had it not ben held at Cumberland, Md., but rather in the heart of the West Virginia field. However, Cumberland well merited such a visit, as the members from Maryland are quite numerous in the West Virginia Coal Mining Institute.

Another reason for a somewhat smaller attendance than usual was the engrossing labor trouble in the Kanawha coal fields, causing 12,000 men to lay down their tools. This materially reduced the number of members from Charleston, W. Va., and the vicinity. On an invitation of the chamber of commerce and as the result of a vote on a recommendation from the institute to the executive board, the winter session will be held at Huntingdon, W. Va.

A Novel Shaft Lining

Marcel Gillieaux of Liege, in the 1914 number of the *Annales des Mines de Belgique,* describes an interesting method of lining shafts with molded blocks of reinforced concrete. After reviewing the systems of shaft linings in wood, brick, cut stone, cement and metal, the author states that his system was the result of an effort to overcome the well known objections to which all these are open; and he claims complete success in the practical operation of his plans.

Figs. 1 and 2 show a vertical and a horizontal cross-

section of a shaft lining, borne by a strong, annular block of reinforced concrete, set just below the shaft opening, as shown at 4, an iron ring 5, distributing the weight of the lining over a large bearing surface. This collar or block of concrete is laid as soon as the shaft has been sunk far enough to permit it; and the shaft lining then proceeds, following the sinking of the shaft as closely as is practically possible. The lining is constructed of sectional blocks which hook into each other, see Fig. 1. In Fig. 3 a vertical section of the block is shown exhibiting the reinforcement and the goosenecks by which adjacent blocks interlock. The dimensions of Fig. 3 are

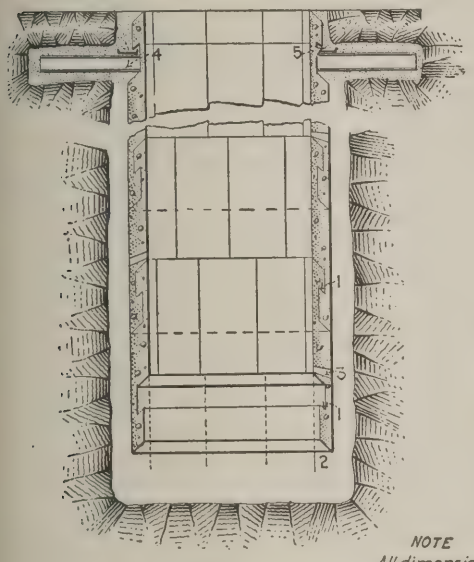


FIG. 1.

FIG. 2.

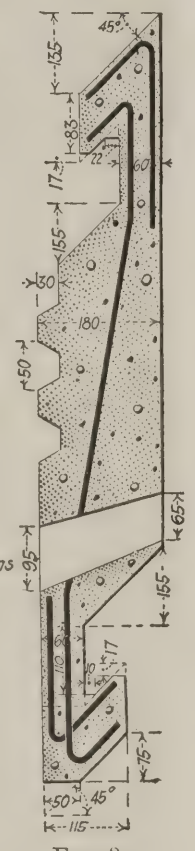

FIG. 3.

A SUSPENDED REINFORCED-CONCRETE SHAFT LINING

in millimeters, the millimeters representing, say, 0.04 of an inch. The opening at 3, Fig. 1, serves a double purpose; it allows the block, and consequently the lining, to be centered by iron bars passing through to the inner side of the shaft, and it serves as a channel to run cement between the shaft and the lining, when the lining has been extended to the required depth. In this way, the completed shaft has a solid lining of cement.

The other construction details, such as the form or mold for the blocks, special forms for locking or completing the cylindrical lining, cradle for handling the blocks, and so on, are treated at considerable length.

Gillieaux claims for his plan, that it can be constructed without the hazards to the workman which go with a lining built from the bottom upward; that it lessens the water in wet shafts; that the lining is homogeneous and equally strong at all points and that the shaft is completed and ready for operation with little loss of time, as the lining goes in while the shaft is being sunk.

The Reliability of Electric-Acoustic Signals in Mines

H. Kliver, of Bochum, Westphalia, Germany, writing in the Jan. 24 number of *Glückauf*, on the causes of failure of electric signals in the Dortmund, Westphalia, mining district, states that it has been noticed that, at times, the signaling system went wrong; either the signals were not received when sent, or the bells rang of themselves, without any action of the attendants. As such irregularities might lead to serious accidents, the management of the mines ordered an examination and report to be made, of every instance of failure within a certain period, with its cause, the means taken to remedy the trouble and the result. A frequent cause of trouble was found in water reaching the wires through defects in the insulation, leading to voltage loss, short circuits and weak currents.

In the summary for 1904, with few exceptions, all the troubles came from defects in the installation or the upkeep, such as defective cable joints, defects in the cable, bell not tight, poor cable insulation, loss of voltage and defective contacts. In a few instances, the signals were not transmitted correctly on account of being sent too hastily.

Defects Finally Restricted to Bell Mechanism

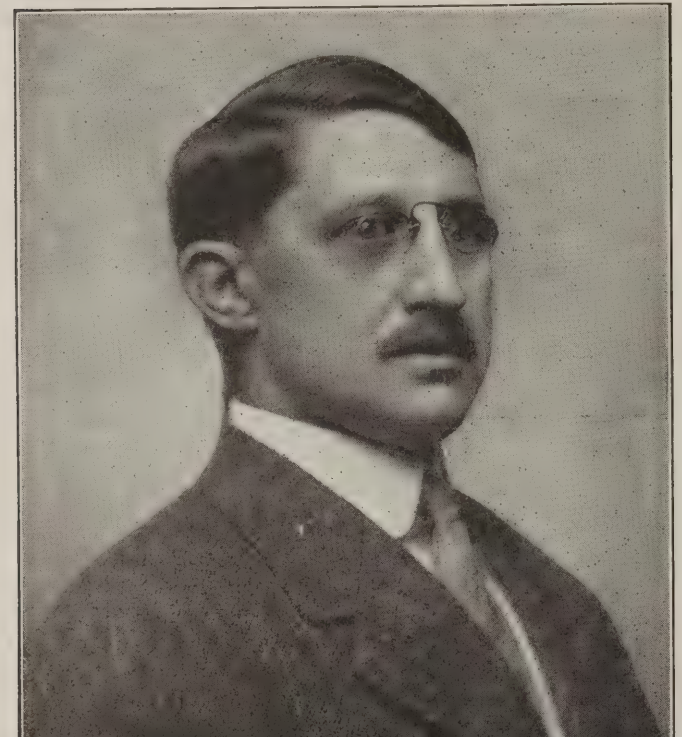
A comparison of this summary with that for 1913 shows that closer inspection had taken care of nearly all these troubles, which now seemed due to too rapid sending, almost exclusively. Nevertheless, the underlying cause for the bells not ringing was found to be in the striking mechanism not being sensitive enough to follow the magnetic action, even with a good contact. This led to the exclusive use of single-stroke (gong) bells.

Still the evil was not overcome entirely; occasionally the bells missed. Further study disclosed that, to insure perfect reliability, the hammers must be exactly equal in weight and length, and must hang in the same position, and the magnetic coils must be of equal strength. Moreover, it was observed that the mechanical and electrical resistances of the ringing mechanism changed, and that some bells rung more easily than others, after a little use, although both were equally sensitive in the beginning. This led to the adoption of a regulating device.

Mr. Kliver concludes that every reliable signal installation must meet these conditions:

(1) All the apparatus should be inclosed in water- and air-tight boxes; (2) the single-stroke bells (which, in Belgium, must consist of a solenoid attracting one end of the hammer lever, the other end striking the bell) should satisfy these requirements: (a) offer equal resistances mechanically and electrically; (b) be sensitive enough to strike at least four blows a minute; (c) be provided with adjusting devices to maintain a constant sensitiveness; (d) be so contrived that under no circumstances could the hammer strike without human assistance; (3) the transmitters should give a complete, perfect contact.

Panama Canal and the Coal Markets



The second of Mr. Wadleigh's articles on "Effect of Panama Canal on World's Coal Markets" was crowded out of this issue, but will appear next week, June 20.

Who's Who in Coal Mining

Charles Enzian

Among the younger men in the coal industry who have advanced to a position of prominence through strict application to work in their chosen field, is Charles Enzian, mining engineer of the U. S. Bureau of Mines. He is in charge of mine accidents and mining methods investigations in the anthracite region.

Mr. Enzian was born at Weissport, Penn., in October, 1877. His early education was obtained in the public schools of Pennsylvania, which preliminary training was

Charles Enzian

followed by a four-year regular course in Lehigh University, where he was given the degree C. E. in 1901. The same institution honored Mr. Enzian with an M. S. degree in 1913.

Charles Enzian was particularly fortunate in obtaining considerable practical experience in engineering prior to his graduation from Lehigh. From April, 1894 to February, 1897, he was assistant to the county engineer of Carbon County, Penn. The work here consisted principally of surveying, municipal and county engineering.

During the summers of 1898 and 1899, he was construction engineer, working on plant extension for the Atlas Portland Cement Co., Northampton, Penn. During the summer of 1900, he was superintendent of construction, building a 2000-barrel cement plant for the Alpha Portland Cement Co., Alpha, N. J.

Immediately following his graduation from college in June, 1901, he accepted a position as engineer and superintendent for the Lehigh Coal & Navigation Co., and the Allen-Crane Water Co., at Catasauqua, Penn. Most of his time while serving in this position was taken up with explorations, water-storage supply and extension of distribution service lines.

In April, 1902, Mr. Enzian accepted a position as transitman and district engineer in charge of surveys at several collieries of the Lehigh Valley Coal Co., Wilkes-Barre, Penn. In this work, he also secured valuable experience in breaker construction, being employed for a time as resident engineer in charge of construction at one of the newer breakers of the "Valley" Co.

In November, 1905, Mr. Enzian was advanced to the position of division engineer, in charge of the Wyoming division of the Lehigh Valley Coal Co. In carrying on this work he had a corps of 25 assistants, and was responsible for surveys, maps, reports, developments, improvements, etc. While in this position, he also made a number of company examinations and valuations. He continued to serve the Lehigh Valley Coal Co. as engineer, in charge of its most important division, for five years, only deciding to leave them for the broader experience he hoped to obtain in the employ of the Mining Bureau.

Mr. Enzian has always been a diligent student of coal-mining problems and matters generally concerning his chosen profession. He is prominent in many mining and engineering societies, being a member of the American Society of Civil Engineers, the American Institute of Mining Enginers, The Engineers' Society of Northeastern Pennsylvania, National Geographic Society, Wyoming Historical & Geological Society, Wilkes-Barre, Nanticoke, Pittston, Scranton and Hazleton District Mining Institutes, Coal & Coke Committee, American Institute of Mining Engineers, Franklin Club, Wilkes-Barre, Penn., Hazleton Club, Hazleton, Penn., and Home Club, Washington, D. C. He is also secretary of the recently organized Anthracite Section of the American Institute of Mining Engineers.

In a literary way, Mr. Enzian has done creditable work. He is the author of the U. S. Bureau of Mines, Bulletin No. 60, Hydraulic Mine Filling in the Pennsylvania Anthracite Fields. He has contributed frequently to Coal Age and other technical journals and was collaborator on the Pennsylvania State Anthracite Mine Cave Commission Report of 1913. He is now serving as a member of the Pennsylvania State Anthracite Mine Cave Commission, which body was created to suggest a satisfactory solution of the serious problem of supporting the surface buildings over mines in the anthracite field.

But few of the younger men in the hard-coal regions are as well informed on the art of mining anthracite as Mr. Enzian, and the Bureau of Mines is fortunate in having availed themselves of his experience and service.

Editorials

The Kanawha Dispute

In the Kanawha district a peculiar situation exists. The operators have conceded everything the miners demanded except the check-off—everything in the union's program but the one illegal item. That demand most of the operators refuse to grant. Those who have submitted have been coerced by a boycott, as illegal as any of which the Standard Oil Co. has been guilty.

But this situation is not strange. What is peculiar is that the Department of Labor seriously is about to debate the difference between operators and miners, to decide in fact if the Sherman Anti-Trust law should or should not be obeyed, whether the companies should be, not only permitted, but almost compelled by one government bureau to violate the laws of the National Government and affront the Department of Justice.

We have never, be it understood, been violently opposed to the check-off. It was, we felt, a violation of the law, but we thought it was natural that the companies, hobbled by the union scales and conditions, should wish others to be similarly crippled and make the going equally hard for all. In short the illegality of the check-off appealed to our intellectual rather than our moral sense.

And so long as the check-off resulted only in agitation, in the laying off of the plants of the nonunion companies, no one objected strongly to its existence except those who suffered from the continued discontent the union fostered among their men.

Perhaps these outstanding opponents of unionism did not pay equal wages with other regions. Perhaps their coal was not more easy to dig or more readily loaded or less free from slate, and, therefore, should not be worked at a lower scale. Perhaps if conditions were exceptionally favorable, the differences in the labor involved had been excessively evaluated in writing the scales. These uncertainties furnished an excuse for collecting subsidies to upset the orderly working of neighboring mines.

So the agitation might be justified after all, if not by the letter of the law, at least by the spirit of equity. Beside the check-off never was an invention of the operator, nor did he ever favor it, despite all that has been recently said to that effect. It was forced upon him, but his resistance was never so strong as it would have been had he not recognized that it had a promise for him of a balancing of conditions between his own and other fields. Of course, the unionizing of his neighbor's collieries rarely helped him in the end as much as he expected, for the differentials existing at the time when the organization took charge were always recognized by the union and will be so acknowledged to the end of time.

But there is now a strong feeling against the check-off; now that it is realized that it is not a mere agitation but a war fund. It does not merely waste the money of the miners; it results in bloodshed. It is no longer a trifling with law, but an offense against morals: an unholy thing.

It is this subsidy to anarchy which the Kanawha operators are asked to provide, and the Department of Labor, by its board of conciliation, is to consider. We do not understand where there is room for consideration. Are the laws of this country to be submitted to a conciliation committee of three appointed by one man, the Secretary of Labor, who himself is appointed by the President? Where do we, the people, appear? Where are our legislative rights?

Strange things are happening, but stranger, indeed, will be the result if the board of conciliation demands that the operators collect from unwilling workmen a fund to promote warfare in Colorado and West Virginia, and a fund which tends to make the industry despicable from the Atlantic to the Pacific.

West Virginia Mine Outputs

Efficiency and conservation have received an immense amount of consideration recently, and West Virginia easily leads in the conservation of coal resources. It would be hard, however, to award any state the palm for efficiency.

We believe, however, that by concentrating efforts on these desirable factors in production, there has been a decline in the interest in large outputs in some parts of the country, and West Virginia is a conspicuous example of a state which produces large quantities of coal only by the undesirable method of operating a great number of small mines. In 1894 there was a single mine, Big Soldier, near Reynoldsville, Penn., which daily produced about 4000 tons. It is strange that today there are whole states which cannot show any such production passing over one tipple. Pennsylvania is perhaps the leading state in obtaining such results.

The trouble is largely psychological and not the fault of equipment or lack of knowledge. If the belief is present of the possibility of running a large tonnage, the hope of accomplishment spurs the managers on, and if the mine is properly equipped, the tonnage desired can usually be obtained. Let us quote the leading tonnages from West Virginia in 1912:

LEADING WEST VIRGINIA TONNAGES, 1912

Company	Mine	Tonnage
Virginia & Pittsburgh Coal & Coke Co.	Kingmont	590,252
United States Coal & Oil Co.	Island Creek No. 1	479,631
Jamison Coal & Coke Co.	Jamison No. 8	476,470
Federal Coal & Coke Co.	Federal No. 1	451,032
Houston Coal & Coke Co.	Houston Nos. 1-2	443,221
United States Coal & Coke Co.	United States No. 9	435,275
Gulf Smokeless Coal Co.	Tams Nos. 1-2-3	401,281

It will be noted that many of the largest coal companies are excluded from this list, not one of their mines reaching the required output of 400,000 tons per annum. Yet many of these companies mine coal by drift and could have a large tonnage if they were really so disposed. Conditions are quite favorable for large development and, in fact, when we look at some of the mines, we cannot avoid the conclusion that when they were constructed big tonnages were expected from them.

But in trapper boy and manager, the doubt in the possibility of achievement is implanted. They all feel it is hard to produce more than a few hundred tons per day. We trust that the figures we have obtained of the Pennsylvania and Illinois tonnages, which we are about to quote, will awaken in West Virginia a desire to make the present plants more efficient and to lay its dependence on the mines opened and not in adding new mines where none are needed.

In Pennsylvania about 2.44 times as much bituminous coal is mined as in West Virginia. Yet, whereas in the latter state there were seven plants mining over 400,000 tons per year in 1912, in the northern state there were in that same year 103 tipples having over that production. Vesta No. 4 alone produced 1,555,420 tons and Iselin tipple dumped from mines 1, 2, 3 and 4, 1,776,410 tons, and the whole state had 23 bituminous-coal tipples producing over 590,252 tons, the largest output of any tipple in West Virginia.

In Illinois, most of the mines are operated by shafts and consequently the tonnage is restricted by that fact. The state produced in 1912 about 10 per cent. less coal than West Virginia. Yet in that year 25 tipples in Illinois each produced over 400,000 tons. That is, there were over three times as many of these larger producers as in West Virginia. And in addition it may be said, that there were five plants each producing more coal than any single plant in that state.

Rambling Mines

In late years there has been a commendable tendency to reduce the area of coal workings opened and to endeavor to get a large tonnage from a small block of coal operated energetically. This does not involve the use of small pillars, because a larger tonnage in a given area can be obtained with large pillars completely extracted than from the same area with small pillars which have to be left undrawn. In fact, large pillars extracted by a retreating longwall system will give under proper management a maximum intensity of operation.

Such concentration of effort results in better supervision with consequent greater safety in operation, better coal product, more certain withdrawal of props, pipes and rail and more equal mining conditions throughout the mine relative to coal thickness. It saves the purchase of much pipe, rail and bonds, and decreases the amount of ventilating current needed. As few headings have to be maintained, steel cross-bars are not prohibitively expensive and if wood is used the spores generated in a labyrinth of old rooms do not impregnate the new timber.

Congestion of traffic has its difficulties also, but they can be met and as the area to be controlled is smaller, the needs of the situation can be better provided than in a mine with workings spread over a larger area. It does not pay to draw coal from a half dozen small distant sources to one common breaker or tipple. Better is it to concentrate on one particular section of the field, exhaust it and move on to another. By the time the first place is worked out, the breaker or tipple may be entirely out of date and the tearing down will be a source of profit.

It has been customary in the past whenever more tonnage was needed to put in a new opening, whereas intensification of activity in one established plant would be far more profitable. The desire to build a brand new tipple, to escape the mistakes of another superintendent, to do something spectacular is too strong among mining men. The effort and money spent in the new outfit would often have more effect if expended in giving support to the plant already in being.

The coal we have not worked, the facilities we have never tested urge us to new locations and entirely new projects. But the old mine, if it cannot be abandoned, may as well be rejuvenated as allowed to continue its existence as an unhappy second to a brand new plant.

Governor Cox Now Favors Ohio Operators

Governor James M. Cox arranged with operators and miners to leave the settlement of the Ohio strike to a committee, to be appointed following the adjournment of the joint convention in Columbus last Friday. The governor is now said to be out of harmony with the miners on the mine-run law. He has declared his allegiance to Ohio operators in their fight against the mine-run wage contract and advance asked by the miners, and assured the operators that he will support them in obtaining a contract as fair as the wage agreement in Pennsylvania.

Attorney-General Hogan has rendered an opinion that a contract calling for payment of miners on the basis of 99½c. for all coal passing over an inch and a quarter screen and 2c. a ton for the fine coal, is legal and within the meaning of the screen-coal law. Governor Cox has put it up to the miners to either accept this offer or shoulder the blame of prolonging a disastrous strike. He calls attention to the fact that they agreed to make the same contract with Ohio as that made with western Pennsylvania operators and that they would also enforce the mine-run provision on all if the law was passed in Ohio. The governor feels he has been tricked and is now out to repair the wrong that has been done to the Ohio operators.

A settlement is expected to be made within the next ten days and Ohio operators believe that work will be resumed by June 20 at the very latest.

Hazards of Coal Mining

Under this head the *Review of Reviews* says, "The coal miner's life at its best is a hazardous one; at its worst, conditions are so hard that men willingly take the chances of war, as they have done in Colorado, in the hope of bettering their lot."

To this, we might append a corollary equally well reasoned. The industry of farming in 1794 proved so dangerous to the Pennsylvania frontiersmen that they left the pursuit of agriculture to bask in the lap of Mars, accounting it safer to face the federal troops than to follow a plow, the point of which might at any time embed itself in a root and injure the husbandman. Agriculture, like mining, is only menacing at times, and the Whiskey Insurrection over, the brave farmers returned to the plow and its dangers.

The July 4 issue of COAL AGE will be devoted entirely to coke. All our readers are invited to contribute articles dealing with some phase of coke manufacture. Manuscripts should be in our hands by June 24, or sooner.

The Labor Situation

Progress has been made recently in the signing of several mine scales. On June 4, the representatives of the coal operators and those of the United Mine Workers of America agreed tentatively on a scale to be paid in the Pittsburgh district No. 5 for two years ending Mar. 31, 1916.

The only wage-scale changes have been advances to outside laborers. Dumpers will get $2.30 per day, rammen $2.48, pushers $2.08, trimmers $2.25 and car cleaners $2. The wages and conditions, under which blacksmiths, carpenters and drivermen work, are unchanged.

Firemen will hereafter only work eight hours a day, but at the same wages as now paid. Monthly men like teamsters, electricians, stable bosses and engineers are not considered as coming under the new scale.

ELECTRIC-LAMP SCHEDULE

Where lamps now in use are exchanged for the improved electric cap lamp, the miner will be debited 3c. per day. Where open lights are used and the electric lamp is substituted voluntarily, the same charge of 3c. per day is to be made. Safety lamps are to be furnished free of charge when required by the mining law.

This scale has to be presented to a special convention of miners which held its opening session on June 4. The operators' representatives were George Schluederberg, Jesse Sanford, John H. Jones, John Donaldson, William Henderson, William A. Luce and Samuel A. Taylor.

The miners were represented by Van Bittner, president of district No. 5; Robert Wood, a secretary of the central organization; James Flood, Oakdale, Penn.; James Charleton, Fairhaven, Penn.; William Hargest, Monongahela, Penn.; John O. O'Leary, Roscoe, Penn.; Sidney Davis, Amyville, Penn., and William Tears, Grove City, Penn.

THE KANAWHA STRIKE

The miners of the Charleston district of West Virginia known as No. 17 struck June 1 as soon as the contract with the operators expired. The next day a settlement was secured with some of the operators and 4000 men were enabled to go back to work. It is said that the concessions made were obtained by notifying these operators that their large collateral interest would be boycotted if they did not concede what the union demanded. Up to that time these particular companies had been determined not to concede the matter at issue.

The companies thus making concession were the Paint Creek Collieries Co. with six mines, Mucklow, Wacomah, Banner, Detroit, Greenbrier and Hickory Camp; the Imperial Colliery Co., with three mines at Burnwell, the Standard Splint & Gas Coal Co., with one mine named Standard, the Christian Coal Co. with a mine at Mahan and the National Bituminous Coal & Coke Co., with two mines at Eskdale on Cabin Creek. The Briar Creek and Coal River mines of the Paint Creek Collieries Co. are also included in the arrangement.

THE OPERATORS REFUSE THE CHECK-OFF

There is a possibility that now these important interests have made concession the others will be forced into it. As the contract involves the check-off, the operators forming the Kanawha Coal Operators Association, who will not make the concessions, have written to the President calling his attention to the provisions which are in their opinion a violation of the Sherman law.

In reply Thomas Haggerty, member of the International Board and Thomas Cairns, president of District No. 7 declared that the money collected would not be sent to international headquarters at Indianapolis, but would be used locally. These men declare that the operators in union districts are pleased to continue relations with the U. M. W. of A. or otherwise why do they do business with them year after year. The answer is very plain, the operators have been intimidated by the methods adopted in West Virginia, Colorado and elsewhere and have thought open war less desirable than submission. They are not pleased with the relations existing between the union and themselves. It is a striking piece of irony to ask the operator to admit that he enjoys the relations forced on him by the union.

THE CONCILIATION BOARD

Under Section 8 of the law creating the Department of Labor, Secretary Wilson has appointed a board of conciliation including Charles W. Mills, of Philadelphia, Patrick Gilday, president of United Mine Workers, district No. 2 of Morrisdale Mines, Penn., and O. L. Faulkner, of Cleveland, Ohio. The latter is an employee of the Department of Labor.

The Kanawha Coal Operators Association in a large advertisement in the Charleston "Gazette," June 2, says:

To our employees: Below you will find a copy of the last and final proposition made by the operators at the joint conference which adjourned sine die Thursday, May 28, the representatives of the unions refusing to accept it unless we agreed to the check-off which we declined to do.

A revision of the rules having been agreed to, we now propose in the interest of peace and harmony to agree to your demand for a renewal of the 1912-14 scale of wages for a term of three years. The only other point at issue between us, the check-off, we cannot agree to.

In short, the officers of the United Mine Workers of America propose to call a strike and throw about 12,000 miners out of employment, resulting in a loss of some $35,000 to $40,000 a day in wages, suffering and hardship for some 15,000 or 20,000 of their wives and children and paralyzing all business enterprises in Kanawha Valley, for the sole purpose, and no other, of forcing the coal operator to take from each of his employees 50c. or $1 a month or more and forward it to the officers of the organization at Indianapolis.

Coal Mining Institute of America

The summer session of this institute will be held in the Eagle Hall, at Monongahela, Penn., the town where the institute was organized in 1887. Two days will be taken, Tuesday and Wednesday, the 16th and 17th of June, respectively.

L. C. Isler, mayor of Monongahela, will deliver the address of welcome at 10 a.m., on Tuesday, and S. A. Taylor will then deliver his illustrated address on "The Advancement in Bituminous Coal Mining during the Last Forty Years." In the afternoon a discussion on mine timber will take place. William Lauder will discuss methods of timbering and quality of timber, William Seddon, Brownsville, Penn., the method of timbering with reference to overlying strata and geological formation, and H. I. Smith, who is assistant mining engineer of the U. S. Bureau of Mines, the possible substitutes for mine posts. The evening session is in the hands of the local committee, Henry Loutitt, Alexander McCanch, William Bird, H. T. Booker and W. A. Luce.

The second day session opens at 9 a.m., with a paper on "Accidents Caused by Machine Mining as against Pick Mining," by A. P. Cameron, of Irwin, Penn. This will be followed by the question box conducted by W. E. Fohl. In the afternoon "Practical Results from Efficiency Methods in Mining" will be discussed.

MORE TIME FOR DISCUSSION THAN FOR READING OF PAPERS

It will be seen that a meager program is provided. This is the result of a careful consideration of the best plan to be adopted. It has always been found that the Coal Mining Institute of America meetings have elicited most animated and interesting discussions, which are of as much value as set papers. It has usually been necessary to limit the discussion because of lack of time. It is possible that the shortness of the program will make possible a discussion of more than usual completeness and interest. It is impossible to make a meeting a success where one paper after another is read in a tedious succession and where an enforced *clôture* deadens the personal interest.

Kentucky Mine Owners

Following are the officers and board of directors of the Kentucky Mine Owners Association, whose term of office expires April 1, 1916.

Board of Directors: Frank D. Rash, Earlington; Percy D. Berry, Providence; C. W. Taylor, Greenville; F. M. Sackett, Louisville; K. U. Meguire, Louisville; White L. Moss, Pineville; H. Laviers, Paintsville; J. W. M. Stewart, Ashland; Hywel Davies, Lexington; all of Kentucky, and George T. Watson, Fairmount, W. Va.

Officers: Frank D. Rash, president; Geo. T. Watson and White L. Moss, vice-presidents and W. H. Cunningham, Ashland, Ky., secretary and treasurer.

Sociological Department

The Illinois Miners' and Mechanics' Institutes

By E. C. Lee*

For several years, mining men in Illinois have tried to induce the Department of Mining Engineering of the University of Illinois to establish schools in the mining centers, for the benefit of men who were unable to attend the regular classes of the University. Plans were discussed for some time, but funds were lacking for this form of university extension work. In 1911 the State Legislature passed a bill establishing the Illinois Miners' and Mechanics' Institutes, and in 1913 an appropriation of $15,000 per annum was made to carry out the work.

The purpose of these organizations as given in the Act is "to prevent accidents in mines and other industrial plants and to conserve the resources of the state," and any means may be employed "to promote the technical efficiency of all persons working in and about the mines and other industrial plants and to assist them to better overcome the increasing difficulties of mining and other industrial employments."

The Act of 1911 put the control of the Institutes in the trustees of the University, and they were by them placed under the general supervision of the Department of Mining Engineering of the University of Illinois, of which H. H. Stock is the head. The work is in charge of a director, and R. Y. Williams, late of the United States Bureau of Mines, was selected for this position, with headquarters at Urbana.

*Mining engineer and instructor, Illinois Miners' and Mechanics' Institutes.

Training Is for Positions Which Must Be Filled by Examination

Three courses have been adopted for carrying on the work: (1) A two-year course of systematic instruction at mining centers; (2) A short course at the University and (3) Unit courses in mining towns. The two-year course at the mining centers is so arranged that a man who can give two nights a week for two years can complete the entire course. The subjects he studies are designed to cover all practical details required in the examination by the State Mining Board, from whom a certificate must be received before a man can hold a position as state inspector of mines, mine manager, mine inspector or hoisting engineer.

Harrisburg School of the Illinois Miners' and Mechanics' Institute

Schools for this two-year course have been opened in Belleville and Collinsville, under W. L. Morgan, ex-state inspector of mines; and in Harrisburg and Herrin under E. C. Lee, mining engineer. The high schools in these cities are coöperating with the institutes, furnishing room, light, heat and janitor service. In addition to this a member of the high-school faculty acts as an assistant instructor, making any physical and chemical demonstrations necessary to illustrate the points brought out in the lecture by the instructor.

The physical and chemical laboratories of the high schools are at the service of the Institutes, and the apparatus in these laboratories is supplemented by apparatus kept in the office at Urbana, subject to the call of the instructors. Stereopticon work is used largely in addition to the physical and chemical demonstrations. In the study of safety lamps, for instance, not only is the lamp in question shown to the class, but assembled ready

for use and taken apart so as to show the different parts, and sectional views of the lamps are shown on the screen at the same time.

Subjects Taught and Time Devoted to Them

In the two-year course, the subjects are arranged in groups, 8 weeks or 16 nights being allowed for each group. The list of subjects and the time devoted to each are as follows:

PROSPECTUS OF STUDIES

Group	Course	Subject	Sessions
A	1	Methods of mining	10
	2	Timbering	5
B	3	Ventilation	8
	4	Mine gases and safety lamps.	5
	5	Special underground rooms..	2
C	6	Geology	5
	7	Surveying	10
D	8	Coal, a fuel	5
	9	Surface plant	5
	10	Steam	5
E	11	Hoisting	7
	12	Haulage	8
F	13	Fire protection	5
	14	Electricity	10
G	15	Drainage	6
	16	Explosives	9
		Review	7
		Total	112

Each subject is considered with reference to safety, efficiency, conservation and the state mining law; and in each subject the points covered are mining practices, mathematics, sciences and English, with sketches illustrating the apparatus used.

The courses are not necessarily studied in the order given in the schedule, the men being allowed to choose, by a majority vote, the next subject to be covered. The only restriction made is that each group must be taken up before the work in any one group is covered for the second time. Men may enroll for any course desired, receiving credit for the courses completed. A copy of the enrollment card is shown, the front to be filled in by the student, and the back for the records of the instructor.

Will Try and Reach Foreigners

Recognizing the fact that many of the miners are of foreign birth, and unfamiliar with the English language, it is planned to establish classes for the men speaking a foreign language, to be taught by a man familiar with their own tongue. In these classes, if possible, a mining man will be selected as instructor, so that the work in English, mathematics and mining may go on at the same time.

The same work is covered in the short course at the University as is taken up in the two-year course in the field, 6 weeks' time being spent in the work. In this course, 4 hours each morning are spent in lectures and discussions conducted by the teaching staff of the University and of the institutes. During 3 hours each afternoon, courses are given in the mining and safety-lamp laboratories, in surveying on the campus, in drawing, and in rescue and first-aid work at the University mine-rescue station. The schedule for the short course for this spring is as follows, men being allowed to enter for any group of subjects or for the entire course:

THE SHORT COURSE AT THE UNIVERSITY OF ILLINOIS

Dates	Subjects for Discussion* Morning Sessions 8 a.m. to 12, Noon	Laboratory and Field Work Afternoon Sessions 2-5 p.m.
April 6-11	Geology Methods of mining Timbering	First aid training Drawing
April 13-18	Coal, a fuel Surface plant Steam	First aid training Drawing
April 20-25	Hoisting Haulage Fire protection	Mine rescue chamber Mining laboratory
April 27-May 2	Ventilation Surveying Special underground rooms	Mine rescue chamber Mining laboratory
May 4-9	Electricity Mine gases and safety lamps Surveying	Surveying on the campus Safety lamp laboratory
May 11-16	Electricity Explosives Drainage	Surveying on the campus Safety lamp laboratory

*For details of the topics covered under each subject, see schedule for the two-year course.

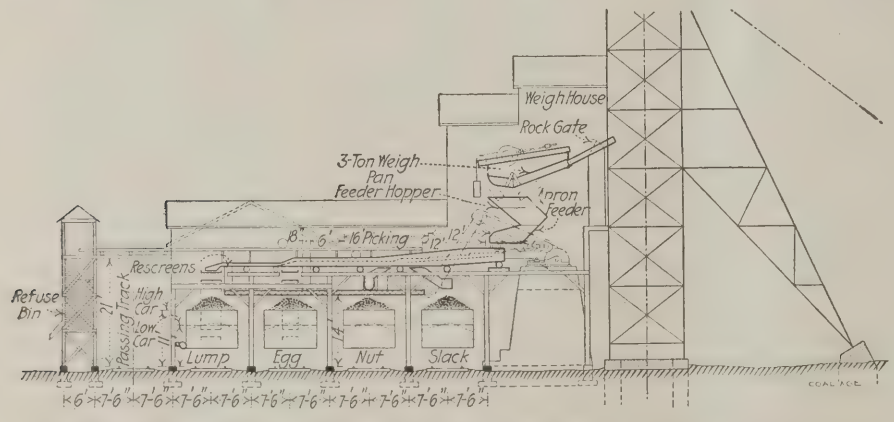
The Unit Course

A unit course is the term applied to one where a single subject is taught at a time, and where a considerable interval is allowed to lapse before another unit is taken up. In the conduct of these unit courses, an instructor is placed in a district where eight towns will arrange to furnish classes of fifteen or more men. Once in every three months the instructor will visit each town in the circuit and give a two-week unit course, which will consist of two hours' work on four evenings each week.

In the conduct of the different courses, the Institutes will coöperate with the State Mining Board and inspectors, the Illinois Mine Rescue Commission, Miners' Locals, the United States Bureau of Mines, the public schools, and with first-aid and other local organizations. It is planned later, when funds are available, to offer correspondence courses for men who cannot attend the regular classes, to print the lectures which are given in the two-year course, and make them the basis on which the correspondence course will be treated.

Firedamp Ignited by Sparks from an Electric Bell

In South Wales a fatal accident has been traced to an ignition of firedamp by sparks from an electric bell in use for signaling purposes. The electric bell was an ordinary one of the trembler pattern worked by an induction coil and a battery of eight Leclanche cells. Tested after the accident, the battery gave 11½ volts. It was proved experimentally that sparks from the bell, when supplied with current from the same battery, would ignite an explosive mixture of coal gas and air, and this latter was subsequently fired by sparks caused by rubbing a file across two wires connected to a pair of cells, giving only 4 volts pressure.



Discussion By Readers

Checking System for Miners' Coal

Letter No. 1—We were much interested in reading the excellent letter by Erskine Ramsay, of Birmingham, Ala., COAL AGE, May 23, p. 862, entitled "A Checking System for Coal Loaded by Miners," and since you have asked for views along this line, I send you herewith a sketch and description of a plan we have formulated for accomplishing very much the same purpose.

The accompanying illustration shows the conventional headframe and weigh-hopper, arranged for self-dumping cages. This design was adopted to meet the requirements stated by Mr. Ramsay, since it was necessary, for various reasons, to determine the exact amount of impurities that may be loaded by a miner, and the following description will explain the way in which we met this condition.

The self-dumping cage, with its weigh-hopper presents no new features. The weigh-hopper is designed to discharge into a feeder-hopper, made large enough to have twice the capacity of a pit car. This feeder-hopper is closed at the bottom by means of a device that feeds the coal out of the hopper in a steady stream and would entirely empty the hopper if permitted to do so. From this hopper the coal is discharged onto a Marcus patent picking-table screen.

PROPOSED ARRANGEMENT OF CHUTES, SCREENS, PICKING TABLES AND WEIGH-HOPPERS TO CHECK MINERS' COAL

The illustration shows the location and size of the screen; which affords 16 ft. of picking space. The 12-ft. screen marked "nut" is provided with 1½-in. round holes, and this perforated plate permits all the small sizes below 1½ in. to pass through to the lower decks so that the 16-ft. picking table, which is unperforated, has upon it only such coal as is above 1½ in. in size. The pickings are thrown into a rock carrier, marked "B," which is a chute attached to the Marcus screen, and shaking with it. By this carrier, all the pickings are carried forward to the refuse bin shown in the illustration.

The capacities of the feeder and of the screen are such that the coal can be dumped and screened at a rate equal to the full capacity of the mine, and yet permit of a small interval on the screen, between consecutive dumps. This interval, though small, is perceptible. Under the outer end of the refuse trough *B* is a small weigh-hopper, arranged with a gate at the bottom which may be opened or closed by men standing at the picking table. The weighman and check weighman, instead of being in the weigh-house, as customary, stand on the screen floor near the picking table.

The operation is as follows: The coal is dumped, weighed, screened and picked, the weighman recording the weight in the usual manner and the picker simply throwing the rock into the rock conveyor, which carries it forward and dumps it through the weigh-hopper at the outer end, which is ordinarily open. But, whenever a car of coal appears to contain an unusual amount of dirt, the man in charge of the picking floor closes the gate in the rock weigh-hopper and watches the dial attached to this scale until all of the pickings from this car are in the scale hopper. He then instantly reports this weight of rock to the weighman who records it opposite the weight of the coal in the same car. Should conditions justify it, the exact amount of pickings could be determined and recorded for every car of coal dumped.

We recognize, however, that there is one thing this device will not do. It will not determine the amount of dirt there may be in the fine coal below the 1½ in., but it *will* absolutely locate the man who is loading dirty coal.

It should be stated that the weight of rock obtained in the rock-weighing process may be indicated by means of a dial, at the weighman's desk, so that, with the miner's check in his hand, he can record the weight of material in the pit car, and immediately thereafter the weight of material picked out.

JOHN V. SCHAEFER, Vice-Pres.,
Chicago, Ill. Roberts & Schaefer Co.

Letter No. 2—I have read with interest Mr. Ramsay's letter on a Checking System for Coal Loaded by Miners, COAL AGE, May 23, p. 862.

A few months ago, I replaced a docking system in use at the mines of the LaFollette Coal, Iron & Ry. Co., with the following system, which has resulted in an improvement of 100 per cent. in the cleanliness of the coal.

A mine foreman should visit every working place in the mine, at least once each day the mine is running, but to do so, in our mines, would be a physical impossibility, owing to the extent of the area mined. To insure a personal visit to each working place, therefore, assistant mine foremen are employed. With this addition, the mine foreman or one of his assistants is able to see each miner at least once every day.

On the tipple, a coal inspector was placed, whose duty is to inspect every mine car as it comes from the mine, which he does without stopping the car. He carries a small two-pronged rake or hoe, with which he digs into the car at different points. He sometimes varies his method by following each car to the dump and watching the coal as it is dumped onto the screens. The cars come to the tipple in trips of 15, with the miner's check number on the outside of each car.

When the inspector finds a dirty car he makes a note of the number of the car in a book, which he carries for that purpose. At the end of the day a list of the numbers of miners loading dirty coal is handed to the mine foreman, who visits these men the next morning, and judges for himself if it is possible for the miner to load clean coal where he is working. If this is not possible, he may change the miner to a place where it is possible to load clean coal. If, however, in the foreman's opinion, the miner can load clean coal from his working place, a heart-to-heart talk takes place. If the miner shows a disposition to do better and not to repeat the offense, he is given another trial. If, however, his subsequent loading proves he is careless or don't care, he is given an order for his money. In the last three months, not more than six miners have been discharged for loading dirty coal.

About 50 per cent. of our coal is made into coke, the balance being disposed of as domestic coal. A much better coke has been the result, and little or no complaint is now being registered against the domestic grades.

A reduction in accidents has also been noted, as much better inspection is obtained. A gain in tonnage has also resulted with a resulting reduction in the cost of production.

La Follette Coal, Iron & Ry. Co.
La Follette, Tenn.

Calculation of Coal-Washing Efficiencies

In a recent article on this subject, Coal Age, May 2, p. 723, G. R. Delamater has attempted to express, by formula, the efficiency of any coal-washing machine or plant, hoping by this means to furnish a standard of comparison of the results produced in the use of different machines for washing coal.

As far as the formulas are concerned, they give valuable indications of the work each machine is doing when the several data involved are considered separately and with due regard to the required market conditions. The attempt, however, to combine the data relating to the percentage of washed coal produced and ash content, by taking the arithmetical means of two different efficiencies and calling this the washing efficiency, is not clear. It is not apparent why these formulas should be combined at all; or why they should be combined by taking the arithmetical mean, rather than by multiplying the results together or by any other method that could be applied. What these combined results represent, it is difficult to say; and it would be interesting to know whether Mr. Delamater has any logical reason for taking the arithmetical mean, instead of the product of the two efficiencies already determined.

As a matter of fact, it would seem that the attempt to combine, in this manner, the efficiencies of two machines working under different conditions, is an impossible task. On the other hand, if a method could be evolved that would express the commercial efficiency of a coal-washing machine under particular conditions, and that would enable a comparison of the work performed by that machine with that performed by another machine operated under the same or other specified conditions, there can be no doubt but that such method would have more value than this will-o-the-wisp, which Mr. Delamater has here presented.

Commercial efficiency, in coal washing, will depend very largely on the market conditions and requirements. Suppose, for example, we have a coal whose standard percentage for washed coal is rated at 95 per cent., with an allowable ash content of 5 per cent.; and suppose this coal, treated in two jigs of different type, gives the following results:

Jig 1, washed coal, 85 per cent.; ash content, 5 per cent.
Jig 2, washed coal, 80 per cent.; ash content, 3 per cent.

From these figures it is desired to ascertain which type of machine should be used to wash this coal. In both machines, the percentage of washed coal is below the standard, and, while the percentage of ash is standard in jig No. 1, it is below the standard in jig No. 2. Therefore, the efficiency of jig No. 1 must be calculated by formula D (p. 727), as the results obtained correspond to the third condition. The efficiency for jig No. 2, however, must be calculated by formula E, as the results here obtained correspond to the fourth condition given by Mr. Delamater on p. 726. The efficiencies as calculated by these formulas are as follows:

$$\text{Jig No. 1,} \quad \textit{effcy.} = \frac{1 + 85/95}{2} \times 100 = 94.74\%$$

$$\text{Jig No. 2,} \quad \textit{effcy.} = \frac{3/5 + 80/90}{2} \times 100 = 72.10\%$$

Regardless of these results, it is quite clear, from a commercial point of view, that, unless there is any pecuniary advantage in obtaining an ash content lower than the standard, 5 per cent., jig No. 1 is the machine to use, since this produces the largest per cent. of washed coal. But, to illustrate, suppose that the market price of the washed coal is x dollars per ton of coal; and that there is a bonus of a dollars per ton, for each per cent. that the ash falls below the standard 5 per cent. Then, the relative values of the products of these two jigs are as follows:

Jig No. 1, $^{85}/_{95}\,x + (5 - 5)\,a = 0.8947\,x$
Jig No. 2, $^{80}/_{95}\,x + (5 - 3)\,a = 0.8721\,x + 2\,a$

Aside from the relative first cost, cost of upkeep and depreciation, the relative commercial efficiencies of these two jigs is determined by equating the above values. Thus,

$$0.8947\,x = 0.8721\,x + 2\,a$$

$$a = \frac{(0.8947 - 0.8721)\,x}{2} = 0.0113\,x$$

From the above, it is evident that if there is no bonus or $a = 0$, No. 1 jig is the most efficient commercially.

But, when there is a bonus granted for each decrease of 1 per cent. in ash, No. 2 jig will be commercially more efficient when the bonus (a) is greater than $0.0113\,x$; or, assuming the market price of washed coal (x) is $5, if a is greater than $0.0113 \times 5 = \$0.065$, or 6½c. per ton. This method of comparing the commercial efficiencies of

different machines was evolved after a study of Mr. Delamater's article. It is possible that numerous faults and fallacies may be pointed out by other readers of COAL AGE, but if it stimulates further thought on the subject, as Mr. Delamater's article has already done, it will serve a useful purpose.

J. B. DE HART.

The Air Factor in Mine Explosions

John Verner has favored us again, COAL AGE, May 16, p. 818, with another letter in which he attempts to further explain his idea of the "reverse impulse" assisting the propagation of a mine explosion. I fail to see that he has made himself any clearer than at previous times. Being desirous of obtaining a clear conception of Mr. Verner's meaning, I would ask him to kindly illustrate his ideas, if possible, by a few hand sketches or diagrams; and state if what he calls the "reverse influence" is the same as what is generally spoken of as "back suction." It is quite commonly assumed that the expressions, "back suction, "vacuum stage" and "back lash," in reference to an explosion, are synonymous terms. These all relate to a reaction that sets in immediately after the explosive wave has passed. If, then, what Mr. Verner styles "reverse influence" refers to a similar reaction following the explosion, I would ask, how could that affect, in any way, the original explosion. Mr. Verner adds:

> It may be properly assumed that the vastly more powerful air blast, traveling in opposition to the explosion flame, must be an important, if not the controlling factor, in propagating explosive combustion.

As no one will probably deny this statement, it follows that what Mr. Verner designates as the "controlling factor" is the air current traveling in its original direction, assuming the explosive wave advances against the intake air. This condition was shown in Experiment No. 13 of the Altofts series, by a resulting 4-lb. vacuum. Mr. Verner also refers to Experiment No. 21 of the same series, where an explosion occurred within an explosion, as shown by the published photographs at the time. He refers to this double explosion as an evidence of the "reverse influence," but does not say where this reverse took place; nor does he make clear on what ground he bases such a conclusion.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

SYMBOLS AND FORMULAS

Most of the rules of mine ventilation are expressed by means of formulas, which show at a glance the relation of the several factors to each other, and make possible many transformations and developments.

Symbols—As far as practicable, the same symbols are used throughout to designate the same factors; and these are, for the most part, those symbols commonly employed in ventilation, as being the initial letter of the word for which they stand. For example, p = pressure; v = velocity; q = quantity, etc. The following table gives the more important symbols used:

TABLE OF COMMON SYMBOLS, MINE VENTILATION

A = area of regulator,	*sq.ft.*	Q = total circulation of air,	*cu.ft.per min.*
a = area of airway,	*sq.ft.*	q = single current,	*cu.ft. per min.*
B = height of barometer,	*in.*	R = resistance of mine or airway,	*lb.*
C = Centigrade reading,	*deg.*	r = any ratio,	....
c = constant,	....	s = rubbing surface of airway,	*sq.ft.*
D = depth of shaft,	*ft.*	T = absolute or higher temperature,	*deg.*
d = diam. or side of airway,	*ft.*	t = lower temperature,	*deg.*
F = Fahrenheit reading,	*deg.*	U = total power on air,	*ft.-lb. per min.*
g = gravity,	*ft. per sec.*	u = power, single current,	*ft.-lb. per min*
H = horsepower on air,	33,000 *ft. lb.*	v = velocity of air,	*ft. per min.*
h = height of air column,	*ft.*	V = volume of air or gas,	*cu.ft.*
K = Efficiency of fan,	per cent.	W = total weight of body,	*lb.*
k = coefficient of friction	0.00000002	w = unit weight,	*lb. per cu.ft.*
l = length of airway,	*ft.*	X = potential of mine or airway,	....
n = number of revolutions,	*r.p.m.*	x = the unknown quantity whose value is sought	....
o = perimeter of airway,	*ft.*		
P = total pressure,	*lb.*	*w.g.* = water gage reading,	in.
p = unit pressure,	*lb. per sq.ft.*	*Sp.gr.* = specific gravity,	....

Small subscript letters and figures are frequently written immediately after any symbol to show its reference to a particular kind or thing. For example, q_1, q_2, q_3, etc., indicate the quantities of air passing in three or more airways; q_a, q_b, q_c, etc., indicate the quantities passing in Splits A, B, C, etc. In like manner, the potential values of different airways and splits are indicated by X_1, X_2, X_3, etc.; or X_a, X_b, X_c, etc., as the case may be.

In some cases, two or more subscript letters or figures are used after a single symbol to indicate its reference; as for example, the pressure potential for Split A is written X_{pa}, or the power potential X_{ua}. The general potential, in a split circulation, is written X_o; or X_{po} and X_{uo} to indicate the general pressure and power potentials, respectively.

It is often necessary to indicate the summation of a number of items of the same kind, for which purpose the character Σ is written before the symbol indicating the kind. For example, ΣX_{abc} indicates the sum of the potential values for the splits A, B and C, instead of writing $X_a + X_b + X_c$.

In a complex circulation, consisting of a main airway and two or more splits, it is often necessary to indicate the general split potential by X_∞ and the mine potential by X_0.

The Coal Age Pocket Book

Use of Formulas—A few formulas comparatively form the basis from which practically all the other formulas of mine ventilation are derived. These few basal formulas also show the true relation, one to the other, of the several factors of ventilation, such as pressure, velocity, quantity, power, rubbing surface and the sectional area of mine airways.

The understanding of these formulas makes it unnecessary to learn and remember a large number of rules of ventilation. A formula is written as an algebraic equation in which each factor is expressed by its proper symbol. The equation shows the equality of certain factors grouped in the form of an expression. For example, the formula

$$p a = k s v^2$$

shows the equality of the total ventilating pressure **pa** and the resistance of the airway when the rubbing surface is **s** and the velocity of the air current **v**.

How Factors Vary—It is evident, from the inspection of a formula, that:

1. Any factor in one member of the equation varies **directly** as any factor in the other member, provided all the other factors remain constant and none of the quantities expressed in the formula are connected by the signs plus (+) or minus (—).

2. Any factor in either member varies **inversely** as any other factor in the same member, provided and except as stated (1) above.

For example, the above formula shows that:

The total ventilating pressure (pa) for airways varies as the resistance (ksv^2) of the airway.

For any given airway, **a**, **s** and **k** being constant, the unit pressure (p) varies directly as the square of the velocity (v^2) of the air current.

For the same total pressure (pa), in an airway, **k** being constant, the square of the velocity (v^2) varies inversely as the rubbing surface (s). Or, in other words, the velocity (v) of the air current varies inversely as the square root of the rubbing surface ($\sqrt{s}$).

For the same velocity (v) of air and the same rubbing surface (s) in an airway, **k** being constant, the unit pressure (p) always varies inversely as the sectional area (a) of the airway.

Transposing the above formula for total pressure, the formula for unit pressure producing a given velocity in a given airway or mine is

$$p = \frac{k s v^2}{a}$$

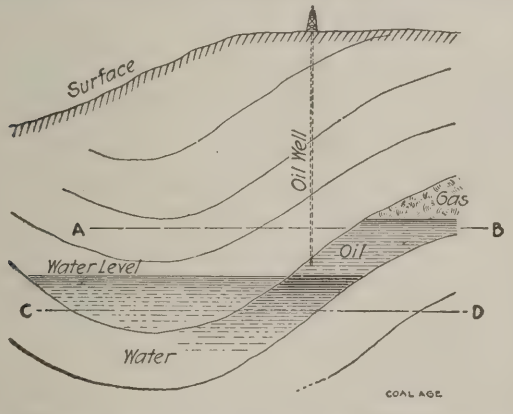
An inspection of this formula shows that:

3. The other factors remaining constant and none of the quantities being connected by the signs plus (+) or minus (—), any factor in the denominator of a fractional term forming either member of the equation varies **directly** as any factor in the numerator of that faction; and inversely as any factor in the other number.

Inquiries of General Interest

An Oil-Well Problem

I am writing COAL AGE for a little information, in order to settle an argument that has arisen over the sinking of an oil well in this community. The sinkers claim that there is oil in this hole, but that it will not rise to the top because there is too much water in the hole. The well is 8 in. in diameter and 1300 ft. deep.



It is argued by some that if this hole was filled with water to the top and there was any oil in the hole, it would rise to the surface of the water. Others claim that the oil will not rise to the surface owing to the great pressure of the water in the hole, which they estimate as being 14 tons. Any information you can give that will throw light on the real condition existing in the hole will be greatly appreciated.

A SUBSCRIBER.

Gilmour, Ind.

It is a well known fact that oil will float on the surface of the water, because its density is less than that of water. This being a hole of large diameter, if there was oil in the hole, it would certainly rise to the surface of the water.

However, the presence of water standing in the hole points to the fact that the water level in these measures

IDEAL CROSS-SECTION OF OIL- AND WATER-BEARING MEASURES

has risen above the bottom of the hole. As shown in the accompanying sketch, suppose that the well has penetrated the productive measures at a point above the indicated water level. In this case, there is nothing to prevent the oil from entering and rising in the hole to a height only determined by the pressure in the measures.

This pressure is frequently so great that the oil is thrown out of the hole in a vertical stream that may reach a height of 50 ft. or more. Such wells are known as "spouting wells." In other cases, it is necessary to pump the oil from the hole into which it drains from the surrounding strata.

In time of a freshet or during a wet season, however, the water level may rise to the line *AB;* while, during a drought or dry season, it may fall to the line *CD.* As the water level rises, in this manner, the oil is forced to a higher level in the measures and is then unable to reach the hole. This produces the condition that is generally known in oil sections as "drowning out" the well. It is possible that this condition may exist, at the present time, in the hole mentioned.

Working Coal Seam with Heavy Parting

Kindly submit the following question to the readers of COAL AGE for discussion:

Would it be practicable or profitable to work a 5-ft. seam of coal that has a parting in the center varying from 6 to 18 in. in thickness? The material forming this parting is hard and shoots with the coal; it can, however, be easily drilled and mined with the pick. Both the roof and bottom of the seam are exceptionally good and a minimum amount of timbering is, therefore, required.

This deposit is located in the northwestern corner of Missouri, in close proximity to good markets, the quality of the coal being superior to that of 75 per cent. of the coal mined in Iowa. Following is a proximate analysis of the coal:

	Per Cent.
Moisture	4.86
Volatile combustible matter	39.48
Fixed carbon	51.12
Ash	4.54
Total	100.00

The coal contains 3.73 per cent. of sulphur, and its calorific value is 13,187 B.t.u.

The mining of this coal presents a proposition of two contiguous seams, each 2½ ft. in thickness, separated by a considerable parting of refuse material. The handling and disposition of this waste material will determine largely the cost of production. I shall much appreciate the suggestions of readers who have had experience in dealing with similar propositions.

FRED MORCK.

Warren, Penn.

This is an excellent question for discussion and should bring forth a number of practical suggestions in regard to the most economical method of mining to adopt. No doubt some will advise the longwall method of mining, as there is plenty of waste material for building the packs. Some, on the other hand, may prefer to drive wide openings and build the waste at the side of the roads, which has the advantage of avoiding the expense of yardage for entry driving, the same as in longwall.

It may be stated that the coal measures, in the section in which this mine is located, are generally favorable to longwall work; but this does not mean to imply necessarily that the longwall method of mining would prove the most economical method to adopt. The question of whether the mining should be done in the parting or in the floor is an important one. Let there be a free and practical discussion.

Examination Questions

Anthracite Mine Foremen's and Assistant Mine Foremen's Examination Held at Pottsville, Penn., May 25, 26, 1914

(*Continued from last issue*)

Ques. 8—Suppose a mine has two openings, one 60 ft. higher in elevation than the other, on the surface; the temperature of the air outside being 85 deg. and that inside of the mine 50 deg., would there be a current of air passing in the mine; and, if so, in what direction?

Ans.—In this case, much would depend on the depth of the two shafts and the inclination of the seam. The surface elevation at one shaft being 60 ft. above that at the other, suggests the possible formation of a cooler and therefore heavier air column in the shaft having the higher elevation at the surface, assuming that the shaft has a temperature equal to that of the mine (50 deg.), which would make this shaft the downcast. In case the shafts were not deep, this condition would probably prevail, to a greater or less extent, and create a permanent circulation of air in the mine.

In case the shafts were deep, however, or the seam had a considerable inclination, the warm outside air entering the downcast shaft would soon raise its temperature, with the result that there would be little or no perceptible current passing in the mine. What little air would circulate under these natural conditions would simply serve to equalize the temperature of the two air columns.

Ques. 9—When a fan is exhausting the air from a mine, how does it produce ventilation? State, also, how a forcing fan produces ventilation.

Ans.—The action of the fan is the same in either case, the system of ventilation depending simply upon the connection of the mine with the fan.

The action of a centrifugal fan is to create a depression at or near the center of the fan and a compression at the circumference. Under the pressure of the atmosphere, air enters the center of the fan and passes thence to the circumference, where it is discharged, owing to the centrifugal force created by the revolution of the air within the fan.

When the central opening of the fan is in connection with the fan drift, air is exhausted from the mine, and passing through the fan is discharged from its circumference into the chimney and thence into the atmosphere. When the fan is forcing air into the mine, the discharge from the circumference of the fan is conducted into the fan drift, the center of the fan being open to the entrance of the outside air.

In the exhaust system of ventilation, the atmospheric pressure acting on the downcast shaft or intake opening of the mine, forces the air through the mine against the depression in the fan drift due to the action of the fan. The mine airways, in this case, correspond to the suction pipe of a pump or a siphon.

Ques. 10—What are the provisions of the law regarding doors in mines?

Ans.—The anthracite mine law (Art. 10) requires (Sec. 9) all main doors to have an attendant to open and close the door for the passage of cars or men and prevent their standing open; (Sec. 11) all main doors to be so placed that one is always closed when the other is open, thereby preventing any break in the air current; and (Sec. 12) an emergency door provided at all main points and kept standing open so that it will not be destroyed by accident, but can be used at once in case the regular door is broken or destroyed by an accident. The framework of main doors (Sec. 13) must be substantially secured in stone or brick laid in mortar or cement, unless permission to the contrary is given by the inspector in writing.

Ques. 11—What material, in your judgment, should be kept on hand at fiery or gaseous mines, to meet emergencies that are likely to arise from explosions of firedamp?

Ans.—At such mines there should be provided a duplicate or emergency fan that could be at once placed in commission, in case the regular fan was disabled or in case a larger circulation of air should be required to clear the mine. There should always be kept on hand a plentiful stock of timbers of the required size, cap-pieces, brattice boards and canvas, nails and tools. There should be provided, also, a plentiful supply of approved safety lamps and these should be kept in condition ready for immediate use. There should also be a fully equipped rescue station, supplied with a reliable type of breathing apparatus, pulmotors, oxygen cylinders, etc., and a well trained rescue corps. The equipment of the rescue station should include either birds or mice that can be taken into the mine in small cages by the rescue party.

Ques. 12—What dangers are probable in a mine after an explosion of firedamp, and what precautions should be taken upon entering the mine?

Ans.—The chief danger is the presence of the afterdamp of the explosion. There may also exist dangerous quantities of explosive gas that may, at any moment, give rise to a second explosion of even greater violence than the first. There is danger, moreover, of heavy roof falls that renders the work of entering the mine extremely hazardous. Only experienced men should be allowed to undertake the work of rescue, and these must be equipped with the necessary breathing appliances to enable them to proceed with caution to examine, in turn, each section of the mine, in advance of restoring the full circulation of air in such sections. The purpose of this first investigation is to ascertain the condition of the air passages and workings, and to discover, if possible, any survivors of the explosion. In this work, only safety lamps or well protected electric lamps should be used. If fire is discovered in the workings, efforts should be made to extinguish it at once. The investigation should proceed in this manner, until every section of the mine has been explored. As the air current is restored in each section, other rescuers and workmen can enter to aid in the work.

Coal and Coke News

Washington, D. C.

In view of the early completion of the discussion on anti-trust legislation in the House of Representatives, that having been closed on Friday, June 5, a strong demand has arisen in the lower chamber for the adoption of a compulsory party programme designed for the adoption of the so called "Conservation bills" all of which have been before Congress in one form or another for a good while past. Included in this programme are the radium bill which provides for government monopolization and control of radium bearing ores, the Alaska coal land leasing bill, the general oil land leasing bill, and the water power and public land bill.

It is not yet certain how the effort to secure action on these bills at the current session will turn out, but up to date about 200 members have agreed to sign a petition to the Rules Committee asking for the preparation of a binding rule which shall insure the pressing forward of this general scheme of legislation.

Secretary Lane and Chairman Henry of the Rules Committee recently had a lengthy conference with President Wilson in regard to this whole matter and it is understood that the President expressed strong interest in the conservation measures although he did not undertake to commit himself to them as a necessary part of the administration scheme of legislation for the year. If the bills can be passed in the House before adjournment, it will be regarded by the advocates of the scheme as a decided victory in behalf of their ideas.

No Coal Freight Advance Is Expected

It is understood that the Interstate Commerce Commission is now definitely in position to hand down a decision in the 5 per cent. advance rate case within a comparatively short time and that in any event a decision may be expected before the end of June. Extreme secrecy has been observed by members with reference to the nature and scope of the report they intend to make. From inquiries that have been made, however, and from the general tone of affairs at the offices of the Commission, it is pretty generally understood that there is no intention of advancing the rate upon any class of coal.

Anthracite coal is already regarded as bearing altogether too high a freight rate while with reference to bituminous coal, it is felt that the operators have made out a case for their contention that if they were compelled to pay more for freight rates the mines in a good many of the fields could hardly continue doing business if they were to pay expenses.

Another factor which contributes strongly to the belief that the Commission will not saction any advance in freight rates is the circumstance that according to general opinion Mr. Brandeis, the Commission's counsel, has not succeeded in restraining the members from determining to make some advances. This practically implies as a corollary that concessions will be made to Mr. Brandeis along other lines and that some of the items in which he has been most earnest to prevent advances will be dealt with as he desired. One of the things in which he has been most interested is bituminous coal.

On June 8 representatives of Ohio bituminous coal operators filed application in the United States Supreme Court for an injunction against the enforcement of the Ohio State Anti-Screen law until its legality can be tested. The matter was presented by A. C. Dustin, who appeared as counsel for the operators of Cleveland. The matter was taken under advisement.

Appropriations for the Bureau of Mines

The Sundry Civil Appropriation Bill which has just passed the House of Representatives contains important appropriations for the Bureau of Mines, which are expected to be retained substantially unchanged by the Senate as follows:

For general expenses, including pay of the director and necessary assistants, clerks, and other employees in the office at Washington, D. C., and in the field, and every other expense requisite for and incident to the general work of the bureau in Washington, and in the field, to be expended under the direction of the Secretary of the Interior, $70,000.

For investigation as to the causes of mine explosions, methods of mining, especially in relation to the safety of miners, the appliances best adapted to prevent accidents, the possible improvement of conditions under which mining operations are carried on, the use of explosives and electricity, the prevention of accidents, and other inquiries and technologic investigations pertinent to the mining industry, $347,000;

For purchase of mine-rescue, first-aid and fire-fighting equipment and supplies for use in the operation of mine-rescue cars and stations, $30,000;

For purchase of steam and electric equipment for supplying light and power to the testing plant of the Bureau of Mines at Pittsburgh, Penn., $10,000.

For investigation of mineral fuels and unfinished mineral products belonging to or for the use of the United States, with a view to their most efficient mining, preparation, treatment and use, including personal services in the bureau at Washington, D. C., not in excess of the number and total compensation of those so employed during the fiscal year 1913, $135,000;

For inquiries and scientific and technologic investigations concerning the mining, preparation, treatment, and utilization of ores and other mineral substances, with a view to improving health conditions and increasing safety, efficiency, economic development, and conserving resources through the prevention of waste in the mining, quarrying, metallurgical, and other mineral industries; to inquire into the economic conditions affecting these industries: Provided, that no part thereof may be used for investigation in behalf of any private party, nor shall any part thereof be used for work authorized or required by law to be done by any other branch of the public service, $100,000.

For inquiries and investigations concerning the "mining," preparation, treatment, and utilization of petroleum and natural gas, with a view to economic development, and conserving resources through the prevention of waste; to inquire into the economic conditions affecting the industry, $25,000;

For one mine inspector for duty in Alaska, $3000;

For per diem, subject to such rules and regulations as the Secretary of the Interior may prescribe, in lieu of subsistence at a rate not exceeding $5 per day when absent on official business from his designated headquarters, and for actual necessary traveling expenses of said inspector, $2500;

For technical and scientific books and publications and books of reference, including payment in advance for subscriptions to publications, $1500;

For purchase or lease of the necessary land, where and under such conditions as the Secretary of the Interior may direct, for the headquarters of five mine rescue cars and for the construction of the necessary railway sidings on the same, $1000: Provided, that the Secretary of the Interior is authorized to accept any suitable land or lands that may be donated for said purpose;

In all, for the Bureau of Mines, $725,000.

Persons employed during the fiscal year 1915 in field work, outside of the District of Columbia, under the Bureau of Mines, may be detailed temporarily for service at Washington, D. C., for purposes only of consultation or in connection with the preparation of results of their field work; all persons so detailed shall be paid in addition to their regular compensation only their actual traveling expenses in going to and returning therefrom; and all details made hereunder, and the purposes of each, during the fiscal year shall be reported, in the annual estimates of appropriations, to the Sixty-fourth Congress at its first regular session.

HARRISBURG, PENN.

The final arguments in the Government suit against the Reading Co., the Philadelphia & Reading Coal & Iron Co., the Philadelphia & Reading Railway Co., endeavoring to dissolve the so called anthracite coal trust which is alleged by the Government to exist as the result of an illegal combination between these companies, were begun on June 3, in the United States District Court of Pennsylvania.

G. Carrol Todd, special assistant United States District Attorney, made the opening plea for the Government, contending that the Reading Co. is a combination in restraint of trade, due to the fact that it owns stock in both the Reading railway company and the Philadelphia & Reading Coal & Iron Co. The Government also contends that this stock is juggled regardlessly and that large sums of money are lent from one company to the other without interest.

Mr. Todd first gave a general outline of the history of the case and cited the former suit against the same defendants which resulted in the court order to dissolve the Temple Iron Co. In explaining the relationship between the Reading Co. and its affiliated companies he declared that the Reading Co., with the Central R.R. of New Jersey, the Lehigh & Wilkes-Barre Coal Co., and the Lehigh Coal & Navigation Co., controlled 63 per cent. of the unmined coal in the Schuylkill region and furnished 29 per cent. of the entire hard-coal output.

In speaking of the alleged combination he explained that such a method was not the natural and normal way for a

railroad to grow. "The natural and normal way for it to grow," said he, "is by acquiring connecting lines and not those in competition. In every state in the Union it is unlawful for a railroad to acquire competing lines. These combinations, however, cannot be effectually dissolved by a distribution of stock."

While discussing the financial relations existing between the old Reading R.R. and the present Reading Ry. with the Reading Coal & Iron Co., Mr. Todd said that the railroad had lent immense sums to the coal company. He said that at the time of reorganization the total indebtedness of the coal company to the old railroad was $68,000,000.

Immediately after the reorganization we have the preposterously absurd situation of the company transferring a debt of itself, to itself, through the Reading Co. Since the reorganization the Reading railway company has made additional advances to the coal company of $12,000,000. These loans are supposed to be secured by general mortgages, but the Reading Co. pays the interest on the bonds and the coal company has never made a payment on them. Thus, we have a total unsecured debt of about $80,000,000 carried on the books as an open account. A sum approximating $12,000,000 in interest has been remitted to the coal company by the railroad company. In view of these facts, is it any wonder that the Reading Co. owns most of the coal business in the Schuylkill region? It is apparent that they could if they so desired.

Jackson E. Reynolds, counsel for the Reading, said in opening his argument, that the so called trust had not charged monopolistic prices. He declared that no product is marketed at so low a profit as anthracite coal and added that in the past 25 years the coal companies have not made more than 25c. a ton profit on their output. It had been testified by the independent operators themselves, he said, that the alleged trust sells the independents coal at a fair price. The coal companies, he asserted, sell to anyone, anywhere, at the same price.

Charges of exhorbitant freight rates by the railroads had been made but these had been so completely refuted that he considered the issue dead. Statistics presented by Mr. Reynolds tending to show the amount of anthracite coal still unmined were greatly at variance with those offered by the Government. He declared that his figures were obtained from the assessors in the anthracite region while those of the Government were taken from a report made by a geologist to a New York financial institution 20 years ago. Mr. Reynolds' figures showed that the amount of unmined coal at the present time to be nearly 1,250,000,000 tons, while, he said, according to the Government, it amounted to less than 700,000,000 tons.

Continuing his argument on June 4, from the day before, Mr. Reynolds denied that the coal-carrying roads were operated in restraint of trade and interstate commerce. Pointing out the circumstances under which the defendants leased their coal lands to independent concerns, Mr. Reynolds endeavored to show that the Reading had done everything in its power to encourage competition in the anthracite mining district of the state.

John G. Johnson, senior counsel for the defendant railroads, took up the principal allegations of the Government. In giving his views of the suit, Mr. Johnson said:

It must be borne in mind that the Philadelphia & Reading Ry. is not the only railway serving the Schuylkill region. The Pennsylvania R.R. ramifies the Schuylkill field, and it is in evidence that in the year ending June 30, 1911, it transported from that region over 4,000,000 tons of coal and in the following year about the same amount. During the corresponding years the Lehigh Valley R.R. transported 2,800,000 tons and 2,230,000 tons, respectively. In this connection it will be recalled that the evidence shows that the Pennsylvania reaches every point of any traffic importance served by the Philadelphia & Reading R.R., both in Pennsylvania and New Jersey, and reaches New York Harbor and Philadelphia in the immediate vicinity of the terminals of the Reading system.

During the course of his argument, Mr. Johnson told the court that it was the very tribunal that authorized the Reading holding company to acquire control of the stock of the Philadelphia & Reading Coal & Iron Co. and the Philadelphia & Reading Railway Co.

It was also asserted that it was impossible to gain a monopoly over the production, transportation and sale of anthracite coal in the Schuylkill region as there were already 32 independent operators in that territory.

PENNSYLVANIA

Anthracite

Mahanoy City—While timbering in a tunnel of the Ridge colliery on June 4, one miner was killed and another fatally burned by an explosion of gas. The men fired the gas with their naked lamps. The fire was quickly extinguished.

Georgetown—Fire of an unknown origin broke out in the blacksmith shop at the Red Ash colliery, on June 3, and for the lack of efficient fire-fighting apparatus several buildings were destroyed, and much damage resulted. The building was burned with a large amount of tools. The timekeeper's office was also burned and valuable books and papers were destroyed. The car shops, located in a frame building near-by, ignited and were badly damaged.

Pringle—Settling of the ground has been noticed near Washington St., the result of weak support of the roof in the mines of the Kingston Coal Co. As yet no serious damage has been done to adjacent property.

Shamokin—The Hickory Ridge Colliery of the Susquehanna Coal Co. suspended operations, June 4, when all union employees went on a strike to force a number of men to become members of the United Mine Workers of America. Between 600 and 800 men and boys quit work. About 500 employees of the Scott shaft, operated by the same company, also went on strike.

Wilkes-Barre—Litigation which has been long pending and which involved the royalties on a considerable area of coal land was brought to a close, June 4, when the Lehigh Valley Coal Co., filed an agreement with the recorder of deeds to pay $155,000. The trustees of the proprietors of Kingston Township are the plaintiffs and the money derived from the settlement will apply to the school districts of numerous towns that have been formed from the original area of the township.

Bituminous

Connellsville—The Connellsville coke trade is steadily dwindling. Of the 37,935 ovens in the upper and lower Connellsville region, 21,020 are in operation, but their output represents only slightly over 80 per cent. of their capacity. A majority of the merchant ovens in operation are running six days per week, but the greater portion of the furnace ovens, on the other hand, are operating but four days.

Butler—As the result of legal proceedings to determine the ownership of the property of the Erie Coal & Coke Co., at Ferris, Fred Roe, a stockholder and five mine guards were recently arrested charged with trespassing. The Roe faction refused to give possession to Levi Deal, who was recently elected president and general manager. Deal's election is held to be legal.

Mount Pleasant—A class in mining has been started in the public schools by a number of young men of this district, and meetings will be held each Tuesday and Friday evening at 7 o'clock. James Wardlow, of Scottdale, has been engaged as an instructor. It is the intention of the students to continue the class as long as there is any information to be gained which will be of benefit to those attending. It is also intended to have instruction in first-aid work once a month.

WEST VIRGINIA

Charleston—Charles W. Mills, A. L. Faulkner and Patrick Gilday, commissioners of conciliation in the Kanawha Coal miners' strike in West Virginia, on June 8 held a conference with Secretary D. T. Evans and others of the operators' association, and Thomas Haggerty and Thomas Cairns, officers of the United Mine Workers, hoping to find a common basis of agreement.

Bluefield—In the first-aid contest held in Bluefield, on May 13, George E. Wysor, C. C. Bailey and T. J. Burwell tied for first honors in the one-man event. This tie was settled in a second contest held on May 30, when George E. Wysor secured first place with a score of 96.4 per cent. It should be added that Mr. Wysor served 10 years in the hospital corps of the United States Army in the Philippines.

KENTUCKY

Winchester—The Fidelity & Columbia Trust Co., of Louisville, was on June 3 appointed as receiver of the Day Lumber & Coal Co. with full power and authority to operate and manage the business of the company whose plants are situated at Clay City, Jackson and Beattyville.

Hellier—The Alleghany Coal Co. will make an increase of from 50 to 75 cars per day in output, effective June 15. Some 200 extra men will also be given work.

Whitesburg—Another big coal-developing company, a subsidiary of the Elkhorn Mining Corporation, is being organized in Baltimore, according to information received here. It is said that the capital of the new organization will be several million dollars. Its organization follows closely on the heels of the recent visit to this section of a party of Eastern capitalists. The new corporation, it is declared, will acquire about 20,000 acres of the Elkhorn Mining Corporation's property in the Boone's fork and Beaver Creek sections and develop them.

Slemp—A 100-acre boundary has been purchased and will be developed by the Leatherwood Coal Co., recently organized. The company has a capital stock of $40,000 and R. C. and M. Cornett are among the incorporators.

OHIO

Columbus—Coal operators and striking miners of Ohio failed to reach an agreement on June 5 on a wage scale, and the joint conference was adjourned. After the adjournment of the joint conference, the miners and operators went into separate executive sessions.

Columbus—The Essex Coal Co., of Columbus, Ohio, has about completed equipping its two new mines in the Pomeroy Bend field which will be ready for operation when the Ohio mining scale is signed. The spur from the mine of the Kanawha & Michigan R.R., which is about three miles in length, has been constructed. One of the mines will have a capacity of 1000 tons daily and the other 1500 tons. Both will have modern electrical equipment and be arranged to conform to the anti-screen law.

INDIANA

Brazil—The tract of land just west of Carbon, recently purchased by the firm of Brown & Owens, has been leased to a company of Brazil business men, who will shortly drill for coal. It is said in case the coal is found at a shallow depth, steam shovels will be employed, and the coal stripped. If it is lower, however, and of a sufficient thickness, a mine will possibly be sunk upon this land.

Sullivan—The Booster Club has raised a bonus of $2500 to obtain the shops and general offices of the Consolidated Indiana Mining Co., which proposes to spend $7000 in building a plant.

The Shirley Hill Coal Co. recently paid the administrator of the estate of Frank Miller, killed in the mine, $9104.

The Jericho mine and coal washer has reopened, after a shutdown since Apr. 1. A string of 800 empty cars was on the sidings.

Clinton—Miami mine No. 8 has resumed, the damages to machinery following a fire having been repaired. It is the largest employer of labor in the Clinton field, and holds the record of the 20 mines for the largest hoist in one day.

ILLINOIS

Springfield—Thirty pupils of the Bunn School have received certificates as first-aid students, as the result of a course given in this subject by the principal of the school and Thomas English, of the Illinois Mine Rescue Station.

Herrin—The engine room and boiler house, together with the generators, and the wash house at Mine B of the Chicago & Carterville Coal Co. was destroyed by fire recently, entailing a loss of several thousand dollars, which was covered by insurance. It will take about two months to repair and put the mine in shape for operation.

Sparta—The Illinois Fuel Co. has just finished the installation of a new crusher at its mine at this place. This company will be the first in southern Illinois to install a crushing plant at its mine to crush mine-run coal for large steam contracts, in order that the screenings may take a lower rate of anywhere from 10 to 20c. per ton under what the mine-run would take, were the mine-run to be shipped in that form and crushed at destination. Several Illinois roads have a lower rate on screenings than on the other sizes, and this mining company has devised a scheme that looks quite attractive to several large consumers.

Benton—The Middle Fork Mining Co., which is sinking a mine two miles southeast of this place, has secured 1700 acres and will make it a 4000-ton per day mine. It will be operated entirely by electricity, and the work is in charge of J. M. Seymour, who has had charge of sinking every mine in the vicinity of Benton.

Belleville—The influence of a certain element of a mining-town population is much in evidence here at the present time. An attempt has been made by the better element of citizens to eliminate the sale of intoxicants and the drunken scenes that have attended the annual picnic of the public schools of this city. Belleville is one of the few mining towns in Illinois that has failed to show any progress in municipal affairs or in a general moral way in the past 25 or 30 years.

The engine room at the Muren mine, operated by the Southern Coal, Coke & Mining Co., of St. Louis, just east of here, on the L. & N., was destroyed by fire recently, with a loss of $10,000.

ARKANSAS

Fort Smith—Fifty men were sworn in as deputy United States marshals at Fort Smith on June 3, and taken to Prairie Creek to guard the mine of the Mammoth Vein Coal Co., operated by the Bache-Denman Co., Despite the fact that the company secured a federal injunction against strikers, clashes have been frequent. The mine recently was put into operation again.

WYOMING

Sunrise—A crew wearing oxygen helmets recently prevented a disastrous fire in the big mine of the Colorado Fuel & Iron Co. at this place. The fire was discovered in the bottom level, and would doubtless have spread had not the use of helmets made it possible for the fire-fighters to work in the smoke and gases.

FOREIGN NEWS

Sabinas, Mexico—It is reported that the French ambassador at Washington has requested the State Department to investigate the confiscation by constitutionalists of coal mines at Sabinas, owned by French interests. Managers of the mines are prepared to forward estimates of their damage to the State Department.

St. Petersburg, Russia—The latest result of the new anti-Jewish law is the closing of 50 collieries in the province of Ekaterinoslav, which are owned or leased by Jews. This action was taken by order of the assistant-governor of the province, and rendered 6000 miners idle. The Jewish proprietors are forwarding a petition to the Minister of Trades.

PERSONALS

J. D. Parker, chief engineer of the American Coal Corporation, resigned from that company on June 1 to engage in other business in Birmingham, Ala.

B. P. Manley, late of Denver and Salt Lake City, has assumed the position of general manager of the American Fuel Co., of Utah, and subsidiary interests.

V. P. Leyson, a native of Wales, has been appointed chief engineer of the Montevallo Coal Co., with mines at Montevallo, Ala., and assumed his duties June 1.

John Wynn, manager of the Edgefield Coal Co., near Canton, Ohio, sailed from New York June 10 on the "Aquitania" for Liverpool. He expects to spend several weeks in the British Isles visiting relatives.

Tom Sneddon, superintendent of the Diamondville, Wyoming coal properties of the Anaconda Copper Mining Co., sailed for Scotland, June 10, on the "Aquitania," on one of his periodical visits. He will be away about three months.

M. H. McCorkle, secretary of the Sterling Coal & Coke Co., has resigned and has been succeeded by Yale H. McManus, formerly secretary of the Winona Coal & Coke Co. H. G. Oaks has been made store manager by the former company.

Mrs. John C. C. Mayo, widow of the democratic national committeeman from Kentucky, it is reported will be elected a member of the board of directors of the Consolidated Coal Co., of Baltimore, and other important corporations in which her husband was interested.

Graene Turnbull has resigned from the Consolidation Coal Co. to take a place as secretary and treasurer of the Empire Coal Co., of Montreal, Can. Mr. Turnbull, for a number of years, was confidential man of President Jere H. Wheelwight, of the Consolidation Coal Co.

W. A. Thomas, for several years past commercial engineer in charge of all sales of mining apparatus for the Westinghouse Electric & Mfg. Co., resigned his position with that company on June 1, and has taken up the practice of consulting engineering in Pittsburgh with offices in the Second National Bank Building. His training in practical mining, coupled with his work with the large electrical companies and extensive experience with mining firms, should peculiarly fit Mr. Thomas for the new work which he has chosen. He will specialize on mining.

CONSTRUCTION NEWS

Hellier, Ky.—The Elkhorn Consolidated Coal & Coke Co. is planning the opening of two new mines and extensions and increases in its plant, employing several hundred additional men.

Greenville, Ky.—The W. G. Duncan Coal Co. has awarded contracts to the Roberts & Schaefer Co. for the building of

two Marcus patent coal tipples for installation at Greenville and Luzerne, Ky.

Pottsville, Penn.—The East Bear Ridge Coal Co. has taken possession of the Girard tunnel at Mahanoy Plain, and is shortly to advertise for the erection of a breaker, plans of which are in course of preparation.

Kewanee, Ky.—The Kewanee Coal Co. will build 50 additional miners' houses and open two additional mines, with a large increase in coal shipments within the next 60 days. Vast improvements will be made in the plant.

Mossy Bottom, Ky.—The Keyser Coal Co. is preparing for an extensive coal-mining operation here and will build a short line branch railroad from the Chesapeake & Ohio to reach it. It will ship from 60 to 75 tons per day from the start, while rapid increases are to be made.

Penny, Ky.—The Elkhorn & Shelby Creek Coal Co., which has its principal office at Jenkins, Ky., is now constructing a tipple and will operate two mines near here, with an initial capacity of 600 tons daily. According to W. J. Christopher, the manager, it may build a small power plant.

Cabin Creek Junction, W. Va.—The steam power plant of the Virginian Power Co., was formally opened June 6, a number of invited guests being present. This plant, which cost $1,250,000, is believed to be the largest that has been constructed as an auxiliary plant supplying current solely to coal operations.

Birmingham, Ala.—The Maryland Coal Co. will increase its output at its Sipsey mines in Walker County. Several additional drift openings will be made at once, the object being to get the output up to 2000 tons per day. Although this mine is only about one year old, approximately 900 tons per day is now being mined. The improvements will cost in the neighborhood of $100,000. The initial steps were taken recently in the actual development of the Panama Coal Co. property six miles east of Sipsey. The engineering force of the Frisco has started the survey for a spur to the mine. This property will be developed at once at a cost of approximately $1,000,000.

Chicago, Ill.—S. M. Felton, president of the Chicago Great Western Ry. Co., has awarded a contract to the Roberts & Schaefer Co., for the building of three 100-ton capacity, reinforced,concrete, counterbalanced-bucket (Holmen type) locomotive coaling plants for installation at St. Joseph, Mo., Carroll, Iowa, and Kenyon, Minn. Also a 50-ton capacity frame coaling station at Red Wing, Minn. In addition, as receiver for the Pere Marquette Ry. Co., he has awarded this firm contracts for the building of two 100-ton concrete stations from the same design for installation at Blenheim, Ont., and Port Huron, Mich. The plants are alike and equipped with 100-ton weighing features.

Riola, Ill.—The Allen & Garcia Co., engineers, McCormick Bldg., Chicago, Ill., have completed the design and specifications for the new tipple to be erected for the Bunsen Coal Co., near Riola, Ill., and is asking for bids. This tipple will be of the well known A. & G. patented design and will probably be one of the largest and strongest steel tipples ever constructed in Illinois. One of the innovations in its construction will be the wide docking table 30 ft. long placed immediately ahead of the weigh pan to enable the dock boss to examine the coal for rock and refuse before it goes onto the screen. A counterbalanced gate is placed at the head of the screen so that a car of dirty coal instead of passing from the docking table over the screens and into the cars can be readily diverted by means of this gate into a railroad car on the 4th track where the coal can be cleaned without interrupting hoisting.

NEW INCORPORATIONS

Dennison, Ohio—The capital stock of the United Coal & Fire Clay Co. has been raised from $10,000 to $100,000.

South Bend, Ind.—The United Mining Co. has been incorporated here, with $25,000 capital stock, to deal in oil, coal and gas lands. The directors are S. M. McDonald, W. R. Roberts and O. S. Womine.

Glen Roy, Ohio—The H. & W. Coal Co. has been organized for the purpose of mining, with a capitalization of $5000. The incorporators are G. W. Welch, Irene Welch, C. M. Reese, Carrie Reese and William Ware.

Fort Smith, Ark.—The Edwards & Edwards Coal Co. has been organized with a capital stock of $20,000. The officers are W. F. Edwards, president; Jesse Edwards, vice-president; Helena Edwards, secretary, and Katie E. Edwards, treasurer.

Cleveland, Ohio—The West Virginia and Ohio Coal & Coke Co., has been organized for the purpose of mining with a capitalization of $15,000. The incorporators are G. L. Cassingham, J. W. Canavan, C. L. Ayers, Ralph Iago, and Almieda Cassingham.

Providence, Ky.—Notices of dissolution of the Luton Coal Co., a Kentucky corporation, have been published. The company recently disposed of its holdings and serves notice that its business will be wound up on June 15. S. K. Luton was president of the company.

Owensboro, Ky.—The Bon Harbor Coal Co. has been incorporated here with a capital of $2000. The company will engage in a general coal business, the mines being situated west of Owensboro. Louis Hoback is president and principal stockholder and S. Weikel, secretary and treasurer.

INDUSTRIAL NEWS

Lookout, Ky.—The Big Branch Coal Co. plans the opening of new mines on an additional coal tract near Lookout, with increases in its old operation of from 75 to 100 cars per day. This to become effective July 1.

Venice, Ill.—The Chicago & Alton R.R. has purchased a large acreage between this place and Brooklyn, adjoining its present right-of-way and near the roundhouse, to be used for an extension of coal-storage tracks.

Knoxville, Tenn.—In a petition in voluntary bankruptcy by the Consolidated Coal & Coke Co., of Knoxville, the liabilities are scheduled at $6,794.86, and the assets at $6,239.46 of which sum $5,369.46 are represented by accounts due.

Columbus, Ohio—According to the financial report of the Hocking Valley Ry. Co. for the month of April there was a falling off of 46 per cent. in the freight revenue of the road as compared with April of last year. This decrease is due monstly to the suspension of mining.

Washington, D. C.—The Supreme Court on June 8 upheld the constitutionality of the Virginia law requiring companies mining coal or manufacturing iron or steel to pay employees at least monthly in money, and making it unlawful to issue scrip unless redeemable in cash at its face value.

Kansas City, Mo.—Coal men of Kansas City have received notice from the Northwestern Mutual Life Insurance Co. that in future it will not accept for insurance common mine workers, mine bosses and others whose principal work is inside the mines. This class has heretofore been accepted at an extra premium.

Pittsburgh, Penn.—Messrs. George H. Deike and J. P. Ryan, late of the U. S. Bureau of Mines, have organized the Mine Safety Appliances Co., with offices and stock rooms in the Curry Building, 451 Fourth Ave., Pittsburgh. This firm will handle the Koehler safety mine lamp, and the Seibe-Gorman & Co., Proto rescue apparatus.

Wilkes-Barre, Penn.—All the larger producing anthracite coal companies report that the production of coal for May will be slightly larger than that for the corresponding month of 1913, when 5,995,742 tons were shipped to market. It is believed that the output for May, 1914, will be somewhat above six million tons.

Washington, D. C.—The New York Central and other railroads were on June 3 refused permission by the Interstate Commerce Commission to cancel the proportional rate of $2.10 per net ton from the Ohio coalfields to the upper Mississippi River crossings applicable on bituminous coal destined to points west thereof. The roads were directed to maintain the above named rate in effect for a period of two years.

St. Louis, Mo.—Advice from Washington, D. C., is to the effect that Col. Joseph F. Wolfner and Alexander A. Bryden, of this city, representing the Southern Illinois Coal Operators' Association, are meeting with considerable success in an attempt to induce the Secretary of the Navy to try out Illinois coal. It is claimed that Illinois mine-run coal can be delivered at various points on the seaboard at a price equal to that of West Virginia coal and at Gulf points for a lower price.

Punxsutawney, Penn.—The majority of the mines in this section are working two and three days per week, and even with this curtailed output, sidings everywhere are being filled with coal cars. Railroad tonnage is cut almost in half, and as a result many brakemen and firemen have been laid off. A number of conductors were also started flagging, and many engineers were put to firing. In Du Bois, more than 400 employees of the B. R. & P. railway have been laid off.

Coal Trade Reviews

General Review

Anthracite storage bins glutted with steam sizes and the initial curtailment in operations inaugurated. Further shrinkage in bituminous demand and the trade continues under heavy stress. Improvement in Lake shipping creates a more hopeful undertone.

Curtailment of operations in the anthracite regions is finally at hand, a few isolated collieries having reduced operation to five days during the current week. The market is glutted with steam grades, while so much has been stocked that storage capacity is about exhausted. With the possible exception of the New England market, the trade is settling down into a pronounced lethargy with the individuals aggressively raking the market for orders and offering large concessions on most sizes. The general stoppage has been further accentuated by an exceptionally light movement up the Lakes, shipments for the season to the first of the current month amounting to only half those for the same period last year.

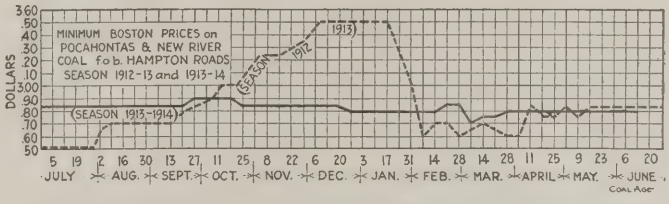
In bituminous there is a growing tendency on the part of the operators to relax from their determined stand for a higher price-level than last year. What contract business remains open will be closed on the same basis as expiring ones. The demand is even less and indications point to a still further shrinkage, while consumption remains at a very low level with no immediate indication of any improvement. But even under the heavy stress the large distributing centers continue remarkably free of demurrage coal. While a moderate improvement may be expected beginning after mid-summer, there is so much excess coal that it will take some time to wipe this out.

A heavier Lake movement supplemented by the long continued shut-down in Ohio has given the first impetus to Pittsburgh district operations which have increased sharply to fully 75% capacity. However, the local trade is spotty, current requirements being light with negotiations on new contracts conducted at unsatisfactory figures. Stocks are generally much reduced, although there is still sufficient to adversely affect the market. The labor conference in Ohio, about which the market there has been hinging for some time resulted in a complete deadlock temporarily, and there is little change in the situation. In the meantime buyers are holding off, only taking sufficient West Virginia coal to meet current requirements pending the return of the Ohio operators into the market.

The May dumpings at Hampton Roads showed a substantial increase, aggregating more than a million tons. The movement at the moment is fairly good, although rather slow to New England, and circular prices are maintained except on small lots, which are subject to some cutting. Lump coal in the Southern market is steady under the impetus of a light summer's stocking movement, and prices are generally firm with only occasional shading to move demurrage coal.

No significant activity is noted in the Middle Western situation. Some dealers find that buyers are showing more interest as stocks are exhausted, and it is reported that a number of railroads will be in the market shortly, but the trade generally is looking forward to a period of unusual quiet.

EASTERN MARKET



BOSTON

Pocahontas and New River prices still weak for inland delivery. No improvement in sight and even lower figures expected. Pennsylvania operators make prices to take tonnages previously held, but Georges Creek remains firm. Marine freights dull. Anthracite still in steady request.

Bituminous—There is substantially no change in the situation reported a week ago. Prices on cars at the various distributing points continue weak, and cargoes of Pocahontas and New River are still being forced on the market. On the few contracts that still remain to be closed there is a strong feeling on the part of shippers who had them last year to meet any price that may be made and the chances are therefore that some new low records may be established before June is over.

Some of the agencies who have cargoes waiting in what are regarded as restricted markets are deadlocked for orders and the trade is looking to see the coal finally moved at ruinous prices. Meanwhile, there is no pronounced offering of Hampton Roads coals at less than $2.85, f.o.b., and while the volume of coal at the piers is not materially reduced yet the various interests seem reconciled to heavy tonnages on cars and manage to worry along with what orders happen to come.

In some industries here there are signs of picking up, but while the more hopeful believe the trend is that way there is nothing like a general improvement as yet. When it does come stocks are so large it will be some time before it creates any extra demand for coal. Certain of the Pennsylvania operators have been scalding down prices lately in the effort to hold business they had last year and several sales have been made at 15@20c. off what had been considered the season basis. Such tonnages, however, are only a normal movement and were taken to keep the mines running. Georges Creek is steady in price but with the output considerably curtailed.

Water Freights are very dull; 65@75c. are the prevailing rates from Hampton Roads to Boston, depending upon the size of the carrier. Several of the large sailing vessels are tied up on account of the slack business.

Anthracite—June is turning out a heavier month for deliveries than was expected. The companies are still well supplied with orders and new business is subject to a fortnight delay in most quarters. The Eastern dealers are taking on supplies up to the limit of storage, although the movement to the consumer is generally light. The cool weather is helping out somewhat.

Current qotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.20@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.45@2.90	2.92@3.02	
New York*	2.45@3.05	2.75@3.20	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.80@2.85
Boston†	.....	.....	.....	3.35@3.63
Providence†	.....	.....	.....	3.40@3.68

* F.o.b. †On cars.

NEW YORK

Bituminous operations further curtailed. Less coal on demurrage but prompt demand entirely gone. Anthracite storage bins congested with steam grades and curtailed operations are going into effect.

Bituminous—The soft-coal market is characterized by a total absence of any new developments. Consumption continues at an abnormally low level, with the possible exception of in the textile lines, and production for the current week will run from 40 to 45% capacity as compared with 50% for last week. If anything, the demand is still less and shows every indication of further shrinkage.

Demurrage coal is rarely heard of only one important instance being noted recently, this involving 1000 tons of a good grade Pennsylvania product, which was offered at $2, but later advanced to $2.25. The comparative absence of consignment coal, in the face of the depressed conditions, indicates an excellent undertone in the market.

What few contracts are still hanging fire will be closed shortly, but the agencies are generally receding from their determined efforts in the early part of the season to obtain higher figures than last year, and the balance of this business will be closed on about the same basis. While there is an almost total absence of prompt demand, the nominal market is not quotably changed and continues as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—All of the prepared sizes of hard coal are now easy, with the possible exception of stove coal, while the steam grades are being put back into storage in such large quantities that bin capacity is being exhausted. Curtailed operations in the mining regions have already been put in effect at one or two collieries, and a general restriction is now definitely in sight. The market is glutted with the steam grades to such an extent that restricted operations are inevitable. The better grades of egg coal can be moved at the circular only when accompanied by a proportion of stove, and the off qualities are selling down to 10 to 20c. less than regular prices. Chestnut is the flatest of the domestic sizes, the off qualities being offered down to as much as 50c. off the circular and the better grades, 25c. less. Pea coal is about equally as bad, with plenty offered at concessions of 25 cents.

In the steam sizes, the low-grade buckwheats are selling down to $2, while the better qualities are holding up to 15 and 20c. less than circular. There is an over-abundance of No. 2 buckwheat on demurrage which can be bought at $1.60, f.o.b., while the better qualities are difficult to move at concessions of 10 and 15c. per ton. The collieries have been restricting the production of barley coal for the past two or three weeks, but there is such an excess supply, that the low grades are selling at $1.25, and sales are even being negotiated at 5c. at the mines in order to permit a continuance of operations. The better grade of barley is selling at 15c. off the circular by the individuals, while the large companies are putting it into storage. The New York market on anthracite is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.80	$4.55@4.70	$4.75	$4.50@4.65
Egg	5.05	4.80@4.95	5.00	4.75@4.90
Stove	5.05	4.95	5.00	4.90
Chestnut	5.30	5.00@5.20	5.25	4.70@5.15
Pea	3.55@3.60	3.30@3.60	3.45@3.50	3.10@3.45
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.00@2.75
Rice	2.30	2.25@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.60@1.80	1.70@1.75	1.25@1.70

PHILADELPHIA

Market for anthracite dwindling. Partial suspension of mining indicated. Orders comparatively few. No change in bituminous situation. Restricted operations fail to stiffen prices and market still continues heavy.

Anthracite—The past week has indicated that partial suspension of mining will be necessary to avoid flooding the market with surplus coal. While it is true that there is a demand for certain sizes, the mines cannot be worked full time to take care of these. It is understood that the storage facilities of some of the companies are well stocked with the small sizes, and as the demand for steam coals has been inactive for some time, the surplus has been going into stock. Of the domestic sizes, chestnut seems to be only one inclined to drag. Broken, egg and stove are all moving well, but the absence of storage facilities in the West, due to the large amount of coal carried over from last year, finds this outlet cut off.

This is doubtless the inception of short time work at the mines during the summer. Every effort is being made to instill some enthusiasm into the market, but the results are far from successful, and it does not seem possible to stimulate any business. Outside of the New England market, which continues about normal, there is really no activity whatever. Individual operators are offering large concessions from the so called circular prices, and making circumstances fit the case. It is understood as much as 35@40c. has been conceded on chestnut coal, in order to effect a quick disposition.

Bituminous—Continued curtailment of mining, coupled with low prices, still fails to create anything like activity in the bituminous situation. The industrial depression still has its effect in the call on contract coal, which in many cases have been reduced fifty per cent. and the demand for spot coal is comparatively nil. Of course, there is considerable tonnage moving, taken in the aggregate, but the comparison is so marked when lined up alongside of last year's business, that it makes a situation far from satisfactory.

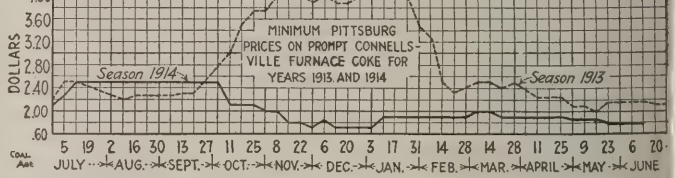
BALTIMORE

General dullness characterizes both the bituminous and anthracite trade. A little better tone in New England and toward the West. Exporting continues the feature of the local market.

In a dull listless market, such as characterizes affairs here, there is little to be said. The hard-coal men say that they are doing some business, but orders for storage coal are only fair at best. Quite a few dealers will grant the full spring discount up to the last of June.

Bituminous conditions remain flat, although it is reported that more coal is being taken on contract for the New England market. Westward too, there is an awakening demand for West Virginia and western Pennsylvania fuels. This inquiry is at present the most encouraging feature of the trade. Meanwhile prices for spot coals remain about the same as last week. Slack is the weakest feature in West Virginia, selling at the mines at from 50 to 55c. Three-quarter gas is worth from 80 to 90c. Little or no change is reported in Pennsylvania line coals.

The export business remains a feature of the trade here and has aided incidentally in preventing any surplus at tide. Necessity for quick loading several times has wiped out some demurrage coal. A wide range is noted in the charter announcements of the past week.



CENTRAL STATES

PITTSBURGH

Mining operations considerably increased in Pittsburgh district, mines operating at about 75% of capacity, chiefly on Lake business. Prices continue irregular, and slack sold at deep cuts. Coke stagnant, prices showing some undertone of strength and production and shipments decreased.

Bituminous—There has been a sharp increase in mining operations in the Pittsburgh district, and the district as a whole is operating at about 75% of capacity, the mines on some lines being in full operation. The increase is due almost wholly to shipments in the Lake trade, which are now fairly good. The Pittsburgh district, of course, is benefited by the partial or complete idleness, of other districts which cater to the Lake trade. There is hardly any domestic trade. The railroads are taking from 60 to 75% of their normal tonnages, and the chief reason that they are not taking full tonnages is that their freight business is light. They have consumed nearly all their stocks laid in some time ago. With manufacturing consumers the case is different, as their stocks are still largely in evidence, because they are operating at from one-half to two-thirds of normal, and stocks which were laid in for 60 days are stringing out to 90 days.

An effort is being made to secure list prices on mine-run and screened coal, though with no great measure of success, and some contracts have lately been taken at rather deep cuts. In the case of slack there is no effort to secure the regular list figure of 90c., and prompt lots have sold down to 55c. in extreme instances. Operators are averse to making contracts for slack except for the full twelve-month, but on such contracts the price is sometimes shaded to 80c. We quote list prices, subject to more or less shading, unchanged as follows: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

Connellsville Coke—The market continues practically stagnant, but with a moderate undertone of strength, as some of the operators are strongly of the opinion that the second-half of the year will prove much better in the iron and steel industry than would be expected from present inactive conditions. One of the four large producers of foundry coke has reduced its price from $2.65 to $2.50, prices usually quoted being to consumers, which means 15c. less to dealers. The other operators are undecided whether to meet the reduced price. Contracting for foundry coke is slow. We quote: Prompt furnace, $1.75@1.85; contract furnace, $1.25@2; prompt foundry, $2.35@2.65; contract foundry, $2.35@2.65, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connelsville region in the week ending May 30 at 244,028 tons, a decrease of 12,602 tons, and shipments at 252,437 tons, a decrease of 23,635 tons. Shipments exceeded production by 8409 tons.

BUFFALO

Indications of a possible stir in bituminous before long. Some consumers exhausting stocks. Strikes elsewhere also having their effect. No improvement in coke. Anthracite dull, but steady.

Bituminous—There is an occasional bituminous jobber who reports better business. Others report similar conditions when they say that the trade is spotty. One jobber says his May trade was 15 per cent. better than April and he is going to make June show an equal increase if he can. But it is a fact that some of the smaller consumers are running out of a supply. The railroads are asking for very little more than they did a month ago, but it is felt that they must reach the end of their supply before long. It all depends now on the consumption.

The strikes in Ohio and West Virginia are reducing the amount of coal coming on the market. It is also said that the agreements with the miners in the Pittsburgh district are not as secure and satisfactory as in the Allegheny Valley. All mines are still run on short time, as it is a certain loss to allow coal to leave the mine unsold. Salesmen are urging coal upon consumers at reduced prices. There is less complaint of coal on track at junction and terminal points, but there is still sufficient to do some harm. If there were none the seller would be able to get a profit, but such is hardly the case now. It is generally agreed that the price of bituminous is at the bottom, yet the more active dealers and shippers stand by the circular, which gives Pittsburgh lump at $2.80, three-quarter at $2.70, mine-run at $2.55, and slack at $2.15, with Allegheny Valley sizes about 25c. lower.

Coke—The market is without new feature of any sort, buyers ordering very sparingly. They are aware that the lowest level has been reached, but this is not a time for accumulation of stock of any sort unless it can be had at sacrifice prices. Coke furnaces are firm at $4.50 for best 72-hr. Connellsville foundry.

Anthracite—The movement is light, but the general tone is good except that jobbers are already dreading the clamor that must come next fall on account of the failure of the consumers to stock up at the low prices. Most shippers by Lake are doing little, although one dock is alone active enough to run the week's total up to 124,000 tons, which is a fair summer average. Lake shipments for the season to June were 603,445 tons, according to custom-house figures, as against 1,143,860 tons to the same time last season. This difference bids fair to widen further as the surplus stocks at Upper-Lake docks is great enough to forbid anything like a heavy movement.

TORONTO

Yards well stocked and trade quiet, but prices steady.

Trade is quiet as compared with previous years at this season. Manufacturers in most lines are restricting their output, and not buying in excess of immediate requirements. The yards are well stocked and few conignments are now coming forward. Prices generally are steady at the following quotations, with occasional shading in steam coal by jobbers who are overstocked: Retail anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6.25; bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars three-quarter lump, $3.75; screenings, $2.75.

TOLEDO

Buyers still holding off. West Virginia mines filling current requirements. Active Lake trade anticipated later in the season.

Pocahontas coal here is very scarce and is bringing prices considerably above the list when it can be secured at all. Domestic Southern coal seems to be in much better demand and there is an improvement in the call for steam fuels. Railroads are not as yet buying to any extent as they seem to be well stocked up. The Lake Shore is said to have purchased heavily of West Virginia coal so that it will be in no danger of a fuel shortage during the busy fall season.

Buyers are holding off and investing in but little of the West Virginia product as it is generally expected that the Ohio operators will be in the field again within a short time. Inquiries are beginning to come in from steam consumers rather freely, indicating that there will be buying from these quarters within a short time. The Lake shipping continues fairly active and there is no weakening of prices. Toledo dealers are hopeful and look forward to a good season's business later on.

COLUMBUS

Nothing accomplished at the labor conference which adjourned "sine die" but with arrangements for again convening later. Operators procrastinating until constitutionality of anti-screen law is finally determined.

With the labor conference a failure, the situation in Ohio shows little change. Mines are still idle and little will be done in negotiating a wage scale until after the constitutionality of the anti-screen law is finally passed on by the United States Supreme Court. The conference found both sides strong in their demands. The miners' delegates stood strongly for a wage scale of 49.65c. for machine-mined coal on the mine-run basis, while operators as strongly opposed giving such a rate, saying that they would be unable to meet competition in other states if such a rate was paid. Governor Cox took a hand in the matter by asking the miners' officials to continue the scale committee and be ready to renew the meetings.

At the conferences, John M. Roan, of the mining department, represented the Governor. The adjournment was made "sine die," but both sides appear hopeful and there is a tendency among the rank and file of the miners to make a compromise.

The demand for steam grades, which is becoming better now since surplus stocks are being exhausted, is being looked after by shipments of West Virginia and Kentucky coal. Mine-run, West Virginia coal is being sold between 70 and 85c. and other grades are correspondingly low. Domestic trade is also showing increased activity. Dealers in Ohio are selling quite a good tonnage, as many householders are inclined to stock up for the coming winter. Pocahontas and West Virginia splints are the popular grades for domestic demand. Little is doing in the Lake trade and comparatively few cargoes are leaving Ohio ports for the Northwest. The ore business continues bad, which has an influence on the coal trade.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.50@$1.40		$1.50@$1.40	$1.50@$1.40
¾-inch	1.35@ 1.30	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.30@ 1.25		1.25@ 1.20	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.10@ 1.05
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.80@ 0.75
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.70@ 0.65

CLEVELAND

Consumers beginning to show an interest in contracts for Ohio coals. Operations will be under way shortly. Price basis same as last year. Improving tone in the Lake trade.

Inquiry for Ohio coal is beginning to be general. No large contracts have been made, but the large consumers of No. 8 are showing more interest than at any time since the coal year opened. The inquiry is largely from lake customers who have only seven and one-half months in which to take in their coal. They at least want to know the price.

Locally the trade is buying from hand to mouth and enjoying prices which cannot last. There is a tendency to sell at very low prices merely because it seems better to move the coal than to store it. In the Youghiogheny field, stocking of slack is going on, but more than enough is coming in to meet the immediate needs of the local market. Withal there is an upward tendency on the part of the operators.

Youghiogheny slack has been selling at 50c. at the mines in competition with Fairmount gas. Toward the last of the week some operators would not meet the low price and from 5 to 10c. more was asked. The spot market was on the basis of $1.60 to $1.65 the last of the week. The low price of Pennsylvania coal has tended to drive Fairmount grades out of the field to a certain extent. Fairmount operators are holding to 50c. at the mines for slack which means $1.65 here to the jobber and this is the high point of the market.

Ohio coal operators will do well to get the same prices as last year, when they start contracting. Pennsylvania has sold coal on contract at 5c. under 1913 prices and some of the larger shippers bought West Virginia fuels on about the same reduction.

The Lake Trade is not improving though a heavier movement is looked for this month. On June 1 two of the largest shippers to Lake Michigan were 50% behind last year on the same date. The Sault Ste. Marie Canals report soft-coal shipments for May to Lake Superior at approximately 475,000 tons less than in 1913 and anthracite shipments were about half. Anthracite movement will be heavier the rest of the season, and Ohio mines will undoubtedly begin shipping Lake coal by June 20.

Vessels of all sizes are plentiful. Boats are being held three to four days for coal. Toledo, Sandusky and Lorain docks, over which West Virginia coals are moved, had heavy line ups last Saturday, many of the boats not getting away for several days. Iron ore shipments are a little heavier than they were and the talk of tieing up more boats is not so pronounced as it was.

For shipments the following prices, f.o.b. Cleveland, are being asked:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.25		
Lump, 1¼-in.		$2.35	
Lump, ¾-in.		2.25	$2.05
Mine run	2.60	2.20	1.95
Egg	3.25		
Nut		2.20	
Slack	2.25	1.55	1.65

CINCINNATI

A freer Lake movement is the only favorable change in the market. Business still slow generally with buying in all departments limited. Restricted production on account of labor troubles apparently having no effect.

In spite of the strike in West Virginia, the market has not improved to any appreciable extent during the past week. Reports indicating that there are more boats at the Lake ports ready for coal is the only news of a cheering nature received for some time; with prospects for a Lake movement of normal volume there will be one outlet for the superabundant supplies, at least. With a large proportion of the West Virginia mines closed down, it would seem questionable to refer to the supplies as abundant, but that is exactly the situation. Dealers are showing a marked reluctance to buy; the steam business is about as slow as it possibly could be, and there is no present indication of improvement.

Inability to dispose of screenings is one of the worst features of the market, and is seriously handicapping smokeless operators, who have their domestic grades sold up. This sluggish steam trade is undoubtedly due to the slow condition of business in general. While the domestic business may regain a normal volume within the month, and the Lake movement also reach its usual proportions, no real recovery of the trade can be expected until general situation improves.

DETROIT

Domestic business showing some increase, but railroad consumption at the lowest point in a long time. Ohio suspension has little effect on the market.

Bituminous—The general trade is still slow, no special inconvenience having been experienced as a result of the long suspension in the Ohio fields. Railroad requirements are down to the lowest point in years, and stocks laid in for 30 to 60 days are proving sufficient to last twice that long. Domestic business is showing some slight activity. Pocahontas egg and lump for June delivery is quoted at $1.75, with July at $2. The circular on splints is $1.50 for June, and $1.75 for July, on egg and lump. Adequate supplies of Hocking lump and three-quarter still seem to be available. The suspension seems to have little effect on the local market, and there is scarcely enough demand to absorb the current arrivals.

HAMPTON ROADS

Movement for the week fairly good. Demand still light with circular prices being maintained. Dumpings for month of May over one million tons.

Dumpings over the piers of the three railroads at Hampton Roads have been fairly heavy with a plentiful supply of coal left on the yards to take care of any vessels which may arrive during the next few days. Foreign shipments have been to St. Lucia, Coronel, Canal Zone, Naples, Ceara, Puerto Madryn, Venice, Port of Spain and Havana. There has been a fair supply of bunker steamers calling here during the week and while shipments to New England have not, perhaps, been as heavy as hoped for at the same time a number of large cargoes have moved to that market.

Circular prices appear to be maintained although there may have been some small parcels sold at a cut. So far as can be ascertained, however, no cutting is being done to any great extent.

During the month of May over one million tons of coal were dumped over the Hampton Roads piers. The Norfolk & Western Ry. is considerably in the lead with 528,270 tons; the Chesakeake & Ohio Ry. dumped 306,290 tons and the Virginian Ry. 263,151 tons. This is an increase of more than 35,000 tons over the figures for the month of May 1913. This increase is divided between the Chesapeake & Ohio and Norfolk & Western, the Virginian Ry. having fallen down to the extent of about 15,000 tons as compared with May last year.

The new steel pier of the C. & O. Ry. at Newport News having been completed and put into operation they are abandoning several of the old wooden piers which will later be taken down.

LOUISVILLE

A decidedly increased domestic demand. Steam grades weak but improvement anticipated shortly. Prices increasing at the usual summer schedule.

There has been a decided improvement in the domestic demand and mines are working on full time generally, with the output of most of them sold ahead up to the first of September. While this is making business good in that respect it is also causing a further glutting of the steam-coal market. Industrial requirements are small, numbers of the large users having reduced orders to half of the normal amount. Some relief is anticipated in the Middleboro section from the announcement of the Southern Railway that it will restore the maximum tonnage at once. Since December this company has been operating on the minimum basis but is now planning to store the surplus for winter and spring use. The situation in the western Kentucky field is not as good as in the east. Many mines are working only one day a week while large numbers have closed down altogether until winter. The railroads which are the large consumers in the summer have been using only small amounts.

Prices on the domestic coals in both parts of the state saw a 10c. increase in June and there will be another in July and August, orders taken now for delivery in those months being at the advance price. Eastern Kentucky block coal ranges from $1.40 to $1.65, while August delivery prices range from $1.60 to $2. Nut and slack are at from 40 to 50c. for the poorer grades and from 65 to 75c. for the better qualities. All prices are f.o.b. mines.

SOUTHERN AND MIDDLE-WESTERN

BIRMINGHAM

Market shows slight improvement over last week. Furnace and foundry coke quiet. Blacksmith coal falling off slightly in tonnage.

The lump-coal market shows some improvement over last week, as the retail yards are beginning to stock up for their fall and winter trade. Prices are remaining firm with no evidence that any reduction will be made from the regular circular. While steam coal is rather quiet, the fact that several of the large railroads have asked for bids on their annual tonnage has had a tendency to make the operators more confident, as the tonnage called for is quite large.

Spot shipments are weak, but prices are remaining about the same, with only an occasional reduction to move track coal. As is usually the case during the summer months, the tonnage on blacksmith coal is falling off slightly, but this cannot be considered as evidence that the market is weakening. Heavy sales of pig iron were made the past week at about $10.50 per ton 2 Foundry, f.o.b. Birmingham. Furnace and foundry coke are still quiet, with no immediate improvement looked for.

INDIANAPOLIS

Conditions are back to normal for June. Mines are making better than half-time and prices are at the usual summer level. Industrial conditions steady.

Reserve stocks, accumulated in February and March, are exhausted and many buyers are again in the market. Contracts are being cleaned up, the larger operators reporting about 80% of them closed. Indiana mines are in operation about four days a week, which is up to the average for this season. Prices are also at about the same level as usually prevails this month, although slack is stronger than at this time a year ago; it is in good demand at 85 to 90c. Operators report industrial conditions in fairly satisfactory shape. The harvest in this state is less than a month away and the marketing of the big wheat crop is expected to mark the beginning of better times, whether the railroads get increased rates or not.

The retailers continue to put the Eastern coals into consumers' bins. There is enough uncertainty yet about mining conditions to induce those that have the money, to get their next winter's coal in hand. Indianapolis dealers are still selling at summer prices though not guaranteeing these later than July 1. The anthracite trade in this city is not lively because of a more general use of coke, which is the principal product of the local gas company. On account of the unsettled mining conditions in Ohio, no coal from that state is coming to this market. Pocahontas and other Virginia fuels find a good market here and dealers so far have been able to fill all orders.

CHICAGO

Little activity in Chicago market. Railroad contracts continue the principal feature in the trade. Not much demand for either steam or domestic coal. No change seen in the dull coke market.

There is nothing of material interest in the Chicago market. With practically no activity in any branch of the trade dealers are looking for a period of unusual quiet. If there is any relieving factor at all, it is a small number of contracts being closed by railroads and a number of large factories, who must use some coal. There is hardly any demand whatsoever for anthracite, while smokeless coal is about the same as for several weeks. Some dealers thought

the introduction of a lower grade of coal, with some of the attributies of smokeless, would effect the high-grade smokeless market, but no change in the latter is seen.

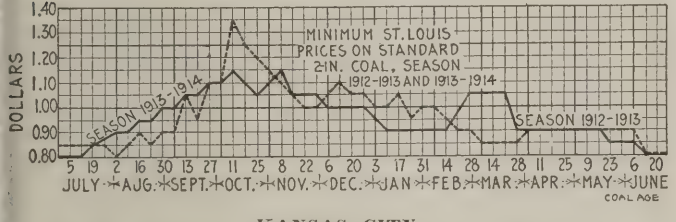
It is generally believed that the money stringency has played a large part in making the present dull situation. There are some, however, who believe that this will soon be relieved and better conditions prevail. The coke market is about on a par with general conditions and there is little, if any, demand.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.05@2.10	$2.30@2.40	$2.10	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.65
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.77	1.96	1.67	

Coke—Connellsville and Wise County, $5@5.25; byproduct egg, stove and nut, $4.45; gas house, $4.25.

ST. LOUIS



Situation generally discouraging but consumers showing a tendency to buy. Car shortage next fall being already anticipated. Surpluses seem well depleted.

There is a little contracting going on, either for steam or domestic, but the consumer is inclined to buy on the open market. Shippers feel that there will be a shortage of cars next fall which is making some of them a trifle cautious. The same unsatisfactory conditions as for several weeks past still continue in the different mining districts in Illinois and the mines in Williamson and Franklin Counties are gradually resuming operations, with practically no market for their output. The large supplies accumulated by the railroads previous to April are about exhausted now and most of the roads are again in the market. This is relieving the condition in the 5th and 9th Districts to considerable extent. Anthracite is moving in slow, and smokeless is picking up a trifle. Inquiries are coming in this month for domestic coke, but on the whole there is very little coal moving.

The market is now quotable as follows:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump			$1.20	$0.80@0.90	$1.15
3-in. lump			1.15		
6-in. lump	$1.20@1.35		1.25	1.00@1.15	1.35
Lump and egg	1.85@2.15	$2.00			1.15
No. 1 nut	1.20@1.35				
Screenings	0.85@0.95		0.80@0.85	0.70@0.80	0.75@0.80
Mine-run	1.00@1.15			0.75@0.80	
No. 1 washed nut	1.40@1.50	2.25	1.50		
No. 2 washed nut	1.25@1.35		1.35		
No. 3 washed nut	1.25@1.30				
No. 4 washed nut	1.25@1.30				
No. 5 washed nut	0.80@0.85				

Coke—Gashouse, $4; byproduct, $4.75, both f.o.b. St. Louis.

KANSAS CITY

Business showing improvement. Coal moving to wheat fields. Lump in better demand from harvesters. Market steady.

Coal is being shipped in quantities to the scene of the wheat harvest in Kansas, Oklahoma and Missouri and business is much improved as a result. Lump is in better demand, about one-third of the threshermen buying lump, and the remaining two-thirds using nut. Nut is to be utilized exclusively in the South, while Northern agriculturists are showing a preference for lump. The market is steady and stiff, with no concessions offered by operators.

PORTLAND, ORE.

Effort being made here to introduce Chinese anthracite on Pacific Coast. Local demand dull and will probably continue so for some time. Some fear expressed that Colorado strike may spread to Utah and Wyoming this fall. Wellington coal enters market.

Shippers at Seattle have corresponded with coal dealers here relative to possibilities of introducing Chinese anthracite on this coast. It is said the coal could possibly be retailed here for not to exceed $12 per ton. Several steamship companies are operating regular service between the orient and this port and it is certain that more satisfactory freight rates could be maintained on this coal than from Australia.

Although it has been reported here that the Panama Canal would undoubtedly be opened to traffic in a few weeks, coal dealers here have received information from the anthracite people in Pennsylvania indicating that there is no probability of any coal ships passing through the Canal before the first of 1915. This would make it too late in the season to admit of any large shipments for the coming season.

It has been intimated that there is a possibility of the Colorado strike situation extending into Utah and Wyoming next fall. This in addition to a car shortage may prove a hardship on consumers as well as dealers the coming fall.

Wellington coal has again entered the Pacific Coast market, and while little has as yet found its way into Portland, it is being shipped to San Francisco in considerable quantities. The condition of the market here has not justified much importation.

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY

Total shipments of coal over this road for April of the current year amounted to 342,843 tons as compared with 345,039 tons for the same month last year.

ANTHRACITE SHIPMENTS

Anthracite shipments for May and the first five months of the current year as compared with last year were as follows:

	May		5 Months	
	1914	1913	1914	1913
Phila. & Reading	1,202,679	1,123,869	5,086,832	5,703,277
Lehigh Valley	1,249,218	1,191,632	4,829,093	5,408,310
Cent. R.R. N.J.	782,889	745,347	3,549,573	3,724,219
Del. Lack. & West	901,596	882,651	3,656,638	3,961,646
Del. & Hudson	663,648	591,499	2,754,627	2,936,187
Pennsylvania	579,869	574,468	2,746,436	2,656,765
Erie	702,892	671,972	3,251,852	3,417,900
Ont. & Western	198,762	214,304	940,552	1,073,503
Total	6,281,553	5,995,742	26,815,603	28,881,807

FOREIGN MARKETS

GREAT BRITAIN

May 29—With the Whitsun holidays so near, business is quiet. Quotations are approximately as follows:

Best Welsh steam	$4.68@4.80	Best Monmouthshires	$4.11
Best seconds	4.56	Seconds	3.87
Seconds	4.29	Best Cardiff smalls	2.67
Best dry coals	4.32	Seconds	2.46

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.

Coke is quoted at: Special foundry, $6.24; good foundry, $4.80@5.52; furnace, $4.08@4.56.

COAL FREIGHT DECISIONS

I. C. C. Nos. 5607 and 5601 Sub. No. 1—J. E. Stone & Son vs. Southern Ry. Co. (No. 5001) and Griffin-Hallman Fuel Co. vs. Southern Ry. Co. (No. 5001 Sub. No. 1).

Rate of $2.05 per ton on coal from Newcomb, Tenn., to Greenville, S. C., found to have been unreasonable insofar as it exceeded a rate of $1.95. Reparation awarded.

Suspension Docket No. 280—Coal rates from Indiana and Illinois mines to stations in Iowa.

Proposed increased rates on coal from grouped mines in southern Indiana and Illinois to points on the Mason City & Clear Lake and Inter-Urban railways in Iowa held to be justified and order suspending their operation canceled.

Suspension Docket No. 338—Coal rates to Dewey, Okla.

Proposed increased rates on slack and run-of-mine coal from West Mineral and Fleming, Kan., to Dewey and Bartlesville, Okla., not found to be justified and directed to be canceled.

Suspension Docket No. 281—Proportional rates on coal from Ohio coal fields to Mississippi River crossings.

The cancellation of the proportional rate of $2.10 per net ton from Ohio coal fields to the upper Mississippi River crossings, applicable on bituminous coal destined to points west thereof, not justified.

Financial Department

Delaware, Lackawanna & Western

President Truesdale, of this company, reports, in part, for the year ended Dec. 31, 1913, as follows:

Results—The earnings, both gross and net, for 1913 were large, and reflected the business conditions of the country generally during that period.

The unusually large crops of all kinds produced in 1912 stimulated business activities in every direction, and as a consequence the railroads of the country during the greater part of the year handled an exceptionally large tonnage, in which this company participated to an extent not equaled in any preceding year. Our mining operations, which were suspended for about two months in 1912, were prosecuted without important interruption throughout the year and the transportation earnings on coal were, in consequence, $1,138,203 more than in 1912.

Taxes—The increase in taxes was $208,020, or 11.74%. This illustrates the current trend of affairs, national, state and municipal.

Coal-Mining Department—Our mining operations resulted in a larger production of coal than in any previous year. The net earnings from this source, however, were $841,876 less than in 1912. This was due to various causes, but chiefly to higher mining cost. As explained last year, many of our mines have reached a point where the larger part of the coal produced is being mined from the thinnest workable veins of coal in the anthracite region, and in mining it large quantities of rock have to be taken out, which in some cases costs more to blast and remove than the coal itself. The miner has to use almost double the quantity of powder in taking out the rock that he uses to secure the coal, and his pay is increased accordingly. Much of the coal from these mines is also mined from the old abandoned workings and is secured only at a high cost per ton. The cost of mining has been further increased appreciably as a result of labor troubles.

The state of Pennsylvania has also undertaken to collect a tonnage tax on the anthracite coal produced on the basis of 2½% on the amount realized by sale of coal at the mines. This tax cost us about $250,000. The increase in taxes levied by the counties and municipalities in the anthracite region cost us the additional sum of $106,804.

The tonnage produced from our collieries and washeries was 8,844,063 gross tons, or 677,273 tons more than in 1912. The development of the new operations, i.e., the Loomis and the Laurel Run, has been pushed vigorously and should by Dec. 31, 1914, be producing a considerable tonnage.

Extraordinary expenses, aggregating $959,511, were made for improved equipment and on the new developments. The outlook for the coming year, as respects the anthracite-coal industry, seems fairly encouraging.

Financial—During the year an increase of $12,000,000 in capital stock was subscribed for by the stockholders; 50% of the subscriptions was called early in the year and the proceeds largely utilized in paying for the work done during the year on the new Clarks Summit-Hallstead line. The balance due on the new stock was payable Jan. 5, 1914. At the present writing these payments have all been made and certificates of stock issued therefor, thus making the present issue of stock outstanding $42,277,000.

General Remarks—During the last two months of 1913 the business activity of the country at large slowed down very rapidly, and at present writing the volume of business being done is from a fourth to a third less all around than at the same time a year ago. This was in part due, no doubt, to the shortage of the corn crop of 1913, but to a greater extent, however, to a widespread feeling of doubt and uncertainty as to the effects of the tariff and currency legislation pending and under consideration by Congress and finally enacted into laws. The railways immediately felt this slowing-down process and have been forced to retrench.

The present outlook for 1914 appears to be somewhat uncertain, not to say discouraging, to the railway interests and those more or less dependent on them for their prosperity. Of course, if later in the year the prospects for abundant crops appear to be good, conditions may change very much from what the present outlook promises.

Gross Revenues

	1913	1912	1911	1910
Coal	$14,418,507	$13,280,304	$14,096,725	$14,067,778
Mdse., fght.	15,089,067	13,999,359	12,462,679	12,443,473

*000 omitted.

Note—For the previous annual report of this company, see "Coal Age," Vol. 3, p. 708.

Lehigh Coal & Navigation Co.

Railroads—The coal tonnage of the Lehigh & Susquehanna R.R. and branches aggregated 9,328,493 tons, an increase over 1912 of 338,790 tons, and a decrease from 1911 of 217,409 tons. The gross receipts were $9,962,036, showing a net increase of $41,850 over 1912. The Panther Creek R.R. has been merged with the Lehigh & Northeastern R.R.

The net revenue received from railroads for the year was $2,495,081, a decrease of $76,124.

Lehigh Navigation Electric Co.—The power plant of this subsidiary at Hauto has been practically completed, and is now in partial operation. Full operation will be inaugurated as soon as connections are made with prospective customers, with whom contracts have been made for the sale of a substantial amount of the power to be produced. It is hoped that negotiations will soon be completed which will provide a satisfactory market for the entire estimated production of the present installation.

During the year electric companies have been chartered to operate in additional townships which may be reached by the Lehigh Navigation Electric Co.'s transmission lines.

RESULTS FOR CALENDAR YEAR 1913

	Coal	Canals	Railroads	Miscellaneous	Total 1913	Total 1912
	$	$	$	$	$	$
Revenue	14,279,914	213,490	2,901,595	899,688	15,294,687	13,808,650
Expenses	9,808,108	253,135	406,514	20,823	10,488,581	9,573,351

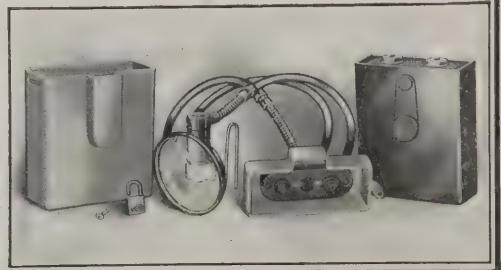
Ask the Mines That Use—

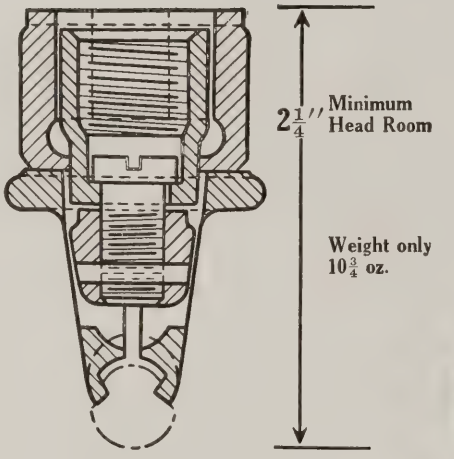
Wico Safety Electric Lamps



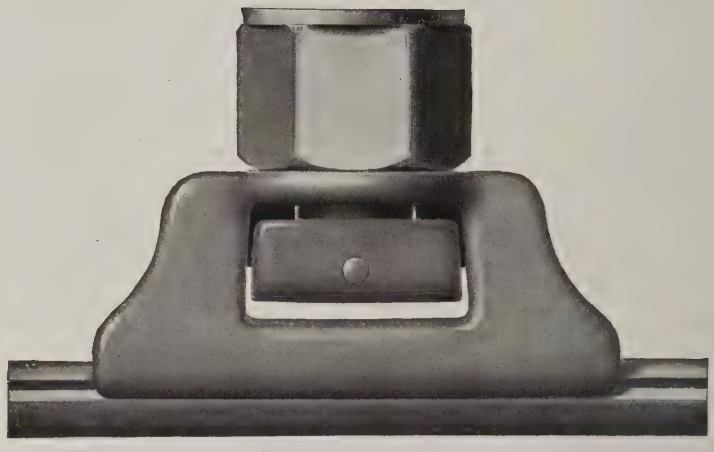
WHETHER the electric safety lamp has reached the stage where it can be considered a practical equipment and they will answer **yes,** most emphatically. They will tell you that you can purchase the Wico lamp now without trial and be assured of economical, efficient service. As compared with other cap lamps, it is much stronger, has more hours of light when first put in service and after months of daily use will burn far beyond the shift requirements when other lamps are out of commission or so short of battery capacity as to be unreliable in the extreme. The vital point of the electric lamp is the battery. The Wico battery is practically indestructible and guaranteed to give twe ve hours of light daily for a year from date of purchase.

Approved by United States Bureau of Mines

So that you can take for granted the safety of the Wico Lamp in gaseous atmospheres. The other big questions, daily cost and efficiency, have been answered **in** practical service. You can have the answers for the asking.



Write today.



Witherbee Igniter Company
Springfield, Massachusetts

It's to your advantage to use

Westinghouse Type RE Trolley Wire Clamps

Consider these points:

1. Ultimate side strain required to pull 4/0 grooved trolley wire from jaws, 1350 lbs.

2. Ultimate vertical strain required to pull 4/0 grooved trolley wire from jaws, 1950 lbs. Should the wire be pulled from the jaws it can be immediately re-inserted and tightly clamped. It is not necessary to straighten the jaws which may have been distorted.

3. The clamp is tight against the suspension body at the same time wire is clamped.

4. When the wire has been inserted in jaws it is held automatically until the clamp is firmly tightened.

VOLUME 5 JUNE 20, 1914 NUMBER 25

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 993

Much depends upon the accuracy of the small scale on a coal tipple, which is used for weighing the loaded mine cars. Errors in weights are a frequent cause of petty strikes.

*AN EPITAPH: *Page* 994

Poem by Berton Braley.

HISTORICAL SKETCH OF THE GEORGES CREEK COAL REGION: *Pages* 995-1000

A history of the Georges Creek field from its earliest settlement. Coal was probably found by the Indians, and it is said Braddock's army burned it on their march West. But not until the railroads and the canal were built did the tonnage increase to 2000 tons per year. The methods of the primitive miners are described, as are also the steps by which transportation and operation were placed on a stable footing. R. A. Walter. COAL AGE, Vol. 5.

ELECTRICITY IN COAL MINING—V: *Pages* 1000-1002

The selection of prime movers, reciprocating engines, steam turbines and waterwheels, is taken up in relation with the first cost and operating expenses of the plant. David R. Shearer. COAL AGE, Vol. 5.

EFFECT OF PANAMA CANAL ON WORLD'S COAL MARKETS—II: *Pages* 1003-1005

This installment is confined essentially to a discussion of the merits of our different foreign competitors. Great Britain is the power to be reckoned with in the world's coal trade, but there are other countries forging ahead rapidly which cannot be ignored. The use of fuel oil threatens to be a powerful factor in the situation, particularly in the Pacific Coast markets. F. R. Wadleigh. COAL AGE, Vol. 5.

*THE LIGNITE BRIQUETTING PLANT AT MINOT, N. D.: *Pages* 1006-1009

With greater supplies of lignite than all other varieties of coal combined, the time is fast approaching when these low-grade fuels will be briquetted and used. In certain instances, including the one here described, this has already proved a commercial success. G. J. Mashek. COAL AGE, Vol. 5.

THE LABOR SITUATION: *Page* 1010

Colorado is quiet, except for rumors of drastic action by the President. Many firearms have been surrendered in the northern part of the state. Mother Jones has been denied admission into Canada by the immigration authorities. Serious trouble was feared in West Virginia, but affairs there are now pacific. COAL AGE, Vol. 5.

MINE INSPECTORS' INSTITUTE: *Pages* 1011-1012

Principal features of the seventh annual meeting of the Institute, held at Pittsburgh, Penn., June 8-12, 1914. Description of the demonstration given by the Federal Bureau of Mines for the entertainment and instruction of the visiting members at their testing station in Pittsburgh and at the experimental mine at Bruceton. The Other Man's Opinion

It's always interesting to compare notes on the paper you read—to ask your friends what they think of it and to get other men's opinions. Out of our regular correspondence we have taken some opinions on Coal Age—you will like to look them over:—

"I have seen enough of your publication to appreciate its value, and I take pleasure in renewing my subscription."
J. F. Welborn, Pres.,
Colo. Fuel and Iron Co.,
Denver, Colo.

"We subscribed for Coal Age with its first issue, and think highly of your paper."
F. L. Schoew, Pres.,
Howard Colliery Co.,
Chattaroy, W. Va.

"I am taking four of the trade papers and without a doubt I get more from Coal Age than from any other journal I have ever seen. You are indeed due to be congratulated upon the success your paper has attained. No coalman can afford to be without it, and in this connection you can count me as a subscriber as long as it is published."
H. E. Bissell,
Asst. Secretary, Black Diamond Coal Mining Co.,
Birmingham, Ala.

"Coal Age is the best paper of all the mining papers."
H. N. Starnes, Pur. Agt.,
Alabama Coal & Coke Co.
816-818 Brown Marx Bldg.,
Birmingham, Ala.

"I am a reader of COAL AGE with much interest, as I consider it the best journal published for mining men as a whole. I have been a subscriber from the beginning and I wish you much success in the future for your paper."
F. G. Morris,
General Superintendent Coal Mines.
Republic Iron & Steel Co.,
Sayreton, Ala.

"Thanking you for the book for this year, which I find very valuable in our business, I am respectfully,"
L. A. Vreeland, Mgr.,
The Canon Coal & Dev. Co.,
Pueblo, Colo.

"The Randolph Coal Co., of which I am Secretary, is a subscriber to your paper. I am so well pleased with it that you may rest assured that as soon as our subscription runs out, we will subscribe again."
L. D. Powell,
Randolph Co. Coal Co.,
Coulterville, Ill.

"I congratulate you on the success of your aims in making Coal Age a necessary publication for mining men."
J. W. Starks,
State Mine Inspector, 5th Dist.,
Georgetown, Ill.

"I know it is the best paper published for mining men in general."
M. D. Daniel,
State Mine Inspector,
Ashland, Ky.

"Coal Age deserves much credit for their general circulation. Your admirable Journal is doing good work and is really supplying a want. You have the best wishes of the fraternity for your continued success."
Very truly yours,
A. C. Finley,
General Manager Penn. Erie Coal Co.,
Rayland, Ohio.

"The writer would not be without his copy of Coal Age."
D. D. Dunkin, Supt.,
McAlister Coal & Coke Co.,
Buck, via Carbon, Okla.

"Find enclosed $3 subscription to your *really* valuable paper. It is a veritable live wire, a boon and a money maker for operator, mine official and miner."
Charlton Dixon, Supt.,
Oliver Coal Company,
104-6th St., Pittsburgh, Pa.

"You are putting out the best coal paper published."
Geo. E. Boyd.,
Boyd Brothers Coal Co.,
Tarentum, Pa.

"Coal Age is necessary to every coal mining man. I couldn't well afford to do without it.
John McClane, Supt.,
Ft. Ligonier Coal Co.,
Ligonier, Pa.

"I must say that you have the best mining paper published today."
J. A. Morgan,
Inside Foreman, Scranton Coal Co.,
325 Garfield Ave.,
Scranton, Pa.

"I wish to say here that I am thoroughly in accord with the sentiment of the Coal Age, and believe its influence for good throughout our coal mining field."
Geo. E. Sylvester.,
Chief Mine Inspector.

"I like Coal Age—in fact it can't be beat. The reading is of the best and when I am needing supplies of any kind, always look at Coal Age ads first."
Gus M. Hodges, Ass't. Gen. Mgr.,
Malakoff Lignite Co.,
Alba, Texas.

"Coal Age is entirely satisfactory, as a matter of fact I am a subscriber of three different mining journals, but consider Coal Age to be the best and am always pleased to see it come."
Emil Ostlund, Mine Supt.,
Utah Fuel Co.,
Utah Mine, Utah.

"I am well pleased with Coal Age and feel that I could not well do without it. It's all right."
R. J. Humphries, Manager,
Buckhannon River Coal Co.,
Adrian, W.Va.

"I can heartily recommend COAL AGE to any one wanting a good clean mining journal."
J. M. Swick,
M. F. & Supt., Humphries Colliery Co.,
Philippi, West Va.

"Coal Age is already in "First Place" and still advancing."
G. W. Coyle, Mgr.,
Hartford Coal & Mining Co., Inc.,
Hartford, W.Va.

"I find that your paper is a great help to me, and I would not be without it at all now."
R. B. Barlow, Superintendent,
Logan Coal Co.,
Ethel, W.Va.

"I assure you my support in every way as I have taken it up with our Mine Superintendents and Foremen and every one else at our mines that I think it would interest in the operation of coal mines. I have tried to impress upon them the fact that they should have this paper, and will continue to do so."
C. J. Ryan, Gen'l Sup't.,
Hutchinson Coal Co.,
Fairmont, W.Va.

"I enjoy every issue and consider some of the articles fit to be incorporated in textbooks on mining."
C. O. Messenger, Mining Engineer,
Wilsonburg, West Va.

"I think Coal Age is one of the greatest mining journals printed, and a help to all mining men. Every mining man would be better by reading it."
Thos. Griffiths, Gen. Supt.,
Belmont C. Co.,
Acosta, Pa.

"The reading material contained in your paper has not only been interesting to me, but also instructive; in fact I consider it the only source from which I may get the latest information on coal mining."
S. Ken Huang,
Tayeh Iron Mines,
Han-yeh-ping Iron & Coal Co., Ltd.,
Tayeh, China.

COAL AGE

Vol. 5 NEW YORK, JUNE 20, 1914 No. 25

Have you ever stopped to consider how much depends upon the accuracy of the small scale on your tipple, which is used for weighing all of the mine cars?

In most cases, no accurate check can be obtained against the mine weights, because the coal before reaching the railroad scales has to be picked and washed, or possibly be subjected to both treatments, and in this separation process, various errors creep in. However, in spite of this fact, many coal companies have no systematic method of testing the accuracy of their tipple scales, nor the tare weight which is credited to the empty cars.

Every now and then, you will hear of a local union calling its men out on strike, as a protest against errors in weights, and the history of such disagreements is generally about as follows:

An auditor, in checking over mine weights according to pay-rolls, against receipts from coal sales over a period of several months, finds a noticeable discrepancy. The manager is notified and immediately takes the question up with the local superintendent. The superintendent warns the company weighman that unless he watches his weights more closely, someone will be minus a job. The company weighman and the miners' check weighman (if there happens to be such an individual around) test out the scale with test weights and find them a little out of balance. They agree to adjust them and, as a sort of compromise to the company for the shortage of the previous two months, decide to lean the company's way for a time.

Here's the result:

Miners notice a difference in their weights, question the check weighman and become suspicious of his manner, elect a new check weighman, demand a new test to be made for determining the tare weights of all of the cars, demand a few other things, such as stopping the cars on the scale for a longer time and finally end up by declaring a strike,

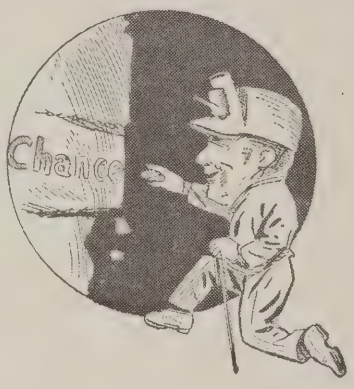
Ponder a minute if you please, as to what might have occurred over a period of several months, to have affected the weights. Here are a few possible happenings:

1.—The weighman might have been dishonest and credited coal to a dummy.

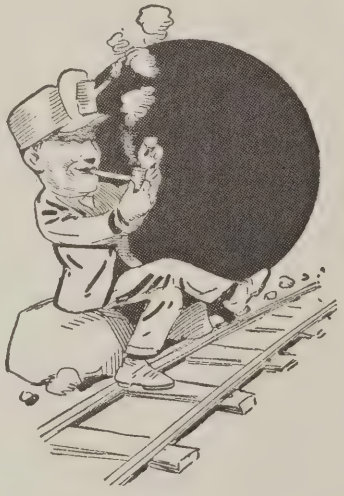
2.—The *railroad* scales might have been out of adjustment for a time and then readjusted without the mine official's knowledge.

3.—The average tare weight of the cars might have been affected by repairs to a number of old cars, or by changes in the type of wheels in use.

4.—The weighman might simply have been careless.



5.—A considerable amount of coal might have been stolen off the loaded railroad cars, between the time they were loaded and the time of weighing on the railroad scales. (This often happens during the winter months, at camps where no check is made on the domestic coal sales.)



Moral—Don't let errors accumulate until they become so large as to excite you unduly and upset your better judgment.

An Epitaph

By Berton Braley

Written expressly for Coal Age

Here Lies
ANTONIO HOROWITZ
Or What is Left of Him,
He Was a Man
of
Splendid Build
of
Vigor and of Vim.

He Never Feared to
TAKE A CHANCE
Wherever He Might Be,
He'd
TAKE A CHANCE
The Roof Was Safe
He Would Not Look
To See.

He'd Use a Drill
To
Tamp a Charge
And
TAKE A CHANCE
on
That,
He'd Smoke in Any Gassy Place
He
Happened to be At.

And
When He Rode Upon The Cage
He Would Not
Grasp
The Bar,
He Never Looked Upon
The Board
Where
RULES OF SAFETY
Are.

But, Being Full of Health and Strength
And Quite Devoid of Fear
He Played at Hide and Seek
With
DEATH
And Now He's Lying
Here.

He TOOK A CHANCE
With Dynamite
He
TOOK A CHANCE
With Damp,
And in the Very PRIME OF LIFE
Fate Snuffed His
Miner's Lamp;

He's Done With
TAKING CHANCES
Now
He's Done with Mines and Such,
And What is Left of Him
Lies Here—
HE TOOK ONE CHANCE TOO MUCH.

Historical Sketch of the Georges Creek Coal Region

By R. A. Walter*

SYNOPSIS—A history of the Georges Creek field from its earliest settlement. Coal was probably found by the Indians and it is said Braddock's army burned it on their march West. But not until the railroads and the canal were built did the tonnage increase to 2000 tons per year. The methods of the primitive miners are described as also the steps by which transportation and operation were placed on a stable footing.

The Georges Creek Coal basin lies almost wholly in the western part of Allegany County, Maryland, in the valley between Dan's and the Savage Mountains. The synclinal axis of this canoe-shaped basin extends from a point four miles north of the Pennsylvania State line, south 27 deg. west, 25 miles to Westernport, the basin maintaining an average width of six miles. The upper Potomac basin, southwest of Westernport, is geologically a continuation of the Georges Creek basin, but has always been commercially considered as distinct and separate from the Georges Creek field.

Frostburg, the largest town in the region, is located on the synclinal axis of the basin, 11 miles west of Cumberland, 5 miles south of the Pennsylvania State line and 10 miles south of the northern end of the basin. It is situated on the divide between Jennings Run, which drains the north end of the basin, and Georges Creek, which drains its south end. From the latter creek, the field derives its name.

Eckhart, Loartown and Vale Summit are located near the eastern edge of the basin on the headwaters of Braddocks Run, which flows through Short Gap, a break in the coal-bearing measures, about three miles east of Frostburg, thence eastwardly to Wills Creek a short distance above Cumberland. Mount Savage and Barrelville lie northeast of Frostburg, near the northern limits of the basin, Midland, Lonaconing, Barton and Westernport being located southwest.

Space does not permit a history of the field in detail, but only such events are noted as were of importance to the general development of the region. The early history of the field, the struggles of the mine owners, the introduction of railroads and canals, the formation and growth of the coal companies and the mining methods of different periods will be briefly dwelt upon.

*Chief engineer, Maryland division, the Consolidation Coal Co., Frostburg, Md.

Cumberland Settled in 1750

Allegany County, Maryland, is especially rich in general historical details, very complete authentic history dating back to 1749 being readily obtainable. In that year a patent was granted to what was known as the Ohio Co., for 500,000 acres south of the Ohio, between the Monongahela and Kanawha Rivers and west of the Alleghenies. This company immediately began an exploration of the country and in 1750 built a trading post at Wills Creek—now Cumberland.

In 1751 a trail, from this trading post, west across the Georges Creek Valley, thence north to the present site of Pittsburgh, was marked by Colonel Thomas Cresap accompanied by Nemacolin, an Indian guide. This trail was used by George Washington, on his expedition against the French in 1753, and improved by him to such an extent that after his return over the same route in the following year, it had become a fairly passable road. It was again used after the completion of Fort Cumberland in 1755 by General Braddock on his ill-fated attempt to capture Fort Duquesne, and has since been known as the Braddock Road.

A canal paralleling the Potomac and largely used for conveying Georges Creek coal to Georgetown

Loading dock at Cumberland, Md., on the Cumberland & Pennsylvania R.R. and the canal

The Chesapeake & Ohio Canal

Notwithstanding Washington's protest, Braddock halted to "level every mole-hill and bridge every brook." As everyone familiar with early American history knows, these delays were primarily responsible for his defeat by the French and Indians. His road-building operations, however, were of great benefit to the Georges Creek and other regions lying west of Fort Cumberland by opening to settlers this hitherto inaccessible country.

Georges Creek Settled before Revolutionary War

It is believed that the first settlement in the Georges Creek Region was made near Loartown, shortly after Braddock's retreat. However, very few settlers moved west of Fort Cumberland until after 1768, as the French-Indian allies were terrorizing the whole frontier by their

massacres. About 1768, the Indians were subdued and a stream of settlers began pouring westward to the fertile lowlands along the Ohio. Quite a few of these stopped along the way, the pioneer settlers of the Georges Creek region being recruited from their ranks. After 1788, the awarding of over 4000 military lots west of Fort Cumberland, to soldiers of the Revolution, was the greatest factor in populating this region until the development of the coal industry began.

Braddock's Road, from incessant use, eventually became almost impassable. No provision was made, nor were funds available, for its repair, and its condition after 50 years' use can readily be imagined. The need for a good road was realized by such men as Washington, Clay and others, who earnestly advocated and supported the project. In 1806, the National Government authorized the building of a turnpike from Cumberland to Wheeling. This road reached the Georges Creek region in 1814 and gave the flow of emigration renewed impetus.

Discovery of Coal Deposits

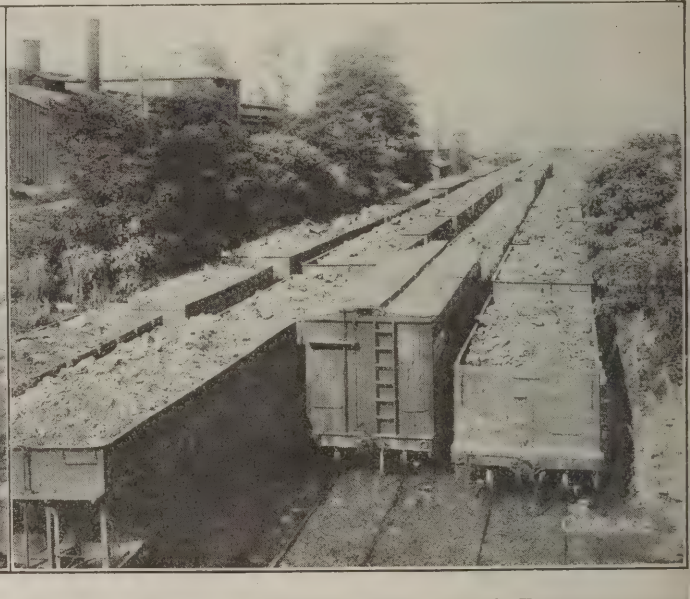
Little is known about the discovery or early development of the coal deposits in the Georges Creek region. Tradition states that the Indians, in their early intercourse with the white settlers, sometimes referred to a black stone found here which burned like wood. From the same source we also hear that the soldiers of Braddock's army in passing through this region on their ill-fated march in 1755 to Fort Duquesne, discovered coal and burned some in their camp fires. Captain Orme, who kept a fairly comprehensive record of the happenings on this expedition, makes no mention of the presence of coal, but it is certain that the excavations made for the Braddock Road on the steep hill-sides directly on the outcrop of large seams, exposed the fuel to view. Whether it was recognized as coal must remain an unsettled question.

For a Long Time after Discovery It Was Not Mined Systematically

The first authentic record of the discovery of coal in the Georges Creek region is noted on a map made by M. Bonne bearing date 1782. As this map was made in France from information previously acquired in America and as the map shows a coal mine at the mouth of Georges Creek, the existence of coal in this vicinity must have been known sometime prior to that date.

During the next 28 years, mention is made but once of the occurrence of coal in this region. However, the country was rapidly being cleared and settled and it is likely that during this period the outcrops of the coal seams were exposed at a number of places and the coal mined for local use. It is reported that in 1810 there was an exceptionally violent freshet, which washed the earth off a considerable area of a large coal seam—probably the Pittsburgh or Big Vein—near Barton. The exposure of this coal is supposed to have caused great excitement and people came for miles to see it. Some of the more enterprising dug it up and hauled it by wagon as far east as Romney and even Winchester, where it was used for smithing purposes. Later it was hauled to Westernport only, and there loaded in flatboats and rafts and floated to Washington.

Early Industrial and Other Uses



In the report of the United States Geological Survey the statement is made that coal was first discovered near Frostburg in 1804. According to Scharf's "History of Western Maryland," the first coal mined in the region was taken from the Sheetz Farm, 1½ miles east of Frostburg—date not given—and hauled to Cumberland. Both of these references probably are to the same mine. It is certain that the mine on the Sheetz Farm was operating in 1816, for at that date the coal from this working was used in Cumberland in the manufacture of glass.

Again, we have the record that during the construction of the National Turnpike in 1814 coal was found at Eckhart, which must have been in the same general vicinity as the mine just mentioned, and wagoned to Cumberland and other points as far east as Baltimore.

The small amount of coal which thus reached the markets was of excellent quality and gave such satisfaction that a demand was created for all that the mine owners

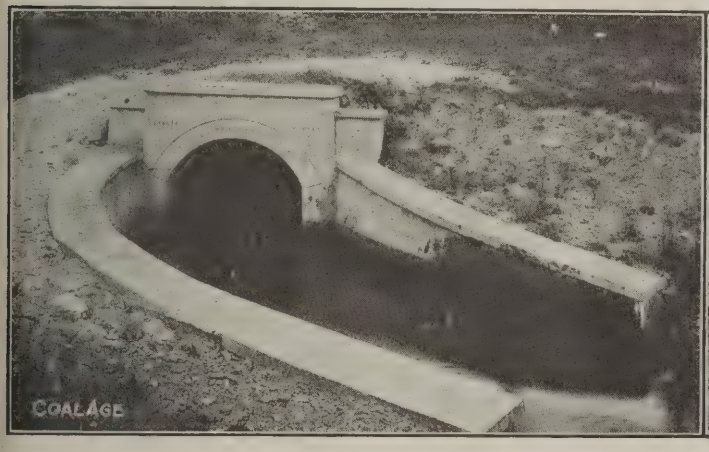
Consolidation No. 10—A Typical Small Seam Mine in Georges Creek Valley

Freight Yards of the Cumberland & Pennsylvania R.R. at Mt. Savage, Maryland

could deliver. To transport coal by wagon without having any return freight was uneconomical, hence it was carried in this way only when the teamster desired to bring back with him a load of supplies.

Boating Coal on the Unimproved Potomac

This, of course, did not satisfy the demand and, as railroads were then unknown and no other means of transportation available, the mine owners began shipping the coal in boats. These boats were flat-bottomed, with square raking ends, and were about 80 ft. long, 13 ft. wide and 3 ft. deep, and held from 50 to 60 tons. They were poorly constructed and clumsy. The combined efforts of the entire crew of four men were required to steer them.



A practical means of transportation having now been discovered, more mines were opened and operated intermittently throughout the year, the coal being hauled by wagon to Cumberland where it was unloaded near the present municipal pumping station on Green Street, and stored in large piles on the river bank awaiting a freshet of sufficient height to float the boats with safety. These were generally built on the banks of Wills Creek of the finest white pine which abounded along this stream, and, at the first signs of a sustained rise, were floated to the stock pile of coal. The coal was loaded as rapidly as possible, the men working day and night. The crew then took charge of the boat, floated it to its destination—anywhere between Cumberland and Georgetown or Washington—and sold the boat and contents, returning to their homes on foot.

The Construction of the Chesapeake and Ohio Canal

By 1820, this traffic had assumed commercial importance and gradually increased until the completion of the Baltimore & Ohio R.R. to Cumberland in 1842, from which date it rapidly dropped off until after the completion of the Chesapeake and Ohio Canal to Cumberland in 1850; when it was abandoned altogether. While at its height as many as 40 boats have been known to leave in one day. Not only mine owners, but farmers, merchants, mechanics and men of every occupation participated in these boating ventures as a quick way of obtaining cash, which was then, as in all frontier communities, scarce.

This method of transportation, however, was at its best uncertain and it could be readily perceived that no systematic and profitable development of the coal seams could be expected unless the carrying facilities were improved. The need for some cheap method of transporting freight had been realized many years before, and well organized efforts had been made to secure it. Washington can be considered as the originator of these movements. On his several journeys through the region between Cumberland and the Ohio Rivers, he had been impressed with its wonderful natural resources and it was owing to his personal efforts that the Potomac Co., the predecessor of the Chesapeake and Ohio Canal Co., was organized in 1785. The object of this company was to so improve the channel of the Potomac River as to render it navigable as far as Cumberland.

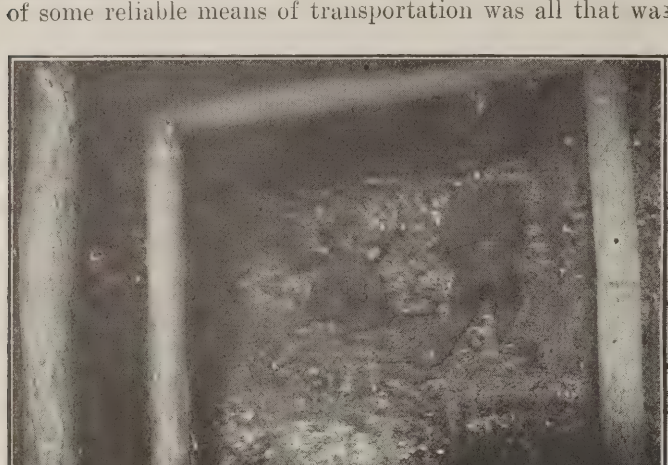
Under the direction of Washington, who was its first president and who remained with it in that capacity until he resigned to accept the Presidency of the United States, the Potomac Co. started work at once and pursued it intermittently until 1820, by which time the public was thoroughly convinced that the Potomac River could not be made navigable by the expenditure of the limited amount of money then available.

East Portal Hoffman Drainage Tunnel

The Consolidation Coal Co.'s No. 7 Mine

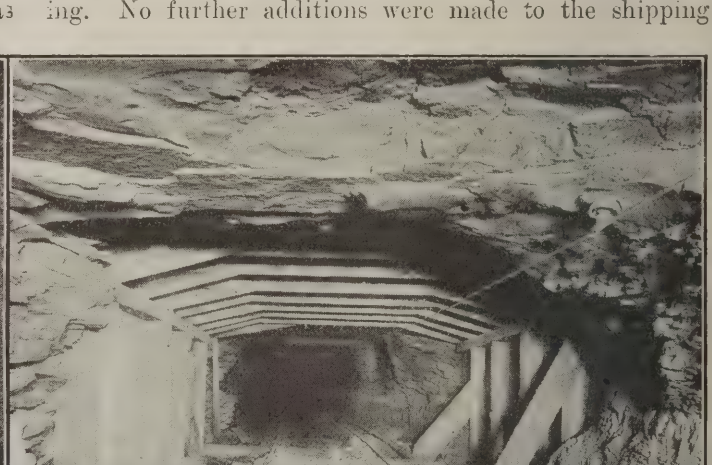
The charter was then withdrawn from this company and granted to the Chesapeake & Ohio Canal Co., organized in 1828 to build a canal from Georgetown to Cumberland and thence to the Ohio River, with an auxiliary canal to Baltimore. The latter was never built but in 1850 the main canal, after great financial difficulties, was completed to Cumberland at a total cost of over $11,000,000.

The Building of the Baltimore & Ohio R.R.



Just prior to the transfer of the charter of the old Potomac Co. to the Chesapeake & Ohio Canal Co., great interest was aroused by the experiments of Stephenson in England and Cooper in America with the steam railroad locomotive. Philip E. Thomas and George Brown, two citizens of Baltimore, were firm believers in the practicability of the railroad and called a meeting of the leading men of the city to discuss the advisability of building a railroad, instead of a canal, from Baltimore to Cumberland and Wheeling.

A plan for the organization of this road was drawn up and presented to the General Assembly of Maryland in February 1827 and an act of incorporation passed a few days later. The Baltimore and Ohio R.R. Co. was or-



ganized the same year and in July, 1828, work was commenced. The practicability of using the steam locomotive for haulage purposes was firmly established in 1831 and in Nov. 5, 1842, the road was completed to Cumberland and in operation.

The First Coal Company Incorporated in 1828

It is a significant fact in connection with the organization of these two great transportation companies, that the first regularly incorporated coal company of the Georges Creek Field was organized in 1828, the same year that ground was broken for the construction of both canal and railroad. The excellence of Georges Creek coal was appreciated at this early date and the assurance of some reliable means of transportation was all that was required to interest Eastern capital in the development of these coal deposits.

Mining the Georges Creek "Big Vein" Coal. There Are No Cleat and Butt Fractures

Concrete Overcast in Consolidation No. 11, before Removal of Forms

The first incorporated company was the Maryland Mining Co., operating at Eckhart. This was followed 10 years later by the Maryland and New York Mining Co., operating between Frostburg and Mount Savage. These companies were the pioneers in exploring and systematically examining the field but sad to say they were organized too far in advance of the arrival of adequate transportation facilities. They eked out a rather precarious existence up to the arrival of the Baltimore & Ohio R.R. in 1842, but finally failed and their property was acquired by others.

Both companies started to build a railroad to Cumberland, down the valleys of Jennings Run and Braddocks Run, respectively. The latter was started in 1845 and completed in 1846 by the Maryland Mining Co. The other road was not completed by the original corporation, but by the Mt. Savage Iron Co., its successor. Before the completion of these roads, all the coal was shipped over the Baltimore & Ohio R.R. after having been hauled by wagon to Cumberland.

The Origins of the Cumberland & Pennsylvania R.R.

The Georges Creek Coal & Iron Co., organized in 1835, built a tramroad from Lonaconing and connected with the Maryland Mining Co.'s railroad at Clarysville in 1847, and in 1853 built a railroad from Lonaconing to Piedmont to connect with the Baltimore & Ohio R.R. at that point. This railroad was purchased in 1864 by the Cumberland & Pennsylvania R.R. Co., which had meanwhile acquired possession of the Mt. Savage Iron Co.'s road and extended it through Frostburg to Lonaconing. This was the first through railroad and remains to date the only railroad traversing the entire region.

In 1872, the Pennsylvania R.R. interests constructed a railroad to the Pennsylvania-Maryland state line at Ellerslie, and the Cumberland and Pennsylvania built a connecting link between this road and its line at Kreigbaum. Eight years later, the Georges Creek & Cumberland R.R., connecting with the Pennsylvania at Cumberland, was constructed from Cumberland to Lonaconing. No further additions were made to the shipping facilities until 1912, when the Western Maryland R.R. acquired control of the Georges Creek and Cumberland R.R. and extended their trunk line across the northern end of the field.

Thus we have a record of the transportation facilities for over a century, from primitive wagon and flatboat until at present there are two competitive railroads with outlets over three competitive trunk lines and over the Chesapeake and Ohio Canal. These splendid shipping facilities, its proximity to tide water and its high grade of coal have given this region decided advantages over other coal fields for shipments into the world's fuel markets.

The Gradual Consolidation of the Georges Creek Mines

In addition to the coal companies already enumerated there were incorporated before 1850, the Frostburg Coal Co., the Allegany Mining Co., the Washington Coal Co., and the Borden Mining Co. Of these, only the latter is now in existence. A detailed record could be given of the other companies incorporated since that time, but with few exceptions, the financial history of one is the history of all. Many were organized prematurely, others were continually on the verge of financial ruin, almost all were merely existing.

No better illustration can be given of conditions than that shown to exist by the following circular issued in 1869 by a committee of the five principal mining com-

panies of the region, including the Consolidation Coal Co., which had been incorporated in 1860 and was at this time operating the properties originally owned by the Ocean Steam Coal Co., Frostburg Mining Co., Mount Savage Iron Co. and the Cumberland and Pennsylvania R.R.

To the stockholders of the companies mining Cumberland coal in Allegany County, Maryland.

An experience of 25 years has convinced many of the most practical and sagacious persons, whose interests have been identified with the development of the Cumberland coal mines, that those interests can be made reasonably remunerative only by a complete change in the system of management. The total product of 1708 tons in 1842 has been increased, by the legitimate demands of the trade, to 1,330,443 tons in 1868, with a prospect of 1,500,000 tons in 1869, and yet, of the immense capital which has been invested in Allegany County, in coal property, how large a proportion has been swept away, and of that now representing the mining interests how insignificant is the portion which, even ocasionally, makes any return to the proprietors. Three reasons may be given to explain these unsatisfactory results. First, remoteness from our principal markets, with insufficiency and high cost of transportation thereto; Second, heavy expenses of multiplied administration, and Third, ruinous and, under existing circumstances, uncontrollable competition.

The first of these obstacles would inevitably subside, if not disappear under a systematic and unified apportionment of production to demand; the second and third would obviously vanish by the substitution of a single management, in the common interest, for the twenty-one separate organizations which, with their complicated and expensive machinery, now absorb the modicum of profit which is left to the owners of the mines.

Five of the largest companies having, with others, tried for years, but in vain, to remedy the evils above adverted to, by harmony of action, have at length determined to find, if practicable, a solution of the problem by uniting their properties under one organization, permanent and homogeneous. A suitable agent has been selected to investigate the relative areas and values of their respective coal lands, preliminary, it is hoped, to the adoption of an equitable basis of incorporation. These five companies are now moving in perfect accord toward that object, and have established a joint committee on consolidation. Within a month it is hoped that they will be prepared to proceed to the consideration of such a basis. To this end it is earnestly desired that as many companies now operating in the Cumberland coal region of Allegany County should unite in having their lands surveyed and appraised; or, if not that, that they will, at least, appoint a representative, or more than one and not more than three, to meet with the joint committee, and discuss with them the bearings of this scheme on their various interests. Stockholders are earnestly requested to press this important subject upon the consideration of their directors.

The five companies issuing this circular were the American Coal Co., the Borden Mining Co., the Consolidation Coal Co., the Cumberland Coal & Iron Co. and the Hampshire & Baltimore Coal Co.

The First Attempt at Consolidation Failed

An agent was selected to report on the acreage and values of the various companies, and after six months' labor submitted a thorough report showing that there remained unworked in the region about 15,000 acres of the "Big Vein" seam alone. The report was unsatisfactory, however, to a number of the operators and the plan failed in attracting into the consolidation any other company than the Cumberland Coal & Iron Co.

The acquisition of the property of this company by the Consolidation Coal Co. gave the latter more than half the coal lands of the region and all the railroad facilities. These holdings were still further increased a few years later by the purchase of the property of the Allegany Coal Co. by the Consolidation Coal Co.

Although this proposed consolidation of all companies in the region failed, its effect on the Cumberland coal market was invaluable. The enlarged company introduced better methods of mining and selling and fixed a high standard of excellence for its product, which has always been maintained. Being on a sound financial footing, it was in position to undertake improvements impossible of execution by any of its smaller component companies. It was the pioneer company of the region to install steam-driven fans for ventilation, and to use mine-haulage locomotives.

It has always been in advance of other companies in the region in conservation of its property and has been making strong efforts toward the ultimate extraction of every available ton of coal. It is the only company in the region that has solved the problem of satisfactorily and economically draining those mines below water level, thus increasing the ultimate recovery from the region and lengthening its life and prosperity. It has, since its inception, paid regular dividends to its stockholders, something unheard of before in this region, and is a fair representative of that class of consolidations which are beneficial alike to competitors, employees and the consumer.

Numerous companies have been incorporated since the organization of the Consolidation Coal Co. Those which were organized along conservative lines with good financial backing and good management were successful, while others, over-capitalized and mismanaged, have had a rather checkered career.

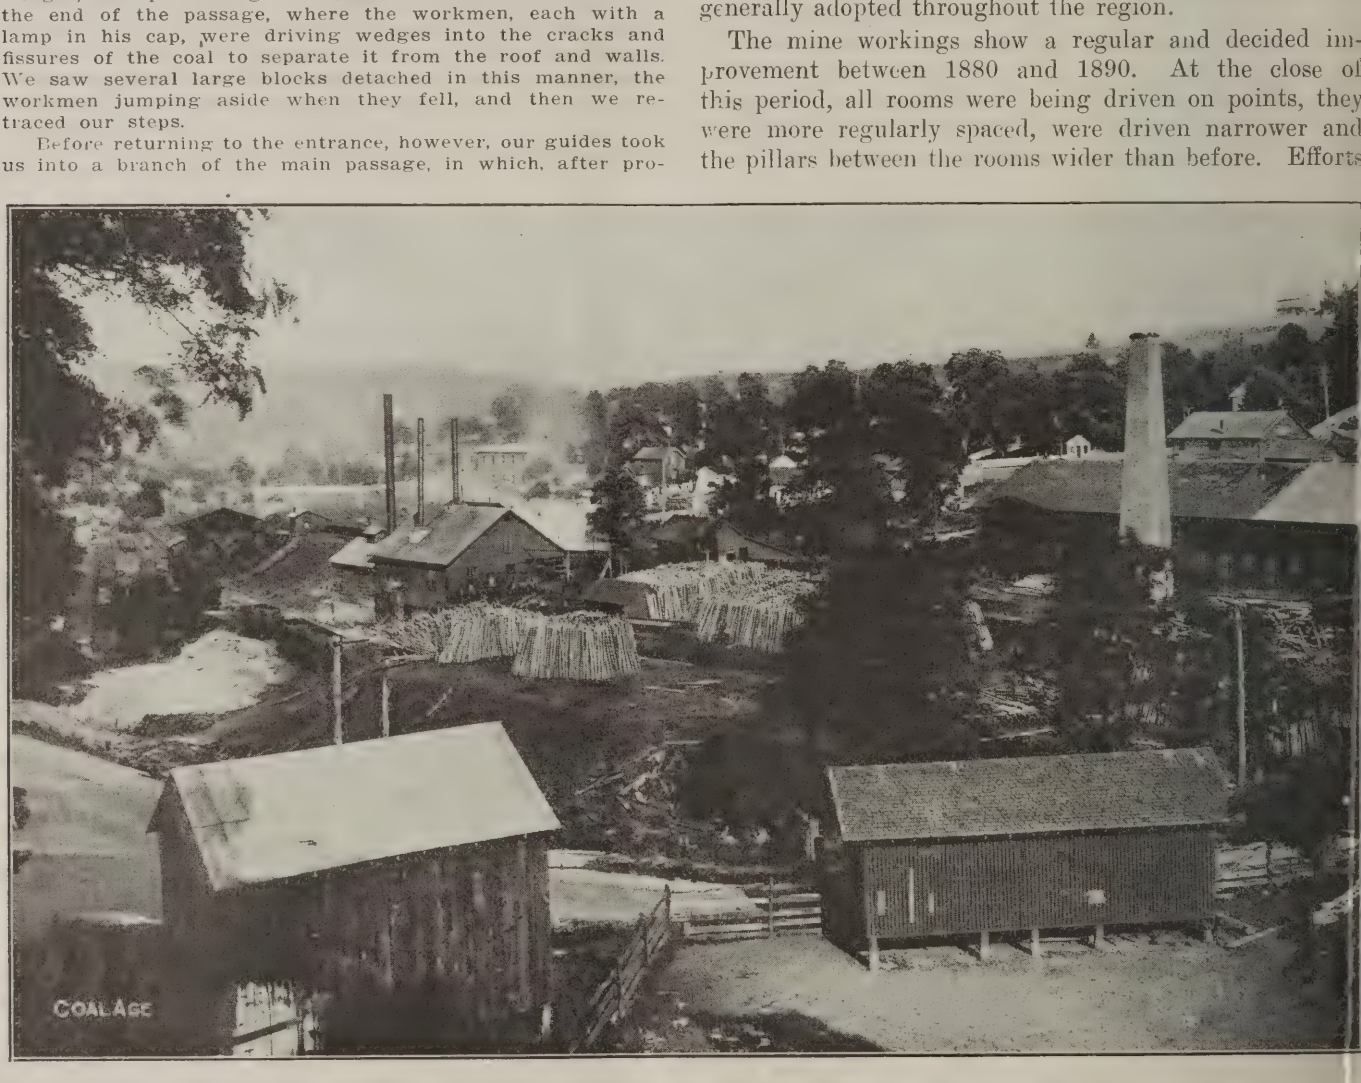
Double-Entry System Introduced about 1850

The early development was almost exclusively in the Pittsburgh or Georges Creek "Big Vein" Seam and the mining methods followed at first were of the crudest. An opening was made into the coal on the outcrop, driven wide and poorly timbered for a hundred feet or so, by which time it generally caved in, then another opening was made and the performance repeated.

This method was gradually modified until about 1840, at which date the general mode of procedure seemed to be to drive a single heading as far as possible without any artificial ventilation. Rudimentary rooms, seldom over 50 ft. long but about 20 ft. wide, were then driven to the right and left with but very little coal remaining between them. This operation was continued as near the outcrop as the condition of the seam and roof would permit and the opening then allowed to fall in.

Mines developed in 1850 show that recognition was being given to the need of better ventilation; in some few instances double entries were driven with furnaces as the ventilating appliance. There was no regularity, however, in regard to crosscuts or break throughs, or to the spacing of rooms. Rooms were driven of irregular width, crooked and running into each other at all sorts of angles, with no provision for the ultimate extraction of all the coal.

William Cullen Bryant, Stygian Rivulets, Etc.



The following description of a trip through a Georges Creek mine, in 1860, by William Cullen Bryant, the famous poet, will no doubt be interesting, and will give some idea of the mining methods of that period:

Our party made a visit to a coal mine some three miles distant from Mt. Savage. From one of the black entrances flowed a lively little stream with yellow waters, into which I dipped my finger to ascertain their flavor. They were acidulous and astringent, holding in solution both alum and copperas. Leaving the Stygian rivulet we came to another entrance, out of which a train of loaded trucks was passing, every one of which was attended by a miner blackened from

head to foot with the dust of his task, and wearing in the front a small crooked lamp to light his way. As they emerged from the darkness they looked like sooty demons of the mine with flaming horns coming from the womb of the mountain.

We now entered, each carrying a lantern, attended by a guide. The vein of coal is from 8 to 10 ft. thick, and the passage is of that height, with a roof of glistening slate, propped in some places by wooden posts. Here and there, on each side of the passage, yawned chambers cut in the veins of coal, and extending beyond the reach of the eye in the faint light of our lanterns. At length we heard the sound of sledges, and proceeding for some distance farther came to the end of the passage, where the workmen, each with a lamp in his cap, were driving wedges into the cracks and fissures of the coal to separate it from the roof and walls. We saw several large blocks detached in this manner, the workmen jumping aside when they fell, and then we retraced our steps.

Before returning to the entrance, however, our guides took us into a branch of the main passage, in which, after proceeding a little way, we heard a roar as of flames, and then saw a fierce light before us. A furnace appeared, in which a fierce fire was blazing; the blackened workmen were stirring and feeding it, and a strong current of air rushing by us went with the flames up the shaft, which reached above to the surface of the ground. This, we are told, was a contrivance to ventilate the mine. All the foul air and all the firedamp and other noxious gases are drawn up and carried off from the passages and chambers by this method. On our way back to the entrance we perceived that the veins lay at just such an inclination as allowed the workmen to roll the loaded trucks by hand along an easy descent to the mouth, as I hear is the case with all the mines.

The Oldest Mine in Operation in the Georges Creek Region. It Was Opened in 1842.

Even in 1870 Alignment Sights Were Set

Workings of 1870 show in some places, rooms regularly spaced and driven on points. Some portions of workings were still, however, driven on the old method and those rooms that were spaced at regular intervals were too wide and the pillars too narrow. The need of ventilation was now more fully realized and almost all headings were paralleled by air courses. No mechanical devices had as yet been installed for ventilating purposes. The furnace was, however, coming into more extensive use.

Slope-haulage engines had been in use since 1845, but this decade—1870 to 1880—witnessed the installation of steam locomotives for mine haulage and also the first power-driven fan for mine ventilation. This was an exceptionally important step forward and one that was soon generally adopted throughout the region.

The mine workings show a regular and decided improvement between 1880 and 1890. At the close of this period, all rooms were being driven on points, they were more regularly spaced, were driven narrower and the pillars between the rooms wider than before. Efforts were now being made to secure all the coal by pillaring. The results were not as gratifying as at present, but were far better than anything attempted before.

The next decade marked the installation of mining machines, compressed-air motors for inside haulage and also the first successful development of the smaller seams of coal. Previous to 1890, mining had been confined almost exclusively to the Pittsburgh or "Big Vein" seam, but since that date the high quality of the coals of the smaller seams has been realized and at present there are more mines working in these beds than in the "Big Vein."

In 1900, about 75 per cent. of the coal was being recovered, but this, by careful management and a more thorough knowledge of the action of the overlying strata has been increased until at present a record of 95, 96 or even 97 per cent. ultimate recovery in some of the mines is by no means uncommon.

Electricity in Coal Mining

By David R. Shearer*

SYNOPSIS—This is the fifth article in the series on this subject. The selection of prime movers—reciprocating engines, steam turbines and waterwheels—is taken up in relation with the first cost and operating expenses of the plant.

Perhaps the most important part of any plant used for mine operation is the prime mover or source of power by which the electric generating equipment is driven. The chief reason for this is the fact that this part of the equipment varies more widely in first cost, operating expense and upkeep than any other part of the entire plant. In considering the generating equipment, we find that the efficiencies of all standard machines are high, ranging from 85 to 90 per cent. of the power expended on the generator shaft. Moreover, if properly installed, a generator is not liable to rapid depreciation or inherent accidents, nor does the efficiency diminish with the age of the machine.

If we examine the steam engine, in the light of generator operating characteristics, we note that it is a very inefficient machine and that this inefficiency increases rapidly with the age of the engine. We cannot, however, consider the engine alone from a practical standpoint in determining the prime-mover efficiency of a steam power plant for the very evident reason that the boiler or boilers play an important part in regard to the operation of the engine.

Engines are classified into several distinct types, each of which may have some favorable points, offsetting which are certain inimical features applicable to each type of machine. The simple slide-valve engine is perhaps the most common, it being cheaper in first cost but far more inefficient than later and more costly types.

Even the slide-valve engine is found in two varieties, the high-speed or automatic-cutoff engine, which is perhaps the more modern type, and the slow-speed or throttling engine. This latter form is almost obsolete, owing to its lack of regulation and its large consumption of steam. For small installations, say 100 hp., the high-speed automatic is very satisfactory, but when it becomes necessary to install a larger unit, it is usually advisable to use a more efficient type of engine.

In the larger types we have the corliss, condensing and compound. The chief value of the corliss engine lies in the type of valve-gear used. In this type the valves for inlet and exhaust may be adjusted separately and individually so that the point of admission and release may be set at the most economical operating points for a given set of conditions, while in the slide-valve engine the same valve unit is used for both inlet and exhaust and therefore is not subject to adjustments.

Within recent years, engines of the four-valve type have been brought out, differing to some extent from the corliss system. High economy is claimed for some of these machines, which are usually of the non-releasing type. Although some simple corliss engines are in use, it is usual to find them run condensing, as by so doing we secure some 10 or 12 lb. more working pressure on the piston heads.

A step further in this direction leads us to the compound condensing corliss engine, in which type there are two cylinders. The steam is admitted first to the high-pressure cylinder and the exhaust from this cylinder used in the large low-pressure cylinder, after which it is discharged to the condenser.

With an engine of this last named type we may secure an efficiency approximately three times as great as with the simple slide-valve throttling engine. Another point in favor of the compound condensing unit is that the efficiency of this type of machine holds up well throughout the life of the plant.

The Steam Turbine

Another type of prime mover which has come into prominence within the last 10 years is the steam turbine, either used alone or in conjunction with a corliss engine. The turbine is noted for its high speed and for its ability to utilize steam containing a high degree of superheat, the use of which cuts down condensation losses and adds to the overall efficiency. Owing to the high speed, it is usual to find the turbine used to drive an alternating-current generator, the direct-current generator not being well adapted to such high speed on account of commutator troubles. The efficiency of the ordinary steam turbine, when used alone, is perhaps not quite so high as that of the compound corliss condensing engine, but when designed for low pressure and used on the exhaust from a corliss machine, a marked increase in economy is possible, considering both engine and turbine as a single unit.

So many factors enter into the proper selection and installation of steam engines and their accessories that each individual case must be worked out separately after all the factors governing the plant operation have been determined. The probable life of the plant must be assumed from past experience with similar installations and the cost of several different types of equipment must be estimated.

After this the economy and cost of operation of the differing types must be determined. With this data clearly expressed, a balance must be worked out between the efficiency desired and the initial cost. No detail should be left out that would go toward adding to the overall efficiency. Such, for instance, as properly covering the steam pipes, the use of superheaters and economizers, the installation of feed-water heaters and the proper utilization of as much of the heat produced by the burning coal as is possible.

Boiler Efficiency Is Important

The efficiency of the steam plant depends largely on the boiler also, since we may use a good engine on a poor boiler or *vice versa*, and secure very unfavorable results. The number of types of boilers and boiler accessories is almost unlimited and it is really difficult to determine just what type to use under certain conditions. Formerly practically all boilers of any size were placed in a brick setting, but within recent years, several manufac-

*Knoxville, Tenn

turers have brought out types of boilers which are self-contained and require little or no brickwork. These boilers have the advantage in that there are no cracks in the setting or furnace by means of which air can leak through and thus decrease combustion efficiency.

As a usual thing, a feed-water heater should be used with a boiler of any size, so that the water may be pumped to the steam generator at as high a temperature as possible, thus securing a gain in efficiency and preventing damage to the boiler plates by the sudden admission of cold water. As the gases usually leave the boiler tubes at a comparatively high temperature, a considerable saving may be effected by passing these flue gases through an economizer before admission to the stack. The draft in the furnace may depend either on the stack or on a system of fans or blowers. Each of these methods has certain advantages and must be determined upon during the design of the boiler-plant layout.

Two methods of firing boilers are in common use, hand firing and mechanical stoking. For small plants where a careful fireman is employed, the hand method is very efficient, but larger plants and those in which it is difficult to secure competent firemen are largely employing mechanical means to force coal into the furnaces.

Two factors of saving are introduced by the use of mechanical stokers; a saving in labor cost if the plant be of some size and the obviation of the personal element in methods of stoking. The mechanical stoker, if properly installed, fires continuously and uniformly, while it is well known that in hand-fired plants, one man may use 25 per cent. more coal than another without increasing the steam output.

Another saving accrues from the fact that when using a mechanical stoker it is rarely necessary to open the furnace doors, whereas with hand firing, this is an absolute necessity and at every time of fuel replenishment large quantities of cold air are admitted to the furnace, thus, to some extent, cooling the boiler tubes.

A fact worthy of the closest attention is the saving made possible by the use of adequate instruments, for the proper determination of the operating characteristics of both boilers and engines when properly manipulated by a fireman or engineer, having in mind the good of his employer and the necessity for economical operation. Among such instruments may be mentioned draft gages, steam-flow meters, water meters, coal-weighing apparatus, carbon-dioxide recorders, feed-water thermometers, besides the regular equipment of any steam plant, such as steam and vacuum gages and other necessities. If these instruments are properly used, and the engineer is forced to keep a systematic record of the operation of his plant, great gains and economy are possible.

Some may say: "What is the necessity of so closely guarding economy in the power plant of a mining operation where coal is plentiful?" The answer to this point, which is often raised, is that the coal which is burned in the boiler to produce power for mining operations is worth just as much as the coal that is placed on the car for shipment, and if it is worth while to mine the coal, in order to ship it, it is certainly worth while to effect any saving possible by reasonable means in the fuel consumption of the plant. Many mine owners forget that although the first cost of an efficient plant is higher than that of one inferior, the saving from this efficient operation extends over the entire life of the mine and may reach such an amount as would pay for the plant several times over. Another point in favor of a more expensive plant than is usually installed is that such a plant is less liable to breakdown and costly upkeep.

Water Power Is Cheap and Dependable

A power which was rarely used in mine work until recently, but which is coming to the front on account of its continuity of service and cheapness, is water. At the present time, we find many mines served by water power solely and this frequently over long transmission lines. It sometimes happens that a water-power plant can be installed more cheaply than a steam plant of the same size, although this is rarely the case. In any event, however, the operating cost of the water-power plant, if within a reasonable distance from the mine, will be considerably less than that of a steam plant.

Many types of waterwheels are in use, each best fitted for a particular condition to be met and many different arrangements of connection between a waterwheel and a generator are in use. The most common type of hydro-electric plant consists of a reaction turbine waterwheel, direct connected or geared to an alternating-current generator. We frequently find, however, a generator belted to a jack shaft, operated by bevel gears from the wheel shaft. The use of direct-current generators in a water-power plant is not at all common, owing to the fact that the power plant is usually located some distance from the mine operation, thus necessitating a high-voltage transmission line to cut down transmission losses and decrease the size of wire necessary.

In location, design and installation of a hydro-electric plant for use in operating a mine, we are confronted by the same problems which have to be met in the steam plant. That is, we must consider all the peculiarities of the power site and of the conditions to be met in the operation of the plant. Many factors must be considered in the initial design and much preliminary calculation done before a definite layout can be determined.

Many mine owners have recently found that several mines may be adequately served from one water-power plant with a marked saving to all concerned. In some instances, when a good water-power site can be secured, it is advisable for the mine owners to form a stock company among themselves and erect such a plant, from which each purchases sufficient power for his own use.

Many mines can be served from one plant more efficiently than one mine, because the surges or load peaks come at different times on the different plants, thus smoothing out the power-plant load. Again, it takes very little more labor to operate a large hydro-electric plant serving several mines than a plant operating only one. When such an arrangement is possible, the owners of the plant can employ more competent electricians and furnish better service throughout.

It is possible also to use one crew of repair men and trouble shooters for all the mines, thus obviating the necessity of each mine running its own repair shop and employing a crew of men which are idle a large part of their time.

Great possibilities are open to mine owners along these lines as the developments during the next few years will no doubt show. But those reaping the greatest gains will be those who soonest put into effect systems of this kind.

Effect of Panama Canal on World's Coal Markets--II

By F. R. Wadleigh*

SYNOPSIS—The second installment of this article which is confined essentially to a discussion of the merits of our different foreign competitors. Great Britain is the power to be reckoned with in the world's coal trade, but there are other countries forging ahead rapidly which cannot be ignored. The use of fuel oil threatens to be a powerful factor in the situation, particularly in the Pacific Coast markets.

West Virginia's competitors in the Pacific markets are put in two classes by Mr. MacCorkle.

First—Coals from Australia, Great Britain, Japan, South America, China, Vancouver Island, South Africa.

Second—Domestic coals from Virginia, Pennsylvania, western Maryland, Alabama.

Our Welsh Rivals

We may as well admit, for it is a fact, that the best Welsh coals are the best coals in the world in heating value, and general excellence for steam making, especially for ships use; but all of the Welsh coals are not the best and the New River-Pocahontas fuels, properly prepared, can compete on even terms with any but the best.

The author does not seem to realize, however, that there are other British coals beside Welsh, with which we must reckon, the latter being taken as the sole example of the British product. The best Northumberland coals are little inferior to the Welsh grades shipped to South America while their cost at tidewater today is considerably lower ($3.25 per long ton) and the freights to South American ports are about the same. The best Northumberland coals (Davidsons, Cowpen, Bothal) have the following analysis from actual shipments:

Moisture	1.40
Volatile	32.80
Fixed carbon	62.90
Ash	2.90
Sulphur	0.83
B.t.u.	14,601.00

This coal is quite hard, stands handling well and is well prepared.

The following are quotations on Welsh coals:

	Nov. 7, 1913	Mar. 27, 1914
Best Welsh coals	$4.80@4.92	$4.35
Best drys	4.32@4.56	4.14
Best Monmouthshire	3.92@4.14	4.09

Judging from the above, the statement that the Welsh coals are bound to increase in price does not seem to be true. Neither the best Admiralty, nor the dry coals (very low volatile, 10 @ 11 per cent) go to South America, except some Admiralty for naval use. (The Argentine navy has just bought 150,000 tons best Admiralty). The coals that do go are Cardiff seconds and smalls, Monmouthshire bests and seconds, on which prices are quoted today as follows:

Cadiff seconds	$4.20
Cadiff smalls	2.60
Monmouthshire bests	4.09
Monmouthshire seconds	3.90

Welsh Coals at Panama—Our article asks if there can be competition, at such prices, with New River-Pocahontas coals at Panama. Not even the English operators themselves ever thought of such competition.

Other Markets besides Panama—Charter rates quoted are as follows:

	Nov. 13, 1913	Apr. 5, 1914
From Cardiff to—		
Rio Janeiro	$3.71	$3.16
Buenos Aires	3.53	3.28
Santos	3.89	3.28

Quoting further, "One charter was made last week for the transportation of 5500 tons from Hampton Roads to Rio Janeiro at 16s. 6d. ($4.01). On the basis of this last shipment, New River and Pocahontas coals were delivered in Rio Janeiro at a cost of $7.01, as compared with $8.63 as the cost of the best Welsh steam coals. These ports are on the Atlantic but roughly exhibit the opportunity for the sale of coal on the Pacific coasts after the Canal is constructed."

Let us take Rio, at present (Apr. 1) quotations, and compare costs:

	Coal	Freight	Total
New River coal	$2.85	$3.58*	$6.43
Welsh coal†	4.09	3.16	7.25

*Cargo of 5131 tons. †Best Monmouthshire.

As already noted, the best Admiralty coal is not shipped for commercial use to South America. Moreover, the Atlantic ports do not "exhibit the opportunities for the sale of coal on the opposing Pacific ports." On the Atlantic side we have only the competition of British coals to meet, while on the Pacific, we have as competitors, not only the British coals, but the Australian, Japanese, native coals and fuel oil, the latter now being used in large and increasing quantities in both Peru and Chile.

Again, if we have this advantage of 78c. on the east coast in our favor, why have we not been able to take these markets away from Great Britain? Why should we get more west coast trade, after the Canal is opened, when we have not been able to get the east coast with everything in our favor? The distance from Hampton Roads to Rio and Buenos Aires is less than the distance from Cardiff to the same ports. Brazil is now readily accessible to us, yet we have a smaller percentage of her total trade than we have of Peru's.

The article then asks if it is reasonable to suppose that West Virginia thrift and enterprise will allow Welsh coals to compete in these markets at the difference in price. The English coal and steamship people are just as thrifty and enterprising as are the West Virginians, besides which they are strongly entrenched in the markets and know much more about selling conditions and the exporting of coal. They are also interested in steamship lines, have their own selling agencies, coaling stations and docks, and own many of the largest industrial plants, mines and railroads. Take the Argentine, for instance; out of a total of 32,854 kilometers of railways, 22,908 are British owned.

THE AUSTRALIAN COMPETITION

Comparing the quality of the Australian coals with those of West Virginia, we find:

*Consulting engineer, 426 Real Estate Bldg., Philadelphia, Penn.

	Moisture	Volatile	Fixed Carbon	Ash	Sulphur
Australian	1.92	3.509	54.08	2.91	0.541
New River	0.983	20.805	74.983	3.229	0.621

Using one cord of seasoned white oak as the unit of measurement, the U. S. "Navy" Department has determined the following equivalents:

	Lb.
New River, average of 7 tests.....	1676
Australia, average of 10 tests.....	2225
1000 lb. of New River coal has the same fuel value as lb. of Australian coal.	1327

The above analysis of Australian coal is wrong; the sum of the constituents (excluding sulphur, always separately determined) is 62.419 instead of 100, and the ash is entirely too low. Typical analyses of New South Wales bituminous, the coal exported to South America are given herewith.

The greater part of the Australian coals suitable for export come from two districts in New South Wales. That from the New Castle district varies considerably in quality, the best of it being similar to Pittsburgh coal and averaging about 33 per cent. volatile, with 7 to 12 per cent. ash. From the Southern district, the coals resemble Pocahontas more, although higher in ash and volatile and slightly harder, these being the best Australian coals, especially for steamship use.

At any rate, one analysis does not represent Australian fuels; there are many different kinds of coals in that country, as the following typical analyses will show:

	Aberdare	Mt. Kembla	Sydney Harbor	Southern Field[1]	Newcastle[2]
Moisture	1.32	1.37	0.67	0.71	2.01
Volatile	40.47	25.14	19.76	23.65	36.01
Fixed carbon....	52.58	62.29	71.67	63.98	58.27
Ash	5.63	11.20	7.90	11.66	8.71
Sulphur	1.23	0.43	0.44	0.47	0.47
B.t.u. dry	....	....	....	13,200	13,300

[1]Average of 35 samples. [2]Average of 75 samples.

The analysis given of New River coal cannot be maintained in actual shipment, the ash and sulphur both being too low. A typical analysis (actual) of the *best* New River coal, *as shipped,* is as follows: Moisture, 1.107; volatile, 20.50; fixed carbon, 73.37; ash 4.96; sulphur, 0.828; B.t.u., 15,053, while the average of 27 cargoes shipped to the Panama Canal was: Ash, 5.395; B.t.u. dry coal, 14,881.

The oak wood equivalent tests are hardly worth considering. In the first place, it was the United States War Department, not the Navy, that made these tests; the Navy would hardly be guilty of such "tests."

This method of determining the comparative values of coals was started 20 or 25 years ago, to show the values of coals for heating purposes at the various army posts and was carried on until only a few years ago. The samples of coal used were only 1000 lb. in weight and were, in some cases, at least, selected, as I know personally, from the best coal in the mines, while the method was inaccurate and has long been a subject of ridicule, even by the Government officials.

There has never been any question as to the inferiority of Australian coals to New River and Pocahontas in heating values, but the former are hard and lumpy, make steam quickly and are excellent locomotive fuels; their price on the west coast has been such that they could compete with the better-grade coals.

With the opening of the Panama Canal, this difference in value will be overcome and the Australian coals largely eliminated from the west coast markets.

"Japanese as Rivals"

Although in 1913, there were 3,800,000 tons of Japanese coal exported, it is unlikely that there will be any increase for the next year or two as the home consumption is steadily increasing and the price of coal has advanced 74c. per ton for 1914. The total output of Japan was 19,000,000 tons in 1912 and is increasing every year. Practically all of the islands are underlaid with coal and it is estimated that there are 7,002,200,000 tons available.

It is stated in the article under review that Japan's coal seams are usually small and the fuel is often a "dirty coal of steaming grade," whatever that may mean, and high in ash and sulphur; also that in the best fields the coal is mined by shafts and that all the mines are wet.

The principal coal fields of Japan are: Chikuho (most important), Taka-Shima, Hokkaido, Miike.

The Chikuho seams vary from 3 to 8 ft. in thickness. In the Taka-Shima district, there are six seams varying from 3 to 17 ft. in thickness. About 150 seams ranging from 1 to 60 ft. in thickness, occur in the Hokkaido district. The seams in the Miike field are 3 to 8 ft. thick normal, though occasionally 25 ft. thick.

Typical analysis of coals from the different fields is as follows:

	Chikuho	Taka-Shima	Hokkaido[1]	Miike
Moisture	4.21	1.16	2.74	0.66
Volatile	42.92	38.83	41.05	41.74
Fixed carbon	45.71	54.43	50.65	48.24
Ash	7.33	5.58	5.56	9.36
Sulphur	0.68	0.82	0.40	3.64
B.t.u. as received.....	12,965	12,979	13,274	13,427

[1]Analysis of the main seam (24 ft. thick) in the Yuparo district.

The article states: "The Japanese coal will compete in the Far East, but not with ours or that of Australia in markets to which Japan has less convenient access." As a matter of fact, 80,000 tons of Japanese coal was brought into San Francisco in 1913, and 30,000 tons were bought by the Chilean Railways in the same year.

Vancouver Island's Coals

As regards western Canadian coals the article states: "The question of the ability of West Virginia to compete with the Vancouver coal is one demanding careful consideration." This followed an analysis made by the U. S. Government "of coals shipped under the trade name of Comox, Nanaimo and Wellington" which is as follows:

Moisture	1.600
Volatile	30.251
Fixed carbon	56.688
Ash	11.461
Sulphur	0.512

There is also another comparison given of heating value, based on the obsolete and inaccurate seasoned white oak standard, which shows that New River coal is 39 per cent. better than the Vancouver product. This analysis is fairly representative of the Comox coal, but there are three other seams, the Wellington, Douglas and New Castle. Recent analyses of these coals are as follows:

	Wellington	New Castle	Douglas	Comox
Moisture	1.16	1.9	1.54	1.0
Volatile	40.47	39.4	33.30	29.0
Fixed carbon	50.04	45.7	56.23	57.2
Ash	7.80	11.7	8.44	11.9
Sulphur	0.53	1.3	0.49	0.9
B.t.u.	13,410	12,470	13,446	13,010

The statement that New River coal is 39 per cent. better than average Vancouver fuel is absurd, as following comparison will show:

	B.t.u.	
New River	15,006	= 100
Wellington	13,410	= 89
New Castle	12,470	= 83
Douglas	13,446	= 89
Comox	13,010	= 86

It is further stated: "The price of Vancouver coal at the loading port, f.o.b., was $3 to $4.50." Which figure should be taken? There is rather a wide difference. Then: "The sailing distance from San Francisco is about 950 miles" while according to Philip's tables, it is 820 miles. As to the ultimate cost at San Francisco, the article says: "I think we can safely estimate the charter rates at about $1.50 per ton; this makes the *cost* of Vancouver coals alongside at San Francisco not less than $6 per ton." It is clear that this is the *price* asked, not the *cost*.

Then the statement is made that New River-Pocahontas coals can be delivered at San Fancisco at the same price, *omitting tolls*. From present indications, tolls must be figured in, which would add about 50c. per ton to the cost of coal. But even now Hampton Roads coals can be delivered alongside at San Francisco for $6.24, based on a $2.85 f.o.b. price, and a freighting bid to the U. S. Navy of $3.39 for a cargo to be shipped in May, 1914.

The statements as to costs and heating value made by Mr. MacCorkle are said to apply to the whole western coast of the United States and to give the West Virginia coals "an absolute determinable advantage" over the Vancouver fuels at San Francisco, Mexico, Central and South America.

This whole question of the coal competition along the west coast, north of Mexico, cannot be settled or determined until the matter of ocean freight rates and canal tolls is known; it is also more than probable that there will be a readjustment of prices on the Pacific Coast coals. We believe that our strongest competitors for the North Pacific Coast trade, leaving fuel oil out, will be the British Columbia coals.

In 1912, there were 858,981 tons of these fuels shipped to the United States, about 38 per cent. of the total output.

South American Coals

The statement is made: "At times reports have come of good coal in South America. Investigation has never proved the report true." Mr. MacCorkle is evidently not familiar with all of the reports on South American coals as investigations have shown that there *are* quite large deposits of good coal there.

There is excellent coal within 100 miles of the Pacific and a railroad is almost completed from the coal deposits to a port, 410 miles south of Panama. This coal has the following analysis (outcrop samples taken by the writer):

	No. 1	No. 2
Volatile	23.21	23.17
Fixed carbon	68.05	70.58
Ash	7.66	5.38
B.t.u.	14,282	14,680

The extent of this field is not accurately known, but it covers a large territory in the Cauca Valley, Colombia, estimated at 10,000 square kilometres.

There are also good coals in Venezuela, as the following analysis of outcrop samples, taken by the writer, show:

	As Received	Dry
Moisture	1.45	....
Volatile	46.26	46.94
Fixed carbon	50.12	50.86
Ash	2.17	2.20
Sulphur	0.82	0.83
B.t.u.	14,542	14,756

This coal is on the coast and transportation facilities could easily be provided. The Chilean coal is not "all dirty" nor does it "steam badly," nor "deteriorate rapidly." The best of it is a fair steam coal, quite equal to some of the West Virginia fuels. Under certain conditions, it has excelled Pocahontas coal as a locomotive fuel. It shows the following analysis, mine samples:

	Lota	Coronel	Curanilahue
Moisture	4.09	3.61	3.71
Volatile	37.56	34.17	35.70
Fixed carbon	55.64	55.74	55.79
Ash	2.67	6.46	4.79
Sulphur	0.20	0.28	0.64
B.t.u. as received	13,835	13,122	13,403

The total output of the Chilean mines in 1911 was 1,277,000 tons, the price at the mines being from $1.20 to $1.40 per ton.

There are also large deposits of coal in Peru, both semi-anthracite and bituminous, some of which will be available for shipment in the next two years.

China and South Africa—As Mr. MacCorkle says, there are large areas of coal in China, some of it, at least, of good quality, but one need fear no competition from this coal for some time to come.

Alaska coals—The possible competition of Alaska coals is dismissed in a few words as being of small importance, which is probably correct. Alaska mining costs and the transportation by water will be prohibitive for some time to come, apart from the question of quality.

(*To be continued in issue of July 11*)

Alabama Mines Are Active

According to the figures of E. W. Parker, of the U. S. Geological Survey, in coöperation with the Geological Survey of Alabama, the production of coal in that state in 1913 was 17,678,522 short tons, valued at the mines at $23,083,724.

The increase in coal production in Alabama in 1913 compared with that of 1912 was 1,577,922 short tons in quantity, and $2,254,272 in value.

Labor conditions were much better in 1913 than in either 1912 or 1911, and car shortage was less acute in 1913 than in recent years, some of the large coal-carrying roads having added materially to their facilities for handling the output. The increased tonnage went principally to points outside the state.

The relations between operators and mine workers were generally harmonious and increased wages were put into force in February. Earnings by miners and mine laborers in 1913 are said to have been higher than ever before in the history of coal mining in Alabama, and improved sanitary and living conditions put into effect by many companies added to the general betterment.

The number of men employed was 24,552 as against 22,613 in 1912. The total time lost by strikes in 1913 was 27,041 days, 1048 men being idle for an average of 26 days. There were 124 men killed in the coal-mining operations of Alabama in 1913.

Coal is being mined in large areas in Servia and in the Balkan basin of Bulgaria, where many seams of friable coal are found.

The Lignite Briquetting Plant at Minot, N. D.

By G. J. Mashek*

SYNOPSIS—With greater supplies of lignite than all other varieties of coal combined, the time is fast approaching when these low-grade fuels will be briquetted and used. In certain instances, including the one here described, this has already proved a commercial success. The plant at Minot differs from customary practice in that the lignite is carbonized in coke ovens before being briquetted.

The Northern Briquetting Co., of Minot, N. D., has erected a small commercial carbonized lignite briquetting plant. It is rated at from 8 to 10 tons an hour and has been operated up to 11¼ tons per hour, making about 2¼-oz. over-stuffed, pillow-shape briquettes from carbonized lignite. This is the first commercial lignite briquetting plant erected in the United States, converting lignite to fuel practically equal to anthracite coal in heating value and nearly smokeless.

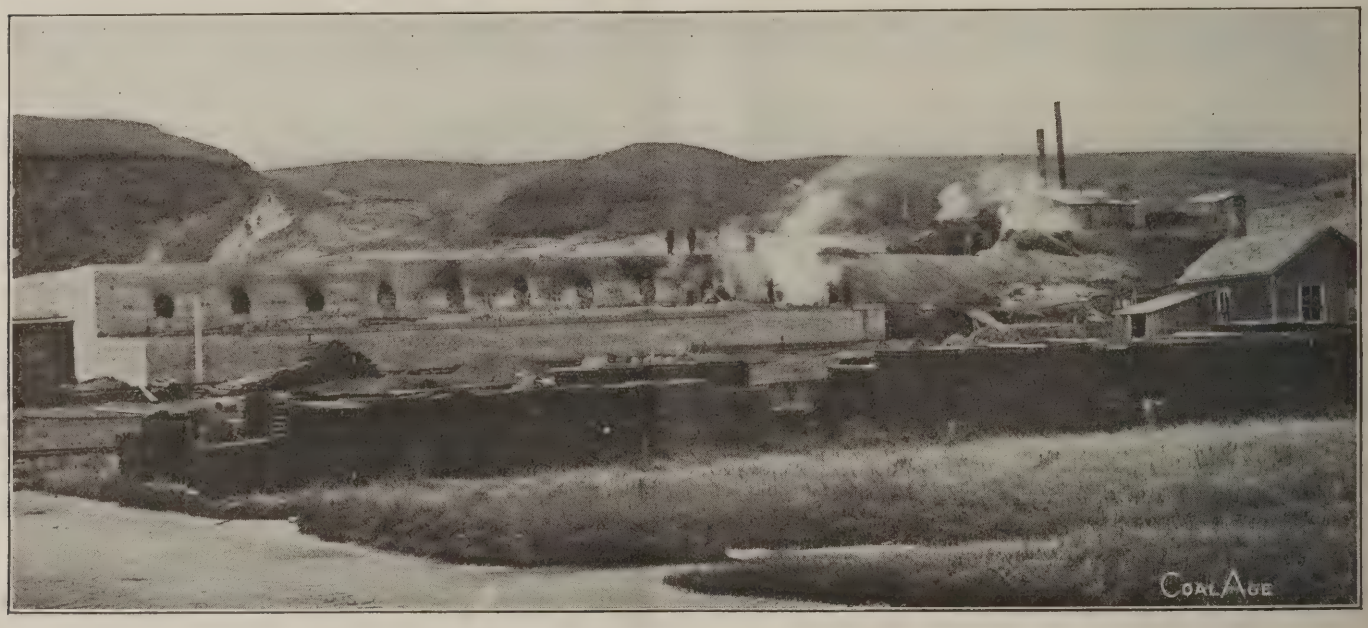


Fig. 1. Beehive Carbonizing Retorts Where the Lignite Is Treated before Briquetting

American vs. European Practice

It might perhaps be proper to mention that while the briquetting of lignite or brown coals in Europe is a large industry, these fuels are considerably different from those of the United States with the possible exception of certain Texas lignites. There are greater deposits of lignite in the Western states than of all the other coal combined, in this country. The main drawback to the development and use of this fuel has been the high percentage of moisture contained and also its air-slacking qualities, which makes it impossible to store it for any length of time.

Thus in spite of all these large deposits, most of the coal consumed in the states having the greatest lignite deposits has been semibituminous, bituminous or anthracite, the price of which, in the Western part of the United States is extremely high. Lignite, however, is available at as low a price as 90c. a ton at the mines.

Many attempts have been made to briquette lignite in its natural state, but all of these have been failures. Raw lignite briquetted is only benefited by the amount of binder introduced, which prevents the tendency to air-slack to some extent. Little better results are obtained during combustion, for the reason that the lignite usually crumbles to dust and much more must be used for steam purposes on account of its low calorific value. Some improvements have been made in the construction of fire-boxes, special grates, etc., so that somewhat better results are obtained with raw lignite under boilers than formerly. However, for domestic use no improvement of any consequence has been made.

A number of European briquette plants have been imported, which, while very successful in briquetting the foreign product, have, as already noted, proved failures when operating on American lignites and under conditions existing in this country. The United States Bureau of Mines, some years ago, made extensive experiments and tests with European machinery to briquette lignite without the use of binders. There have been produced some fairly hard briquettes from certain deposits of young lignites that contain considerable quantity of natural pitch. But these deposits are rather rare. The briquettes made by this process (under a pressure of approximately 20,000 lb. per sq.in.) have withstood the weather fairly well, but when thrown into the furnace they really gave little, if any, better results than lignite in its natural state, clearly demonstrating that briquetting lignite without the use of binders is out of question as a commercial undertaking in the United States.

*President, Mashek Engineering Co., New York.

Development of the Carbonizing Process

The manner of briquetting lignite by carbonizing the raw product first has been a success for upwards of ten years. But no material progress was made in this industry until the fall of 1909 when the state of North Dakota made an appropriation to the State University for the purpose of carrying on further experiments and tests in this direction. The work was undertaken by Prof. E. J. Babcock, Dean of the School of Mines, and the researches, tests, etc., made are of great value to the industry, especially the possibilities which were discovered of producing gas for industrial purposes from lignite.

Fig. 2. Carbonized Lignite Briquetting Plant, Minot, N. D.

The state purchased a small experimental carbonizing, gas-purifying apparatus and briquetting-plant equipment which was installed at the Experimental Station in the North Dakota lignite fields at Hebron. This plant was in operation for upwards of four years, carbonizing considerable lignite and briquetting the same, so as to prove the process a commercial success. The equipment was furnished by the Mashek Engineering Co., "Y" type, having a capacity of about two tons an hour of 2¼-oz. briquettes, being installed.

The tests made on the carbonizing of lignite are particularly valuable as exhaustive experiments were conducted with various types of carbonizers. These varied from a closed retort, where all the gas and byproducts were saved, carefully measured and analyzed, down to what is practically a beehive oven where the byproducts are consumed, assisting in the carbonization, or allowed to go to waste. Dean Babcock's report on "Investigation of Lignite Relative to the Production of Gas and Briquettes," is an important addition to the knowledge on this subject.

The selection of a suitable carbonizer in the installation of a lignite-briquetting plant is an important item. The type of apparatus is dependent on whether it is advisable and profitable to save the gas for use in gas engines or firing boilers. If there is no market for the gas, the simplest type of carbonizer may be used.

Heat Value of the Briquettes

The gas produced by a suitable carbonizer will average from 9000 to 10,000 cu.ft. per ton of carbonized lignite of approximately a calorific value of 500 B.t.u. The average analysis of this lignite gas from practically all the Western and Northwestern lignites is as follows:

Illuminants	3.11
Carbon monoxide	17.24
Hydrogen	45.16
Ethane	0.14
Methane	15.59
Nitrogen	5.49
Oxygen	1.76
Carbon dioxide	11.51

When the lignite is properly prepared and treated in a suitable carbonizer, the gas is all given off at a temperature of 900 to 1000 deg. F. This comparatively low temperature to obtain gas is an important natural advantage which lignite possesses.

The average comparative calorific value of lignite as mined, lignite residue, briquettes and anthracite coal is approximately as follows:

	B.t.u.
Lignite as mined	7,500 to 7,800
Lignite retort residue	10,500 to 11,500
Lignite briquettes	12,000 to 12,500
Anthracite coal	12,500 to 13,500

And these have an average comparative analysis as follows:

	Moisture	Volatile Matter	Fixed Carbon	Ash
Lignite as mined	35.01	25.11	34.67	5.21
Lignite briquettes	0 to 6	2 to 8	75 to 85	10 to 14
Anthracite coal (a market sample)	3.68	3.26	80.51	10.55

It will be seen that converting the lignite into briquettes makes the product practically equal to anthracite coal. The carbonized lignite briquettes, however, are freer-burning and if there is no market for the gas it is necessary to carbonize the fuel only enough to remove the moisture, lighter volatiles, ammonia, etc., leaving considerable volatile matter still in the residue. This produces a smokeless flame during combustion and for that reason and also on account of their free-burning qualities

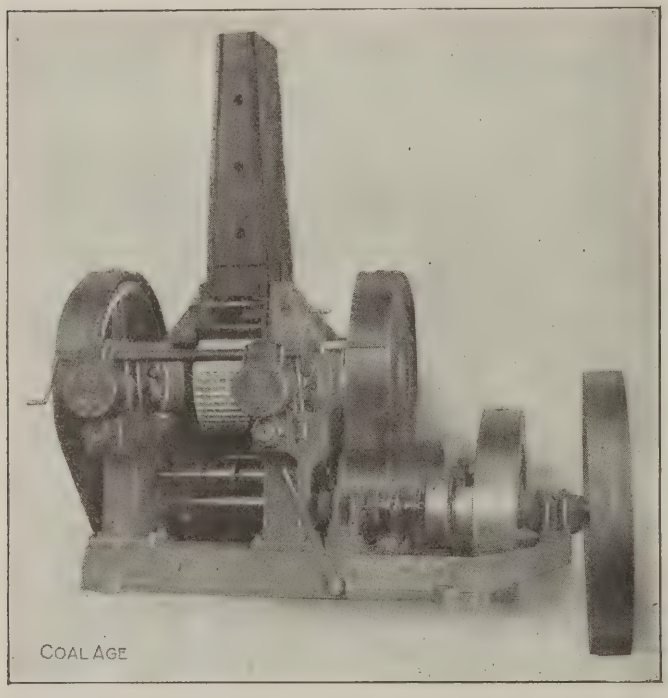

FIG. 3. A SEVEN- TO TEN-TON PER HOUR BRIQUETTE PRESS

the lignite briquettes are preferable to anthracite coal. These data are taken from Prof. Babcock's reports.

DESCRIPTION OF THE PLANT

The Northern Briquetting Co. began construction on their carbonizing and briquetting plant in the summer of 1913. Not having a market for the gas, a special type of beehive carbonizing retort was constructed at the mines, which are located about six miles from the briquetting plant. After the product is carbonized, it is transported in special gravity-discharge steel cars to the briquetting plant located in Minot. A view of the carbonizing plant is shown in Fig. 1 and the briquetting plant in Fig. 2.

This plant is equipped with special lignite briquetting machinery, size "M-1" built by the Mashek Engineering Co., of New York. It is about as small a commercial plant as was deemed advisable to install so that the cost of operation would not be excessive.

The material arriving at the briquette plant proper is discharged from the cars into a track hopper, from which it is taken by an elevator and delivered to the steel carbonized-lignite bin. This bin is 28 ft. in diameter by about 28 ft. high, mounted on steel columns. Adjacent to the steel bin is a three-compartment wooden bin, each compartment having a capacity of approximately 200 tons; these are used for storing bituminous coal screenings, anthracite coal screenings and dust resulting from the breakage and handling of briquettes as they are loaded into cars.

All of these bins are equipped with special, automatic, measuring feeders operated by variable-speed control, the material being fed directly into a conveyor in front of all the bins. This conveyor takes the material, measured out in direct proportions required, into a special type of all-steel pulverizer which reduces the coal so that it will pass approximately a 12-mesh screen.

From the pulverizer the material is elevated to the top of the building, where it passes, by gravity, through a special steam preheater and then to a steam-jacketed mixer; part of the binder is introduced before the material reaches the preheater and the balance in the steam-jacketed mixer. This mixer is so constructed that a satisfactory product can be obtained with as low as 1½ per cent. of liquid pitch or asphaltum. The material is pugged and partially compressed in the mixer and expelled through a contracted opening into three tempering or binder-fixing mixers. From these latter the material passes to the briquette press; the passage from one machine to another, down to the briquette press is by gravity.

THE BRIQUETTE PRESS

The press, which is shown in Fig. 3, is of the two-roll, rotary type, with the briquette-shape molds in easily removable roll shells. This press has been specially built for carbonized lignite so as to get the maximum pressure without over-pressing; it is equipped with positive discharge aparatus, etc. All the gears and working parts are well protected from dust. The roll shells may be changed so that several different weight briquettes can be made, varying from 1½ to 5½ ounces.

The briquettes are conveyed from the press by a belt conveyor to a bucket elevator which takes them to the top of the bin building, where they are evenly distributed on an all-iron cooling table; they remain on this table, which is constantly in motion, for about half an hour and are then discharged into any part of the briquette bin, ready for shipment. The briquette bin is of the usual construction, with spouts and screens for loading into cars; there is a track on one side of the bin with a wagon driveway through the center and on the other side.

The binder-handling equipment in this plant is arranged to take coal-tar pitch, oil-residuum asphaltum or low melting-point gilsonite, and also has appliances for introducing a low-grade flour. This flour, during the process of manufacture, is converted into starch and dextrine. The amount of binder required to make hard briquettes capable of standing transportation and handling, is about 5½ per cent. coal-tar pitch with 1 per cent. of low-grade flour. No attempts have been made up to the present time to use gilsonite, but experiments have shown (depending on quality) that about 4 per cent. will be required to make an extremely hard briquette which is practically smokeless.

The coal-tar pitch briquettes will produce a little smoke on ignition only. The asphalt-residuum briquettes make considerably less smoke, principally on account of the

chemical change that takes place between the starch and dextrine and the asphaltum. The older the briquettes are the less smoke they will produce on ignition; they also increase in hardness with ago. Carload samples of these briquettes have been exposed to the weather in North Dakota for upwards of two years, at the end of which time they were harder than when placed in the pile, and they also burned with considerably less smoke.

The size and shape of the briquette for domestic use is an important item, especially when using lignite. They must be of a size to suit local conditions and about the same as the natural coal the people in any particular locality have been in the habit of using. This eliminates the necessity of giving any special instructions as to how the fire should be manipulated, etc.; such instructions are seldom followed so that the product often fails to give satisfactory results. After considerable experimental work, it was found that carbonized lignite briquettes weighing from 2¼ to 2½ oz. gave the best results in the markets available to this plant. The shape of the briquette should also be such as to leave a little greater air and gas opening between the pieces than would be necessary with harder coals.

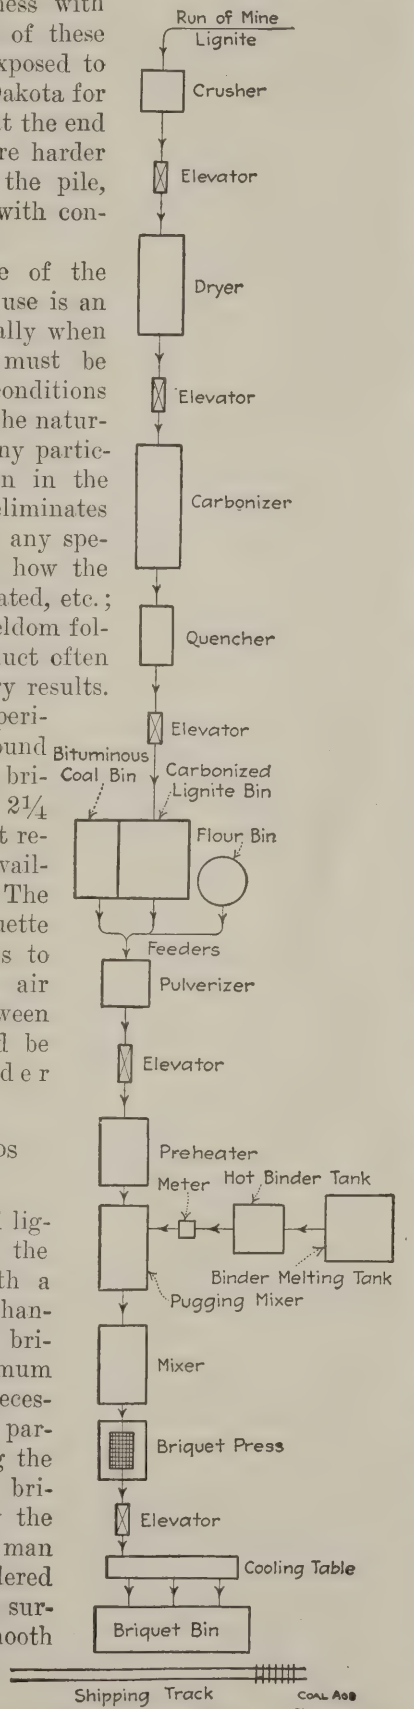

FIG. 4. FLOW SHEET, SHOWING NECESSARY MACHINES FOR PLANT USING A MECHANICAL CARBONIZER

OPERATING METHODS AND COSTS

Since the carbonized lignite is rather weak, the press is equipped with a special adjusting mechanism which forms the briquettes under a maximum pressure without unnecessarily crushing the particles of lignite during the operation. When a briquette will carry the weight of a 160-lb. man it is ordinarily considered sufficiently hard. The surface must also be smooth and equally as hard as the interior.

The power for this plant is furnished by two 150-hp. horizontal tubular boilers, one being sufficient to run the plant continuously, using raw lignite as a fuel. The plant is driven by a 13x16-in. double-cylinder automatic engine. The power required to drive the briquette plant proper is about 72 horsepower.

The plant is automatic from one end to the other, four men per shift being sufficient to operate it. Two outside men will take care of unloading the carbonized lignite and loading the cars. The plant is so arranged that a duplicate unit can be put up without disturbing the arrangement of the machinery now in place.

In the flow sheet, Fig. 4, is shown the sequence and the necessary machines in operating a plant using a mechanical carbonizer.

The cost of manufacture and operation in detail of the complete plant is given in the accompanying table. The labor cost in operating a single-unit plant of larger capacity will be lower as the number of men required are practically the same.

The briquettes produced find a ready market in Minot and throughout the Northwest, and are retailing at from $10 to $11 per net ton. The price of anthracite coal is on an average of $12 a ton.

ESTIMATED COST OF MANUFACTURING LIGNITE BRIQUETTES IN NORTH DAKOTA. TYPE "M-1" PLANT. LIGNITE CARBONIZED—GAS NOT UTILIZED

Lignite Containing 28 Per Cent. to 33 Per Cent. of Moisture, Producing 9 to 10 Tons of Briquettes per Hour, Running Two Shifts of 12 Hr. Each

Labor for Two Shifts:

Men		Rate	Total
3	Loading and unloading cars	$2.25	$6.75
2	Drying and crushing plant	2.25	4.50
2	Carbonizer and quencher	2.50	5.00
2	Boiler firemen	2.50	5.00
2	Mixers and briquette press	3.00	6.00
2	Cooling table, dust and briquette bins	2.25	4.50
2	Oilers and assistant plant runners	2.50	5.00
2	Binder preparing plant	2.25	4.50
2	Foremen	4.00	8.00
1	Clerk and weighmaster	3.00	3.00
1	Watchman	2.50	2.50
1	Laborer and sweeper	2.25	2.25
	Total wages for two shifts		$57.00
	Labor cost per ton of briquettes (210 tons per day)		$0.27

Binder:		
6% coal-tar pitch @ $16 per ton	$0.96	
1% low-grade flour @ $28 per ton	0.28	
5% bituminous slack @ $4 per ton	0.20	1.44
Boiler and Carbonizer Fuel:		
225 lb. of lignite @ $1 per ton		0.11
Rebriquetting degradation, breakage, etc.		0.06
Lignite:		
1.7 tons of lignite slack @ 90c. (25 per cent. moisture)		1.53
Lubricating oil, waste, etc.		0.01
Fixed Charges:		
Depreciation and upkeep of plant @ 10 per cent. estimated on minimum production of 40,000 tons per annum		0.17
Insurance @ 3 per cent.		0.03
General office and sales expense, $7000 per annum		0.17
Contingencies, losses, etc. @ $7000 per annum		0.17
Total average cost per net ton f.o.b. cars at plant		$3.98

The Issaquah & Superior Coal Mining Co., of Issaquah, Wash., has concluded arrangements with the Independent Coal & Ice Co., an old established firm at Portland, Ore., to handle their coal there. It is believed the coal will be retailed at the rate of $8 per ton for domestic purposes. The company's mine is at Issaquah, 26 miles from Seattle, and for the present the coal will be brought in by rail. With the completion of the Washington Canal, tracks will be built from the mines to the wharf thus enabling shipments by water. It is understood that barges will be placed in commission and this will mean a saving of at least $1 a ton on coal shipped to this port. The Issaquah company is owned by a German syndicate organized about 16 months ago and approximately $1,000,000 has already been expended in the ground and development work. Ninety attractive cottages have been erected for the workmen and their families and a good sized community has already been established.

It is the intention of the company to utilize all of the byproducts as is done in the mines in Germany, and it is expected to begin the manufacture of creosote in the near future. There is a big demand for creosote on Puget Sound.

The Labor Situation

SYNOPSIS—Colorado is quiet except for rumors of drastic action by the President. Many firearms have been surrendered in the northern part of the state. "Mother" Jones has been denied admission to Canada by the Immigration authorities. Serious trouble was feared in West Virginia, but affairs there are now pacific.

Quiet still reigns in Colorado, the strong hand of the federal troops not being removed; however some lack not of strength, but of intention threatens to cause trouble. So long as rumors come that the President intends to close the mines on some near date if the operators do not agree to arbitration, the agitators feel that there is hope for success if they can only prevent a resumption of work on the part of the miners now on the union pay-rolls. The date set for this ultimatum of the President is said to be June 20, the day on which this report will leave the press, but this has been denied, not however so vigorously as to remove anxiety that the President is considering such a high-handed proceeding.

To lay men idle is surely one of the last ways in which to promote peace. Idle men are always strife makers. Of course the President would intend should he take this action, not to secure peace so much as to terminate the strike by removing its cause. But in this, his action would not be in any sense military, but legislative and it is clearly not his business to legislate for Colorado. We doubt whether he would compel the arbitration of labor disputes in Vera Cruz should a disturbance arise among the employees and employers in that city, and he has no more right to do so in Colorado. He should be very careful not to interfere with the prerogatives of the legislators of the state or nation.

WHY MARTIAL LAW IS DECLARED

Martial law is declared because it replaces the slow progress of law making for the rapid necessities of a military situation and because it puts the control in the hands of those who being disinterested can deal with the situation without local prejudice. But if the people of Colorado have for years refused to pass a law requiring arbitration should Mr. Wilson pass it for them? The closing of saloons and shutting off of ammunition, an expulsion of those without occupation and like actions are necessary precautions but interference with peaceable industry is not regarded as within the sphere of martial law.

Weakness also is shown in expelling working men while admitting agitators. At first the Union was told that the agitators would probably not be admitted. Later Fred. D. Thomas and Andrew Reese, two Pennsylvania organizers, arrived and were compelled by the troops to remain at their hotels. However, Robert Burt, of Iowa, was permitted to take charge of the Walsenburg headquarters. But Col. J. Lockett finally received orders to let in all the agitators of the Union. They are required, however, to do "nothing which will irritate or inflame the situation."

On June 3, an interurban car enroute to Cokedale was fired at just outside the city limits. The bullets just missed the car which carried many passengers. Two Austrian coal miners on their arrival from Raton, New Mexico, were met by union pickets and taken to headquarters. These Austrians say they were told to join the Union and threatened with death if they went to work at the mine at Sopris, to which they were bound. They were kept at headquarters for two hours, at last making their way through town surrounded by 3000 or more strikers, but they were finally rescued by a policeman and a constable and forwarded on a car to Sopris.

Col. Lockett seems from the reports, which we hope do not do him justice, to be more interested to know whether they were invited to come to work on came of their own incentive than to determine who threatened them with death and who detained them on their way. Could it be possible that the Colorado Fuel & Iron Co. was endeavoring to replace some men who had left because they feared death at the hands of the strikers? This is, from reports, Col. Lockett's problem.

NO IMMEDIATE PROSPECT OF ARBITRATION

As usual there come reports of the probable success of arbitration, but the recognition of the Union is the unvarying demand of the officials and the companies do not seem any more willing than before to concede it. John Lawson says, "I do not know of any prospects of a settlement. The miners will never go back without recognition of the Union if they follow my advice."

INVESTIGATORS ARE PLENTIFUL

Colorado is full of investigators who get most divergent results according to the parties to whom they listen. The state conciliators are back from their various trips and Senator S. K. Burris, the chairman, says "We will settle the strike." Senator Burris and his committee had been in conference with J. F. Welborn, President of the Colorado Fuel & Iron Co., and had been recognized by him as a conciliation or mediation committee.

Meantime Hywell Davies and William R. Fairley have been investigating and have returned to Washington to inform the President regarding conditions. J. B. Densmore, solicitor for the Department of Labor and Ida Tarbell both put absenteeism as the root of the trouble. That is, we believe, partly true. It is not perhaps being helped by the President's continued absence in Washington, from the trouble in Colorado. But the President tries to control the situation, whereas the absentees of the Colorado Fuel & Iron Co. leave that to their lieutenants in the field which is, on the whole, a far wiser plan.

LIQUOR SELLING HAS BEEN PROHIBITED

Governor Ammons has prohibited the sale of liquor all over the northern Colorado strike district and over 500 guns including pistols and rifles and over 5000 rounds of ammunition have been surrendered by the miners in northwestern Colorado. Whether this confiscation has disarmed the law-abiding only, we do not know. The disarming of the citizens who only use arms for defence will not improve conditions when once the military forces are removed.

Representative Keating and Senator Owens respectively introduced into the House and Senate a bill for a commission of five persons to pass upon and inquire into the questions in controversy between operators and strikers in the Colorado coal fields. A report is to be made to Congress not later than Dec. 1, 1914.

MOTHER JONES DEBARRED

Temporarily Colorado has been spared the annoying presence of "Mother" Mary Jones. She went to New York, then to Seattle, and tried to reach Nanaimo, Vancouver, that she might make trouble there, but the Canadian immigration inspection service stopped her and now an appeal has been made to President Wilson in the hope that he will cause the Canadians to admit that "daughter of discord."

MORE TROUBLE AT COLLIERS

The situation at Colliers, West Virginia, was for a time desperate. The village is situated in Brooke County, one of the four counties forming the panhandle of Ohio. The trouble was in the mines of the West Virginia & Pittsburgh Coal Co., and lasted about nine months.

The strike seemed a short while ago to be nearing an end. Most of the strikers had left the region. But at one time there were some 600 men affected who worked normally in three different mines. Two murders had been committed and several persons had been assaulted and shot.

On hearing that the houses occupied by strike breakers of the West Virginia & Pittsburgh Coal Co. had been riddled with shots, Governor Hatfield telegraphed Sheriff George Patterson that he must keep order. The sheriff made an investigation and reported that there was no breach of the peace which he could not handle.

Superintendent R. Z. Virgin had a narrow escape from being shot when he was fired on from ambush, and on June 11 an attack was made on the Locust Grove mine of the West Virginia & Pittsburgh Coal Co. Shots were fired and a dynamite bond was exploded at the mine entrance. The occasion for the recrudescence of trouble seems to be a number of suits listed in the courts of Brooke County for the ejection of strikers from the houses of the West Virginia & Pittsburgh Coal Co. Two months ago, Governor Hatfield sent Captain C. R. Morgan to investigate the situation.

Recently the strikers were told that no further money will be forthcoming as the money used in Ohio and Colorado had depleted the funds. However, President Van Bittner, of Pittsburgh, promised that strike benefits would be paid. It is now stated that the whole trouble is ended by an agreement between the contending parties.

Mine Inspectors' Institute, U. S. A.

By J. T. Beard

SYNOPSIS—Principal features of the seventh annual meeting of the Institute, held at Pittsburgh, Penn., June 8-12, 1914. Description of the demonstration given by the Federal Bureau of Mines for the entertainment and instruction of the visiting members of the Institute, at their testing station in Pittsburgh, and at the experimental mine at Bruceton. Election of officers of the Institute for the ensuing year.

The seventh annual meeting of the Mine Inspectors' Institute of the United States of America, held at Pittsburgh, Penn., last week, was largely attended by the members of the Institute, their wives, daughters and many friends. The visitors included a large number of prominent mining men from different states, who were privileged to attend the open sessions of the Institute and to enjoy the entertainment given the members.

The first day of the session, Monday, was devoted to the registration of members and other preliminary arrangements. A meeting of the executive committee was held to consider various details of the organization and complete the program for the meeting.

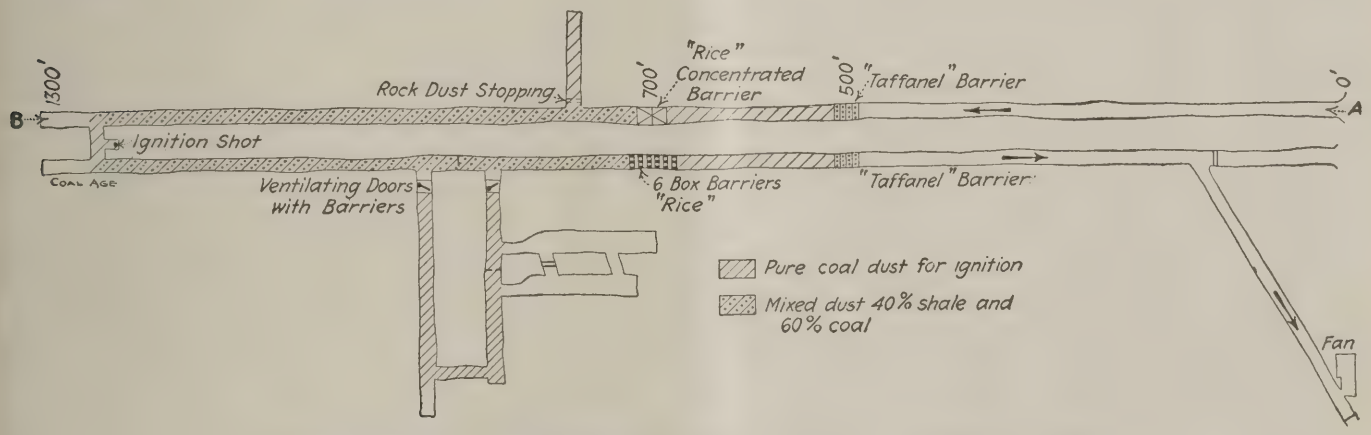

Diagram Illustrating Explosion Test No. 120, at Bruceton Mine

The opening session of the Institute, Tuesday, June 9, was called to order by the former president, Thomas K. Adams, Pennsylvania, who after a few brief remarks introduced City Solicitor Charles A. O'Brien, representing Mayor Joseph G. Armstrong. Mr. O'Brien delivered the address of welcome and was followed by D. P. Black, president of the Chamber of Commerce, who also extended a hearty welcome to the members of the Institute and their friends, in behalf of the Chamber of Commerce.

At the conclusion of these addresses of welcome, the president of the Institute, David J. Roderick, Pennsylvania, responded in a few words expressing appreciation of the welcome so freely extended to the Institute by the city. Mr. Roderick then followed this with a carefully prepared paper, bearing on the prominent features of the coal-mining industry that give rise to mine accidents. He drew special attention to those conditions that have increased the fatality rate in the mines of this country, and which do not exist to the same degree in other countries. Mr. Roderick much deplored the fact that the published lists of mine fatalities in this country did not usually explain these conditions as contributing to the increase of the death rate. Prominent among these causes, he stated, was the employment, in our mines, of an exceptionally large proportion of foreign labor, and a greater production of coal, per capita, than in any other country. The paper was thoroughly discussed by the members, in the afternoon session of the same day.

In the evening the Institute and its guests enjoyed a steamboat ride on the Monongahela River. The steamer "Sunshine" had been engaged for the occasion and was well furnished with refreshments, music by an orchestra and other means of entertainment that contributed much to the enjoyment of the evening. The trip extended as far up the river as McKeesport .

The second session of the Institute, Wednesday, was marked by an interesting and valuable paper by John Dunlop, a former state mine inspector of Illinois. The paper described the utility and advantage of the use of "booster fans," under certain conditions in mining where it was necessary to resort to some means of increasing the circulation of air in the mine, but where the expectation would not warrant the necessary outlay for the installation of another permanent fan on the surface. The paper provoked an animated discussion among the members and proved one of great interest. At the same session a paper on "First Aid to the Uninjured" was read by P. J. Moore, anthracite mine inspector, Pennsylvania. Mr. Moore's paper was valuable, as pointing out the need of precautionary measures to prevent the frequent recurrence of mine accidents, and emphasized the importance of educating the large class of foreign labor and other ignorant workers in the mine, so as to enable them better to protect themselves and avoid injury. While complimenting the great work that had been done in the training and development of efficient rescue corps at many mines, Mr. Moore claimed that the same interest should be taken to prevent, as far as possible, the accidents that made rescue work necessary.

The discussion of this paper was followed, in the evening, by a largely attended banquet of the members and guests, at the Monongahela House. The principal addresses of the evening were made by H. M. Wilson, of the Federal Bureau of Mines; David Ross, former Commis-

sioner of Labor, Illinois; Samuel A. Taylor, mining engineers of Pittsburgh; W. L. Affelder, E. E. Bach and W. R. Crane.

Thursday was devoted to a visit to the testing station of the Bureau of Mines. Following a brief address by H. M. Wilson, of the Bureau, explaining its purposes and describing the work accomplished and that projected, a number of interesting tests demonstrating the explosibility of coal dust, behavior of safety lamps, use of rescue appliances, etc., were witnessed by the members present.

In the afternoon, at the invitation of the Bureau, the members of the Institute boarded a train for Bruceton, where they witnessed an explosion in the experimental mine at that place. The test was designed, primarily, to show the efficacy of different kinds of stone-dust barriers to arrest the propagation of an explosion in the mine entries. The accompanying diagram shows the general arrangement of the mine. Three types of barriers had been constructed in the main headings at points 500 and 700 ft., respectively, from the entrance to the mine. As shown in the sketch, the well known Taffanel barrier was located 500 ft. inby from the entrance. This consisted of ten dust-laden shelves spanning the roadway.

At a point 200 ft. inby from these barriers were located two other barriers designed by George S. Rice, mining engineer of the Bureau. As indicated on the diagram, one of these barriers was of the concentrated type and consisted of two 7-ft. platforms, swung above the roadway and loaded with 2½ tons of shale dust. Between these two barriers, as indicated in the diagram, was a pure coal-dust zone, the dust being placed on shelves along the entry, to the amount of 2 lb. of dust per lineal foot of roadway. This zone was designed to determine whether the explosive wave passed the concentrated barrier at the 700-ft. station.

Inby from that station, the entire entry was stored with mixed coal dust and shale, the latter forming 40 per cent. of the mixture. The load here amounted to 3⅓ lb. per lineal foot, of which 2 lb. was placed on the side shelves and the remainder on the cross-shelves, in the entry. A similar formation of dust zones was prepared on the return entry, as indicated in the diagram.

The ignition shot, as shown, was located in a short blind cut made in the outby rib of the crosscut at the head of the entry. A charge of black powder was fired from a cannon at this point and discharged into the crosscut against the inby rib. The blind cut in which the cannon was placed was stored with 25 lb. of very fine coal dust; and the crosscut was likewise stored with 100 lb. of similar dust, the latter being placed on shelves, while the former was scattered or spread on the floor of the entry.

On the return air courses, the barrier erected at the 700-ft. station consisted of six boxes, spaced 10 ft. apart, center to center, each box being loaded with 700 lb. of shale dust, making the entire load somewhat over two tons. These boxes were arranged so as to be upset by the force of the explosion acting against them. The concentrated barrier at the 700-ft. station on the intake entry was connected by wire with a device about 100 ft. inby on the entry, and so arranged that the hinged platforms would drop and discharge their load into the airway at the moment the explosive wave reached that point.

An interesting feature of this test consisted in the fact that an air current of practically 40,000 cu.ft. per minute was circulated in the mine previous to and during the explosion. This current entered the intake airway at the point marked *A* on the diagram, and passing through the crosscut at the head of the entry returned to the fan, which was operated on the exhaust system. This fan was running at a speed of 245 revolutions per minute.

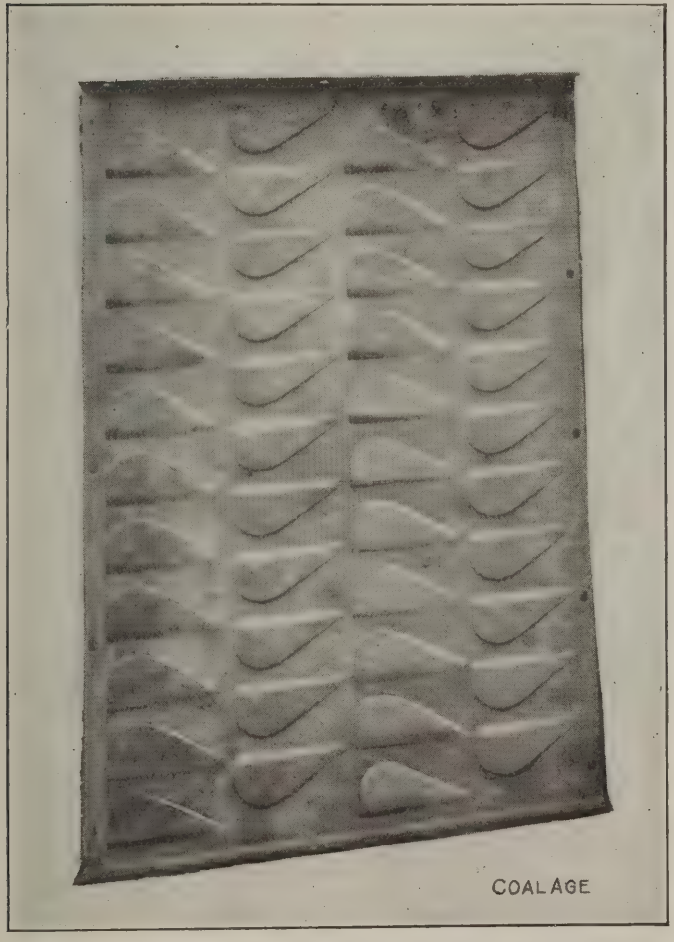
Pressure manometers stationed at different points in the mine were connected with delicate instruments for recording the pressure throughout the mine at any instant. These instruments were located in the office on the surface and furnished a more or less complete record of what took place in the mine. Tinfoil circuit-breakers, likewise connected by electric wires with instruments in the office on the surface, were used to measure the velocity of the flame. Wires also connected all the rock-dust barriers used in this test, except the Taffanel barriers, and served to indicate the time when the explosive wave reached them.

The test appeared to be quite satisfactory and demonstrated, to a degree, the efficacy of coal-dust barriers to arrest the propagation of an explosion in mine entries. At the moment of explosion there was a distinct shock felt, and a few seconds later a huge puff or blast of smoke and dust issued from the main entry at *A*. This, however, was unaccompanied by any evidence of flame. About the space of three seconds after this blast from *A*, there was a light puff of dust and smoke that issued from the mine where the fan drift enters the return air course. This, however, was very light.

In the evening, the members of the Institute and guests were banqueted at the Seventh Avenue Hotel, at which time all the ladies of the party were present, and an eloquent address was given by David Ross, former Labor Commissioner of Illinois.

The last day of the session, Friday, June 12, was marked by the reading of two valuable papers, the first entitled "The Value of Organized Effort in Increasing Safety in Mines," by Mine Inspector I. G. Roby, of Pennsylvania; and the second entitled "Some Recent Experiments Pertaining to Control of Mine Explosions," by George S. Rice, engineer Bureau of Mines. These papers were both followed by discussion. The reports of committees and the election of officers, together with the selection of St. Louis, Mo., as the place for holding the next annual meeting, closed the business of the session. The afternoon was devoted to an inspection of the principal features of interest in and about the city, automobiles being provided for the purpose.

The following officers were elected for the ensuing year: John Dunlop, Peoria, Ill., president; J. B. McDermott, Helena, Mont., first vice-president; George E. Sylvester, Rockwood, Tenn., second vice-president; Thomas Graham, Victoria, B. C., Canada, third vice-president; James W. Paul, Pittsburgh, Penn., secretary; R. S. Wheatley, Salineville, Ohio, assistant secretary; Joseph Knapper, Dravosburg, Penn., treasurer; J. T. Beard, New York City, editor-in-chief.



The meeting, taken as a whole, was one of the most successful thus far held. There was a larger attendance of members than on any previous occasion. This was chiefly due to the fact that the place of meeting was the most central point in the coal fields, and more easily accessible than any other point that could have been chosen.

New Anthracite Discovery

An anthracite coal field has recently been discovered in the Province of British Columbia, Canada, within two miles of the G. T. P. Railway, main line. Frank Frank, of Vancouver, B. C., and for years a prominent coal man of Ontario, has located several seams, one apparently 40 ft. wide, and has had an analysis made of the coal outcroppings discovered showing: Carbon, 80.93 per cent.; volatile matter, 7.07 per cent.; moisture, 4.02 per cent.; and ash, 7.98 per cent. Specific gravity, 1.661. The coal makes a strong and lasting fire, free from clinker. The early development of this field will mean a great deal to the entire Pacific coast, as well as to the Asiatic markets. Iron ore is also much in evidence.

A Simple Slate Picker

One of the most difficult problems encountered in the preparation of anthracite is the efficient removal of the slate and refuse from the coal. In the smaller sizes such as pea, hand picking is out of the question, and

Semi-Perforated Plate of the Kerrigan Slate Picker

if this slate is not removed in some manner the ash content of the fuel may be extremely high.

Many ingenious mechanical devices have been tried for slate removal, one of the simplest of which is the Kerrigan slate picker, manufactured by the Cross Engineering Co., of Carbondale, Penn. This consists of what might be termed a semi-perforated plate, as shown in the accompanying illustration, which is usually attached to the end of the screen. The slot leaves cut in the plate are raised to allow the slate, bone, and other flat refuse, which is heavier than the coal, to pass through, while the coal itself passes over.

This device will clean coal from No. 1 Buckwheat up, but has proven especially satisfactory in the removal of flat refuse from pea, nut, and stove sizes, and when placed upon the end of mud screens will automatically remove all but about 2 per cent. of the slate and other flat refuse.

This device is most frequently used on the discharge end of jigging screens, and does not decrease the screening area. It has also been found satisfactory when used at a point above where the coal enters the jig.

The slot leaves are adjusted for a given size of coal such as chestnut, for instance, at the time of manufacture, but may be easily readjusted to meet the sometimes varying conditions found in different localities.

Increasing Hoisting Capacity

By Ralph W. Mayer*

The capacity of the haulage plant at a mine of the Northwestern Improvement Co., at Roslyn, Wash., was almost doubled recently by the addition of one electric locomotive to supplement the work of the hoisting engine.

At this mine the coal measure lies at an inclination of about 20 deg., outcropping at the top of a hill and extending beneath a valley. It is worked by means of a slope driven in the coal. The railroad tracks and tipple are located at the foot of the hill, a tunnel being driven from the tipple until it intersects the slope. Partings and side tracks are made at both ends of this tunnel.

The hoisting engine is located on top of the hill at the mouth of the slope. It had been the custom to hoist the coal up the slope and drop the loads back onto the parting at the slope end of the tunnel. At every second hoist the cars were coupled together on this parting and dropped out of the tunnel to the tipple by the hoisting engine and rope, the grade of the tunnel being sufficient to allow the loads to run by gravity after they had been pulled up the slope a sufficient distance to give them a start.

By using the hoisting engine only to handle the cars on the slope, and depositing them at the parting and providing a motor to handle the cars in the tunnel, the output has been practically doubled at a cost of only a motorman, the expense for power, and the maintenance of the locomotive.

The motor enters the tunnel at the head of a trip of empties, leaving them on the empty track next the slope. This side track is long enough to accommodate several trips of empties, and has a slight down grade toward the slope, so that when the motor is uncoupled there is no danger of the cars running out of the tunnel. This avoids the use of safety blocks or derail switches, and the lost time incidental to their use.

The switch at the outer end of this parting is spring operated and set for the empty track, while the inside switch is an automatic one set for the loaded track. A lever, to which a chain is fastened, is pivoted to an ordinary switch stand. The chain passes over a pulley and a weight is attached to the end of the chain. This holds

*Roslyn, Wash.

the switch set for the loaded track and allows the cars to be pulled off the empty track, but can be thrown over for this track when necessary.

When set for the loaded track it is in the correct position for both the hoisting engine pulling out of the slope and the motor hauling out of the tunnel.

When the motor uncouples from the empties it runs around the end of the parting through the automatic switch onto the loaded track and pushes the loads. The switch stand for the empty and loaded tracks at the tipple is placed a trip's length inside the tunnel from the switch, and connected therewith by means of rods the same as is done on railroads. The motorman pulls his empty trip off the empty track clear of the switch and without leaving his seat throws the lever which sets the switch for the loaded track so that he has a clear road to the end of the tipple when he returns with the loads. A stand is also placed at the switch and so connected that the latter may be thrown from either place.

No Delay in Handling Mine Timber

Formerly all mine timber was loaded on cars while on the main track and the haulage system over the entire mine would be at a standstill while two men loaded the timber. In their eagerness to cause as little delay as possible, they would sometimes fail to fasten securely long timbers and rails and accidents would result. Lowering the timber on the night shift when few men were working was tried. This avoided the delay to the hoisting during the day, but the timbers had to be unloaded in the mine and reloaded during the day to distribute them to the working places. A switch and side track to the timber yard at the tipple has now been put in.

The motorman with the loss of but a few minutes' time drops a trip of empties into this side track and goes on with his hauling. The timber men then load the cars and have sufficient time to do it properly not being rushed for a few minutes and doing nothing for a long time.

Tonnages of Bituminous Coal Plants

We recently called attention to the size of some of the large coal plants in Pennsylvania and Illinois and to stimulate emulation of the records in these states, we print the lists we have collated in full. Many a thriving coal district fails to do as well as the single Iselin plant in Indiana County.

It is only fair to say that if the figures for 1913 were taken, the order would not be the same. Important advances have been made at Vesta No. 5 and at Lucerne. Unfortunately the records of the production of the various states are so far behind the present date that a really timely table cannot be constructed.

TONNAGES OF LARGEST BITUMINOUS PLANTS IN PENNSYLVANIA
1912

	Company and Plant	Tonnage
1	Pittsburgh Gas Coal Co., Iselin Nos. 1-2-3-4	1,776,410
2	Vesta Coal Co., Vesta No. 4	1,555,420
3	Monongahela River Consolidated Coal & Coke Co., Crescent	972,222
4	Westmoreland Coal Co., Export Nos. 1-2	955,622
5	Cowanshannock Coal & Coke Co., Yatesboro	952,027

Milwaukee's Coaling Plants

Milwaukee, which has become one of the greatest coal-distributing points on the Upper Lakes, furnishes a conspicuous example of extraordinary efficiency in the line of coal handling. The necessity for taking care of over 5,000,000 tons of coal during a comparatively short season of navigation, calls for the use of the best modern appliances, and in this respect Milwaukee is not outclassed by any port on the inland lakes.

There are 28 coal-receiving plants along the several channels which go to make up Milwaukee Harbor. More than half of these are located in the Menominee Valley, which is the busiest manufacturing center of the city.

Coal Dock on the Upper Menominee River at Milwaukee

The 28 coal-receiving plants at Milwaukee have a combined storage capacity of something like 4,000,000 tons, while the machinery with which they are equipped represents an unloading capacity of 100,000 tons every 10 hr. and called for an investment of about $2,000,000. Without exception the various plants are equipped with the very best machinery applicable to existing dock situations, but there are several conspicuous examples of capacity and efficiency which deserve mention.

The 16th St. yard of the Milwaukee-Western Fuel Co. is equipped with two portable eight-ton man-trolley bridges and two portable steel towers, the outfit being capable of unloading 20,000 tons of coal in the space of 10 hr. There is only one larger man-trolley on the upper lakes, a 10-ton bridge at Superior, Wis.

The revolving bridge at the works of the Milwaukee Coke & Gas Co. is said to be the largest gantry crane ever constructed. It has a clear span of 360 ft. and cantilever extension of 120 ft., and carries a five-ton bucket. At this plant three fast hoists take coal from vessels at the rate of 300 tons per hour each, or a total of 900 tons per hour. The equipment delivers coal into storage at the rate of 600 tons per hour by belt conveyors, and out of storage by bucket conveyors at the rate of 400 tons per hour. The plant was designed to handle 1,500,000 tons of coal over the dock in the course of a season.

At least six of the yards at Milwaukee are equipped to unload cargoes ranging between 5000 and 10,000 tons in the course of 10 hr. An unusual feature of the coal-handling system is the employment of two river barges which were formerly lake schooners, by the Milwaukee-Western Fuel Co. One of the barges is equipped with elevating machinery by which coal is transferred direct to bins or yards connected with power houses, thus avoiding a vast amount of teaming.

The Youghiogheny & Ohio Coal Co. will soon be in shape to receive coal over its new dock on the South Menominee Canal. The steel hoists are nearing completion and dredges are deepening the canal and slip on which the dock is located. This company contemplates the establishment of another dock on the Kinnickinnic Basin.

In some boiler houses as much as 4.7 kw. per hr. is allowed per rated boiler horsepower. The tendency to force boilers to a higher steam output is on the increase.—Bromley in "Power."

Who's Who in Coal Mining

Alfred W. Calloway

In all the category of coal-mining men there is no name more suitable to conjure with than that of A. W. Calloway. Production and Calloway are synonymous. Maximum output and Calloway also mean the same thing. Yet he doesn't hurry, nor run, nor fuss, nor yell, but somehow or other lots and lots of coal flows over the tipple.

When most men holding high positions of authority change their place of abode and become identified with

ALFRED W. CALLOWAY

new activities in an entirely different field, the question is asked, Can they repeat? Meaning, in plain English, Can they handle the new work with as much success as they did the old? However, there are some men whom we take for granted. Much is expected of them in the way of quantity and quality, and they invariably deliver the goods in exact accord with preliminary specifications. Such a man is Mr. Calloway, and no one of his friends doubts but that he will get as much in proportion out of the West Virginia mines he now manages as he did out of the Pennsylvania plants, which were brought to such a high state of efficiency under his direction.

A. W. Calloway was born June 21, 1872, at Manchester, England. He came to America when 10 years of age and entered the public schools of Brooklyn, N. Y. He graduated from one of the Brooklyn High Schools when he was 16.

This ended Mr. Calloway's school days, and he immediately entered the engineering corps of the Pennsylvania Railroad, remaining in this line of work for the same company during the succeeding five years. Leaving the employ of the Pennsylvania Railroad in 1893, he became identified with the Rochester & Pittsburgh Coal & Iron Co., of Punxsutawney, Penn., his first work being in the operating department. He continued in the service of this corporation for 20 years, winning successive promotions, which finally placed him in the office of the general manager of the company, with headquarters at Indiana, Penn.

During his years of service in Pennsylvania, Mr. Calloway came to be recognized as one of the leading spirits in the bituminous industry of that great coal state. He identified himself with the Coal Mining Institute of America, and after serving as vice-president of that organization in 1910 and 1911, was elected president of the Institute in 1912, resigning in 1913 on account of pressure of other duties. He was appointed to the Bituminous Inspectors' Examining Board of the State of Pennsylvania in March, 1913, for the term of four years, by Governor Tener., and at the first meeting of the board was chosen president.

In December, 1913, Mr. Calloway resigned his position with the Rochester & Pittsburgh Coal & Iron Co., to accept the vice-presidency and general managership of the Davis Coal & Coke Co. In March of this year, Mr. Calloway was elected president of the Davis company, which advancement was due to the quick recognition of his exceptional ability on the part of the West Virginia corporation. Aside from being president of the Davis Coal & Coke Co., he is also president of the Maryland Smokeless Coal Co., and president of the Buxton & Landstreet company.

Alfred Calloway is a modest unassuming man, whose forcefulness, ability and strength of character are indicated by action—never by blatant boasts. He is beloved of his men, respected by his competitors and adversaries. He was married in November, 1893 to Miss Mary Henshey, of Altoona, Penn. They have three children. He is the nearest approach to a one-track man in the matter of occupation that we have ever known. He is familiar with coal mining in all its ramifications, and all his energy is concentrated on his activities in this line. He says that the only important work of a scientific or literary nature he ever did was to sign a subscription blank to COAL AGE.

[*Whenever we have discontinued the short biographical sketches of prominent men, published on this page, inquiries have come in asking why, and readers have requested us to continue the work. It is one of the most popular pages in our paper. Send us the names of men you want us to write a story about.*—ED.]

Editorials

Coal and Other Barons

The expression "coal barons" has received an increased fitness from the events in Colorado. The mine owners have, like the feudal lords of olden time, supported their armed men. We do not think that they themselves would declare that such a retinue was other than ominous and unfortunate. Certainly the citizens generally believe it is to be deplored.

But deploring and condemning will serve but little purpose, the main need is for a cure. Such a correction of the ills besetting our social conditions can be assured by legislation similar to that which eliminated castle-building and the maintenance of private armies, which had been necessary during the Middle Ages. Acts of parliament and court orders were of no avail. In fact, these private armies were the only guarantees of order, the forces of the state not having been created.

There can be no act passed which will prevent an apple woman from defending her stock in trade and similarly no act will prevent men from preparing to meet in battle those who propose to destroy their property or invade their inherent rights without title of law.

The change of the barons from a warlike to a peaceful basis was effected by commuting feudal services for a money payment. This made the state rich and strong and able to impress its power on all those under its tutelage. Secondly, a standing army was brought into existence by which rebellion of either barons or people against the state was made futile. Our British ancestry, like ourselves, feared a standing army, but found in it the only safeguard against the existence of private armies, the continued maintenance of which is unthinkable under modern conditions.

When the law was enforced by a power which to every element was overwhelming, the disarmament of all the citizens followed and private guardsmen became unknown. It is because we have been remiss in providing for good order and for the supremacy of the law that the operator, like the applewoman, has had to be on the defensive.

Give both adequate protection, and the needs for defense being removed, the means for self-protection will not be acquired. The mine guards are the sure outcome of a government, weak because of divided counsels, constitutional restrictions and disrespect for legal enactment. The operators have dispensed with guards and arms twice already, each time as soon as the duly constituted authority promised the enforcement of even a part of the law.

They have submitted even to violations of it at the hands of duly constituted authorities in the hope of peace. For example, they have been forbidden by a presidential ukase from bringing in men to replace those who were driven out by the violence of the strikers and to replace men who were killed in their attacks. But so long as orders of the executive are not too obviously unfair and illegal, they did not and will not protest, even in the courts provided for that purpose.

A better plan than waiting till civil war exists would be to provide a force always ready to require an obedience to the laws, one which would entirely remove from the operators the necessity of self-defense. A small force of constabulary would assure such a result and Colorado should not have failed at its last legislative session to form such a body .

Nothing but opposition to all order explains the defeat of the constabulary bill. There is such a body, in addition to a standing army, in every country from which those people come who have made so much disorder. Here when trouble occurs, we have for weeks neither constabulary, militia nor standing army, for the first does not exist, the second is not assembled till disorder becomes riot, and the last is only to be obtained when riot becomes open rebellion.

Disorder is in the air—there are riots in Colorado, West Virginia, New York and Pennsylvania. All industrial workers are discontented with their lot, all are bound to form trusts to protect their labor and increase their earnings at the expense of each other. In order that their controversies may always be conducted within the law and lawfully restrained, we need in every state a constabulary as amenable to discipline and as well trained as that in Pennsylvania.

Occupational Fatigue

Now comes a doctor who asserts that premature old age is brought on our miners by permitting or encouraging them to spend their leisure time in gardening. The extra work after hours is supposed to cause additional fatigue, lessening industrial efficiency and shortening life.

If this be true, and we must choose between old age and our gardens, let us by all means accept the latter and pay the price by living a shorter span of years. However, we think our medical friend is wrong, for the average coal miner is not unlike the workman in any other industry. We all need relaxation, and there is no greater form of beneficial exercise than gardening when it is done for fun and not for business.

All normal men require diversion—that is, something different from our daily grind. The banker and merchant take up golf, the younger men probably baseball or other forms of strenuous athletics. What could be devised to amuse and profit a miner more than a little garden plot, with its flowers and wholesome vegetables? Also, what is better calculated to create self-respect which comes with decent cheerful surroundings?

Anyone who thinks to increase the efficiency of employees by housing them in shanties erected on clay banks, with an outlook on nature neither fit for beast nor man, is following a mistaken policy by planting in men a type of religion not likely to help in the campaign for good fellowship and contentment so necessary to industrial success.

If we have come to a point where miners are worked to such a limit, that they must recline and rest their bodies from the toot of the closing-down whistle in the evening until the first call to work in the morning, then let us change conditions by still further shortening the hours of labor. No occupation should be permitted to claim a man's energy to the total exclusion of all else.

The doctor is quite in error. Our miners are not such absolute slaves to their trade as he would have us believe.

Concentration of Surface Operations

Some years ago, the man who spread his mine plant over a five- or ten-acre lot, had strong arguments to back his action. He was afraid that a fire, wiping out part of his equipment, would spread to other parts and above all he was desirous that no conflagration he might have would fill his mine with unbreathable gases and suffocate the men.

But times have changed. Nowadays we build all our structures of fireproof material and nothing is gained by spreading our plants over all the ground available. If the plant is not fireproof, it should be made so, not only to save insurance losses and to take care of the workmen, but also so that the plant can be concentrated round the shaft mouth with perfect safety.

We recently visited a plant on which much money had been spent. Coal for the boilers was hoisted up the material shaft and dumped into a larry and then hauled electrically on a steel trestle to the boilers, where it was stoked by hand. The coal should not have been brought up that shaft at all, for the boilers ought to have been fired with the waste from the picking table or by slack screened out of the coal about to be shipped.

The larry should have been replaced by a conveyor, which could have been put in operation without any travel or labor. The money saved, by eliminating the trestle and larry, even had the conveying distance been the same, which was unnecessary, would have paid for the conveyor, and made the labor saving clear profit.

As the power house was located a long way from either shaft, the power losses were bound to be considerable, and poorly laid and maintained lines made this defect even more obvious. Moreover, the blacksmith and carpenter shop lay considerably lower than the collar of the main shaft. As a result it was not possible to lay a tram road connecting the shop with the top of that shaft. Consequently, if any car is found defective when dumped, it must either be laid aside on the ground near the main shaft or dropped to the coal bed, transferred to the material shaft, hoisted, and then trammed to the blacksmith shop. Life is all too short for such methods.

The Clayton Bill

Of all recent legislation, none so vitally concerns the coal industry as the Clayton bill. This law has already passed the House of Representatives and has been referred to the Senate Judiciary Committee. The parts of this bill of especial interest to coal-mining people are as follows:

Sec. 3—That it shall be unlawful for the owner, operator, or transporter of the product of any mine . . . to refuse arbitrarily to sell such product to a responsible person, firm or corporation who applies to purchase such product for use, consumption or resale within the United States or any territory thereof . . . and any person violating this section shall be deemed guilty of a misdemeanor.

Sec. 7. That nothing contained in the antitrust laws shall be construed to forbid the existence and operation of fraternal, labor, consumers, agricultural or horicultural organizations, orders or associations instituted for the purposes of mutual help, and not having capital stock or conducted for profit, or to forbid or restrain individual members of such organizations, orders, or associations from carrying out the legitimate objects thereof; nor shall such organizations, or associations, or the members thereof, be held or construed to be illegal combinations or conspiracies in restraint of trade, under the antitrust laws.

Next of interest, and deserving careful study is the proposed law to cover the issuance of injunctions. It reads as follows:

Sec. 18—That no restraining order or injunction shall be granted by any court of the United States, or a judge or the judges thereof, in any case between an employer and employees, or between employers and employees, or between employees or between persons employed and persons seeking employment, involving, or growing out of, a dispute concerning terms or conditions of employment, unless necessary to prevent irreparable injury to property, or to a property right, of the party making the application, for which injury there is no adequate remedy at law, and such property or property right must be described with particularity in the application which must be in writing and sworn to by the applicant or by his agent or attorney. And no such restraining order or injunction shall prohibit any person or persons from terminating any relation of employment, or from ceasing to perform any work or labor, or from recommending, advising, or persuading others by peaceful means so to do, or from attending at or near a house or place where any person resides or works, or carries on business or happens to be, for the purpose of peacefully obtaining or communicating information, or of peacefully persuading any person to work or to abstain from working; or from ceasing to patronize or to employ any party to such dispute, or from recommending, advising, or persuading others by peaceful means so to do; or from paying or giving to, or withholding from, any person engaged in such dispute, any strike benefits or other moneys or things of value; or from peaceably assembling at any place in a lawful manner, and for lawful purposes; or from doing any act or thing which might lawfully be done in the absence of such dispute by any party thereto; nor shall any of the acts specified in this paragraph be considered or held unlawful.

Another interesting point is contained in Section 20, which provides that in trials for contempt "such trials may be by the court or upon demand of the accused by a jury." Still further in Section 21 it is stated "that the evidence taken upon the trial of any person so accused may be preserved by bills of exception, and any judgment of conviction may be reviewed upon writ of error in all respects as now provided by law in criminal cases; it may be affirmed, reversed or modified as justice may require."

The Senate Judiciary Committee is composed of the following members:

Hon. Chas. A. Culberson, of Texas, Chairman.
Hon. Lee S. Overman, North Carolina.
Hon. Wm. E. Chilton, West Virginia.
Hon. James A. O'Gorman, New York.
Hon. Duncan U. Fletcher, Florida.
Hon. James A. Reed, Missouri.
Hon. Henry F. Ashurst, Arizona.
Hon. John K. Shields, Tennessee.
Hon. Thos. A. Walsh, Montana.
Hon. Hoke Smith, Georgia.
Hon. C. D. Clark, Wyoming.
Hon. Wm. P. Dillingham, Vermont.
Hon. Knute Nelson, Minnesota.
Hon. George Sutherland, Utah.
Hon. William E. Borah, Idaho.
Hon. Frank B. Brandegee, Connecticut.
Hon. Elihu Root, New York.
Hon. Albert Cummins, Iowa.

We urge that everyone interested in the questions covered by the Clayton Bill write his views to some of the members of the committee above mentioned.

Extracts from a Superintendent's Diary

To-day I sneaked off to town to witness my first ball game this season. It was not premeditated in the least. Ten minutes before I left the office, I had not even thought of going. I was sitting at my desk brooding over last month's cost sheet, just completed by our district auditor and sent post haste by special messenger, when I overheard a conversation between my office boy and a commissary driver, standing just outside my office:

"H'its sure gwine to be some game, Sam."

That settled it for me. I followed the impulse. In two seconds I was enroute.

I am quite sure that only two seconds elapsed, because I spoke two words; they were addresed to my chief clerk, "Going out."

I enjoyed the game immensely until about the middle of the second inning, then I happened to turn in my seat to follow a foul with my eyes, when, lo and behold, sitting behind me with his gaze intently upon me, I spied our general manager.

Again, I had an impulse; it was to sink through the floor; but the general manager broke the spell before I could execute it. Come back here, Thompson, he said; plenty of elbow room and a better view of the game. I went.

Here a strange thing happened. The general manager and I began to discuss our likes and dislikes and all but forgot to follow the game. His views, as expressed to me, are worth preserving here. I won't attempt to recall his exact words, nor will I worry with quotation marks.

The trouble with most mine superintendents, said he, and, in fact, with all men in authority around coal mines, is that they don't cultivate an avocation; in consequence, they have about as much imagination and humanity as a ship's stoker. I would rather stake my chances, if I were a miner, on a man who sneaked off to the ball park for an occasional hour, than on any fellow who stuck to his job 365 days in every year. I've generally found that the mining man who takes an interest in base-ball, loves to hunt, fish, raise vegetables, tells capital yarns, loves children and books and knows a few things about human beings in general. Just where our men get their idea that we expect them to be grinding away at their job 24 hours in every day in the year, is more than I have ever been able to figure out. Yes, actually when we propose safety-first contests and prize gardens to some of the superintendents, they are at a loss to understand how they can spare the time to do their part.

Undoubtedly, this narrow interest in things in general explains in part why coal-mine officials are so easily outclassed as debaters, when they get into newspaper controversies with the Union officials, during strike periods.

You can't tell me that a narrow-minded official with no points of live contact with the outside world and no actual knowledge of books or history, has any chance of moving the masses or even the classes, no matter how sound his arguments or outraged his cause, if he has to argue against a man who has bled and suffered, even though the suffering has been self-inflicted.

No, sir! We need red-blooded men in command today, who have at least some idea as to where the pulse of the world can be located.

Another American Mine Safety Association Section

With about 50 miners present from Tower Hill Nos. 1 and 2, Thompson Nos. 1 and 2 and Orient and Republic mines, a meeting was held in the first-aid rooms at Republic last evening to organize the Republic section of the American Mine Safety Association. Following are the officers elected: President, W. W. Fleming; vice-president, Ralph Keena; secretary and treasurer, H. C. Millward; executive committee, William Fowler, D. P. Millward, Richard Minerd, Dr. C. C. Ryan, A. Lake and C. J. Carroll.

The next meeting will be held in the Republic first-aid rooms on Friday evening, June 19. At this meeting a first-aid demonstration will be given in charge of H. O. and D. B. Millward. The former has a Slavish first-aid team, while his brother has two companies of young girls who will execute a first-aid drill. A paper will be read by Dr. C. C. Ryan on "The Physician in Relation to First Aid." D. B. Millward will respond on behalf of the miners. The American Mine Safety Association, of which the new organization forms a part, has already charters in 22 states. The Republic section will give an outdoor meet sometime this summer and will be assisted by a government exhibit. D. B. Millward has a large class of first-aid men, women and boys.

Recent Legal Decisions

Eight Thousand Dollars Not Excessive Recovery for Personal Injury—Eight thousand dollars was not excessive recovery for injury to an employee of a fuel company, attributable to negligence of the company, where his right leg was broken and permanently shortened and distorted. (Wisonsin Supreme Court, Janiak vs. Milwaukee Western Fuel Co., 146 Northwestern Reporter 788.)

Injury to Miner Through Falling Roof—A Pennsylvania mine owner is not responsible for injury to a miner for the foreman's failure to provide sufficient props to support a roof at the miner's place of work, unless the mine owner or his representative knew of the mine foreman's omission of duty, or unless the injured miner voluntarily encountered the risk, knowing the danger. (Pennsylvania Supreme Court, Peters vs. Vesta Coal Company, 90 Atlantic Reporter 65.)

When Miner Assumes Risk of Injury—As a general rule, an employee engaged in making an entry in a coal mine assumes the risk of injury arising from the nature of the work as it progresses, and must take customary precautions to avoid injury to himself. But, if he is injured as a result of omitting timbering at the direction of a superior, the employing mining company may be held responsible, if such direction appears to have been negligent. (Iowa Supreme Court, Williams vs. Craig Dawson Coal Co., 146 Northwestern Reporter 735.)

Liability of Initial Carrier of Interstate Shipment—When a railway company receives carload freight under a bill of lading calling for delivery at a point in another state, but on an understanding that the shipments shall be diverted to points beyond on other lines of railroad, at through rates computed from the place of original shipment, the company becomes liable for loss of, or injury to, the shipments on such other lines of railroad, under the provision of the Carmack Amendment to the Interstate Commerce Act which makes an initial carrier of an interstate shipment liable for loss caused by a connecting carrier. (Illinois Supreme Court, Gamble-Robinson Commission Co. vs. Union Pacific Ry. Co., 104 Northeastern Reporter, 666.)

Right to Recover Under Entire Contract—A coke company which agreed, in consideration of its release from a contract to deliver its entire product for six months, to sell enough coke to enable defendants to fill certain contracts, deliveries to be made throughout a period of five months, is not entitled to recover for a partial delivery, having delivered less in the first month than was called for by the new agreement and nothing during the second month. "The present is a case in which the manifest purpose of the agreement would be defeated were it held to be a divisible contract, thereby allowing the plaintiff not simply to disappoint the defendants in what it was intended they should receive for a specific and express purpose, but requiring from the defendants payments for so much performance as met the pleasure, convenience and advantage of the plaintiff." (Pennsylvania Supreme Court, Producers Coke Co. vs. Hillman, 90 Atlantic Reporter 144.)

The Wage-Scale Conference in Ohio

Outside influences are said to be at work to help terminate the Ohio suspension and a hopeful feeling is expressed by many who are familiar with the situation. After the meeting with the miners' officials, Gov. Cox said he felt encouraged with the day's proceedings and hopeful of the outlook. On the other hand, there are other equally expert opinions that there are no prospects for immediate settlement because of the poor absorbing power of the market. They insist that with the Pennsylvania, West Virginia and Kentucky fields operating at 75% capacity and with a demand greatly below normal, the market is being well taken care of.

Miners in the smaller towns throughout the state are said to be feeling the effect of the strike more than ever because the stores are insisting on cash for goods. Recent estimates show that the miners have lost about $2,000,000 in possible earnings since they quit work and that the operators have lost even more.

Little progress was made Wednesday in the conference. Eastern Ohio operators are still insisting upon a scale of 99.2c. or 41.12c. on the mine-run basis and steadily refuse to consider a higher figure while the miners' officials declare they will not consider such a scale at all. Senator Green, author of the mine-run law and secretary-treasurer of the miners' union, offered a proposition to ascertain the average percentage of screenings in all districts in Ohio, but this proposition was not looked upon with favor by the eastern Ohio operators.

Coal Mining in Michigan

Michigan participated in the general increase in coal production in 1913, mining 1,231,786 short tons, valued at $2,455,227, according to figures compiled by E. W. Parker, of the United States Geological Survey, in coöperation with the State Survey. The increase over 1912 was 25,556 tons in quantity and $55,776 in value. Michigan is an important manufacturing state, particularly in the making of furniture and in the evaporation of salt. The uptodate character of the state's manufacturing establishments is indicated by the fact that most of them are equipped with mechanical stokers using slack coal that is obtained cheaply from West Virginia and is of better quality than the Michigan product. Michigan slack thus becomes a drug on the market, and the coal mines are obliged to depend almost exclusively on the domestic trade, which requires lump coal. The coal mines were practically free from labor troubles in 1913, a strike of seven men for 180 days being the only one reported.

Approximately 10 to 15 per cent. better evaporation per pound of coal will be obtained in a clean boiler as compared with one in which there is a small deposit of scale. Scale $1/64$ in. in thickness causes a loss of 2 per cent. of the fuel burned; $1/32$ in. in thickness, a loss of 4 per cent. of the fuel, and $1/16$ in., 9 or 10 per cent. loss.

It All Depends on the Way You Look at It

Discussion By Readers

A Longwall Proposition

Letter No. 1—Referring to the inquiry of H. R. Hartsuff, COAL AGE, June 6, p. 944, referring to the adaptation of the longwall method of coal mining to the conditions he has described, I would say that the proposition would not be an encouraging one. While it might be a physical possibility to mine this coal by the longwall method, I do not believe it would be commercially profitable.

My duties, for some time, have concerned the solution of just such problems as that presented by Mr. Hartsuff. In one case, the conditions were very similar to those he has described; and, in that case, we found that entries with short, wide rooms driven off both the entry and the air course were impracticable, insofar as obtaining the maximum recovery of coal, per acre, was concerned; and were by no means profitable, from a commercial standpoint, disregarding the completeness of the recovery of coal.

The chief difficulty lies in the fact that both the roof and the coal have greater crushing strength than the unrestricted fireclay bottom. The short rooms will not open up an area of sufficient breadth to permit of a good fall. (The length of the room does not enter into this consideration.) In the instance referred to by Mr. Hartsuff, I doubt whether he could break the absolute roof of the mine, which he refers to as a "sulphur binder" and the overlying strata. I believe this would be a difficult matter to accomplish even with a hard bottom, having a strength equal to or greater than the top slate.

Whether or not the working of any coal seam will prove to be commercially profitable depends on more factors than the physical conditions. But, aside from this, I believe it to be perfectly practicable to break any roof. In my own experience, I have never met with a condition of coal, including the top and bottom, that could not be handled by some means. In Mr. Hartsuff's case, I would suggest that the problem of overcoming the heaving of the bottom and breaking the absolute roof can probably be solved by reducing the load on each pillar and increasing the bending moment of the roof. Under these conditions, however, what is more important than anything else is to rob the pillars clean and permit no stumps of pillars or timbers to remain in the gob. If these are left, they will prevent a good roof fall, and the weight resting on the pillars will cause the bottom to heave; and result in a squeeze that cannot be controlled.

In order to reduce the load on the pillars, the ratio of width of pillar to width of opening must be increased; and to increase the bending moment of the roof, wider rooms must be driven and longer break lines must be established. These should run at an angle of from 45 to 60 deg. with the center lines of the rooms. It seems scarcely necessary to add that the rooms must be driven of a uniform width and on centers. The requirements of ventilation will probably make it impracticable to increase the width of the pillar sufficiently to resist the tendency of the bottom to heave, unless the width of rooms be likewise increased. It would seem practicable to drive the rooms 250 or 300 ft., provided the miners are not rerequired to handle their cars between the face of the room and the entry.

In the instance to which I have referred, our coal was 38 in. thick; and the mine cars were built low so that we did not have to lift bottom in the rooms, but only on the entries. Our rooms were driven 300 ft., with a width of 18 ft., on 65-ft. centers. Pillars were robbed as quickly as the rooms were completed. No more rooms were opened in advance of the robbing than was necessary to maintain a fair tonnage from the entries tributary to the line of robbing. In our case, the roof immediately above the coal was soft and overlaid with a hard sandstone, so that it was necessary to use both cap-pieces and footboards for all timbers. For cap-pieces, we used old car planks sawed 12x18 in.

The double-entry system was employed, the entries being driven at such an angle with the strike of the seam as to give a suitable grade in favor of the loaded cars. The rooms were turned to the rise off one entry only. The mine, in this case, was opened out in the shape of an isosceles triangle, the angles at the base being each 45 deg., and that at the apex or opening, 90 deg. The break line corresponds to the base of the triangle. We experienced the maximum weight when the robbing line had advanced about 350 ft. from the opening. At that time, the cover broke 300 ft. to the surface. Later, breaks in the mine roof occurred at regular intervals; and, at less frequent intervals, breaks extended to the surface.

The coal was mined in a satisfactory manner, the percentage of recovery, per acre, was increased to about 88 per cent., from what was formerly about 50 per cent. This increase in the percentage of coal recovered enabled us to compete successfully with other mines employing more wasteful methods of mining.

A MINE INSPECTOR.

———, W. Va.

Letter No. 2—In reply to Mr. Hartsuff's inquiry, relating to longwall working, I would suggest that this method could be tried without entailing extra expense, and without making any material change in the present system of mining, at first.

The method I would suggest is as follows: Drive two pairs of entries, say 100 yd. apart, to the boundary line. At the head of these entries, start to turn rooms along the line, drawing back the pillars as quickly as the rooms are finished and proceeding thus to work out all the coal from the boundary toward the old workings. This work should be so conducted that the rooms at the head of the entries will be the first to finish, so that the pillar workings can follow up the rooms, in regular order.

An important feature in this method of working would be to drive all the rooms on centers, for the sake of uniformity; but especially should this be the case in respect to the rooms driven off the two inner entries of each pair, so that these rooms will cut into each other in line.

The rooms being driven 150 ft. deep, this method will give a total line of break equal to the length of four rooms, plus the entry centers, or between 600 and 700 ft., which should cause the "sulphur binder" to break and fall, eventually, when the rooms and pillars have been worked back a sufficient distance from the boundary line.

When this fall occurs, longwall working can be started on the retreating plan, the coal being worked back on the butts. There would be 300 ft. plus the entry centers, of working face, to each pair of entries or roads. The coal can probably be cut by longwall mining machines operated across the face. The mining should be done in the fireclay, to avoid the loss of coal. The longwall face should be protected by four or five rows of posts set according to a systematic method, and, for greater safety, two rows of cribs may be used. These should be set on slack or dirt so that they can be readily removed as the work progresses. All timbers should be recovered and used again. The number of men that could be employed on this face would be determined by local conditions and customs.

This system of mining by longwall will afford the loader an increased earning capacity, as the track is carried along the face on steel ties and moved forward as the work advances. The car is thus always close to the coal to be loaded. It is important to employ a sufficient number of men that the face will retreat rapidly.

This system affords all the advantages of the longwall method of mining. The only possible difficulty that could arise would occur in the event of a break closing the longwall face. This, however, is not likely to take place, as I believe the conditions described by Mr. Hartsuff are favorable for such a method of working. The first break would give the roof strata a free end, after which the action of the overburden could be controlled by cribs and posts, as the great weight would naturally settle on the gob, in the rear of the working face.

Should the adoption of this longwall method of working prove successful in Mr. Hartsuff's case, it would not be necessary to continue work longer in the rooms. More entries could be driven to the line and the work brought back in the manner described. No packwalls will be required in this system of mining. The expense for yardage, in driving the entries, will not be as great as shooting down the roof, building the necessary packwalls and keeping open roads, as required in the regular longwall system. All the roads here are in the solid coal, and will require little or no upkeep.

JOHN CRAWFORD,
Foreman, Mine No. 1,
The Pittsburgh-Belmont Coal Co.

Steel, Ohio.

Letter No. 3—I believe the conditions described by Mr. Hartsuff, COAL AGE, June 6, p. 944, are favorable for employing the longwall method of mining. The roof slate, which he states can be shot down, will form good material for the packs; and if these are properly built and kept in good shape, all squeezes can be controlled.

As the "sulphur binder" is strong, it will allow a large area of coal to be taken out before the roof starts to settle. By that time, the packs will have become quite solid, owing to the roof slate drawing away from the rock and settling down on the packwalls. This will form more or less of a cushion over the packs to receive the great weight of the overburden when the first break occurs.

By that time, however, another cross-road will have been started at the coal face, which will cut off the other lengthening roads in which the tracking can then be pulled and used again. It is important to draw all timber when building the packs. With reference to the cost of the work, much will depend on the class of labor employed. The men must understand how to build good uniform packs so as to make them solid, as the success of the method depends largely on the character of the packwalls.

The entire work must be in the charge of an experienced miner who has a thorough knowledge of longwall methods. Good packing means good ventilation. The mine foreman must outline the work and mark where the packs are needed. The work of building these packs is performed mostly by night men. The slate is drilled in the day time and blasted down between shifts, ready for the night men to stow away. It will be sufficient to carry a 12-ft. pack on each side of the roads, which should be turned every 60 ft. The coal face should be "staggered," by which I mean one place should be about 30 ft. ahead of the other. New crossroads should be started every 200 yd., so as to cut out the old territory or worked-out area.

If longwall work is properly conducted, 100 per cent. of the coal can be extracted. This feature alone is a great advantage and goes a long way toward reducing the cost of producton. If Mr. Hartsuff will work one portion of the mine on the room-and-pillar system and operate the other on the longwall system, and compare the cost of the two, he will undoubtedly find that the longwall method will prove the best system to adopt.

JACOB RILEY.

Universal, Ind.

The "Safety-First" Call

Letter No. 1—Referring to the "Safety-First" campaign, so often mentioned in COAL AGE, a short time ago certain West Virginia coal operators appointed "safety inspectors" for service in their mines. The sole duty of these inspectors, as stated, was to assist the mine foreman in regard to everything relating to the safety of the employees and the mine.

The operators, at that time, addressed a letter to the chief of the Department of Mines in West Virginia, Earl A. Henry, acquainting him with their action. Coöperating with them, Mr. Henry, at once, mailed a copy of the letter he had received to every coal operator in the state, in an effort to interest them in similar measures.

In contrast with this safety movement in West Virginia, compare the recent action of 400 miners employed by the J. R. Crowe Coal Co., at their mines Nos. 19 and 20, at Scammon and West Mineral, Kan., who are reported to have "walked out," stating that they would not return to work until the danger signs that had been posted by Gen. Supt. R. A. Gray, in and about the mines, had been removed. The men claimed that they could take care of themselves without such reminders of danger.

These two examples, though not typical, serve to illustrate the relative importance placed on the "Safety-First" movement by some operators and miners. Not all operators go to the same length or take the same interest as

those in West Virginia and Supt. Crowe in Kansas. Neither do all miners go to the same length as those employed by the J. R. Crowe Coal Co. to which we have referred. On the whole, miners as a class, manifest greater indifference to the "Safety-First" campaign than would naturally be expected since it is chiefly in their interest that the work is being pushed.

The extra expense entailed in the effort to secure greater safety in the mine falls wholly on the operators, not a cent being taken from the miners. While it is true that the operators are repaid, to an extent, for this expenditure, by a reduction of the accident list, lawsuits, damages and payments to the Workmen's Compensation Fund, the movement for greater safety does not emanate purely from selfish motives, and the benefits to the miner far exceed in value those derived therefrom by the operator. Who can place a value on a human life? Miners would do well to remember this.

In view of these facts, it is strange that miners as a whole do not take a greater interest in this campaign for safety. While there are many points on which operators and miners will continue to disagree, the safety campaign certainly affords an opportunity for their earnest coöperation. The effort to secure greater safety in mines should appear to all labor leaders, who should take active steps to enlist the rank and file of the miners in the movement. Instead of labor agitators devoting their time and energies to discover points that will arouse dissatisfaction among the workers, if these men would devote a few remarks to the interest of safety in the mines, their services would be more effective and better appreciated by those whom they attempt to serve.

The fact that little space is given to promulgate the safety movement, in labor papers, and the limited efforts put forth by labor organizations to secure the same end, all reflect on the attitude of these workers toward the demand for the hearty coöperation of all parties engaged in the work of mining coal. Miners should apply the official motto of their organization to their own attitude in relation to their employers—the coal operators. This motto "United we stand; divided we fall" if applied and made to include the entire coal industry—operators and miners—would produce an untold effect. Present conditions in the mining world are demonstrating the truth that *the "get-together spirit" is the highway to increased efficiency and increased earnings.*

The "Safety-First" campaign is not a dream but a practical, worthy attempt. The goal, however, can only be reached when all unite in a consistent effort to further the work.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Basal Formulas—There are, in fact, but two truly basal formulas, in mine ventilation; the one expressing the **resistance** that an airway offers to the passage of an air current having a certain velocity; the other expressing the **power on the air** producing a certain velocity in an airway, against a certain resistance. These formulas, which have been previously explained, are as follows:

Resistance of airway, $R = pa = ksv^2$

Power on the air, $u = pav = ksv^3$

From these two simple formulas as a basis, with the aid of a few other recognized formulas and principles for determining the quantity, horsepower, water gage, rubbing surface, etc., all the numerous formulas of mine ventilation are derived.

An Important Principle—One of the most important principles of mine ventilation may be stated briefly as follows:

Every airway or mine possesses a certain definite **resisting power,** which is determined by the ratio of its area of passage to rubbing surface. For this reason, a given power will produce a certain velocity and develop a certain resistance, in a given airway; the velocity of the air current varying inversely as the resistance. **Ventilating pressure** is caused by and equal to the resistance developed. **Power,** then, creates **velocity,** which in the airway develops **resistance;** and the resistance produces **pressure.**

The conclusion is, therefore, evident that it is the resisting power of a mine or airway that determines the velocity and pressure a given power will produce in that airway. The airway, it is clear only possesses this resisting power potentially, its development requiring the passage of an air current. Hence, it is proper to term such resisting power, expressed in terms of the airway, the "potential of the airway" or the "mine potential," in respect to a mine.

As has been explained, the equivalent of the mine potential, expressed in terms of the power, quantity or pressure, is properly called the "potential of the circulation."

Illustration of Formulas—To illustrate the use of formulas in mine ventilation, and to make clear their application, the following table is given, in which most of the formulas in common use are classified under their proper heads. Many of these formulas, as will be observed, are simple transpositions of another formula or obtained by substitution. The calculations, in the table, all refer to an airway 5x10 ft. in cross-section and 4000 ft. long, passing an air current of, say 25,000 cu.ft. per min.

The Airway—

Perimeter,		$o = 2\,(5 + 10) = 30$ *ft.*
Length,		$l = 4000$ *ft.*
Rubbing surface,	$s = lo$	$s = 4000 \times 30 = 120{,}000$ *sq.ft.*
Sectional area,		$a = 5 \times 10 = 50$ *sq.ft.*
Potential of airway or mine,	$X = \frac{a}{\sqrt[3]{ks}}$	$X = \frac{50}{\sqrt[3]{0.00000002 \times 120{,}000}} = 373.4$

The Coal Age Pocket Book

The Air Current—

Velocity,	$v = \frac{q}{a}$	$v = \frac{25{,}000}{50} = 500$ *ft. per min.*
	$v = \sqrt{\frac{pa}{ks}}$	$v = \sqrt{\frac{12 \times 50}{0.00000002 \times 120{,}000}} = 500$ *ft. per min.*
	$v = \sqrt[3]{\frac{u}{ks}}$	$v = \sqrt[3]{\frac{300{,}000}{0.00000002 \times 120{,}000}} = 500$ *ft. per min.*
	$v = \frac{u}{pa}$	$v = \frac{300{,}000}{12 \times 50} = 500$ *ft. per min.*
Potential of circulation,	$X = \frac{q}{\sqrt[3]{u}}$	$X = \frac{25{,}000}{\sqrt[3]{300{,}000}} = 373.4$
	$X = \sqrt[3]{\frac{q^2}{p}}$	$X = \sqrt[3]{\frac{25{,}000^2}{12}} = 373.4$
Quantity,	$q = av$	$q = 50 \times 500 = 25{,}000$ *cu.ft. per min.*
	$q = a\sqrt{\frac{pa}{ks}}$	$q = 50\sqrt{\frac{12 \times 50}{0.00000002 \times 120{,}000}} = 25\,000$ *cu.ft. per min.*
	$q = a\sqrt[3]{\frac{u}{ks}}$	$q = 50\sqrt[3]{\frac{300{,}000}{0.00000002 \times 120{,}000}} = 25{,}000$ *cu.ft. per min.*
	$q = \frac{u}{p}$	$q = \frac{300{,}000}{12} = 25{,}000$ *cu.ft. per min.*
	$q = X\sqrt[3]{u}$	$q = 373.4\sqrt[3]{300{,}000} = 25{,}000$ *cu.ft. per min.*
	$q = X\sqrt{Xp}$	$q = 373.4\sqrt{373.4 \times 12} = 25{,}000$ *cu.ft. per min.*
Pressure,	$p = \frac{ksv^2}{a}$	$p = \frac{0.00000002 \times 120{,}000 \times 500^2}{50} = 12$ *lb. per sq.ft.*
	$p = \frac{ksq^2}{a^3}$	$p = \frac{0.00000002 \times 120{,}000 \times 25{,}000^2}{50^3} = 12$ *lb. per sq.ft.*
	$p = \frac{u}{q}$	$p = \frac{300{,}000}{25{,}000} = 12$ *lb. per sq.ft.*
	$p = \frac{q^2}{X^2}$	$p = \frac{25{,}000^2}{373.4^2} = 12$ *lb. per sq.ft.*
	$p = 5.2$ *w.g.*	$p = 5.2 \times 2.3 =$ *say* 12 *lb. per sq.ft.*
Resistance,	$R = pa$	$R = 12 \times 50 = 600$ *lb.*
	$R = ksv^2$	$R = 0.00000002 \times 120{,}000 \times 500^2 = 600$ *lb.*
	$R = \frac{u}{v}$	$R = \frac{300{,}000}{500} = 600$ *lb.*

Inquiries of General Interest

Cubic Contents of a Bushel of Coal

Kindly state the number of cubic inches contained in a bushel of coal, assuming 80 lb. per bu., for loose coal.

J. S. Watson.

Baxter, W. Va.

The cubic capacity of the standard U. S. bushel is 2150.42 cu.in. The weight of this volume of water is 62.5 × 2150.42 ÷ 1728 = 77.7 lb. Taking the average specific gravity of bituminous coal as 1.3, the weight of this volume of solid bituminous coal would be 77.7 × 1.3 = say 101 lb.

The legal weight of 80 lb. per bu. of coal in West Virginia, Ohio, Indiana, Illinois, Iowa, Colorado, and other states, allows only 20 per cent. for voids in the loose coal, while the legal weight of 76 lb. per bu. for bituminous coal in Pennsylvania, Kentucky and Montana, allows practically 25 per cent. for voids in the loose coal. These data evidently refer to a well shaken bushel, as the allowance for voids commonly ranges from 30 to 35 per cent.

Cleaning Safety Lamp Gauzes

Will you kindly suggest the best method of cleaning safety-lamp gauzes, so as to expedite the work, save time and obtain the best results. The usual method of cleaning the gauzes of a large number of safety lamps, especially where two gauzes are used in each lamp, consumes much time and is often imperfectly done. Without a close inspection of each gauze, it is difficult to detect when this work has been slighted.

Aside from the use of the common handbrush, which we are employing at the present time, is there any other cheap and convenient method of doing this work effectively and avoiding the necessity of installing a special machine for that purpose? Inquirer.

Johnstown, Penn.

Some time since, a correspondent stated that the best way to clean a safety-lamp gauze was to hold it before a comparatively strong steam jet until perfectly clean; then dry before an air blast or in a drying chamber through which a current of warm air is passing.

Two Questions of Safety

There are two questions I would like to ask, in Coal Age, that affect to a greater or less extent the safety of mine operations.

1. The coal in our mine is all undercut with chain machines, at night. The first thing in the morning, the machine cuttings or slack is loaded out from probably fifty working places. This is done and the places sprinkled, before any shots are fired. I have always thought that the dust raised by from 30 to 50 miners loading this fine slack ("bug dust" as they call it), at the same time, floated in the air and produced a dangerous condition before firing. Is this the case?

2. Is it considered a good plan to carry a part of the intake current through some old workings, before conducting it to the working places? The present arrangement could be changed so as to ventilate the old places with the return air current, which I think, would be safer and better.

Mine Foreman.

————, W. Va.

In answer to the first question, there can be no doubt but that the loading of the fine dust produced by the cutting machines, a short time before firing shots throughout the mine, is a dangerous practice and should be discontinued. Some arrangement should be made by which this dust could be loaded out during the night, so that three or four hours will elapse before shots are fired in the mine. The working places should then be thoroughly sprinkled for a distance back from the face, before shots are fired.

In answer to the second question, it is always a bad plan to permit the intake air current or any portion of it to circulate through abandoned workings, before reaching the working face. The ideal plan of mine ventilation is to conduct the intake current along the main roads or air courses to the farthest point inby, as far as practicable, and then cause it to return along the working face. All abandoned workings should either be ventilated by a separate "scale" of air, if this can be spared from the general circulation at the face; or the return air current should be made to circulate through the abandoned places, on its way out of the mine.

Engineer of Mines

Referring to the inquiry relating to the title "Engineer of Mines," Coal Age, May 9, p. 784, and the answer there given, I want to ask, If a man has had seven years' experience in mines of different kinds and has completed the mining engineering course contained in 14 volumes of the International Correspondence Schools of Scranton, Penn. and holds their diploma for finishing that course, is he entitled to write the letters, E. M., (engineer of mines) after his name? I would like to learn the opinion of reputable mining engineers on this subject. My question has reference only to the title, "Engineer of Mines," and not "Mining Engineer."

Ralph W. Mayer.

Roslyn, Wash.

As principal of the school of mines to which correspondent has referred, for a period of 16 years, this question often came to me from students who had completed their course; but then, as now, I was compelled to reply that the school was not authorized to give the degree, "Engineer of Mines;" and, therefore, while students who completed the course in mining engineering as given by that school, were practical mining engineers and could rightly so style themselves, they could not properly use the letters, E. M., which refer to a degree the school could not give. See, also, Coal Age, May 9, p. 784.

Examination Questions

Pennsylvania Bituminous and Anthracite Examinations

(Bituminous Questions, May 5-6, 1914)

Ques. 10—What information would you enter, in your daily report, to comply with the bituminous mine law?

Ans.—Art. 4, Sec. 18, requires the mine foreman to enter each day, in a book provided for that purpose, and to sign with ink a report of the condition of the mine, stating any danger he may have observed during the day or that has been reported to him; besides stating whether or not there is a proper supply of material on hand for the safe working of the mine, and whether or not the requirements of the law are compiled with.

Ques. 11—What are the legal duties of a shotfirer and what instructions should he be given?

Ans.—Art. 4, Sec. 14, makes it the duty of a shotfirer employed in a mine generating explosive gas in quantities sufficient to be detected by an approved safety lamp, to charge, tamp and fire all holes properly placed by miners, and to refuse to charge any holes not properly placed. The shotfirer shall use none but incombustible material for tamping, which must be provided by the mine foreman at convenient places inside the mine. All such holes shall be fired by an electric apparatus.

Each shotfirer shall keep a record and report to the mine foreman every hole he has refused to charge, every blownout shot and every hole that has misfired. Every shotfirer or miner permitted to fire his own shot must fired, before leaving the mine, to see that no fire or other visit and examine the place where such shots have been danger is present. No shotfirer shall fire a shot in a place where he can detect explosive gas with his safety lamp; and, in gaseous and dusty mines where locked safety lamps are employed, no holes shall be fired in entries and rooms that have not been thoroughly wetted for a distance not less than 80 ft. back from the hole to be fired.

Ques. 12—The water gage reads 2 in., the velocity of the air current is 500 ft. per min., and the length of air course is 4000 ft.; what would the water gage read if the length of this air course be extended to 8000 ft., and the velocity of the air current be increased to 800 ft. per min.?

Ans.—Both the pressure and water gage vary as the length of the airway and the square of the velocity of the air current. In other words, the water-gage ratio is equal to the length ratio, times the square of the velocity ratio, which gives, in this case,

$$\frac{w.g.}{2} = \frac{8000}{4000}\left(\frac{800}{500}\right)^2 = \frac{2}{1}\left(\frac{8}{5}\right)^2 = \frac{2 \times 64}{25} = 5.1 \text{ in.}$$

Ques. 13—If a workman had his leg broken or had arteries severed, what would be your method of rendering first aid to him, in both cases?

Ans.—Handle carefully, place in as comfortable a position as possible, with soft coal or cushion under fractured limb. Use a cushioned splint and apply a bandage to hold the limb firmly and prevent the broken bones from moving one against another, being careful not to bandage too tightly.

If arteries are severed, press the wound tightly to stop or diminish the flow of blood, using a handkerchief or cotton over the fingers to prevent getting dirt into the wound. As quickly as possible, apply a tourniquet over the artery between the wound and the heart.

(Anthracite Questions, May 17-20, 1914)

Ques. 13—Describe fully your method of examining a mine for firedamp, beginning with your preparation before entering the mine; and explain each step taken until the examination is completed and report made to proper officials.

Ans.—Properly clean, fill, trim, examine and adjust the safety lamp to be used in the examination of the mine. Before descending the shaft, observe the operation of the ventilating fan, and note whether it is running at its usual speed. Then, place a suitable danger signal at the entrance as a warning for men not to enter the mine. Proceeding at once to the foot of the downcast shaft or intake opening, note whether the usual quantity of air is passing into the mine.

Following the intake air current, proceed to examine, in turn, all airways, rooms and other working places, to ascertain the possible presence of gas in dangerous quantities, taking note also of the condition of the roof and coal face in each working place. Where gas or other danger is found, fence off the entrances to the place and mark the same with the usual danger sign. In this manner, proceed throughout the section of the mine to be examined, and, on completing the work, return at once to the shaft or slope bottom and enter the report of the examination in the book kept for that purpose. If the mine is in safe condition for the men to enter and proceed to work, remove the danger signal from the entrance to the mine and report to the mine foreman that all is safe for the men to enter, except the places where you have found any danger. The checks of the men working in these places should be removed from the board so as to prevent them from entering the mine.

Ques. 14—What device would you use to remove gas from holes and cavities in the roof of gangways or breasts?

Ans.—It is often necessary, in such cases, to erect a special brattice of canvas that will deflect the air current into the cavity in the roof and sweep out the gas. It is not a safe operation to attempt to brush the gas out of such a cavity with a piece of canvas.

Ques. 16—What quantity of air is passing through an airway 7 ft. 4 in. high, 11 ft. 9 in. wide, when the velocity of the air current is 434 ft. per min.?

Ans.—The sectional area of this airway is $7\frac{1}{3} \times 11\frac{3}{4} = 86\frac{1}{6}$ sq.ft. Assuming the given reading is an average reading for this cross-section, the quantity of air in circulation is $86\frac{1}{6} \times 434 = 37{,}396$, say 37,400 cu.ft. per min.

Coal and Coke News

Washington, D. C.

In a speech before the National Gas Association of America at St. Louis, which has just been made public here, Joseph A. Holmes, Chief of the Bureau of Mines, again emphasizes the necessity for a careful use of natural resources.

Mr. Holmes, who believes that conservation of these resources is one of the most important problems confronting the people of the country today, said,

I am not interested in any way in that sort of conservation which looks toward the locking up of the natural resources of the country for the future when we need those resources ourselves during the present generation. I think we will all agree as a practical doctrine of conservation, that while we have a right to use everything we need at the present time, we have no right to waste unnecessarily what is the heritage of generations yet to come.

It is hard, I find, to get people to realize the importance of conserving our natural resources under this principle, especially in view of the fact that we have a new, and to some extent, undeveloped country, but in talking with people from the older countries like Great Britain where they have operated industries for a thousand years as compared with our one hundred years, I find that they realize what a thousand years means and they realize how the resources which they are now using at so rapid a rate will, in a few hundred years, be practically exhausted and that when those resources are exhausted it means almost annihilation for any country situated as Great Britain is, and which is so entirely dependent for its commercial success upon the development of its various mineral resources with which it has been so generously blessed.

And when we realize the importance of preventing waste of mineral resources, drawing our information from the experience of the older countries, it makes us more serious in dealing with this important problem in this country.

In the last few decades, we have become a great manufacturing and industrial nation. In the earlier years of our history we were an agricultural people, but when you look at our production of coal, which is becoming more and more an index of the great industrial progress of the nation, it makes us realize pointedly the importance of conservation in view of increased demand, for you will find that during the past 100 years—it was just about 100 years ago that we began to use coal in the United States—we have doubled our consumption of fuel every decade. In other words, from 1900 to 1910 we used almost as much coal as we had used during the 75 years preceding.

When you say that to a man he is apt to reply, "Of course that cannot keep up indefinitely," but why may not the consumption of coal increase enormously? We used 30 years ago about one ton of coal per capita. During the past year we used nearly six tons of coal per capita.

More and more we are becoming a labor-saving country; more and more we are becoming a manufacturing country; more and more we are becoming a country of transportation and all our industries depend upon the utilization of our natural fuels.

My opinion is that replacement of fuels by water power is going to be somewhat like the replacement of the street transportation facilities of a great city like New York by sub-ways and elevated roads. You may remember when the construction of elevated roads in New York City was proposed people said that these roads would destroy the surface lines, but they are crowded; and when the subways were projected they were to accommodate everybody, and yet the surface cars are just as crowded now as they were before the elevated or the subways were used.

I don't believe we will ever notice a difference in our consumption of coal or natural gas—except locally—through the development of our water power, for that will be an incident, not a big factor, in the future development of this country. These great resources with which nature has provided us are resources which we ought to use wisely and by using wisely I mean that they should be used with common sense, with rigid economy and without any unnecessary waste.

Would Settle Colorado's Difficulty

Representative Keating has introduced the following resolution in the House:

That the President of the United States is hereby directed to appoint a commission of five persons, distinguished in experience, discretion and integrity, and free from any interest in the disputed questions, to invite the coal operators and coal miners of the State of Colorado to immediately submit the questions in controversy to said commission for settlement. Said commission shall inquire into, consider, and pass upon the questions in controversy, and, if submitted, settle the same upon a just and permanent basis, with a view to preventing the recurrence of such difficulties in the future, and in any contingency make a full report of the facts and their conclusions to Congress at the earliest practicable date, and not later than Dec. 1, 1914.

HARRISBURG, PENN.

When the Public Service Commission meets again, the members will have before them the books presenting arguments in the case brought against the anthracite carriers for the purpose of obtaining a reduction in the rates for transportation of hard coal from the mines in the state to Philadelphia. After due consideration is given the arguments the decision will be rendered.

Since this case was heard the Supreme Court of the United States has rendered an important decision which may have some effect upon the opinion of the Commissioners. The traffic in the anthracite case is known as intrastate traffic, because it is wholly within the state of Pennsylvania, originating at the mines in this state and having a destination which is also within this state. It is thought by some of the Commissioners that the Shreveport decision of the United States Court would not have any bearing upon the anthracite case.

Anthracite shipped to Philadelphia for consumption in that city and vicinity may be regarded as wholly independent of interstate traffic, but shipments made to this port for transportation "beyond the capes" as the trade expresses it when anthracite is destined to New England, would probably fall within the scope of the Interstate Commerce Commissions jurisdiction whose orders would in such cases be paramount to those of the State Commission. The Shreveport case gives an entirely new aspect to the anthracite case and consideration must be given by the State Commission when rendering its opinion.

Briefs on the case to test the constitutionality of the anthracite coal tax are now being prepared by attorneys for both the coal operators and the state. They will be filed shortly, meanwhile the Auditor General is marking time on collections.

PENNSYLVANIA

Anthracite

Mt. Carmel—Three men were caught in an explosion of gas at the Sioux colliery on June 8, resulting in the death of one man, while the others were severely injured. The men fired an unusually heavy charge of explosive, which ignited the gas.

Pittston—The families of Edward Delaney and Jacob Serma at Port Griffith had an unusual experience early on the morning of June 8. The two houses in which the families lived dropped into a mine cave almost up to the second stories. All were gotten out however from the wrecked dwellings.

Pottsville—The mine foremen's Examining Board in the 19th Anthracite District on June 13, announced that 81 candidates successfully passed the examination for mine foremen and assistants. The validity of the papers of several of the successful candidates will be tested in Court by the United Mine Workers of America who assert that only practical miners should be allowed to become mine foremen, and that the examination should not be open to all classes of employees around the collieries.

North Scranton—On June 12, lightning struck the shaft tower at Cayuga colliery of the Delaware, Lackawanna & Western R.R. Co., breaking off a section of the wood-work, disarranging the electric wires and interfering with the hoisting apparatus. For a time it was believed the entire electrical appliances of the mine were destroyed.

Wyoming—Because several of the workmen employed at the Westmoreland colliery of the Lehigh Valley Coal Co., failed to have their union dues paid up to date, 400 men, the entire force went on strike on June 10. The strike is contrary to the agreement entered into by the operators and miners and union officials are endeavoring to make it short-lived.

Sugar Notch—Officials at No. 9 colliery, Lehigh & Wilkes-Barre Coal Co. which was forced to shut down June 10, as a result of the workings being flooded from a pond running into a part of the mines though a 100 ft. cave, expressed fear that the colliery will not resume operations for at least two weeks. The efforts to block up the cave in the bottom of the pond with bales of hay, stumps of trees and other débris were of little avail. Much damage was done by the water, as the dirt is washed from beneath the tracks and a large quantity of mud is deposited in the gangways.

Bituminous

Pittsburgh—The adjustment of the wage scale in the Pittsburgh district resulted in many of the 40,000 miners returning to work under a contract that is to be in force for

two years. Machine men are to be paid 69c. per ton; pick miners, $1 per ton, and each miner is to be provided with an electric safety cap lamp.

Connellsville—The coke trade appears to have settled down to a 50 per cent. basis for the summer. The shutting down of furnace ovens in this region has ceased for the present, and it is hoped no further curtailment will be necessary. Merchant plants are making better time. More than half of them are working their active ovens six days per week, while the remainder will average between four and five.

Rockwood—The Mountain Smokeless Coal Co. at Casselman which has been closed down for several months will again resume operations in the near future.

Washington—Three men were killed in the mine of the Meadowland Coal Co. near here June 12. They were all caught under a single fall of slate.

Lynn Station—The sale of the Cyrilla No. 5 plant of the Sunshine Coal & Coke Co. was postponed on June 12 to June 26. The sale was started at Cyrilla at 1 o'clock; the first bid being $250,000, and the highest $350,000. The latter was thought to be insufficient by the trustees and the sale was postponed until the above mentioned date.

Evans Station—The Evans Coal & Coke Co. which has been running three days a week for some time past is now operating on full time, and giving steady employment to about 200 men. The production is about 800 tons per day, and the demand promises to continue sufficiently good to keep up steady work for a considerable length of time.

WEST VIRGINIA

Charleston—A liberal estimate places the number of men now idle in the Charleston district at 5325, although about 12,000 quit when the strike was called June 1. It is further estimated that the loss to the miners in wages amounts to $266,250 per month while the strike lasts. A number of operators in the district have, however, signed up with the Union.

Lookout—George Wills and Samuel Cook were killed, and Lawrence Wills and Samuel Flint were probably fatally injured recently when an electric locomotive crashed into the tipple of the Blume Coal Co. The men were thrown from the tipple into a deep ravene.

Colliers—The strike of the miners at the West Virginia and Pittsburgh Coal Co. was declared off June 12, following the announcement of leaders of the miners that they would waive demand for recognition of the Union. It was unofficially stated that the company had granted the eight-hour day, the wage of the United Mine Workers of America in the Pittsburgh district, and given the miners the protection of the Insurance Department of the West Virginia Public Service Commission.

Moundsville — During a severe thunder storm, recently lightning struck the powder house at the Rail & River mine No. 3 at Big Run, destroying 2000 dynamite caps but not injuring 1500 pounds of dynamite that were stored near them in the same building.

Bluefield—It is understood that the Sandy Ridge Coal & Coke Co. has decided to increase its holdings on Lewis Creek, and plans are being made for opening one or more mines in the near future.

KENTUCKY

Lexington—Contracts have been made by three of the southeastern Kentucky coal companies by which they will receive the electrical power for operating machinery at their mines from the Kentucky Utilities Co., with headquarters in Lexington. The mining companies concerned are the Wallings Creek Coal Co., the Clover Fork Coal Co. and the Harlan Coal Mining Co. These concerns have been manufacturing their own power, but before the end of the summer will cease to do so and receive the current direct from the central station along the transmission line which the Utilities company is building into that section. Other similar business will likely come to the Utilities company, which is steadily increasing its operations in the eastern and central part of the state.

Whitesburg—Development undertakings are to be begun soon by the Mineral Development Co., owning large boundaries of fine coal lands in Letcher County along the L. & E. R.R. Numbers of announcements have been made as to the plans of the company, but actual work has not been started.

OHIO

Hartford City—The signing of a three-year working contract between the coal operators and the thousand or more men employed in the Pomeroy Bend coalfield has been reported. The miners are granted the check-off and a number of other concessions not heretofore enjoyed.

Columbus—The application for an injunction by Ohio operators to prevent the anti-screen law from being enforced was denied by the Supreme Court of the United States June 15, which finally settled the question of the constitutionality of this law. No further action on the part of Ohio operators is contemplated.

It is estimated that the cost of changing tipples in Ohio to conform to the new anti-screen law will mean an outlay of about $2,000,000. None of this work has been started as yet.

INDIANA

Sullivan—The shops and offices of the Consolidated Indiana Coal Co. are being moved from Hymera, Ind., to this city, to a site given by the Sullivan Boosters Club. The plant has been at Hymera for 10 years.

Linton—The Froschner Coal Co. has opened a new stripping plant six miles north of this city.

Brazil—Six men recently narrowly escaped asphyxiation in the mine of the Brazil Colliery Co. near Billtown. The men failed to come to the top when their shift was completed, and a searching party of miners found them lying on the bottom of the mine unconscious from inhaling gas. They were quickly taken to the top, and soon revived. It is thought that the accident was due to the men being late in firing their shots, as the other miners had discharged their shots and the smoke and gas accumulated to such an extent that the men were overcome before they could reach fresh air.

ILLINOIS

Belleville—The Kolb Coal Co., of Mascoutah, has filed, in the recorder's office here, an increase in stock from $6000 to $20,000.

Trenton—The last Trenton coal has been mined, and the name will be but a memory in coal-trade circles hereafter. The Breese-Trenton Mining Co. found the producing cost too high to finish out the small unworked acreage, and has abandoned and dismantled the mine. This mine was sunk about 12 years ago on the last section containing Trenton coal. During the past winter the daily output was 800 tons. The regular summer price for the screened sizes of this coal was $1.75, and the winter price about $2—the highest priced coal in the inner district.

Danville—The Bunsen Coal Co. has effected an agreement with its miners for the ensuing two-year period.

Hillery—Work, probably not steady but somewhat over half time, will soon begin in this district again. It is understood that as soon as proper arrangements can be made, the mines will work from three to five days each week, some perhaps doing even better than this.

Canton—According to reports, the new Gilchrist mine No. 5 of the Alden Colliery Co. has been closed down indefinitely. Operations will be resumed, it is understood, as soon as the busy season opens in the late summer or early fall.

Springfield—Out of 96 applicants for mine managers, first and second grade, mine examiners, and hoisting engineers, examined by the State Mining Board at the last examination, April 20, fifty-eight have been given certificates of competency. The details of the list are as follows: Mine Managers, first class, examined, 39; passed 21; Mine Managers, second class; examined 10; passed 10; Mine Examiners, examined 26; passed 16; Hoisting Engineers, examined 21; passed 11. Total number of men examined 96; total number passed 58.

MISSOURI

Kansas City—The interstate field meet proposed for Kansas City is now a certainty, though the exact date has not yet been fixed. The five state tournaments held in Iowa, Missouri, Kansas, Arkansas and Oklahoma were successes in each instance and interest in safety-first and rescue work is at a high pitch. H. D. Ryan, of the Bureau of Mines, is in charge of the plans for the interstate meet, which will probably take place in September. The last of the state competitions took place at Pittsburgh, Kan., on June 13.

MONTANA

Red Lodge—State Coal Mine Inspector, John Sanderson, reports that all of the eight applicants for positions as mine foremen and fire bosses who took the examination for the state certificate recently passed with high marks. The persentage of 75 is required to obtain a certificate. Every applicant turned in papers that came above 80; the majority of them over 90. Carl B. Cheek of Washoe turned in the best paper, receiving 99 per cent.

ARKANSAS

Heber Springs—A bed of anthracite was discovered in court square by blasters who were working on a well, on June 8. The vein, 4 ft. thick, was struck at a depth of 36 ft. Another measure is separated by a layer of soil. The anthracite is believed to be of a high grade.

PERSONALS

Otis Mouser has been elected Vice-President of the Stonega Coke & Coal Co., in charge of sales and traffic matters.

E. J. Prescott has resigned as Comptroller of the Interstate Railroad Co., and has been elected Vice-President of the Virginia Coal & Iron Co.

Governor Dunne of Illinois recently appointed George Denny, of Peoria to membership on the State Mine Rescue Commission succeeding Stephen Wolschlag, deceased.

Morris H. Bush, son of the late C. G. Bush, long connected prominently with the big iron furnaces in the Birmingham district, was recently elected President of the Shelby Iron Co.

Edward Johnson, chairman of the board of directors of the Lorain Coal & Dock Co., of Columbus, Ohio, left recently for a trip to European health resorts. He was accompanied by his son.

James E. Roderick, Chief of the State Department of Mines of Pennsylvania, was recently operated on in Baltimore for an internal ailment of long standing. His condition is reported good, and an early recovery is anticipated.

Frank Bradford, Superintendent of the W. J. Rainey plant at Moyer, has been retired on a pension. He had been in the W. J. Rainey service for 33 years, being superintendent at Moyer since the death of Thomas Jones a number of years ago. He has been succeeded by Robert Hogsett, of Uniontown.

OBITUARY

W. S. Cherry, a pioneer in the development of the northern Illinois coal fields, Federal Superintendent of the Chicago, Willington & Vermillion Coal Co., died recently at his home in Streator, Ill.

TRADE CATALOGS

The Standard Underground Cable Co., Pittsburgh, Penn. "Standard Wires and Cables and Cable Accessories." Leaflet of 12 pages, 3¼x6 in.

The Buckeye Engine Co., Salem, Ohio. Bulletin No. 111-B. "Buckeye-Mobiles." Sixteen pages, 8x10 in., illustrating and describing various applications of Buckeye-Mobiles.

The Standard Underground Cable Co., Pittsburgh, Penn. "Steel-Tape-Armored Cables." Twelve pages, 6x9 in., illustrating and describing this type of cables and accessories.

The Link-Belt Co., Philadelphia, Chicago, Indianapolis. "Wagon and Truck Loaders." Thirty-two pages, 6x9 in., illustrating and describing wagon loaders and their application.

Helmick Foundry-Machine Co., Fairmont, W. Va. "Frogs and Switches." Twenty-two pages, 5x8 in., illustrating and describing frogs, switches, crossovers and other track equipment.

The Ingersoll-Rand Co., 11 Broadway, New York. Forms Nos. 8011 and 8011-1. "Little David Riveting Hammers" and "Rivet Set Retainer for Little David Riveters." Twelve pages, 6x9 in., illustrated.

Morgan-Gardner Electric Co., Chicago, Ill. Catalog 57. "Mining Locomotives." Forty pages, 7x10 in., illustrating and describing the sizes and details of construction of Morgan-Gardner locomotives.

The Chicago Pneumatic Tool Co., Chicago and New York. Bulletin No. 154. "The Chicago Stoper." Twenty-four pages, 6x9 in., illustrating and describing the Chicago stoper with dust allayer attachment.

The Ohio Brass Co., Mansfield, Ohio. Catalog No. 14. "Overhead Materials, Rail Bonds, Car Equipment, Specialties and High-Tension Porcelain Insulators." Bound volume of 606 pages, 6x9 in., illustrated.

The Ingersoll-Rand Co., 11 Broadway, New York. Form No. 4020 second edition. "Leyner-Ingersoll Water Drills." Thirty-two pages, 6x9 in., illustrating and describing Leyner drills and some of their applications.

The Hess-Bright Mfg. Co., Philadelphia, Penn. "Hess-Bright Ball Bearings for Axle Lighting Generators." Twelve pages, 4½x7 in., giving a brief discussion concerning ball bearings and their application to axle generators.

The Link Belt Co., Philadelphia, Chicago, Indianapolis. Advance Section A of General Catalog No. 110. "The Original Ewart Detachable Link-Belt and Sprocket Wheels." One hundred and twelve pages, 6x9 in., illustrating and describing this type of link-belt and its attachments.

PUBLICATIONS RECEIVED

Department of the Interior, Bureau of Mines, Technical Paper 67, "Mine Signboards," by Edwin Higgins and Edward Steidle. Fifteen pages, 6x9 in., illustrated.

Department of the Interior, U. S. Geological Survey. "The Cement Industry in the United States in 1913." Twenty-six pages, 6x9 in., containing many tables and curves.

Illinois Coal-Mining Investigations Bulletin 4. "Coal-Mining Practice in District VII," by S. O. Andros. Fifty-three pages, 6x9 in., illustrated with many drawings and halftones.

Department of the Interior, Bureau of Mines. "Abstracts of Current Decisions on Mines and Mining, March to December, 1913," by J. W. Thompson. One hundred and forty pages, 6x9 in.

Department of the Interior. "Report of the Mine Inspector for the Territory of Alaska to the Secretary of the Interior for the Fiscal Year Ended June 30, 1913." Ten pages, 6x9 in., unillustrated.

Mellon Institute of Industrial Research and School of Specific Industries, Smoke Investigation Bulletin No. 7. "The Effect of Soot in Smoke on Vegetation," by J. F. Clevenger, M. A. Twenty-six pages, 6x9 in., illustrated.

University of Illinois, Engineering Experiment Station, Bulletin No. 71. "Tests of Bond Between Concrete and Steel," by Duff A. Abrams. Two hundred and forty pages, 6x9 in., with many drawings, diagrams, curves and tables.

Department of the Interior, Bureau of Mines, Bulletin 57. "Safety and Efficiency in Mine Tunneling," by David W. Brunton and John A. Davis. Two hundred and seventy-one pages, 6x9 in.; profusely illustrated with drawings and halftones.

West Virginia Geological Survey, County Reports, 1914, Kanawha County. Bound volume of 679 pages, 6x9 in., with many tables, drawings and halftone illustrations. This volume is accompanied by three large folder maps in neat cloth-bound container of the same size as the book.

CONSTRUCTION NEWS

Scranton, Penn.—Bids will be received within a short time by the Scranton Poor District for the erection of a conveyor and coal pocket at Clark's Summit on the railroad siding used for freight for the Hillside Home.

St. Louis, Mo.—The building of the Laclede Gas Co.'s coke plant is now under good headway. This work was held up on account of the death of Jacob L. Haehlen, the coke expert of the Laclede Gas Light Co., who lost his life in the M. A. C. fire.

Streator, Ill.—Edward E. Evans, Joseph F. Baldwin, and George M. Baldwin have taken the preliminary steps toward forming a corporation for the purpose of mining coal. They have also leased land lying south of this city, and have commenced work on sinking a mine.

Cairnbrook, Penn.—The Loyalhanna Coal & Coke Co., contemplates the erection of several large blocks of houses to be built here in the next two months. After these are completed, the company will erect a large office building, a store and other structures.

Pittsburgh, Penn.—The Anthracite Coal Co., which is controlled by a number of Pittsburgh banks will soon hold a meeting to consider the erection of another breaker. This firm has developed and proven over 4,000,000 tons of Lykens Valley coal and controls 2400 acres.

Chicago, Ill.—T. A. Lemmon, receiver of the Chicago, Wilmington & Vermillion Coal Co., has appointed the Allen & Garcia Co., Engineers, McCormick Building, Chicago, as consulting and constructing engineers to complete the construction work at the Orient, Franklin County mine, including a new rescreening plant, concrete lining for shafts, etc.

Birmingham, Ala.—The Tennessee Coal, Iron and Railroad Co., expects to begin work next month on putting in the mining towns and operating the Bayview Mines which have been under preparation for the past two and a half years. The output at the beginning will be somewhat over 1000 tons of coal daily.

Penny, Ky.—An incline 800 ft. long will be constructed by the Elkhorn & Shelby Creek Coal Co., W. J. Christopher, manager, in the development of two mines. In addition a power plant, which may be second hand, will be purchased. A 150-hp. boiler will be procured and a small hoisting engine for the supply track as well as a drum to hold 1000 ft. of ½-in. wire rope.

Winchester, Ky.—A new railroad in the coal fields of eastern Kentucky is being surveyed by a force from the Wisconsin Steel Co. This will be an extension of the Cumberland Valley Branch of the Louisville & Nashville R.R. It is to run up Poor Fork from Benham, in Harlan County, through a tunnel under Pine Mountain, near Hurricane Gap, following thence the route of Line Fork to its mouth, connecting there with the Lexington & Eastern Ry., also an L. & N. line. The length of the road will be 10 to 14 miles. It will give Winchester a short route to the Harlan coal fields.

NEW INCORPORATIONS

Mascoutah, Ill.—The Kolb Coal Co. has increased its capital from $11,000 to $200,000.

Chicago, Ill.—The Marquette Third Vein Coal Mining Co. has changed its name to the LaSalle-Hennepin Coal Co.

Hillsboro, Ill.—The Oconee Coal Co. has been organized to do a general coal mining business. The capital stock is $10,000, and the incorporators are Frank L. McDavid, Amos Miller and John R. McDavid.

McAllester, Okla.—The Kennedy Coal Co., of McAllester has been organized with a capital stock of $10,000. The incorporators are G. O. Nolley of Wister, L. P. Sorrells, and W. E. Harley, of McAllester.

Davenport, Iowa—The Wisconsin Mine & Development Co., of Davenport, Iowa, has been organized with a capital stock of $20,000 for the purpose of mining coal. The incorporators are Carl L. Lambach, Leon J. Zoeckier, Charles S. Simpson, Jacob Vogler and Z. E. Haywood, all of Davenport, Iowa.

INDUSTRIAL NEWS

New York, N. Y.—The Seaboard Air Line Ry. recently placed an order for between 500,000 and 600,000 tons of coal. This order was divided between the Pratt Consolidated Coal & Iron Co., the Alabama Fuel & Iron Co., and the Alabama Co.

Spokane, Wash.—Effective July 1, the rate on coal from the Bear Creek, Mont. district to Spokane, will be reduced by all railroads from $3.60 to $3.50. This will make the rate on Bear Creek coal equivalent to that on coal from the Red Lodge district.

Republic, Penn.—Fifty miners recently organized the Republic section of the American Mine Safety Association. The following officers were elected: W. W. Fleming, president; Ralph Keenan, vice-president; and C. H. Millward, secretary and treasurer.

Pottsville, Penn.—Surface rights of a 32-acre farm lying between Minersville and Pottsville, and known as the James Farm have been purchased by a syndicate for $14,000. A part of the tract will be laid out as a town, but much of it will be developed for coal mining.

Johnstown, Penn.—A $60,000 coal deal was consummated recently when T. S. Davis of Eversburg purchased through Howard Davis, the Conemaugh real estate dealer, several tracts of valuable coal land lying between Conemaugh and Mineral Point, comprising about 800 acres in all.

Des Moines, Iowa—Seven of the 9 railroads which began action in the United States District Court in December, 1910, to prevent the enforcement of lower rates on coal ordered by the State Railroad Commission have abandoned their cases, while the two remaining roads, the Rock Island and Minneapolis & St. Louis, are expected to dismiss their suits within the next few days.

Pittsburgh, Penn.—The first shipment of Monongahela River coal forwarded direct from Pittsburgh and consigned to the Panama Canal Zone will follow an expected rise in the Ohio River. The towboat "Exporter" has a tow of 22 barges of coal to be delivered at New Orleans, there to be transferred to colliers and by them unloaded at the receiving station at the Panama Canal.

Victoria, B. C.—A considerable quantity of sawdust briquetts is being manufactured at Victoria, while a firm at Vancouver is building a briquette factory. The refuse from the saw mills is cut into small pieces, thoroughly dried, and finally compressed. The briquetts are 3 in. in diameter, and the total cost of production is said to be only $3 per ton. The selling price will be governed by that of coal. It is claimed that these briquetts are a better fuel than either coal or wood.

Connellsville, Penn.—The Baltimore & Ohio R.R. has found coke breeze a satisfactory fuel for use in locomotives equipped with automatic stokers. This is indicated by the fact that the railroad is loading two or three carloads of this waste material every day at Leisenring and is taking quantities away from Juniata and other points, while it is unofficially stated that negotiations are being made with the H. C. Frick Coke Co. for the entire coke breeze output of its plants.

Birmingham, Ala.—The Tennessee Coal, Iron & Railroad Co. announces the addition of another plant to its operations. This firm will erect a plant for the manufacture of basic slag fertilizer at a cost of between $300,000 and$500,000. The utilization of basic slag for fertilizer has never before been attempted in this section. The fertilizer to be made is said to be superior to the basic bessemer slag fertilizer which is used in the German Empire, and about 20,000 tons of which are imported to this country each year.

Toronto, Ont.—The Pacific Coast Collieries, Ltd., is offering an issue of $500,000, of 30-year 6 per cent. bonds, at 98 and interest. Its authorized bond issue is $3,500,000, of which $1,600,000 are issued. The company was incorporated to acquire the Pacific Coast Coal Mines, Ltd., with valuable coal holdings at South Wellington, Suquash and other points on the east coast of Vancouver Island. The South Wellington and Suquash properties are estimated to contain 200,000,000 tons of bituminous coal, approximately half of which has been proved.

Pensacola, Fla.—Loading 5000 tons of coal in one day, the navy collier "Brutus" recently sailed for Galveston with the initial shipment of Alabama coal for the Navy.

Pittsburgh, Penn.—According to operators more coal has been moved to the Great Lakes during the past week or ten days than during any other period of this year. The resumption has been made possible by a better iron ore movement which brought vessels for coal cargoes to the lower lakes. The shipment has increased mining operations and a larger force of men have been put to work, with the prospect, the operators say, of a complete resumption of lake coal shipment by July 1.

Milwaukee, Wis.—Judge Page of the District Court recently found that there was an unlawful combination in restraint of the sale of anthracite coal in Milwaukee County, but that the guilty persons were not in the jurisdiction of said county. The Court held that no coal was sold in Milwaukee, either wholesale or retail, in the open market by dealers in competition. The evidence produced during the investigation has been submitted to Attorney-General MacReynolds to be used in possible prosecution of dealers in Pennsylvania and Ohio, from which states most of the coal used in Milwaukee is received.

Toronto, Ont.—The Nova Scotia Commissioner of Works and Mines has introduced a bill in the legislature for aiding the Intercolonial Coal Co. to acquire the property formerly owned by the Acadia Coal Co., and to install plant for working the same. The bill proposes to guarantee the payment of a loan not exceeding $100,000 and interest at 5 per cent. The output of the Intercolonial has been steadily decreasing, owing to the increased cost of working at a greater depth. The same difficulty caused the stoppage of work at the Acadia property adjoining. The reorganization now undertaken provides for the more economical working of the Acadia vein by the Intercolonial with the aid to be afforded by the government.

Coal Trade Reviews

General Review

Further curtailment in the anthracite regions and demand easing off all along the line. Bituminous consumers crowding operators for better prices and market weak with more declines in sight. Lake trade fair in some sections. Uncertainties in the Ohio situation rapidly clearing up.

Many of the hard coalers are still working full time, but curtailed operations are becoming more general throughout the mining regions, and the end of the current month will see practically all companies on a short schedule. The demand is gradually easing off all along the line, and there are complaints from different quarters as to the poor business, but as a rule the trade generally is pulling along at about the customary midsummer rate. The opening period saw a slow movement, particularly in the Lake trade, and it is possible that the summer business may be accelerated in order to wipe out the deficiency made there.

The general heaviness in bituminous has been further accentuated during the past week. The market seems to be absolutely devoid of any absorbing power, and consumers are more thoroughly in control of the situation than at any time during the current year; they are eagerly taking advantage of the weakened condition of the market to crowd the agencies for better prices, and in most cases find the latter ready to make concessions in order to hold favored business. An increased demand from the West and Northwest, as a result of the labor unsettlement in Ohio, supplemented by an abnormal export business, have been the only favorable developments in the Atlantic Seaboard trade.

Under the stimulus of the increasing Lake trade, and a complete shutdown throughout all the Ohio fields, the Pittsburgh district is enjoying a steadily increasing business. Contracts as a rule continue at the full circular, although prices in the spot market are irregular, and the line trade light. However, persistent work by the selling agencies has resulted in keeping the coal moving while operators are becoming less insistent upon working the mines full time, and the trade seems to be on a more equitable basis.

Insofar as market conditions go, there has been little change in the situation in Ohio, the most important development of the week being the decision of the Supreme Court upholding the constitutionality of the new screen law. What the ultimate effect will be remains to be seen, but at any rate the uncertainty has been removed, and the participation of Governor Cox in the labor conferences, toward the close of the week, gives promise of a speedy solution of the wage-scale question also.

The bunkering trade at Hampton Roads was abnormally heavy during the week, although the dumpings as a whole were only fair, and Coastwise business rather light. The Southern markets slowed down somewhat, orders for both steam and lump coal being few, and the majority of the mines reducing operations to four days a week, although a few still maintain full time. A heavy demand from the country trade in the Middle West, due to the large crops, has injected a rather better tone in the situation, and the market is relatively strong. Prices are somewhat firmer, while an unexpected car shortage on one of the main coal roads has created some apprehension over the outlook this fall.

EASTERN MARKET

BOSTON

Market largely in buyers' hands; Pocahontas and New River still being forced on inland territory. Water freights very low and steamers being tied up. Pennsylvania grades unchanged, with some operators trying to meet low prices on other coals. Anthracite business continues fair, with no difficulty about filling June requisitions.

Bituminous—There is no relief to the generally weak market that prevails in this territory, particularly on Pocahontas and New River coals. Prices are practically in the hands of the buyer, whether in small lots or by the cargo. Practically every discharging point today has quantities of coal in bottoms waiting for orders and so long as cargoes come forward unsold in this way so long will the market show its weakness. More than one steam collier has been laid up within a fortnight because orders are so scarce and it would be no difficult matter to charter transportation from Hampton Roads to Boston for one trip, say, at 50c., perhaps the lowest water freight that has been named in several years.

There is no longer any more than a thinly veiled pretence of asking $2.85, f.o.b. Norfolk or Newport News. Delivered prices are frankly based on nearer $2.65 on the few sales that are being made and on any but the fanciest grades. Even on this basis the tonnage is small and in an ordinary year it would be considered negligible The less favorably known coals are being offered down to as low as $2.50. In brief, the New England tidewater market is about as near being demoralized as at any time since 1909. A three- to five-week wait on large vessels for the cargo to be disposed of is now nothing unusual, and if the situation holds at so low an ebb there will be some demurrage bills to pay.

Under such conditions it is rather a poor prospect here for coals mined in Pennsylvania. In a few instances, however, operators there have met the situation and are getting some scattered business at prices that net down to $1.10@1.20 for grades that are well regarded. The number of mines in position to keep running in times like these is relatively small and the volume of coal placed is hardly significant. The position of Georges Creek coals in this market bears close analogy to that of the better Pennsylvania grades. They, however, in considerable degree have their own transportation and are enabled to make delivered prices that defy analysis. F.o.b. prices on Georges Creek are firmly held on the season basis.

Anthracite—There are no new developments in hard coal. New business is still subject to short delay in shipment, but the companies are freely soliciting orders for June delivery. There is only a scattering business, however, and not enough to keep the mines on full time for much longer. One small feature of the anthracite market just now is the extreme slowness with which fancy grades of Lehigh are being shipped. There are many April orders that are still unfilled.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.45	$1.10@1.60	$1.67@1.77	
Philadelphia*	2.15@2.70	2.35@2.85	2.92@3.02	
New York*	2.45@3.00	2.65@3.15	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95	
Hampton Roads*	.....	.....	.....	$2.60@2.85
Boston†	.....	.....	.....	3.40@3.68
Providence†	.....	.....	.....	3.30@3.68

* F.o.b. †On cars.

NEW YORK

Bituminous production still further restricted. Requisitions on contracts at about 60%. Anthracite heavy, but about normal for this period. Stove the only active size. Much coal going into storage.

Bituminous—There is a total absence of any new features in the New York soft-coal market and, if anything, the general heaviness has been further accentuated during the past week. While present indications are that June will show a heavier movement than May, due principally to the delay in

getting under operations in the latter month, production for the current week will be less than last week. Requisitions on contracts range from nothing in some lines, such as steel, for instance, up to full quotas in others, such as municipal and public-service corporations, the general average on all contracts probably being around 60%.

The indications that operators are refraining from sending consignment coal to Tidewater, still prevail, no embargoes being reported and coal on demurrage seldom heard of; but, on the other hand, there is considerable coal being carried on boats to avoid demurrage. West Virginia mines shipping this market are on about 40% capacity, while the western Maryland operators are down to about three days per week. An unusual demand from the Western roads, due to the shutdown in Ohio, has created some activity in West Virginia gas fuel.

Most agencies continue optimistic over the future and see indications of an active market this fall, but the current trade is about as dull and flat as could be expected. The nominal market, at which probably no prompt business is being negotiated, continues unchanged as follows: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.60@2.70; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—While some companies continue on a full-time basis, restriction of operations in the hard-coal regions is becoming steadily more general. The end of the current month will probably see all the large companies working on a curtailed basis. However, as a rule, the trade is pulling along about as is to be expected at this period of the year, although there are many complaints of poor business in some quarters. Undoubtedly, the market is easy on all grades. Large tonnages of the steam sizes are reported afloat where they have been placed as a last resource to avoid demurrage.

Stove coal continues the leader and is the only grade in which there can be said to be any demand at all. Egg and nut are slowing up, considerable of both grades going into storage; the Erie R.R. is reported short of egg coal, however. In the steam department, pea, buckwheat and barley are all in excess supply and difficult to move even at substantial concessions on the circular. No. 2 buckwheat is the only steam grade at all active and it is only in fair demand. We quote the New York market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.80	$4.55@4.70	$4.75	$4.50@4.65
Egg	5.05	4.80@4.95	5.00	4.75@4.90
Stove	5.05	4.95	5.00	4.90
Chestnut	5.30	5.00@5.20	5.25	4.70@5.15
Pea	3.55@3.60	3.30@3.60	3.45@3.50	3.10@3.45
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.00@2.75
Rice	2.30	2.25@2.30	2.00@2.25	1.60@2.25
Barley	1.80	1.60@1.80	1.70@1.75	1.25@1.70

PHILADELPHIA

Anthracite business continues to shrink, and demand is practically centered on certain sizes. Curtailed operations likely this month. No improvement in bituminous.

Anthracite—It is more apparent daily that the usual falling off in the demand for anthracite is developing earlier than usual. There is practically no call for chestnut, and it is safe to say that 50% of the small sizes now being produced would more than meet the requirements on contracts. With this surplus, and with storage facilities already crowded, the producing interests are rather chary about continuing operations, and full-time work will be the exception rather than the rule from now until fall.

Prices on chestnut and pea have been cut heavily by the individual operators, and if the demand for stove was not sufficient to take care of the entire output, the large companies would not have the only incentive the customer has in placing orders with them for other sizes. It has proved a potent lever in more than one instance, in securing orders. While it is understood that the New England business still continues fair, there is every indication that the dealers are becoming filled up, and the end of June may find this branch of the trade in the same condition. Prices at tidewater are quoted about on a parity with the week previous.

Bituminous—Taking the situation as a whole, there is little improvement, although there seems to be a feeling in the trade that conditions will grow more favorable as the coal year advances. Spot coal appears to be in better demand, although customers are loth to pay any advance over existing prices.

BALTIMORE

Improvement in anthracite trade and an increasing export business in bituminous. Soft coal spot market weak, and contract demand light.

An element of briskness to the anthracite trade developed the past week. The delayed purchasing of storage fuel for the coming fall and winter season has at last awakened. There was considerable movement along that line. Industrial fuels remain in poor demand as a whole. All classes of hard coal are in easy supply, and yards as a rule are well stocked for the season.

The most promising features in bituminous are the inquiries from the Northwest and West, and the heavy export business. Prices are steady, West Virginia three-quarter gas holding around 80c., run-of-mine at from 70 to 75c. and slack 50c. Pennsylvania low-grade coals command from 95c. to $1.10, with best fuel holding firmly around $1.35 to $1.40.

Export business is taking a wider range all the time. Heavy shipments sent to French, Italian, Spanish and Egyptian ports are cutting heavily into a field that was at one time almost monopolized by coals from Great Britain.

CENTRAL STATES

PITTSBURGH

No change in activity from formal acceptance of wage scale. Mining operations at over 75%, almost wholly on Lake business. Prompt prices still irregular. Coke stagnant; shipments exceeding production and tending to liquidate accumulations.

Bituminous—There was no return of the miners to work last week, as reported in the daily press. The formal acceptance of the wage scale for the new period occurred, but the men had already gone back to work to the extent that employment was available for them.

Mining operations have shown a slight further increase. Some large interests are operating almost full, or at 80 to 90% of capacity, and the average for the whole district is probably above 75%. The line trade is still extremely light, and the domestic trade amounts to very little, but Lake shipments are very good, considering the dullness in other quarters. The Pittsburgh district is naturally profiting by the partial idleness in other sections.

Prices for free coal continue to be quite irregular, and some important contracts are being booked at concessions, but as a rule contracts are reported as being made at full list prices. Slack on some divisions continues to sell down to 55c., but only in prompt lots. The majority of operators refuse to make contracts for slack for less than twelve months, then quoting 90c. or in a few cases 80c. Regular list prices are: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

Connellsville Coke—The market continues to drag. There is no demand for prompt furnace coke and as it is offered at less than contract prices quoted, furnaces are disposed to buy from hand to mouth rather than contract for third-quarter or second-half. There is somewhat more interest in foundry coke, as most contracts expire at the end of this month, but negotiations for the new twelve-month are not yet very active. The market is quotable as follows: Prompt furnace, $1.75@1.85; contract furnace, $1.85@2; prompt foundry, $2.35@2.65; contract foundry, $2.35@2.65, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending June 6 at 243,609 tons, a decrease of 419 tons, and shipments at 254,831 tons, an increase of 1394 tons. Shipments appear to have exceeded production by 11,222 tons, helping to make up for the many weeks in which the balance was in the opposite direction.

BUFFALO

Bituminous steady. No improvement in sight, though the volume of business is slowly increasing. Activity hardly possible before fall. Anthracite moving about normally with a light local trade.

Bituminous—There is a small increase in the movement of bituminous due largely to hard work on the part of the selling agencies. The trade is slowly settling down to a more steady business. Nobody expects to sell more than a moderate amount but all are making an effort to sell the coal before it leaves the mines, as it is a hard matter to make a profit on anything that is sold under pressure.

The operators are not so insistent about working and if a representative cannot keep the mines running they are prepared to slow down. There are few operations tributary to this market that are running more than half time, but only a few are shut down, for it is possible to make some profit. There is no complaint at present of cheap coal offering at consumers' prices and the situation is clearing up materially in that direction. There is some coal selling on contract at prices close to those of a year ago. The railroads are only buying moderately; they refuse to stock up and are not likely to make any sort of outlay that they can avoid.

There is less report of price cutting, though it is not denied that only the best coal can command full quotations. Pittsburgh lump brings, per circular, $2.80; three-quarter, $2.70; mine-run, $2.55 and slack, $2.15, with Allegheny Valley sizes about 25c. lower.

Coke—There is still a falling off in the coke production, due to the slow operations at the iron furnaces. Districts in any way dependent on the large coke-making centers for business report an added quiet condition of late. Prices are lower, $4.25 for best 72-hr. Connellsville foundry now being quoted.

Anthracite—The Lake movement is fair, the rail line-trade quiet and the city demand light. These conditions commonly prevail at this time of the year, but they were not preceded by the usual shipments early in the season, so that the shippers would be pleased to be able to make up some of the deficiency. If it is not done through the summer it will have to be done next fall, when the demand is excessive.

Reports from the Upper-Lake docks are not reassuring, as consumers are not buying heavily enough to relieve the docks very much. It is believed that the coming heavy crops alone will insure liberal buying in the fall, but it is likely all to come in a lump and embarrass the shippers as is usually the case. Shipments by Lake for the week amount to 169,000 tons, according to the custom-house report.

TOLEDO

Market continues heavy but the outlook much improved. Threshing demand already coming in and record-breaking crops will stimulate business generally. Unfavorable outlook in transportation lines.

The coal movement continues sluggish although there is some indication of improvement and it is generally conceded that threshing coal will be in heavy demand within a short time. Ohio is slated for unusually large crops this season. Crops all over the country are looking good and coal men are predicting a big car shortage the coming fall. The railroads have been buying little or no equipment to replace that condemned a couple of years ago. The mine difficulties should be adjusted shortly, while factories, which have been using up their surpluses, will again be in the market for coal and the Lake movement will be heavier.

Pocahontas coal is exceedingly scarce and high in price. The situation here has not been affected in the slightest degree by the closing down of Ohio mines; in fact it is believed to have been a good thing for the market. The list prices thus far remain unchanged although it is expected that some changes will be made the first of the month.

CLEVELAND

Trade dull in all lines and the general situation in coal unchanged. Many concerns still reported to have large stocks. Prices about the same as last week.

A resumption of operations in Ohio may be brought about after the meeting this week between the Ohio operators and the scale committee of the miners, at which Governor Cox will probably be present. Many of the Ohio mine owners are of opinion that an adjustment will be agreed upon along the lines of the western Pennsylvania mine-run basis.

Pittsburgh slack is offered for shipment at from 45c. to 55c. at the mines, freight rate $1, Cleveland, with the absorbing power about one fifth of normal. Fairmount mine-run is quoted at $1.90 to $1.95 f.o.b. Cleveland and ¾ inch lump at $2 to $2.05.

The general feeling is that when fall orders begin to come, the railroads will be unable to handle shipments because their equipment is in such poor condition.

Lake Shipments have decreased slightly since last week. With poor demand throughout the Northwest and with some of the docks at Duluth and Superior still out of commission because of the recent gale, the other docks have become jammed, making coal cargoes not quite so plentiful.

Shipment prices are as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.15		
Lump, 1¼-in.		$2.35	
Lump, ¾-in.		2.25	$2.00@2.05
Mine run	2.60	2.10	1.90@1.95
Egg	3.15		
Nut		2.15	
Slack	2.20@2.35	1.60	1.65

CINCINNATI

Heavy curtailment as a result of the labor trouble has not yet affected the market. Abnormally slow steam demand hampering the entire trade. Both rail and Lake business is very poor.

The business depression in practically all lines continues to exercise an unfavorable influence, practically offsetting even the good domestic demand for smokeless. The difficulty in moving slack has so curtailed the production of domestic smokeless and splint that there is not sufficient to meet the call of the trade. The bituminous market is weak, however, and it can hardly be said that there is any encouraging factor at present.

The prospects for continued idleness in the Kanawha field do not seem to have affected the market as yet, although there is just cause for apprehension on the part of the retail trade. But dealers are not worrying, and are making no effort to lay in coal. It is estimated that the number of idle miners in Ohio and West Virginia is close to 60,000, and this necessarily means a serious fuel shortage somewhere. Of course, the present dullness in manufacturing lines wipes out a part of the shortage, but, aside from this, there is little coal in stock. The demand is bound to come later on, and from present indications there will not be enough coal to supply it.

COLUMBUS

Conference of the scale committee before Governor Cox. Decision from the U. S. Supreme Court on the constitutionality of the anti-screen law. Trade still playing a waiting game.

The latest development in the mining situation in the Buckeye State is the calling of another conference of the scale committee made at the request of Governor Cox who is anxious to see the wage scale adjusted. The decision from the United States Supreme Court upholding the constitutionality of the Green anti-screen law has cleared away this uncertainty.

Some increase in the demand for steam grades is reported from certain sections of the state. It appears that the surplus stocks are exhausted and steam users have been compelled to purchase West Virginia coal. Prices for that class of fuel are extremely low, mine-run being quoted down to 80c. Some demand for domestic sizes has also developed but dealers' stocks have been sufficient to take care of this trade. Some of the larger users of domestic grades are laying in their fuel supply. Orders have been placed with dealers for delivery during the latter part of June or early in July. Pocahontas and West Virginia splints are the favorite grades in the domestic demand.

While Ohio mines are still idle there is a considerable tonnage from West Virginia and Kentucky being shipped to the Lakes for the Northwest. The Toledo docks of the Hocking Valley Railway have handled more than a half million tons since the opening of navigation. The ore trade is quiet and this has a bad effect on an active Lake trade for coal.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.50@$1.40		$1.50@$1.40	$1.50@$1.40
¾-inch	1.35@ 1.30	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.30@ 1.25		1.25@ 1.20	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.10@ 1.05
Nut, pea and slack	0.85@ 0.80		0.35@ 0.80	0.80@ 0.75
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.70@ 0.65

DETROIT

No actual improvement noted but a generally better feeling prevails. Anthracite gradually slowing down.

Bituminous—While there has been little improvement in the coal business itself, there is a decidedly more hopeful feeling in general industrial circles which should be reflected in the coal industry shortly. In fact, the market seems to be gradually gaining strength and prices are already stiffening, though without any specific advance as yet. The high price of $2.25 on Pocahontas egg and lump is still being nominally held, though sales down to as low as $2 are reported. Slack is weak and considerably in over-supply, selling down to 55c. per ton and in some cases as low as 40c. An increase of 15c. is predicted by the first of next month. West Virginia operators are now demanding $1.50 for lump coal. There is little or no Ohio fuel coming into this market, and there will be none until the labor situation is straightened out there.

Anthracite—The hard-coal market is gradually slowing down, business so far this month being confined to receiving last month's shipments. However, it is expected that the end of the month will find the customary activity which prevails when the summer discount is in effect.

Coke—The coke market continues dull and unsatisfactory, several cars of Connellsville having been disposed of at a substantial concession in the circular, although circular prices are generally being maintained as follows: Connellsville, $2.90 and Solvay, $3.25, f.o.b. ovens.

HAMPTON ROADS

Shipments during week only fair. Large fleet of bunker steamers taken care of. Quantity of loaded cars on railroad yards still in excess of normal.

Although there has been a large number of vessels in port during the week the dumpings over the various piers will in all probability show up only fair. Cargoes destined both foreign and coastwise have not been extra heavy but the supply of bunker steamers has been large. Such cargoes as have moved foreign went to Kingston, Trieste, Santiago, Montevideo, Manaos and Para.

In addition to cargoes of New River and Pocahontas mine-run there has been some movement of nut and slack and high volatile coals to the New England ports and to the South as well. The government has also taken two cargoes of Pocahontas coal for the stations at San Diego and Mare Island, Calif.

Perhaps the largest quantity of bunker coal loaded into any one vessel at this port for some time went into the S. S. "Banffshire" which took 3750 tons. This vessel was en route from New York to Sydney, N. S. W.

LOUISVILLE

Prices stiffer in the eastern Kentucky field, with indications of still better conditions in the fall.

A continued stiffening of the domestic market is the principal feature in the eastern Kentucky field, while little change is reported from the western end of the state, the demand for domestic sizes from that section usually being a later development. Eastern Kentucky operators have booked orders well on through July and August, at an average advance of 10c. on the ton for each month. On September business operators are finding it possible to hold out for higher prices. Little change for the better has been marked in the industrial demand, though it is considered that the situation with respect to the Kentucky market will improve shortly.

SOUTHERN AND MIDDLE-WESTERN

BIRMINGHAM

Coal market not quite as active, although a big railroad order was placed. Little improvement in coke. Pig iron slightly more active.

The market on both steam and lump coal fell of slightly, few orders being booked for either lump or steam coal. While some of the mines are running on full schedule, the majority are only working about four days a week. Both furnace and foundry coke remain quiet with little evidence of improvement in the near future. Blacksmith coal is about normal for this season of the year. While not quite as large a tonnage of pig iron was booked as last week, more orders were taken in smaller quantities, with prices about the same.

The placing of a contract by the Seaboard Air Line, involving between 500,000 and 600,000 tons of coal, was the main feature of the week. The order was distributed among three companies, the Pratt Consolidated Coal & Iron Co., the Alabama Fuel & Iron Co. and the Alabama Company.

INDIANAPOLIS

Indiana mines working about half-time. Usual number of contracts closed but coal not being ordered out. Prices at customary summer level, except on screenings. Domestic movement slow.

Conditions in the Indiana coal fields are at the usual summer quiet. Mine owners say they have closed an average number of contracts for the season but the coal is not being taken. The mines are on not much better than half-time and operators say this means that the buyers are on about the same schedule. The fact that no Ohio coal is in the market seems to have made no difference. Agents say coal from the Virginia fields can be had at about the same price as from the Indiana mines.

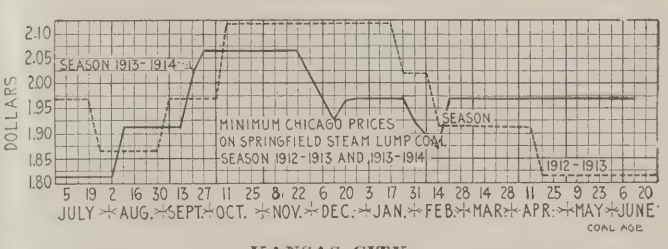
The fact that there is plenty of free coal on the market has not affected prices, as it has been found that concessions do not increase the demand, so the general policy is to hold prices at a fair level. Screenings are still scarce and command 90c. to $1 as against the contract price of 80 to 90c. Among the factories the largest in the state are on short time but the smaller ones are running about normal. One operator says his largest buyer has closed down for the first time in many years.

The wheat harvest has begun in the southermost counties of the state and will work rapidly north. It will make more work for the railroads and they will need more coal. Whether the increased activity will extend to related industries is what coal operators are waiting to see.

CHICAGO

Prospects for future beginning to brighten up. Improvement anticipated in steam and domestic coal after July 1. Smokeless market showing better form. Demand for screenings exceeds supply and price increases. Coke demand stronger for future delivery.

Railroad conditions take an important part in what is expected in the Chicago coal market. The railroads expect to obtain the increase in freight rates which will mean that the curtailment in expenditures will be ended and naturally the coal market will be affected favorably. Most of the railroads close their fiscal year June 30 and so are spending as little as they possibly can for the time being. It is expected that after July 1 they will begin buying coal for storage as a heavy rush is looked forward to in the fall. Another factor in the expected improvement is that large orders are anticipated by the steel trade on account of the advanced freight rates.



Although anthracite sales have been below normal since Apr. 1, the year's business will be up to the usual figure, with rush deliveries during August, September and October. Reasonably strong conditions prevail in the smokeless coal market. While there is considerable of this grade offered at $1 a ton, the larger companies are holding to the circular price of $1.25 for mine run, on contract coal. There is little demand for lump and egg, but the supply is no better.

There is a variety of prices demanded for Franklin County coal. One company is getting some business at $1.50 for lump, egg and No. 1 nut while another, now getting $1.35, announces that the price will be advanced to $1.50, July 1. Several companies are quoting $1.25 and others have even gone below that figure. Mines in this district are running an average of three days a week. Prospects are fair in the Carterville district, with price conditions similar to those in Franklin County. With the demand for screenings increasing there is a scarcity evident which was not anticipated. During the week the price has increased about ten cents a ton for the better grade and five cents for the ordinary. Dull conditions still prevail in the spot market for hard coke, but an improvement is looked for during the second half of the year.

Prevailing prices at Chicago are:

	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump.....	$2.07	$2.30@2.40	$2.12	
Steam lump.....	1.97		1.97	
Egg.....		2.30@2.40		$3.95
Mine-run.....	1.87	2.15@2.25	1.87	3.05@3.30
Screenings.....	1.62@1.67	1.95@2.05	1.62@1.67	

Coke—Connellsville and Wise County, $5@5.25; byproduct egg, stove and nut, $4.65; gas house, $4.25.

KANSAS CITY

Kansas City market improved. Demand from wheat belt causes slight increase in operations. Market steady on summer basis.

Movement of coal in this section has shown a distinct improvement during the past week. The wheat crop has materialized in good shape and threshermen are actually beginning operations, though it will be a week before all of the separators in the Kansas, Missouri and Oklahoma wheat belts are in full swing. Operating time has been increased as the result of the brisker movement, three days being the minimum in all quarters, with four and five the average. The market has held steady, and with a stiffening tendency which may result in a slight advance shortly. Some danger of a car shortage is felt, though railroads are coping with the situation effectively so far.

ST. LOUIS

Improved demand from country trade due to the heavy crops. An unexpected car shortage on the Iron Mountain causes apprehension over the outlook this fall. Prices unchanged but firmer.

There was a better tone to the high-grade market during the past week, occasioned perhaps by the fact that there is considerable country buying. This is largely in anticipation of the harvest and the coal for threshing purposes is beginning to move. This is not, however, affecting the Standard market any, and the same conditions exist in that field that have for several weeks past.

There has been practically no change in quotations, in either the high-grade or Standard field; screenings and steam sizes seem to be holding their own, but it is likely that in the next week there will be an advance in Carterville and Franklin County screenings on account of the gradually increasing car shortage. For five days straight the Iron Mountain failed to furnish cars, and the only apparent reason for this is that the road is not fixed financially to repair its

equipment. This road is in bad shape financially, while the C. & E. I., one of the other heavy coal carriers in the southern Illinois field, is in the hands of a receiver, and cars are not at all plentiful on it.

The Illinois Central and the Burlington are the only two roads out of the high-grade field that are financially strong. The Burlington does not enter St. Louis from the south, which leaves the Illinois Central as the main carrier and this road has never been able to furnish more than 35% of the equipment demanded by the mines during the fall months.

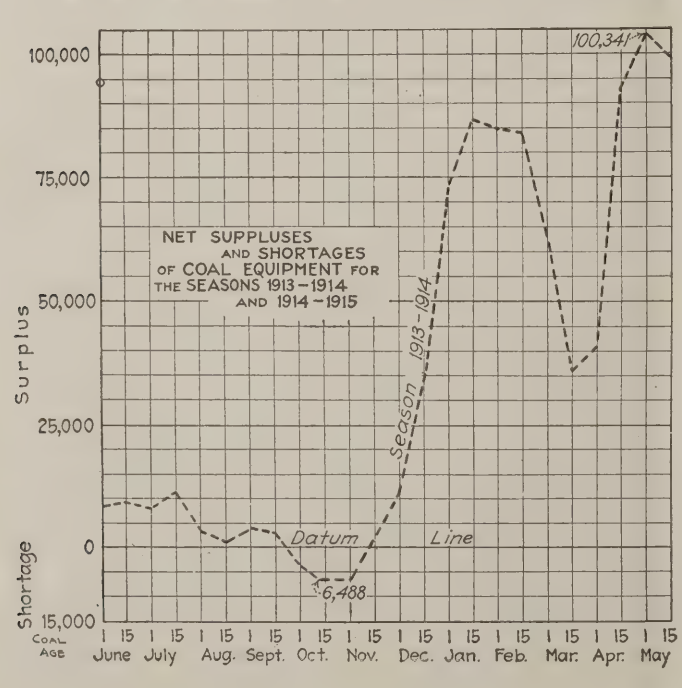
There was a dropping off in the orders for anthracite last week, and several cars were reported under demurrage at East St. Louis. This is mostly independent coal, and it is somewhat hard to move, being in open cars and in many cases drop bottoms which the dealers refuse to receive.

The market is now quotable as follows:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	.....	.....	$1.15	$0.80 @ 0.90	$1.15
3-in. lump	.....	.....	.....	.....	.....
6-in. lump	$1.20 @ 1.35	.....	1.25	1.00 @ 1.15	1.35
Lump and egg	1.85 @ 2.15	$2.00	.....	.....	1.15
No. 1 nut	1.20 @ 1.35	.....	.....	.....	.....
Screenings	0.85 @ 0.95	.....	0.80@0.85	0.70 @ 0.80	0.75 @ 0.80
Mine-run	1.00 @ 1.15	.....	.....	0.75 @ 0.80	.....
No. 1 washed nut	1.40 @ 1.50	2.25	1.50	.....	.....
No. 2 washed nut	1.25 @ 1.35	.....	1.35	.....	.....
No. 3 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 4 washed nut	1.25 @ 1.30	.....	.....	.....	.....
No. 5 washed nut	0.80 @ 0.85	.....	.....	.....	.....

Coke—Gashouse $4; byproduct, $4.75, both f.o.b. St. Louis.

PRODUCTION AND TRANSPORTATION STATISTICS



THE CAR SITUATION

American Ry. Association reports surpluses and shortages of coal equipment for two weeks ended June 1, as follows:

	Surplus	Shortage	Net*

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during May and the past four months of the current year in short tons:

	February	March	April	May
Pocahontas Field	942,477	1,161,793	1,156,670	1,239,653
Tug River District	204,074	246,490	221,344	263,155
Thacker District	198,228	274,786	232,181	280,148
Kenova District	71,401	88,616	96,116	101,768
Clinch Valley District	152,769	153,704	156,502	150,916
Other N. & W., Territory	3,694	2,741	2,827	2,596
Total N. & W. Fields	1,572,643	1,928,130	1,865,640	2,038,236
Williamson & Pond Creek R.R.	26,314	43,865	79,828	74,875
All other railroads	67,518	140,123	171,818	225,561
Grand total	1,666,475	2,112,118	2,117,286	2,338,672

Distribution of shipments for April and May compare as follows:

	April			May		
	Shipped	Tipple	Total	Shipped	Tipple	Total
Pocahontas	1,066,583	16,336	1,082,919	1,123,694	16,249	1,139,943
Tug River	219,221	2,123	221,344	260,887	2,268	263,155
Thacker	222,770	9,411	232,181	270,356	9,792	280,148
Kenova	87,884	8,232	96,116	92,958	8,810	101,768
Total	1,596,458	36,102	1,632,560	1,747,895	37,119	1,785,014

Shipments of coke, entirely from the Pocahontas field amounted to 64,340 tons in April as compared with 60,949 tons in May.

FOREIGN MARKETS

Lower Coal Freights from Wales—The heavy fall in freights for coal from Cardiff may be seen in the table herewith. This table covers certain selected ports in which American coal exporters may be expected to have a special interest:

Ports	Highest in 1912	Highest in 1914	Lowest in 1914	Ports	Highest in 1912	Highest in 1914	Lowest in 1914
Alexandria	$3.28	$2.00	$1.67	Gibraltar	$2.55	$1.67	$1.39
Algiers	3.08	1.54	1.35	Havre	1.76	1.09	0.85
Barcelona	3.28	2.00	1.82	Montevideo	5.71	3.40	2.79
Bordeaux	2.02	1.20	0.96	Port Said	3.10	2.06	1.64

Goodrich LONGLIFE CONVEYOR BELT

carries the big load

"Longlife" does more work than any other belting—and at lowest tonnage cost. Its great tensile strength, combined with perfect flexibility and good friction, make it the leader in its field. Its edge construction is unequaled. Users of "Longlife" eliminate spillage, edge wear and guide idlers from their mine problems.

We will gladly refer you to plants which are finding our belts the best.

There is nothing in Goodrich Advertising that isn't in Goodrich Goods

What Users Say About the Bronze Sleeve Bearings Supplied on

Baldwin-Westinghouse

Electric Mine Locomotives

The modern bronze sleeve bearings with oil and waste lubrication used in the motors on Baldwin-Westinghouse Electric mine locomotives give such satisfactory life that many testimonials have come from satisfied users commenting upon this feature.

One large mining company in Arizona operating eight 15-ton locomotives for a period of two years advises that they never replaced an armature bearing and a careful test on one set of bearings at the end of two years showed the wear to be only .003 inch.

A company in Utah, which has had in operation four 18-ton locomotives since 1910, states that none of them have ever been out of service for repairs to the armature bearings and that all motors are still running with the original armature bearings. Some of these locomotives have operated three shifts a day for three years, handling 1250-ton miles per shift.

A very large mining company in Montana has had nine 3-ton locomotives with sleeve bearing motors in operation for three years working three shifts a day and all armatures are still in the original bearings.

Several large companies in Pennsylvania which have used all types of bearings prefer the modern bronze sleeve bearing.

These facts prove that bronze sleeve bearings satisfactorily meet the exacting demands of mine locomotive service.

Specify Baldwin-Westinghouse Barsteel Electric Mine Locomotives and you are assured of reliable operation.

A Message To You From The President Of The West Virginia Coal Mining Institute

The Weekly Ad-Talk Page

You will be interested in the following remarks by Neil Robinson, president of the West Virginia Coal Mining Institute, delivered at the recent meeting at Cumberland.

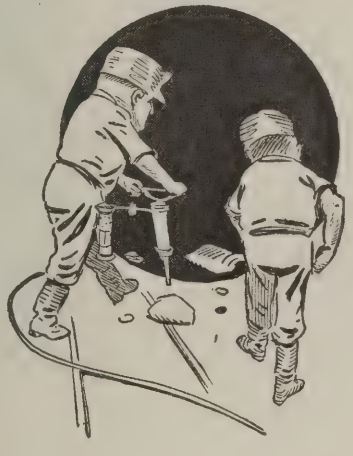
" * * * The value of the mining journal to the superintendent, mine-foreman and every ambitious employee of a mine is simply amazing; and the members of our Institute can perform no greater service to the industry they represent than by encouraging, I may almost say coercing, the men under their direction to subscribe for and read and study at least one of the many good papers available.

"We would not care to employ a lawyer who knew it all and never kept in pace with new laws and new decisions; nor would we knowingly entrust a doctor with the care of our physical ailments if advised that he never read a medical journal and only had vague hearsay knowledge of new medicines and new treatments.

"If we apply this test to the men who are to pass upon points of law, and those who are to treat the ills of an individual, how much more rigidly should we apply it to the men who are responsible for hundreds of lives in the depths of the mines? No man can keep abreast of the times who fails to profit by the wonderful stores of knowledge presented every week and every month in the journals that specialize on coal and coal mining. The advertising columns, with illustrated descriptions of new machinery, have a value almost equal to the literature in the body of the paper, and we can truly say that a good journal will give us a profit from cover to cover. The fine periodicals now at our disposal will carry to every mining village in our State quick knowledge of progressive methods wherever they may be adopted, whether in our country, Germany, Belgium, Great Britain or far-away Australia.

"My message is brief but it is important. Let me urge, with all possible earnestness, that every member of this Institute shall lend his best efforts to the dissemination of the wonderful stores of information contained in the trade papers, to the end that the men connected with the mines in West Virginia may become the best posted men in the mining world."

This is a fine illustration of the value the leading coal mining men place upon both the advertising and editorial sections of the modern coal mining papers. Their advice is good—are you following it?



COAL AGE

Vol. 5. NEW YORK, JUNE 27, 1914 No. 26

Back To The Mines

By Berton Braley

Written expressly for Coal Age

Back to the mines with you, drawers of dividends,
Back to the mines where your treasure-house lies,
Back to the men who are digging your coal for you
Back where the Job is right under your eyes,
Dingy and dull is the mining community,
Ugly its outward and visible signs,
—Therefore it gives you the more opportunity
Back to the mines!

Though it is gay in the mighty metropolis
Far from the mining town, grimy and grim,
Far from the spot where the miners are laboring
Down in the galleries dusty and dim,
THESE are the people who daily are needing you,
Life runs for them on the hardest of lines,
Go and live close to the folks who are feeding you,
Back to the mines!

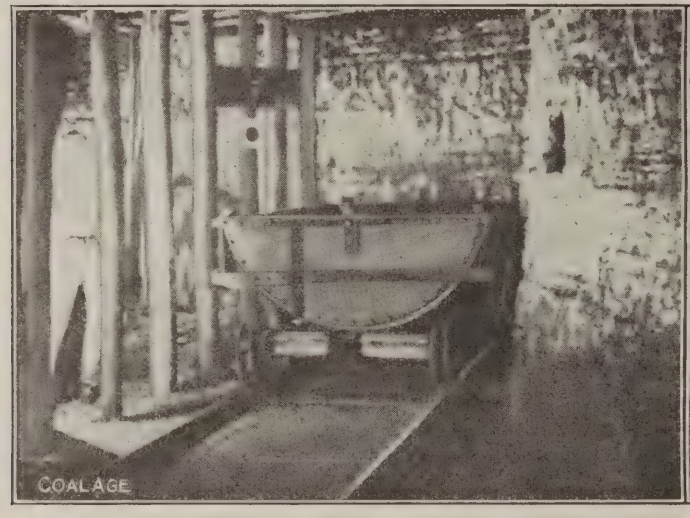
Distance is dulling to kindness and sympathy,
Dulling to skill and efficiency too,
Absentee owners grow careless and cynical
Anxious for nothing but dividends due,
Back to the mines—and to justice and sanity,
Learn how the other half struggles and pines,
Back with the woes and the joys of humanity,
Back to the mines!

The Moving Picture in Coal Mining

By Frank H. Kneeland

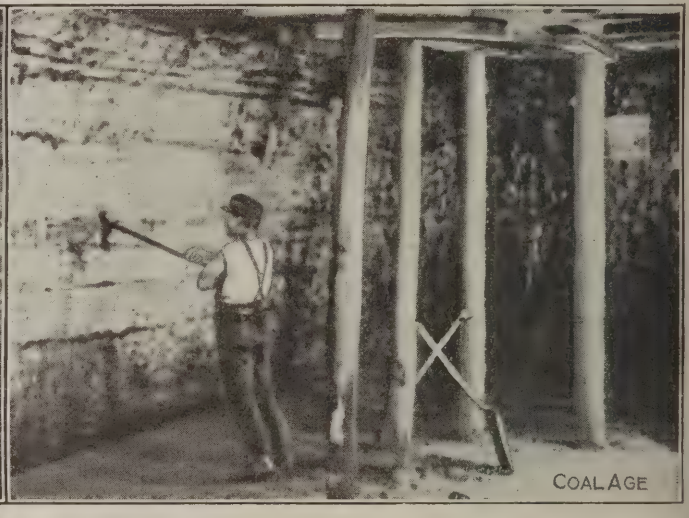
SYNOPSIS—The American mining industry is a confusion of tongues; pictures may, however, be clearly understood by all. Recognizing this fact a progressive West Virginia company has adopted the cinematograph as a means of instructing its employees in methods of both safety and efficiency.

Any language, either articulate or written, has its limitations, territorial or otherwise. Numerous as have been the attempts to invent and establish a world tongue, they have all met with dismal failure, and we have at the present time no speech or dialect which may be universally understood.



This does not signify, however, that a person speaking one language is unable to communicate with those unfamiliar with his particular tongue. On the contrary, by the use of motions, gesticulations and grimaces, he may readily make his wants and wishes known. In other words, communication may be established by means of signs.

The engineering profession perhaps possesses the nearest semblance to a universal written language that the world has yet seen. The working drawing and sketch are not hedged in by the limitations of time and know no territorial boundaries. The plans of Hiero and the drawings of Leonardo da Vinci are as intelligible to the engineers of today as they were to the Egyptican workmen 200 years before the dawn of the Christian era or the Italian artisans of the middle ages. Thought preserved in the form of a properly made drawing is universally intelligible throughout all lands and eras to those who plan.



The working drawing, however, is made with one primary and fundamental object; namely, construction. If we wish to convey other ideas than those structural, we must resort to other means, of which the picture is the most common and intelligible. Furthermore, a picture or painting conveys a meaning and an idea to those who may be utterly ignorant of sound symbols and punctuation marks. The only means at present at our command, therefore, whereby ideas may be transmitted from one person to another without a knowledge of a common tongue, is by means of sign language; in other words, a visual language without an alphabet.

The ranks of our present-day coal miners are recruited largely—probably considerably over half—from the countries and municipalities of southern Europe, where illiteracy is prevalent and where the languages and dialects are numerous. In short, our coal-digging forces are composed largely of Italians, Greeks, Poles, Slavs, Lithuanians, Bulgars, Montenegrins, Huns, Armenians, with a more or less generous admixture of races from other climes, such as Germans, Scandinavians, Russians, Hindoos, Chinese and Japanese.

Many, if not most of these men, when they first apply for work at our coal mines, are not only utterly ignorant of our language and customs, but also of the first principles of coal mining. It is at present the law in the anthracite region of Pennsylvania that no man may assume the duties and responsibilities of a miner who has not first served at least a two years' "apprenticeship," passed a miner's examination and must hold a miner's certificate. A similar statute is in force in Illinois, and there is and has been strong agitation for like enactments in other mining localities.

Loading Out the "Bug-Dust." Note Danger Board on Third Post

Drilling the Center Shot Hole. Notice Cleanness of the Place

This "Apprenticeship" Is Not Perfect

While this "apprentice" system may be an improvement over the conditions existing in these fields before its adoption, and is greatly superior to no instructions in the trade whatever, it nevertheless leaves much to be desired and is frequently subject to deplorable abuses. The possibilities of the evasion or perversion of such a statute are so well known as to require no further comment here.

Furthermore, however much knowledge the prospective miner may acquire under this system of the gentle art of coal digging, it is certain that not all, and probably only few of the instructors are men both careful and efficient in their daily work.

The result is obvious. The apprentice learns not only the few proper and efficient methods of his instructor, but acquires his many foibles and shortcomings as well.

It is probable that the state law requiring a term of mining apprenticeship was not promulgated with the primary idea of either rendering the calling more safe or insuring greater efficiency of the individual worker. On the other hand, this measure was doubtless fostered by the miners' union with the intention of throwing a legal barrier around the member and his job, and thus rendering it unlawful for the coal operators to place at work as miners men who had not seen at least two years' service in the mines of Pennsylvania.

In those coal fields not employing this apprenticeship system, conditions may be either worse or better than where it is in vogue. In most mining localities the old method of procedure still prevails. A man applies for work and is asked certain questions concerning previous employment. As his principal object is at the time to secure a job, he usually answers "yes" or "no" to the questions propounded as he deems most advantageous to his cause. His fellow countrymen and friends have probably coached him as to what to expect and what to reply.

We will suppose that he is successful in securing a position as a miner and reports for work. If he then knows how to take care of himself and keeps out of danger, all is well; if not, he is possibly either injured or killed. In this latter contingency the reports of the accident show that he had received all customary attention and instructions, and that his misfortune was due solely to his own fault, the foreman under whom he worked and the company employing him being blameless.

Progressive Companies Make Sure

Among the most progressive companies, however, and especially those considering "safety first," it has been the custom for some time to take nothing for granted, and to be sure that all men entering their employ are properly instructed in the work they are expected to do. When hired, every man is given a book of instructions printed in several different languages, and upon going to the mine is placed in charge of a sub-foreman, who watches him closely, giving from time to time such verbal instructions as he may consider necessary.

In coal mining as in most other occupations, there are but few movements or operations to which "scientific management" may not be applied with benefit. To do this intelligently, it must be done by efficient instructors and all false motions and unnecessary movements avoided. Here, as elsewhere, there is one, and usually only one, right and proper method of procedure, and this right and proper method of performing any operation is the one in which the workman should be thoroughly instructed.

In order to render this instruction effective, one or more of several methods may be employed. The men may be taught verbally at frequent intervals by a sub-foreman or other person, who must not only give them detailed instruction, but illustrate the same by frequent examples. Where the men to be instructed lack a knowledge of the language in which the instructions are given, or are unable to understand any language if put in scientific terms, or those necessary to give full and detailed explanations, it is impossible to teach them verbally; they must be shown. There are two ways of showing such men; one is to have experts do each particular kind of work under their observation. It will be necessary to have this work gone through with three or four times before the men will comprehend what the expert is driving at, and such teaching becomes an endless job.

The Adaptability of the Moving Picture

The other method is to have motion pictures made of an expert doing each particular kind of work, then have these exhibited before the men as often as it is deemed necessary. This can be done more quickly, more perfectly and more economically, produces better results and can be more readily comprehended by the men themselves than any amount of verbal instructions given in the mines. For just as the working drawing is comprehensible to the engineer, so the moving picture is understandable by everyone, child or adult, alien or native.

It was with the idea of familiarizing its employees not only with means and methods of greater safety in the mines, but also with the standardization of mining processes that the United States Coal & Coke Co., a subsidiary of the U. S. Steel Corporation, with mines in McDowell County, W. Va., adopted the moving picture as a means of instruction.

The stereoptican had been in use for some time by the H. C. Frick Coke Co., and other steel corporation subsidiaries in teaching methods of accident prevention. It was believed, however, that this means of instruction was open to many objections. It showed how *not* to do things, rather than how they should be done. Furthermore, when a series of lantern slides were exhibited, illustrating a number of fatal accidents, the impression made upon the audience was unquestionably a bad one, and particularly so upon the women, who, understanding little or nothing of actual mining operations, would imbibe the belief that coal mining was an extremely dangerous calling and would hardly care to have any of their male relatives engaged therein. They at least would fail to grasp the fact that the four or five accidents which they had seen illustrated upon the screen in the course of the evening had been scattered through perhaps a year's time and had occurred in several different mines. So far as the miners themselves were concerned, the pictures showed what they should not do, and the result of failure to observe certain precautions. While this was in a sense beneficial, it left the miner to a considerable extent at sea as to what should have been the proper method of procedure.

Furthermore, it was utterly impossible to show in lantern slides the most efficient methods in coal mining. With moving pictures on the other hand, it is possible to show to the novice and man of long service alike, the best methods which years of experience have been able to devise for the prevention of accidents and the attainment of efficiency.

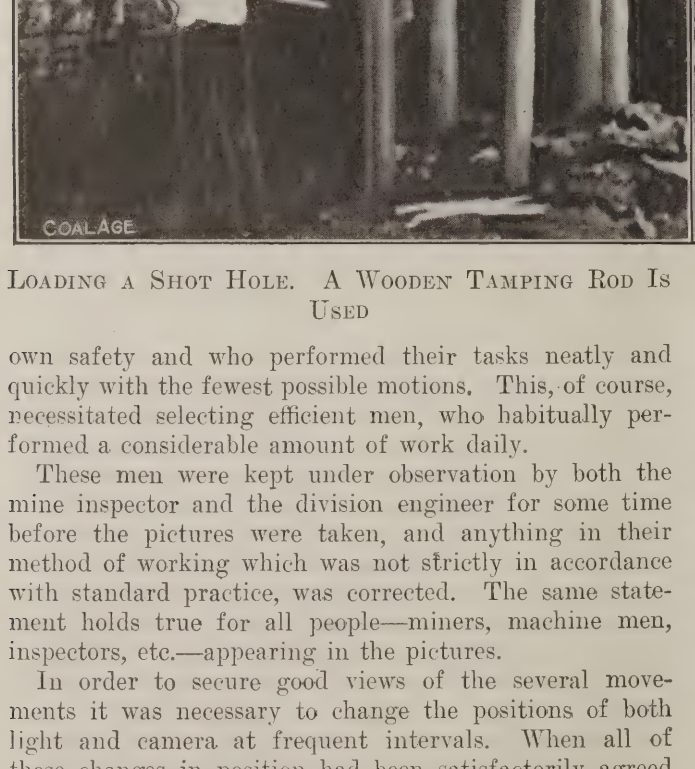
The Method of Taking the Pictures

The best method of taking moving pictures underground had to be determined by experiment. Although careful inquiry was made, both by the company and by the U. S. Bureau of Mines, whose photographers actually took the pictures, no data were found anywhere about the light required for taking such pictures. After a few trials with arc headlights, it was found necessary to install eight direct-current "Kleighlight" lamps, with a capacity of 5000 c.p. each, and using a specially prepared carbon rich in violet rays, in order to cover the work with-

out casting shadows and to get the light uniform and sufficiently strong for instantaneous exposures. The power consumption of the lamps when in operation was about 75 kw., and as they were connected to the trolley wire and there was a considerable reduction in the voltage when the mine locomotives were pulling heavily, most of the pictures were taken after these machines had stopped running in the evening. The lights were connected to the trolley line by 2-0 wire, were set on movable pedestals, and provided with adjustable reflectors.

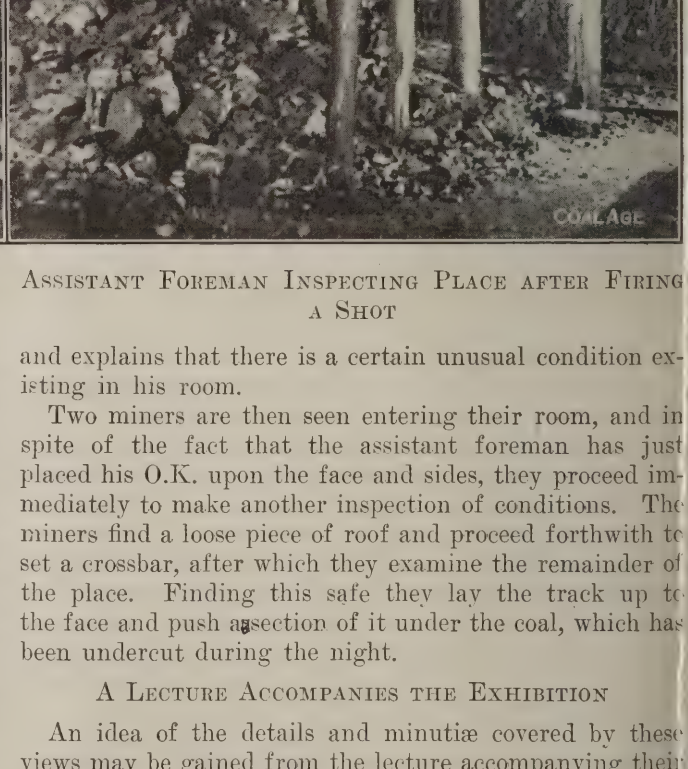
In order to show the work in detail it was necessary to cover as large a space as possible at the working face, so that two men might be shown at work simultaneously and illustrate each operation as it was performed. This necessitated cutting a pocket at the face of the room, about 15 ft. deep on one side and 25 ft. deep on the other.

The men selected as subjects for the moving pictures were careful workmen who always looked well after their own safety and who performed their tasks neatly and quickly with the fewest possible motions. This, of course, necessitated selecting efficient men, who habitually performed a considerable amount of work daily.



These men were kept under observation by both the mine inspector and the division engineer for some time before the pictures were taken, and anything in their method of working which was not strictly in accordance with standard practice, was corrected. The same statement holds true for all people—miners, machine men, inspectors, etc.—appearing in the pictures.

In order to secure good views of the several movements it was necessary to change the positions of both light and camera at frequent intervals. When all of these changes in position had been satisfactorily agreed upon, the men practiced their parts three or four times within the range of the camera before pictures were actually taken. This was deemed necessary on account of the nervousness of the operatives more than for any other reason, as in doing this work before the camera they would commit mistakes which ordinarily would not be perpetrated. In spite of this nervousness, however, the pictures were remarkably good and showed that but little attention was given the picture-taking machine when the men were actually engaged in their work.



The Entire Process of Coal Production Is Illustrated

The series of pictures taken illustrated the entire process of coal mining, from the working face to the railroad car. The assistant mine foreman was first shown entering his section of the mine and closing a gate, forming a danger board and debarring the miners from entering. He is then seen going into a room up to the working face, testing the air for gas, and the roof and face for loose coal and slate, and placing his O.K. and the date upon the face of the room and the sides.

The miners are seen arriving at the entrance of the section and waiting outside the closed gate, in the meantime reading the special notices and accounts of accidents as posted upon the bulletin boards. The assistant foreman is then seen returning to and opening the gate, allowing the miners to enter. He calls one man to him and explains that there is a certain unusual condition existing in his room.

Loading a Shot Hole. A Wooden Tamping Rod Is Used

Assistant Foreman Inspecting Place after Firing a Shot

Two miners are then seen entering their room, and in spite of the fact that the assistant foreman has just placed his O.K. upon the face and sides, they proceed immediately to make another inspection of conditions. The miners find a loose piece of roof and proceed forthwith to set a crossbar, after which they examine the remainder of the place. Finding this safe they lay the track up to the face and push a section of it under the coal, which has been undercut during the night.

A Lecture Accompanies the Exhibition

An idea of the details and minutiæ covered by these views may be gained from the lecture accompanying their exhibition to the company's employees, from which we quote as follows:

The miners are now laying track in order to run the mine cars up to the face of the coal for loading. It is necessary to take up the short length of track each evening after the coal is loaded out in order to allow the mining machine to properly make its undercut for the next shift. You will notice that Carnegie steel room ties and 20-lb. rail are used. These steel ties do not require spikes or bolts, there being a clip about 6 in. from the end which turns around and fastens the rail to the tie. With these ties and using 20-lb. rails the track can be laid under the coal where it has been undercut by the machine. When the coal which has been shot down

over the track is being loaded out the car can always be kept at the face and the coal loaded over the side.

Approximately 4.3 per cent. of the total time spent by the miner in the working place is consumed in laying track.

The workmen are now making the track straight, which is extremely important. Crooked tracks are often the cause of derailments allowing men to become injured in wrecks or in replacing cars, to say nothing of the expense and time lost by such accidents. The track as laid leaves an 8-in. clear space between the side of the cars and the props and rib. The driver is now bringing in an empty car for the miners to load. While he sets the brakes a miner puts a safety block under the wheel to keep the car from running away. This mine is equipped with all-steel mine cars, many of which are supplied with Carnegie rolled steel wheels made in the same manner as those used on passenger and freight cars.

The miner is now loading the fine coal made by the mining machine in the undercutting process. This fine material or "bug-dust" must be loaded before shooting to lessen the possibility of an explosion of the fine coal or dust by a blown out shot. The dust is also cleaned out from under the cut so that the coal may be shot down more readily.

You will here get a good view of the systematic timbering, which requires posts to be set 3 ft. on centers on roadways, with 6-ft. cap pieces turned at right angles thereto, which affords some protection over the roads. The back rows of posts are set on 6-ft. centers and cap pieces are placed parallel with the roadway, the cap piece being 4 ft. long in rooms.

This system of timbering requires three rows of posts in all places over 18 ft. wide. Posts are required to be kept within 6 ft. of the coal that is being worked at all times, and where conditions are bad, they must be set closer than this. Approximately 6.5 per cent. of the total time spent by the miner in the working place is consumed in timbering.

You will notice the safety board hanging on the post, upon which the assistant mine foreman marks the time of his visit each time he enters the place, which is of great assistance in determining the time the assistant mine foreman was last in the place in case a man should become injured between his visits. This board also shows the length and width the place is to be driven. It is moved up as the working place advances.

The car is now about loaded and the driver comes in to take it down to the landing for the haulage motor. Notice that the miner removes the safety block from the front of the wheel, and that the driver rides on the rear end of the car, as it is against the rules of the company for anyone to ride on the front end of motors or mine cars whether empty or loaded.

PROPER METHODS OF SHOOTING ARE ILLUSTRATED

After the machine cuttings have been loaded out, one miner drills a center hole for shooting down the coal. It is the rule of the company to shoot the coal down with three shots, one being in the center of the room, or heading, and one upon either side, the center shot being made first, and only one hole being fired at a time. The shot hole must be thoroughly cleaned so that there will be no fine coal left in it. While one of the miners is drilling the hole for the center shot the other is preparing cartridges of clay tamping and putting his detonator in the powder charge. He makes the hole in the latter for the detonator with a wooden pin provided for this purpose. Clay for tamping is brought in from the outside and put in each working place.

Having completed his cartridges he starts back to the working lace where his "buddy" has been drilling the center hole for the shot. The miner is now loading the center hole. The assistant mine foreman is required to examine the place and tamping, attach the wire and shoot the hole. You will notice that a wooden rod is used for tamping, also that one miner is drilling the rib hole while the other is loading the center hole, thus losing no time.

The shot is now properly tamped. The assistant mine foreman attaches the wire and he and the miners leave the place, one of the latter taking out all of the tools.

Having reached a place of safety, the assistant mine foreman fires the shot by means of an electric battery, after which he returns to examine the place before the men are permitted to enter. Finding some loose slate, he directs the miners to take it down. The assistant mine foreman is required to stay with the men until all dangerous slate is removed and all necessary posts set. If that piece of slate had fallen on a man, it would have killed or severely injured him.

After the slate has been taken down, both the assistant mine foreman and the miners examine the roof to see that it is safe. Approximately 2 per cent. of the miner's time is consumed in taking down loose slate.

PLACING A PROP BEFORE LOADING OUT AFTER A SHOT

COAL CUTTER READY TO START ON THE SUMPING CUT

MINUTE DETAILS ARE SHOWN

This picture shows a closer view of the hole being charged for shooting, with two miners doing the work. They tear the paper off the end of the adjoining sticks of explosive so that the latter will come together. This makes the explosive one mass and avoids any liability of having one stick fail to detonate when the shot is fired. The limit of charge allowed in the mine is 2 lb. for one hole and only one hole may be fired at a time.

No explosive is permitted to be used that has not passed the test of the U. S. Bureau of Mines and been designated as a permissible safety powder. In former years it was the custom to use black powder for shooting down the coal. This was extremely dangerous. The permissible safety explosives give a much shorter flame and a lower exploding temperature.

Approximately 4.3 per cent. of the miner's time is consumed in drilling, 3.8 per cent. in charging holes and 0.4 per cent. in waiting for shots.

As the miners load the coal, they are required to throw back the slate and refuse which accompanies it. The coal adheres to the slate and has to be cut loose. The miner at the rear makes room for the car to be pushed to the face, which enables both men to load from the sides. Approximately 7.3 per cent. of the miner's time is consumed in cleaning the coal. Undercutting to a depth of 8 ft. 6 in. allows the room to be driven 20 ft. wide and provides a full day's work for two men and also enables practically all the coal to be loaded into cars without rehandling.

Approximately 41½ per cent. of the miner's time is consumed in loading coal, while only 3.2 per cent. is consumed in reshoveling.

The pictures show the miners removing a short section of the track after the day's work has been done and the coal completely loaded out, the assistant foreman making his evening inspection to be certain that the place is safe for the incoming machine men. The miners leave the mine, hanging their checks upon the check board. The machine men with the undercutter enter the working place, unload the machine, draw it to the face, make their sumping cut, make the crosscut, remove the machine, load it upon its truck and move out. In all of these operations, a standard practice is carefully shown, and the work is accomplished with the least possible manual labor, the least loss of time and with the greatest possible safety.

Processes Outside the Mine

Views are also shown of the haulage motors leaving the drift mouth at the head of a loaded trip. The trip is seen arriving at the tipple, the motor uncoupling, passing around a special runaround and recoupling to a waiting trip of empty cars. The coal cars are shown passing over the dumps of the tipple, discharging their contents and proceeding thence to the empty track. A view is also shown underneath one of the tipples, where a 70-ton coal car may be loaded in approximately one minute.

The primary idea for taking and exhibiting these pictures, as explained above, was to show how the various operations of coal mining might be done with the greatest safety, efficiency and dispatch. Upon their exhibition before the company's employees considerable interest was aroused and no small amount of discussion among the miners themselves was stirred up. Such discussion is, on the whole, beneficial, as a miner will frequently see some point which the expert may have entirely overlooked.

It is the intention later to take detailed pictures of many of the single operations necessary in mining and to standardize these at all mines.

Educational Value Quickly Appreciated

Although these photographs were primarily made for exhibition before the employees of the United States Coal & Coke Co., their possibilities as a means of instruction were quickly recognized, and they have accordingly been exhibited quite generally throughout Westmoreland and Fayette counties of Pennsylvania, both in the mining towns and the larger communities as well. They have been shown in New York, Philadelphia, Harrisburg and Pittsburgh; in the states of Indiana, Illinois, Virginia and West Virginia and will shortly be sent to New Mexico. They have also been shown before the Canadian Mining Institute, at Montreal, and a copy of the film is being prepared for use by the University of West Virginia in mining-extension work.

As stated above, these pictures were taken by and under the direction of the U. S. Bureau of Mines. From the best information available they are the only extensive views of the kind ever secured and, together with the stereoptican slides of the H. C. Frick Coke Co., previously mentioned, form what is believed to be the most comprehensive exhibit ever gotten together illustrating coal-mining devices and methods for the attainment of both safety and efficiency.

While it is doubtless true that the full significance of these pictures cannot be acquired without a thorough understanding of the accompanying lecture, yet it is unquestionable that much good is done the miner who sees the picture, but is unable to understand English. The constant and ever-recurring inspection of the working places by all those who enter them, regardless of their mission or purpose, the placing of the safety blocks on the rails, the careful setting of timbers to support a weak roof, and the other safety precautions, cannot fail to be intelligible and to have their effect upon the most ignorant or most unintelligent person in any mining community. He is dull, indeed, who cannot understand a picture.

Pumping Out an Anthracite Mine

Floating on two rafts on the surface of the slowly receding water of the Schooly mine of the Pennsylvania Coal Co., which has been flooded for the last 15 years, are two 2-stage centrifugal pumps which will lift 2000 gal. of water 375 ft. in one minute. The pumping out of this mine began on Jan. 27 of this year and will take many months to accomplish. The mine is 588 ft. deep, and the water was lowered about 130 ft. in the first two months of work. At 181 ft., the pumpers began removing water from the gangways and chambers as well as the shaft, and the work has proceeded more slowly. At this depth they met the Checker vein. At 311 ft. they will meet the Pittston vein, at 389 ft. the Marcey vein, and at 581 ft., the Red Ash vein.

The method of freeing the mine from water is unique and interesting. The pump, which is driven by a vertical motor placed directly on top of it, is contained in a huge iron tank which forms the float. The buoyancy of the float or raft is sufficient to sustain the weight of the tank, pump and motor, but the tank is suspended by wire ropes which are paid out as the water recedes. These are for use in case of emergency, and have proved a wise precaution. The water is pumped up through a fixed pipe in the shaft, connected to the pump by a flexible rubber hose of large diameter. When the hose, which must stand a pressure of 200 lb. to the square inch, is stretched to its full length, the pumping is stopped and a new length added to the fixed pipe in the shaft.

The estimated amount of water in the mine is 600,000,000 gal., but there is an additional flow of 2000 gal. a minute coming into the mine to be coped with. There are other operations near this flooded mine, separated by barriers, and the Pennsylvania Coal Co. does not want to leave that vast body of water threatening its workmen, whether the operation is profitable or not. The two 10-in. streams which are contending with this huge quantity of water are making slow but steady progress, but the prize to be won is 7,000,000 tons of coal.

In the early days of the enterprise the water in the main shaft got 20 ft. lower than that in the adjacent air shaft, and when the latter finally caved at the sides, or the obstruction which was holding back the water gave way, the pump, motor and men were hurled upward in the main shaft. Fortunately, no harm was done, and the wisdom of having the wire ropes instead of relying exclusively on the buoyancy of the tanks was effectually demonstrated.

Notes on the Mineral Fuel Co.'s Development in Eastern Kentucky

Special Correspondence

SYNOPSIS—Some comments on recent developments in the Elkhorn field of Kentucky, with interesting notes on the preliminary steps. Construction was carried on along unusually elaborate lines and involved heavy initial expenditures.

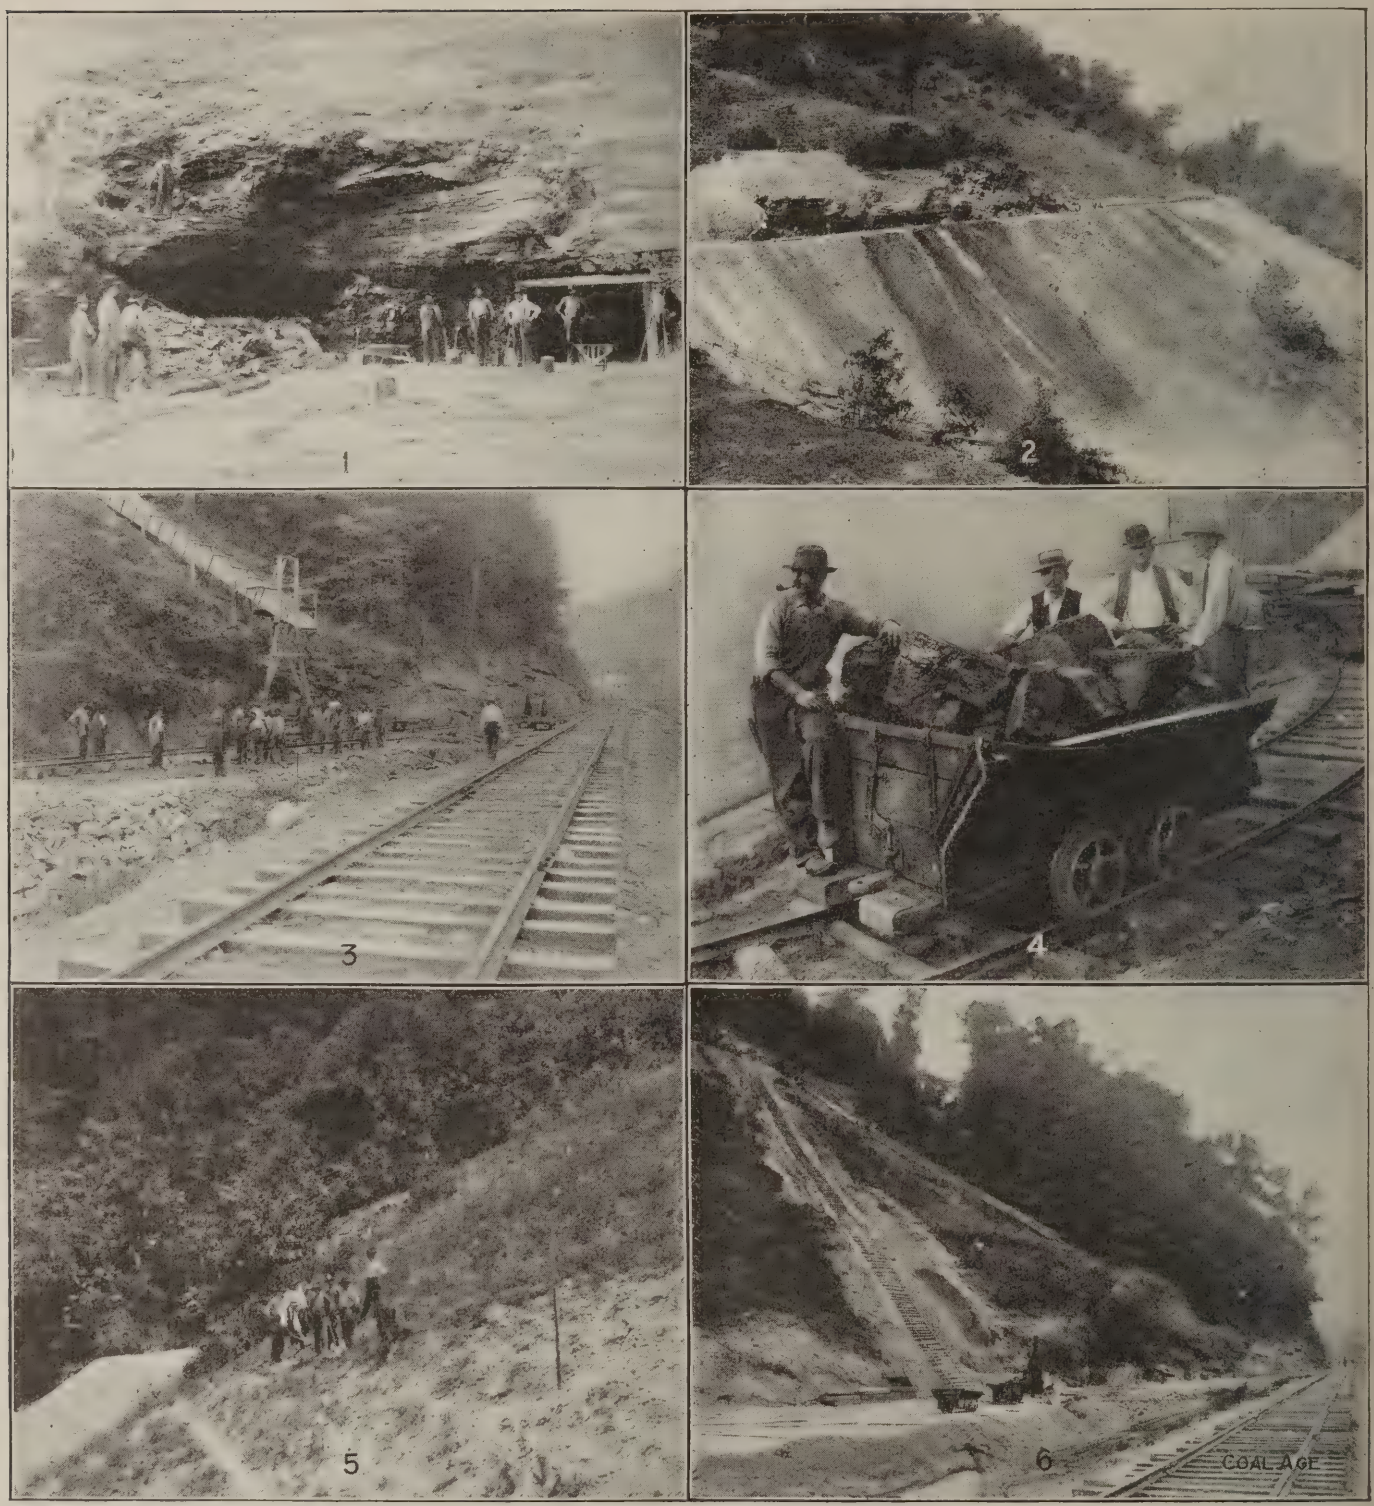
For two years the Elkhorn field, of eastern Kentucky, has been attracting unusual attention throughout the country, and a number of large concerns have come into the territory. Among these is the Mineral Fuel Co., composed largely of Maryland, Pennsylvania and West Virginia capitalists.

Three years ago there was not a railroad line within 50 miles of this field, but at that time the Louisville & Nashville and the Baltimore & Ohio became interested. The former purchased the Lexington & Eastern, extending from Lexington to Jackson, Ky., 94 miles and made immediate plans for construction along the North Fork of the Kentucky River from Jackson to Boone's Fork, a distance of about 103 miles. The Baltimore & Ohio, made arrangements with the Chesapeake & Ohio's Big Sandy Branch and built a line from Shelby Station through a rich field, penetrating the narrow valley of Elkhorn Creek to its headwaters where the Consolidation Coal Co. (after purchasing 100,000 acres of coal) announced a mammoth development program. Today the terminus of the Louisville & Nashville is at the town of McRoberts, built by the Consolidation Coal Co., three miles above Fleming, the center of the operations of this company. The terminus of the Baltimore & Ohio is at Jenkins, four miles away on the Elkhorn Creek side. All this territory is rapidly becoming a great industrial section.

Some time ago the Mineral Fuel Co. was organized after purchasing approximately 10,000 acres of coal on Boone's Fork on the Louisville & Nashville railroad, and started the development of about 5000 acres of this property. Mines 301 and 302 were opened and the first shipments were made in October, 1913. When the construction at Fleming had been completed, the company set to work on a similar town on Pottersfork, called Haymond, in honor of Thomas S. Haymond, the manager of the work. Mines Nos. 303 and 304 were opened here. The Louisville & Nashville then let a contract for the construction of a three mile branch up Pottersfork to Haymond and another mining town on Yount's Fork, called Hemphill, was started. Mines 305 and 306 were opened here. The railroad company then began construction on another three mile branch up Yount's Fork. The output of mine No. 301 at Fleming is being shipped to the markets of the Northwest, while mine No. 302 is shipping to the Central West and South.

Construction of the Towns

About 300 houses have been completed in Fleming, all of which are occupied. An unusually large company store, a substantial, well built office, a municipal building, a hotel, Y. M. C. A., post-office and bank building have been completed, while school and church buildings, hospital, etc., are planned for the immediate future. A water system is now under way, the present supply being obtained from wells.



Miners' Houses at Haymond, Ky.

New Construction Work at Fleming, Ky.

At Haymond, 250 buildings are completed, over 100 of which are occupied, and this will shortly have to be increased by another 100, making a total of 350 for the whole town. It is also probable that another 100 will be necessary. These will include a number of modern business blocks, hotel, office building, machine shops, supply houses, commissary building, etc., while churches and schools are under way and will be built this year.

Hemphill's buildings will consist of 300 houses, about the same as those in Haymond, with a probability of another 150 in the near future. Fleming, according to a late announcement, will have 230 more houses built this year. The Nicola Building Co. of Pittsburgh, Penn., has the unusually large building contract and is prosecuting the work vigorously. They constructed the cities of Jenkins and McRoberts, and are also building Wayland and Weeksbury for the Elkhorn Fuel Co. on Beaver Creek. The Elkhorn company is a subsidiary of the

OPERATIONS OF MINERAL FUEL CO. IN KENTUCKY

1—Opening drifts to mine No. 301. 2—Grading for tramway. 3—Laying steel for mine siding. 4—First mine car loaded at Fleming, Ky. The fellow under the derby who looks so pleased is Tom Haymond. 5—Marking location of mine 301. 6—Constructing incline plane and coal chute.

Mineral Fuel Co., and is developing some 25,000 acres in that section.

The Mineral Fuel Co. is spending thousands of dollars in the interests of its employees. In Fleming a Y. M. C. A. has been completed, while Haymond and Hemphill will each have buildings, fitted up for moving-picture shows. A large central hospital will also be built in Fleming at a considerable cost and much attention is being devoted to improving the local highways.

All the houses are neat, comfortable and convenient, having six and eight rooms, and plastered inside. Plastering is used because it is more cleanly and sanitary and makes a warmer, cleaner house than ceiling. There are grates in every room except the kitchen, which is provided with a brick flue.

The towns are laid off with uniform streets, and there are alleys in the rear of all buildings for convenience in removing refuse, delivering coal, etc. All miners' houses are alike and painted the same, while those of the offi-

TOP-CUTTING MACHINE LEAVING ROOM

cials are different. There are electric lights in every room, the cost of which is 25c. a month, each. The company receives its light and power supply from the large central power station of the Consolidation Coal Co., at Jenkins.

The miners are required to keep their yards clean, and the company hauls away all trash and refuse. They also furnish lime for the closets which are well built and will later be connected with a general sewerage system. At present they have a vault which is emptied every day.

PERMANENT TIPPLE AT MINE NO. 301

The company is determined to run its plants on strictly sanitary lines.

The coal is known as the Elkhorn seam and runs on an average from 8 to 9 ft. thick. At Haymond the seam is 8 ft. and 6 in. thick. The same seam but running as much as 10 ft. thick, is being mined around McRoberts and Jenkins. It is a fine splint coal for domestic use.

It is estimated that 100 years, at least, will be required to exhaust the local supply; thus it can be seen why the Mineral Fuel Co. is putting in such permanent works.

In the mines, cross entries are turned at right angles at intervals of about 400 ft. The entries are driven about 13 ft. wide with an 18-ft. pillar. All entries are driven on sights. Rooms are turned from the cross entries on 35-ft. centers, and the coal mined by the room-and-pillar advancing method, with 25-ft. rooms and 10-ft. pillars.

I wish to extend thanks to General Manager Thomas S. Haymond for the many courtesies which have made possible the preparation of this article.

Output of Anthracite Coal Beats All Records

According to the figures reported to the Topographic and Geologic Survey of Pennsylvania, working in coöperation with the United States Geological Survey, the production of anthracite coal in 1913 was 6,395,825 gross tons in excess of the output of 1912, an increase of 8½ per cent. Part of this increase is undoubtedly due to the closing of the mines in 1912, pending the settlement of the mining scale, yet it is almost 1,000,000 gross tons in excess of the production of 1911, which was the previous high record year. This marked increase again brings up the question of the ultimate maximum output of anthracite coal. While it is well known that the output of bituminous coal doubles each decade, yet the increase in the output of Pennsylvania anthracite shows no such change. This is, at least in great part, due to the fact that anthracite is no longer a manufacturing fuel, but essentially a domestic one. It has been thought by some that the present output will not be greatly increased.

The average selling price at the mines for several years is shown by the following table:

Year	Average Price per Gross Ton
1903	$2.28
1908	2.13
1909	2.06
1910	2.12
1911	2.17
1912	2.36
1913	2.38

The average cost of mining anthracite coal in 1909, as reported by the Census Bureau was $1.93 per ton, exclusive of any charges for depreciation, amortization or interest. On the same basis, with the increase in the mining rate as provided in the agreement of May 20, 1912, the cost would be, according to Mr. E. W. Parker of the United States Geological Survey, $2.07 per ton. This would mean in 1913 that the average selling price was 31c. per gross ton above the mining rate, from which must be deducted the items of depreciation, amortization, interest, and the increase in all items of expense not covered by the agreement of May 20, 1912.

The following table gives the total production in each of the several counties for the years 1912 and 1913:

PRODUCTION IN GROSS TONS OF ANTHRACITE COAL IN 1912 AND 1913 BY COUNTIES

County	1912	1913
Carbon	2,568,305	3,066,314
Columbia	1,079,866	1,078,481
Dauphin	843,841	946,670
Lackawanna	19,283,814	20,240,490
Luzerne	28,289,879	31,539,379
Northumberland	6,020,440	6,261,502
Schuylkill	16,038,507	17,328,666
Sullivan	579,673	.....
Susquehanna and Wayne	532,808	1,123,192
River dredges	85,722	133,986
Total	75,322,855	81,718,680
Total value	$177,622,626	$195,181,127

Up to date the observations carried out in the Hatunhuasi coal region of Peru show the existence of from 35,000,000 to 40,000,000 tons of coal.

A Simple Method of Calculating the Resistance of Bonded Rail Joints

By Vincent Rhea*

SYNOPSIS—Formula and tables are given, by the use of which the resistance of any compressed terminal bond may be ascertained in terms of feet of unbroken rail.

Since many of the mining companies have adopted the compressed terminal type of rail bonds, the question, "What is a standard for a properly bonded rail joint?" has frequently arisen. It is impossible to assume an arbitrary value for a bonded joint, as the length of the bond, the size of the terminals and the weight of the rail in which they are installed, must all be taken into consideration.

It is essential, both in making tests of bond installations, and in estimating new work that the resistance of a bonded joint be known. The following tables and formula will show the electrical mining man just what resistance a well bonded joint will have.

To find the resistance of a rail joint bonded with compressed terminal bonds, the following formula is used:

$$\frac{L \times R + 2 \times CR}{RF} = JR$$

in which

L = Length of bond in inches;
R = Resistance of one inch of cable or strands composing the bond;
CR = Contact resistance of bond terminals;
RF = Resistance of one foot of rail;
JR = Resistance of bonded joint expressed in feet of rail.

As most bond-testing instruments show the resistance of the bonded joint, as compared with the equal resistance of a certain number of feet of unbroken rail, it is more convenient to express this value in such terms than in ohms.

RESISTANCE AND CARRYING CAPACITY OF RAILS

Figures Based on Rails Having a Ratio of 12 to 1, as Compared with Copper, and at 70° F.

Weight, Lb. per Yd.	Resistance, Ohms per Ft.	Carrying Capacity in C.M.
16	0.0000622	169,764
20	0.00004923	212,206
25	0.00003935	265,257
30	0.00003321	318,309
35	0.00002844	371,360
40	0.00002489	424,412
45	0.00002212	477,463
50	0.000019355	530,515
60	0.0000166	636,618

RESISTANCE OF SOLID TERMINALS

Figures Based on a Pressure of 15 Tons per Square Inch of Contact Surface

Diameters	Resistance, Ohms
½"	0.0000008
⅝"	0.00000064
¾"	0.00000053
⅞"	0.00000045
1"	0.0000004

RESISTANCE OF BOND CABLES PER INCH OF CONDUCTOR AT 75° F.

Size	Resistance, Ohms per In.	Capacity in Amperes
1/0	0.00000829	210
2/0	0.00000657	265
3/0	0.00000521	335
4/0	0.00000414	425
250,000 C.M.	0.0000035	500
300,000 C.M.	0.00000275	600
350,000 C.M.	0.0000025	700
400,000 C.M.	0.00000219	800

To illustrate the use of the above formula and tables, assume that a 40-lb. T-rail is to be bonded with compressed terminal flexible cable bonds, 4/0 capacity, ¾-in. terminals, 26 in. in length. The resistance of each joint when the bond has been installed is desired. By referring to the tables, the resistance of one inch of 4/0 cable is found to be 0.00000414 ohm, and the resistance of a 26-in. bond is 26 times 0.00000414, or 0.00010764. The resistance of a ¾-in. terminal is 0.00000053 ohm, and of the two terminals is 0.00000106 ohm; adding the cable resistance and the contact resistance the total ohmic resistance of the installed bond is 0.0001087 ohm. To express this in terms of equivalent rail length, divide by the resistance of one foot of 40-lb. rail, and the resistance of the bonded joint will be found to equal that of 4.2 ft. of unbroken 40-lb. rail.

Splice Bars Do Not Help Much

Trials made with standard bond-testing instruments show that when bonds are installed with reasonable care, the resistance of the joint will very closely approximate this calculated resistance. Abutting rail ends and clean tight splice bars may slightly lower the resistance of the joint, but this is quite negligible and should be disregarded.

Numerous tests made of complete haulage roads, installed under usual mining conditions, show that an average will vary but a fraction of a foot from the calculated resistance.

The use of the tables will not only be found of benefit in learning standards to test individual joints for their efficiency, but they can be used to great advantage in figuring voltage drop on proposed work.

In calculating voltage drop on a circuit composed of a trolley and a rail return, a formula is generally used which is correct for the copper loss, but does not take into consideration the weight of the rail and the size and length of the bonds. By calculating the voltage drop on the trolley and feeders only, and then on the rail, when properly bonded, the exact drop for a given load is secured. This method has been found particularly advantageous where a potential of 250 volts is used and the current transmitted over long distances, as is common with bituminous mines.

For instance, taking the example mentioned above, assume that a road 3000 ft. long is to be bonded, and the actual drop on the return side of the circuit is desired. With 30-ft. rail lengths, there will be 100 joints on one rail, having a total resistance of 420 ft. About 10 per cent. should be added to the joint resistance to take care of short rail lengths and bonding at switches.

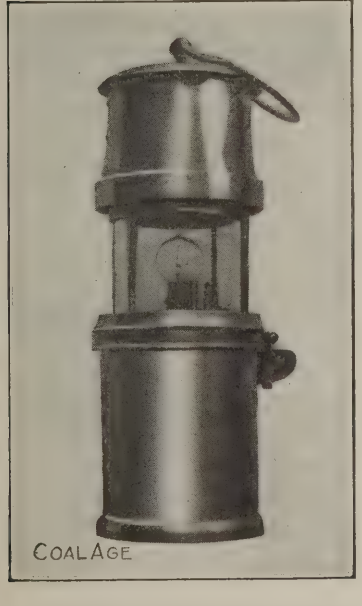
Then the resistance of one rail will be equal to that of 3460 ft. of unbroken rail, or 0.00836394 ohm, or for the two rails in parallel 0.00418197 ohm. The voltage loss on the return side is the load times the resistance, then by calculating the drop on the trolley side, the exact drop on the circuit is easily ascertained.

In the same manner, these tables can be used to test the efficiency of the bonding of an entire haulage road or a certain section. With voltmeters at both ends of a section and an ammeter on a locomotive, the voltage drop

*Scranton, Penn.

at a certain load can be learned. It is a simple matter to calculate the drop on the positive side of the circuit and on the return side, assuming the bonds are in good condition. Any difference found will be an increased joint resistance, and the individual bonds should be tested with a bond tester and the defective ones replaced.

A number of companies have adopted this method, as an entire mine can be gone over on an idle day or night, and the individual joints need only to be tested in those sections which show defective bonding.



Mine operators who are desirous of obtaining efficient and economical results from electrical mining equipment will find it well worth their while to make such tests following them up with any necessary repairs.

One company recently tested in this manner a newly bonded road. The test showed that the joint resistance was 69 per cent. of the total circuit resistance, where it should have been only 8 per cent. Upon making an examination of the road, it was found that the track men had neglected to install bonds at two of the switches.

As their load was heavy, this unnecessary resistance would have cost a considerable sum in a month's time for power, which in this instance was purchased, even though it had not increased, as it undoubtedly would have done.

Combined Electric Lamp and Gas Tester

An underground electrical engineer, Thomas Heaton, of Wigan, Lancashire, England, has invented a miner's electric lamp, in the base of which is an accumulator. The upper part of the lamp consists of a top plate or cap, which screws onto the base. Both the lamp bulb and the gas detector are protected by inclosing them within a glass tube or cylinder. A turning movement given to the lower portion of the lamp switches either the electric bulb or gas detector out of circuit at will.

A Gas-Testing Electric Lamp

The latter consists of a wick placed near a resistance wire or bridge of platinum or nickel-chrome. This is supplied with an inflammable oil or spirit, which is stored in the top plate of the lamp. When the wire or bridge is heated by the passage of a current, the wick ignites and can be used for testing. The lamp top is fitted internally with double-wire gauze cones, one overlying the other.

Advantages

It will be seen that Mr. Heaton's lamp is intended to provide either an electric light for the use of the miner or an oil flame for use as a gas detector, as may be desired. The claims he makes for his lamp are reproduced as follows:

There is no danger of sparking should the lamp be struck by or come into contact with metals, such as picks or spades, rails, nails, etc. There is no danger should miners tamper with the lamp, as immediately they do so the light goes out, owing to the contact being broken. Should the lamp be unlocked and an attempt be made to unscrew it, the light will go out. There is no danger of a defective lamp getting into the mine, because if defective the lamp will not light.

The lamp will withstand any ordinary usage, and indeed may, without danger, be more harshly treated than the ordinary safety lamp. The lamp can be easily and cheaply maintained in good order and repair by the ordinary lamp-room staff. Used for lighting, the construction of the lamp is such that it will not ignite gas within or without. (To use as a gas tester, it is necessary to switch off the electric bulb and rotate the accumulator onto the contacts of the gas tester, which ignites the wick in the recess adapted and arranged for the gas testing only.)

The lamp battery is so constructed as not to be liable to form a short-circuit or to polarize, and as ordinarily tested, the lamp gives a light of 2 cp. throughout a period of 20 hours. The lamp gives a light all around in a horizontal plane. Its weight is only 4 lb.

The construction of the accumulator is such as to prevent escape of the liquid whatever the position of the lamp, though the gas generated by chemical action is allowed to escape freely. The cost and upkeep of the lamp are neither above the general average. The lamp can be manufactured with or without the gas-testing section, as desired.

It is so arranged that changing over from an electric lamp to a gas tester is readily accomplished by means of a loose collar. All the change needed is to rotate the lower portion of the lamp on its base collar, without removing the lamp top or exposing the light in any way. Used as a gas tester, it will detect a cap so as to meet fully the requirements of the British Coal Mines Act, 1911.

Drawbacks

In connection with the last claim, Mr. Heaton explains that in a simple experiment on the surface in coal gas he he got a cap in as low a percentage as 1.5 per cent. Should the claims he makes be substantiated under severe tests below ground, the problem of efficient light for the miner may possibly be solved. However, the dangers of the safety lamp are accentuated rather than reduced, for evidently the miner is expected to relight his oil detector when he desires to test for gas and he may well do so in a dangerous atmosphere. The light moreover is well below the top of the lamp and so not in a good position for observing the roof, which is not true of electric lamps as now offered for sale.

The right way to discover whether your furnace is giving results is to have a gas analyser or a CO_2 recorder and test for carbon dioxide. This test of the gases in a Babcock and Wilcox or Stirling boiler must be made in its various passes and in an ordinary return-tubular boiler must be made in the front or rear and not in the breeching or stack because it is the efficiency of the furnace as a heating agent which is in question and excess air entering beyond the heating surfaces interferes with the draft and does not affect otherwise the heating qualities of the furnace.

The Calamity Trail

By C. W. Crawford*

SYNOPSIS—A somewhat satirical soliloquy on the design and operation of steam engines with particular attention to those of the genus high speed; also a few remarks on the shortcomings of steam boilers, piping and separators and the ignorance and gullibility of coal operators in general.

More reasons than bad design and bad construction may be assigned for the delinquency of steam engines. When an engine looks well and works quietly it goes without comment that it is doing good service. Fashion has much to do with forming such opinion, but everything is sacrificed to quiet running. It doesn't matter that the engine may have 6 per cent. clearance waste, or that it may be using 40 lb. of steam per horsepower per hour; it runs quietly at high speed and is, therefore, considered economical.

Piston speed is only considered in terms of revolutions per minute, without reference to the number of times during that period that the clearance is incurred. If the machine has a shaft governor, so much the better; it is uptodate. Admirers of this class of engines maintain that high compression is no loss; that compression up to initial pressure is all given back in the next stroke. But where does the compression come from?

It's a funny game. Steam hits the piston a clip, knocking it endways. The flywheel gets the spent blow through the crank, meantime the eccentric takes a hand and shuts the steam off. The steam then tries to expand and in doing so knocks the valve open and gets out. Then the flywheel, having a good start, blocks the game at the other end and sets up a back pressure ahead of the piston, which gets another knockdown blow from the steam on top of the already high back pressure, which latter turns state's evidence just as the crank comes over the center. The governor acting as umpire keeps up the continuous vaudeville.

In this continuous scrap the piston is knocked back and forth between two buffers of back pressure, and the useful effect is derived from a little more than half the stroke, aided by the compression that is *given back*. The rest of the stroke is occupied by expansion of short duration, by the exhaust, and largely by compression and back pressure. The economy is found in the advertising matter of the builder.

It is true that economy is considered worth while in some localities, and some really efficient engines are built, but the majority are quite the reverse. It is believed the old fashioned engine of 50 years ago—the common throttling engine with a flyball governor—was just as economical as the present high-speed automatic, if not more so, when equally well made and run at high piston speed. Hoisting engines in coal mines are a fair example of the disregard of economy. These machines have probably as heavy duty as any class of engines in the country. Hoisting three tons at a trip from mines 300 ft. deep, in 7 to 15 sec., requires a strong pull and very quick handling.

*President Crawford & McCrimmon Co., Brazil, Ind.

Output Not Efficiency Is Prime Requisite

To get coal rapidly and cheaply is the ambition of every coal operator. Coal is cheap—at the mines—and a ton or two more or less per day burned under the boilers doesn't count. It is the large output that tells, and everything is made to lean in that direction. Therefore economy of coal or stream is little thought of. Engines are usually worked full stroke—or nearly so.

The improvements demanded are those that increase the output per day, and those that lighten the work of the engineer so that he may hoist more rapidly. Larger engines are being used every year, while old machines are made to do double duty. Automatic cutoffs are offered by builders, but seldom taken.

The mines are mostly shallow, and since the starting must be done at full stroke, there is little time during a hoist for cutoff and expansion. If lack of expansion were the only calamity attending the more aggravated instances, it might be condoned. But, water passing through the cylinders heated nearly to the temperature of the steam not only entails useless duty on the steam generators, but destroys lubrication, wastes the water after it has deposited its content of scale-forming material in the boiler, and discharges a large percentage of the heat derived from the coal into the atmosphere without its having contributed anything to the work in hand.

Practically all boilers send over more or less water in spray mixed with the steam. It sometimes happens in a set of boilers that the cleaning of fires lays off one or more of them at a time, compelling the others to keep up the quota of steam. It is possible at such periods of unusually hard firing for the violently boiling water to be drawn in a mountain of spray toward the outlet opening, and more or less of it to be forced into the pipe line. It is also even possible for water in considerable quantity to be caught occasionally, and when once started in the pipe, this is compelled to go through the cylinders—in the absence of an efficient separator—with what destructive effect every engineer is aware. It is generally not believed that water is thus carried over, but it goes over just the same.

During the old steamboat days, it was a universal custom to use domes, or drums, on all boilers as a preventive of the entraining of water over into the cylinders. These drums were very large—sometimes double drums were used. There was a supposition in those times that in hard firing, as was universal, the water might be drawn in a solid stream through the pipes and cylinders, exhausting the boilers and causing explosions, hence the use of large steam drums 3 ft. or more in diameter, reaching across the battery of boilers.

In these latter times domes are rated as a nuisance and are not furnished by boiler makers, except with a protest. A header line, more or less insufficient, is used instead to connect the boilers, fitted with a slim pipe connection to each unit. It is reasoned the large domes are conducive to condensation and loss of pressure—and are too expensive anyway.

The outlets of boilers have grown so small in recent years that the steam is forced to travel at the rate of

two miles a minute when boilers are pushed to capacity. The standard nozzle opening of a 72-in. by 18-ft. boiler is 6 in. in diameter. Is it worth while to notice that slugs of water are sometimes carried over and engines wrecked?

The calamity that follows the slugging of water through the cylinders is more far-reaching than the mere matter of economy, which is serious enough. Smash-ups are often attributed to any other cause than the right one, and it is generally disputed that water in the cylinder has anything to do with them. But such accidents do occur when it is known the weakest point in the engine, if any can be called weak, has a factor of ultimate strength of 200 times the greatest pressure in the cylinder of steam, not water.

Why Smash-Ups Occur

From whence comes the terrific pressure that breaks bedplates, cranks, crossheads, pistons, and loosens crankpins, cranks, winding drums, etc.? Not from direct steam pressure, but from solid slugs of water carried over from the boilers. It will be noted that when the exhaust is closed near the end of the stroke, the water is trapped and the piston moving toward it. Followed by the piston, which is impelled by the momentum of the 10- or 15-ton winding drum revolving at a speed of 100 r.p.m., the water's only escape is in tilting the valve and being forced back into the steam chest. This occurs at the toggling point of the crank where its force is practically infinite. It will be noted also that while the water *has* an avenue of egress, the concussion comes so suddenly that it hasn't time to escape. Hence a trail of wreckage involving possibly a new engine.

Yet engineers and operators persist in doing the same thing over again. The prime mover in this train of calamity is the boiler maker, who furnishes the cause. The engineer fails to use a large enough header line, and installs an insufficient separator, or none at all, and the operator who is ignorant of it all pays the bills.

Lack of domes or their equivalent on boilers, attenuated steam pipes and the absence of separators of sufficient and efficient capacity is the cause of it all. A separator is not particularly costly. There is but one principle upon which it can be made efficient and that is rarely used. That is by employing gravity as its chief characteristic. The market is full of splash-board separators, which make the users wise until some accident makes them a little wiser. But why depend upon a separator alone? Why not begin at the boiler and separate by a dome or a dry pipe or otherwise—anyway the water is better to be in the boiler than in the engine.

A Mine at the Panama-Pacific Exposition

At the request of various mine operators and the Exposion, the U. S. Bureau of Mines has undertaken to construct, in coöperation with the mining industry and the manufacturers of mining machinery, a mine beneath the floor of the Palace of Mines and Metallurgy at the Panama-Pacific Exposition, San Francisco, next year.

The financial and operative success of the mine is assured through exhibits promised as shown below, whereby typical metal and coal-mining operations will be reproduced by full-size working places, in which mining machinery will be installed and operated. The walls of the mine will be covered with either ore or coal typical of the mine illustrated. Among others, the Copper Queen Consolidated, of Arizona, Bunker Hill-Sullivan Co., of Idaho, Homestake Mining Co., of South Dakota, Goldfield Consolidated Mines Co., of Nevada, Jones and Laughlin Co., of Michigan, Lehigh Coal & Navigation Co., of the anthracite field of Pennsylvania, Pocahontas Fuel Co., of West Virginia, Consolidation Coal Co., of Kentucky, and Pacific Coast Coal Co., of Washington, have each agreed to reproduce one of their working places or stopes and to contribute the sum necessary to the installation and operation. Tentative promises of similar action have been received from the Rock Island Coal Co., Peabody Coal Co. and Pittsburgh Coal Company.

Various mining machinery and appliances have been promised, including a mine cage and cars by the Joshua Hendy Co., a cage, hoist and motor, by the Denver Engineering Works, locomotives by the Westinghouse Electric & Manufacturing Co., pumps by Byron Jackson, air compressor, drills, drill sharpener and winze hoist, by the Compressed Air Machinery Co., drills and coal cutters by the Ingersoll Rand Co. and the Sullivan Machinery Co., lamps by the Justrite Manufacturing Co. and the Koehler Manufacturing Co., enamel signs by Stonehouse Enamel Sign Co. There is little doubt that other necessary machinery and appliances, such as safety lamps, portable electric lamps, fan, mine telephones, mine rescue apparatus, switches, track, etc., will be received as exhibits.

The entrance to the mine will be through the Bureau of Mines space, and visitors will be attracted to it by being given portable mine lamps, and by being lowered in a very slowly moving cage while a panoramic effect of the strata lining a mine shaft will pass by them so rapidly as to produce the illusion of descending to a considerable depth. In case of crowds, these may enter by a slope. Exit will be by a slope into the radium booths of the Bureau of Mines where actual radium examinations will be shown.

There will be a motion-picture room which visitors will pass in going from mine to mine. In it will be shown such great open workings as are not illustrated by the underground mines, such as those of the Utah Copper Co. and those of the Nevada Consolidated Co., at Ely, the iron diggings at Hibbing, Minn., hydraulic gold mining, and the quarrying of building stone.

Twice each day there will be an imaginary explosion or fire in some portion of the mine announced by telephone to the superintendent's office in the Bureau of Mines space on the surface, and rescue men wearing breathing apparatus will enter the mine and bring out supposed victims who will be given first-aid treatment in the surface emergency hospital.

In the Bureau of Mines space on the floor of the main building, there will be, in addition to the radium booths, exhibits of carnotite, pitchblende and other radium ores, their alloys and concentrates, an emergency mine hospital and smoke room for rescue training, exhibits of fuel efficiency, smoke abatement, explosives, mine-welfare work, etc.

The prime purpose of the mines will be that of educating the investing public, stockholders, members of legislatures and the uniformed antagonists of the industry relative to the importance of the mining industry, its extent, variety and the cost of operation.

The Necessary Training of Mine Officials

By P. J. Brennan*

SYNOPSIS—In the past many ignorant and unscrupulous officials have made a reputation for themselves at the expense of their employers by "hogging." The day is probably coming when only men of integrity, who are fitted for their particular work by education or experience can secure or hold a position of trust or responsibility.

The magnitude and importance of the mining industry of West Virginia is sufficient justification for our pausing to consider the qualifications of those on whose shoulders fall the responsible and sometimes onerous duties of supervision and management.

According to the annual report of the Department of Mines for the year ending June 30, 1912, there was mined in the state 59,581,174 long tons of coal. This production found employment for nearly 70,000 persons, and necessitated the investment of a considerable amount of capital. The tonnage, the number of employees and the capital invested have been steadily increasing from year to year, and the high point has not yet been reached.

New mines are being opened, mostly shafts of various depths, and consequently more difficult to be safely worked than the older drift mines, and many companies are remodeling their old plants, tearing out all obsolete equipment, and replacing it with the most modern and efficient machinery obtainable. And all this with a view to improving in the near future upon the continued progress for which the coal industry of the state is already noted; yet withal, there is one extremely important element in the operation of the mine that is being overlooked, and that is, the training and preparation of the men who are to be the official staff, upon whom will depend, to a considerable extent, the safety of those 70,000 or more employees, also, the success of the operation and the security of the capital invested.

It is unreasonable to expect more than a minimum of efficiency from the efforts of any man who is placed in charge of a mine operation, without having at least an elementary training in the art and science of mining.

Many of the ruined mines, with their consequent high cost of production, are due to the mismanagement of officials who had neither the necessary knowledge nor ability to fulfill the duties to which they were appointed. Sad to relate, some such officials have succeeded in building up for themselves reputations as large tonnage getters by surreptitiously hogging and ruining mine after mine.

One such individual once informed the writer that the most successful officials were those who could hog out the largest tonnage and get away before the evil effects of a squeeze and closed air courses began to show. Such men are a menace to the mining profession, and can only be eliminated by a general raising of the standard of competency for all grades of officials, from the fireboss upward.

The Fireboss and His Duties

The fireboss is an important factor in the safety of a mine where methane (CH_4) is given off in any quantity, but his ability to recognize a blue cap on his lamp, as certainly indicative of firedamp, ought not to be a sufficient reason for intrusting to his care the safety of a mine and those employed therein.

He should be able to read and write sufficiently well to permit of his making out an intelligent report of the conditions he has found existing. He should, also, have a good knowledge of the properties of the different gases given off in a mine. He should have a competent understanding of the barometer, thermometer, water-gage and hygrometer, as used in connection with mining. He should not only have a perfect knowledge of the use of a safety lamp, but should know, also, why it is a safety lamp, and what makes it so. The state mine law says, "He shall have a practical knowledge of the subject of ventilation of mines, and the machinery and appliances used for that purpose." Why should he not know, also, something about the theory of ventilation?

The next official above the fireboss is the mine foreman. The mine law of the state describes his duties, so far as complying with the law goes. A knowledge of the mine statutes, as printed in the book, is, I believe, about all that is necessary in order to secure a certificate.

Now, the foreman is a very important factor in the successful operation of a mine. It is he who, more than any other official, influences the length and weight of the payroll. It is he who may pay out considerable sums of money in a year for which the operator may receive little or no return. It is he who, if not "onto his job," pays for work that is unecessary, and leaves work undone that is important. It is he who is responsible for the protection of the life and limb of every man in the mine (and this is where he has his hands on the purse strings of the state through the Compensation Law). It is he who is also responsible for the drainage and ventilation, and the pumps and machinery appertaining thereto. It is he who, through carelessness or want of knowledge, may be the cause of making widows or orphans. It is he who is responsible for the output. It is he who, in his anxiety to secure a large tonnage at a low cost, may unwittingly hog away 40 per cent. of the coal, and lose the other 60 per cent.

In fact, it is the foreman who is responsible for the prevention of every accident or injury to both person and property. It is he who is in absolute control of everybody and every appliance in the mine, and has the power to hire and fire at will.

Anybody outside the mining profession would conclude that the official having so much authority and carrying such heavy responsibilities, must surely be of more than the average intelligence, and of considerable technical knowledge. But, we who are in the business know that he is in some cases a man with little or no education, and without any technical knowledge whatever.

The Qualifications of a Mine Foreman

In the writer's opinion, a mine foreman should have at least five years' practical experience in the mine, one

*Coketon, W. Va.
Note—Paper read before the West Virginia Mining Institute at Cumberland, Md., June 2, 1914.

year of which should be as assistant foreman. He should also have a fair school education and a reasonable amount of technical knowledge. His examination should consist of the following subjects:

1. Reading and writing.
2. Arithmetic, including square root.
3. The mining laws of the state.
4. A knowledge of permissible explosives and shot-firing.
5. Knowledge of the various systems of working.
6. Use of the barometer, thermometer, anemometer, water-gage and hygrometer.
7. The properties of gases met with in the mine, and the ordinary methods of ventilation.
8. Timbering roadways and working places.
9. A practical knowledge of the machinery used for ventilating, pumping, hauling and coal cutting.
10. A knowledge of first-aid to the injured. The writer's experience is that all these subjects are very interesting studies for the practical miner who is ambitious of joining the official rank.

Between the operator and the mine foreman, an official called the superintendent, is usually appointed. His duties are to see that the foreman gets all the necessary supplies for the proper operating of the mine, to assist the foreman in the proper and economical use of material, and by inspections and consultations, advise and assist in the economical management and safety of the mine. At the same time he must not forget to keep both eyes on the cost sheet.

If the superintendent is to give his employer a maximum of efficiency, he should know the mining business from A to Z. He should have such a knowledge of it as can only be obtained by hard work and study. He it is who should be able to advise and direct the foreman in the many complexities that cross his path from day to day, and should be competent to be a leader and not a follower. Yet, many serious and costly errors are made from time to time by superintendents, who are doing their utmost to do right, but fail through lack of knowledge of the business they are trying to run.

An amusing incident occurred some time ago in this state which proved to my satisfaction that technical training was necessary for a superintendent. The principal actor in the incident was the superintendent of a large number of mines. He had never seen a water-gage, and did not understand how it worked. One day, however, the mystery was explained to him, and fully demonstrated by a borrowed water-gage being placed on the door of one of his fan drifts, where the fan was running exhausting. The water-gage registered 2.8 in.

This difference in the level of the water in the two legs of the gage evidently set the worthy gentleman to thinking, for in a few days afterward a quantity of 2-in. pipe was delivered at one of his mines and promptly put together from the fan race to a swag in the air course where a pool of water lay.

Well, I don't suppose that superintendent knows yet why the fan did not pull that water out of the air course. Of course, he lost nothing, but the company paid the bill, as it no doubt has done with many others, for foolish experiments, performed through want of training and knowledge on the part of officials.

The Superintendent's Training

We may differ as to the necessary training for a mine superintendent. The writer, however, believes he should have the following qualifications:

1. He should be at least 25 years of age.
2. He should have had five years of practical experience in a mine, or three years' practical experience and two years at the mining and mechanical section of the State University (or its equivalent), and should be able to pass an examination in the following subjects:
1. Elementary chemistry in all its practical bearings upon the gases in the mine.
2. The use and various types of safety lamps.
3. Coal dust as an explosive agent.
4. Knowledge of permissible explosives and shot firing.
5. Practical and theoretical ventilation.
6. Underground management.
7. Shaft sinking and drift opening.
8. Geology.
9. Mechanical engineering as applied to mining machinery.
10. Practical knowledge of electricity as applied to mine machinery, and a good knowledge of mathematics and surveying.

Most operations with a number of different plants and superintendents, appoint an official as general superintendent, who has control over all superintendents and operations, and usually the chief executive of the operating end. He should be a man possessed of a good sound education, and an abundance of common sense and good judgment. Otherwise, it would be impossible for him to analyze the results of the different superintendents and plants, and classify them according to the conditions prevailing at the different works, it being a well known fact that no two plants are operated under the same conditions. There are from time to time many difficult propositions that are brought before him for discussion and decision, making it necessary that he should have a technical knowledge equal, if not superior, to that of the superintendents under him.

As a rule, the general superintendent is kept with his nose to the grindstone more hours per day than any other official on the job. It is sometimes said of him that the only pleasure he gets, is that derived from drawing his blue pencil across a bunch of requisitions, and imagining what the other fellow feels like when he finds it out.

He should be an excellent judge of character, and capable of getting the best out of the men under him, and sufficiently broad minded to, at times, bear with the other fellow's weaknesses.

He should not discriminate against those under him who don't happen to belong to the same lodge, or sing in the same church choir, or because Mrs. Smith is not on visiting terms with Mrs. Jones. He is the one man from whom all others, from the trapper to the superintendent, expect to receive a fair and square deal.

Two Objections to Standard Raising

In discussing this question of raising the standard of mine officials with mining men who are interested, among other objections, the following two are the most notable:

1. If you raise the standard of qualification, a movement for increase of salaries will inevitably follow.

2. Technical education is impossible for the man who has not the time and the means to allow of his going to the State University.

The first objection is almost too absurd to be taken notice of, as I am confident that such a movement would never be necessary. There would be created an absolutely new type of official, instead of the class who now hold the offices, because there is no one better to replace them, and whose principal interest in the matter is payday.

We would see a more intelligent and able class, a class imbued with ambition, a just pride and determination to excel in the profession they had undertaken to study.

The employer would find a reduction in his bill for supplies, brought about by a more careful use of material and the prevention of waste. Mines would be better kept up, air courses would be kept open, and such men, themselves disciplined, would maintain better discipline in the mines. Consequently, fewer accidents to person and appliances would occur, all of which would tend toward producing an increased tonnage at less cost. The employer would not be slow to notice such improvements, nor would he be likely to allow such men to go long without proper recognition.

As to the second objection, why should it not be possible for working men to get a technical training, such as would fit them for promotion to official life in their calling? This is within the power of the State of West Virginia. Furthermore, it is the duty of the state to give its workers a fair opportunity to acquire a technical education, and improve their position in life and their usefulness to the commonwealth at large. It is true the state provides a university fairly well equipped for teaching mining, and kindred subjects, but the people who require the teaching most are not in a position to avail themselves of this provision.

The state could and should establish a technical-education board, to be appointed by the governor. Such board should be provided with sufficient funds with which to establish technical schools in suitable centers of the mining and other industries, and provide sufficient capable lecturers for teaching weekly evening classes during the winter months. County or local committees could be appointed to supervise the work under the state board.

I imagine someone asking, but where is the money to come from? The state can always find money for any good purpose, and in the matter of technical education, it would be an investment that would return over 100 per cent. interest. Not all men who studied would be found sufficiently competent to fill the posts of their ambition, but all men who studied would be the better therefor, and the state would be so much the richer.

It is more than probable that if our working miners were given a reasonable opportunity for improvement and advancement, they would settle down in the State of West Virginia and cease to be a migratory element.

In conclusion, I desire not to be misunderstood, as I know full well that many men who have been called upon to manage mines in the past were shrewd, fairly intelligent and capable men. What they lacked in technical education, they were compelled, by the sheer force of circumstances, to supply by observation and practical experience. This they often did and did it well.

Extracts from a Superintendent's Diary

We had some women visitors in camp today; a party of social settlement workers from the city. As usual, most of the sarcasm was aimed at the multi-millionaires' representative, the "super." Ordinarily the sarcastic remarks of outsiders are about as amusing to me as feature stories in Sunday papers, describing canary birds as safety lamps, but today I partially lost my temper and as a result, I fear at least one young woman carried away impressions of the camp's superintendent that quite tallied with her previously formed opinion of such monsters.

The party was at my house being entertained by my wife; they had been tramping for an hour or so about our tenements, when my wife sent them an invitation to come over and rest a while on our shaded porch and enjoy such refreshments as our cook could improvise. Being proud of our tenements and especially of the sanitary condition of our camp, as compared to most other camps in our section, I foolishly journeyed over to the house expecting to hear some pleasing remarks about the result of our efforts.

Just after I arrived on the scene and before my wife had an opportunity for introductions, one young lady looking straight at me, but addressing her remarks to my wife, piped out something that meant: Doesn't your conscience trouble you when you look out over the camp and compare the wretched dwellings of the miners to this comfortable home furnished you by the mine owners?

Just what followed won't be recorded in this diary, I might be tempted to repudiate it some day; but now that I've mentioned my residence, in the diary, I can't resist the temptation to record a few random occurrences.

Whenever I am compelled to discharge a married man, his wife and children (and a few of the neighbor's children) proceed to our mansion's back door and my wife is assured that if the family starve, their souls will be on my head. Once I suggested to my wife that if a certain man were allowed to return to work, the effect on our discipline would endanger a thousand men's lives and the responsibility would be on my head without question; she still recalled the discharged miner's wife so vividly that my picture was wasted.

When the love knots of our younger residents become hopelessly entangled, the victims always follow the trail that lends to our back door. Nothing especially terrifying about that, as it is written, but when we consider that our young people are of many nations and religions with various and sundry ideas of morality, it sounds different.

Some of the stories that my wife repeats to me are almost unbelievable, and I am almost persuaded that she doesn't always tell me the worst.

The widows and the orphans—there are always many of them around coal-mining villages; and until our compensation laws become perfected, many of them must suffer grievous wrongs and, in consequence become rebellious. To them our mansion is only too often the visible connection to the iniquitous corporation which has brought on all of their misfortunes and, in consequence, our charities are judged, not by our ability, but by the capitalization of the corporation. It's hard, indeed, to offer assistance beyond your means and receive in response a malediction. And so it goes; but this is enough for today.

What Shall Be Considered Maximum Recovery?

By A. W. Hesse*

SYNOPSIS—The percentage of recovery varies widely in different fields and frequently in the same locality strongly divergent results are obtained. High figures secured in one field may not necessarily be a criterion for another, even though physical conditions may be similar.

The Bureau of Mines informs us that probably one-third of the bituminous coal now worked is left underground by our present methods. In other words, the average recovery in bituminous fields is only about 67 per cent.

What will the next 10, 20 or 50 years show? Surely, if not better by the end of the latter period, there is little hope toward eliminating these losses.

What are the "most modern and approved methods of mining?" Apparently they are like our warships—modern today and obsolete a year hence.

In order to get an idea of what is being accomplished in other fields, inquiries were sent out to different sections of the United States. The results are shown in a condensed form by the accompanying table.

You will note on this table, the wide variation of percentages given for different districts in various states. All are large producers of coal, with one or two exceptions, and employ what are presumed to be modern methods of mining. It is noticeable that the thin seams usually are overlaid with good roof; and the percentage of recovery is high. Also, that but one operator expects the ultimate recovery to fall below his present percentage.

Southern Colorado Secures 80 to 90 per Cent.

In the southern Colorado field, where the roof and bottom conditions are favorable for pillar drawing, no roof coal is left for protection and the recovery is given as 80 to 90 per cent., working on the room-and-pillar system. It is claimed that in the Cañon City district, where the longwall system is used, that 100 per cent. of the seam is recovered. This is in the thinner seam, which measures about 3 feet.

The coal in this section of the country belongs to the Cretaceous series and the intrusion of dikes should affect pillar drawing considerably, inasmuch as they would make more difficult the breaking of the overlying strata.

Rooms in the southern Colorado district are driven 16 to 18 ft. wide on 45-ft. centers, while in the Walsenburg district, where the coal is harder and has less cover, rooms are driven 35 to 40 ft. wide, leaving the same thickness in pillars which are recovered by machine and pick work. Track is laid on each side of the room and frequently one or two cuts are taken off the side of the pillar with a machine before beginning pick work.

The bottom of the Colorado seams is usually slate of a soft character, which heaves when weight is thrown onto the pillars, making it necessary frequently to drive a skip along the pillar in order to reach the back end before beginning to draw it.

There are districts where both roof and bottom conditions are unfavorable and much difficulty is encountered in breaking the overlying strata. In these sections the recovery is estimated to be 60 to 65 per cent.; 15 or 20 per cent. is lost in roof coal because the strata next overlying the coal cannot be propped.

With the conditions just given, and most of the operations advancing under heavier cover, do you believe the present recoveries will be maintained?

Another company, operating in practically the same field, states its recovery runs 75 to 80 per cent. of the entire seam, while a higher ultimate recovery is expected. This firm is now driving room entries to the boundaries and the last rooms are worked first, thus making it possible to draw the pillars on the retreat.

In the Michigan field, especially in the Saginaw district, the coal is in pockets rather than a continuous seam. The basin lies for the most part in a low, flat country, and shafts about 200 ft. deep are necessary to reach the coal. The bed averages about 3 ft., and is of poorer grade than the Ohio and Pennsylvania fuels, so that its market is somewhat limited.

The top in these mines is usually black slate, while one mine has a fireclay roof, making it necessary to leave top coal. Yet rooms are driven 40 ft. wide with track along each rib. The length of the room is 150 ft., as the miner pushes his cars from the working place to the entry. With the conditions just given, the recovery claimed is between 80 and 90 per cent. The 65 per cent. recovery given in the table (Item 4) represents the result of leaving pillars for surface protection within the city limits.

Adverse Public Sentiment Affects Southern Illinois

Going into central Illinois fields, where the No. 6 seam is operated extensively, we learn of adverse public feelings and unsettled industrial and labor conditions, which materially affect the percentage of recovery. Surface costing $100 to $250 per acre costs the operator two or three times these values in cases of subsidences, if the mining rights do not clearly cover the property. Besides these factors, the companies operating in the Glen Carbon, Mt. Olive and Divernon fields, state that owing to thick, soft clay under the coal or great overburden (300 ft. to 400 ft.) that they do not recover more than 50 per cent. In the southern fields better results are claimed, since the cover is about 110 ft. thick and all soft.

The slightly inferior seams of coal above or below the Nos. 5 and 6 seams are now receiving considerable thought as to future values, and for this reason they are trying to prevent roof movements by leaving sufficient pillars.

In the Sherrard field of Illinois, the recovery is reported at 90 per cent. Here the top and bottom are good and conditions propitious for drawing pillars. The seam of coal is only 3 ft. 8 in. thick, with many clay veins run-

*Assistant engineer, Consolidation Coal Co., Fairmont, W. Va.

Note—Read before the West Virginia Mining Institute, Cumberland, Md., June 3, 1914.

ning through it, which evidently must affect recovery to some extent.

An inquiry sent into the southwest section of Pennsylvania shows a recovery of 72.5 per cent. Here, 10 in. of roof coal is allowed to remain on account of drawslate and the operations for the past three years have been under the plant and town.

The bottom in this mine is fireclay of rather soft character. The rooms are driven from both sides of entries on 60-ft. centers and widened to 21 ft., leaving 39-ft. pillars to be drawn by machine and pick work. By this method, the ultimate recovery is expected to show a material increase over that given.

The company reporting from Westmoreland County, Pennsylvania, where conditions seem favorable, both in the steam- and gas-coal fields, shows a recovery of from 82 to 86 per cent. of the entire seam; and expects the ultimate recovery to fall below these figures.

In Somerset County, Pennsylvania, where coals of the Allegheny series are worked, the recovery is given as 94.75 per cent. of the entire seam. Here, excellent roof and bottom conditions prevail, and I understand that all room headings are driven to the limit before any rooms are driven at all. Then, the rooms are started at the rear and pillars drawn as soon as these are finished.

Practically the same conditions exist in the George's Creek field in the Sewickly seam, only the recovery is reported as 97 per cent. In this same field, the results obtained in the "Big Vein" or Pittsburgh seam, show 88 per cent. Considerable propping is necessary, owing to the drawslate and the wild coal just above it. The systems of mining the coal in this field have changed from time to time until now headings are driven 9 ft. wide, rooms only 13 ft. wide and the distance between room centers maintained at 100 ft., thus providing against squeezes. Under this process, 90 per cent. extraction is expected.

Pillars Are Not Drawn in Ohio

In Ohio, as well as some parts of West Virginia, no attempt is made to draw pillars at all. Rooms are driven 25 ft. wide with 8- to 12-ft. pillars between. In one of the largest mines of Belmont County, rooms were driven from both sides of the headings and it was no infrequent occurrence to have a territory squeeze shut, leaving considerable blocks of coal between the ends of unfinished rooms. In this mine, 50 per cent. would approximate the recovery.

In Harrison County, Ohio, it is nearly as bad. The recovery is reported as 70 to 75 per cent., but the same conditions exist in this section as in Belmont County, excepting perhaps the driving of rooms both ways from the same entry. The Ohio Mining Commission found in its recent investigations that 30, 40 and as high as 50 per cent. of coal is being left underground as pillars in that state.

There are mines in West Virginia which show recovery from 85.6 per cent. to 99.8 per cent., the highest percentage resulting from the fact that all the work was in the solid. These figures were presented by W. A. Grady, of the Pocahontas Coal & Coke Co., at the last meeting of this institute at Charleston, W. Va. The average result of the figures presented for 10 mines showed about 92.6 per cent.

The foregoing figures reveal what is possible, at the

TABLE OF PRINCIPAL FACTORS GOVERNING RECOVERY OF COAL IN DIFFERENT DISTRICTS

Item	Operating District and State	Per Cent. of Recovery of Entire Seam	Ultimate Recovery Compared to Present	Period of Operation, Years	Average Height of Seam	Roof Coal Carried	Nature of Top	Nature of Bottom	System of Mining	Are Pillars Drawn	Clay Veins Encountered	Remarks
1	Southern Colorado	80-90	Same	5 to 30	8′ 6″	0 to 24″	Slate	Soft slate	Room and pillar	Yes	Dikes	
2	Colorado (other Districts)	60-65	Same	5 to 30	8′ 6″	18″ to 24″	Very soft	Soft slate	Room and pillar	Yes	None

same time showing what is actually, presumably, being accomplished. Shall we assume that because the United States Coal & Coke Co., at Gary, W. Va., is recovering 95 per cent. and more of the coal in which it is operating, that this should be accomplished in the districts of Colorado, showing only 60 to 65 per cent.?

None of us, I am sure, would accept an average of the percentages here given as a fair maximum, nor even an average of the same field. It is unfair to compare ultimate recovery of mines now drawing to a close with those mines at the best of their production. No doubt, the systems under which they were inaugurated were considered modern, but they would not be considered so now.

From reports sent in, it is apparent that there are five factors limiting the possible recovery in these fields; namely,

1. Mining rights and public feeling.
2. Roof and bottom conditions.
3. Weight and character of overburden.
4. Labor conditions.
5. Market value of the coal.

1. Where the mining rights do not allow breaking of surface, the recovery naturally varies inversely in some ratio to the overlying weight.

2. Where roof and bottom conditions make it necessary to recover as quickly as possible, market conditions will affect recovery; for pillar work of this kind will not wait.

3. Weight and character of overburden require systematic mining and competent supervision.

4. It is a matter of what is next best when unions insist on conditions which increase both cost of operating and loss of coal.

5. The market value of the coal dictates how far any of us can go toward its recovery.

Straight Recovery Figures Are Meaningless

These points are mentioned because we are apt to compare straight figures of recovery without taking into consideration the conditions under which they are derived. The Ohio Mining Commission, for instance, uses the mines and operations at Gary for an example of what Ohio should follow. Conditions, however, are so different in these two localities, that to secure the same results in recovery would require several radical changes. Generally the roof in Ohio is poor, union scales require rooms entirely too wide for economic pillar drawing, the general labor situation is always more or less unsettled and the selling qualities of the coal are inferior to those of the Pocahontas seam at Gary.

There are always other conditions which affect good pillar recovery, three of which were given by H. V. Hesse, in his paper read before this institute at Charleston, W. Va., Dec. 1, 1908; namely: (1) Insufficient or incompetent engineering; (2) incompetent management, and (3) impatience of owners for quick returns.

Maximum recovery in any one mine is hardly to be based on what is being done in some other section or state, or on the average of the same region, or even in adjoining mines. The quality of the coal may affect this. For instance, I have in mind an operation in which at least 18 in. of the top coal is so poor that to mix it with the balance of the product would simply throw the coal from that mine off the market, yet right in the adjoining property the coal is taken on the first mining to the full height of seam.

Suppose that a body of coal was such that the market demanded it only during seasons of scarcity, at other times the mine running one-half or one-third of the time. This mine has a fireclay top, which disintegrates by contact with air, thus making it both dangerous and, likewise, expensive. Owing to the inferior conditions, the management placed here, both outside and inside, is not the highest priced and consequently not the most efficient. The system of mining is that generally followed throughout this particular field. What per cent. of recovery could be considered the maximum? Is an operator required to conserve his commodity at prohibitive costs of production? Must he follow the general system of the region, even though his recovery is much lower than the general average, and his cost of production much higher?

Many mines have advanced a considerable distance in their development, but few are provided with sufficiently large barrier pillars along the main headings to give reserves for the final mining. The most of us know that the extraction of heading stumps on one side and a barrier pillar of 100 or 150 ft. on the other side is a slow process with small output, and I have wondered what effect the recovery of these barrier pillars will have on the ultimate recovery in a good many mines. Personally, I feel that the present high recoveries cannot be maintained to the end. Nature does not yield to us without effort on our part, and our exertions are on the increase while the capacities remain practically the same. There will be a period in the life of many mines when operations must move rapidly to keep down costs of production.

To tell what the maximum recovery should be under modern methods of mining appears premature, but certainly there are many factors to be considered when a question, such as that forming the subject of this paper arises.

Explosion at Hillcrest, Canada

A disastrous explosion occurred in Mine No. 20 of the Hillcrest Collieries Co., Ltd., on June 19. Mine officials say that 236 men had entered the mine on the morning of the explosion, and of this number only 37 survive. The explosion was so severe that it shook the countryside for miles around, demolishing many small buildings. Rescue corps arrived at the mine soon after the accident and engaged in a desperate effort to clear the pit and reach some of the entombed miners at the foot of the shaft. Heavy falls of rock in the shaft rendered the work of the rescuers difficult.

Among the dead is Thomas Quigley, superintendent of the mine. Fire broke out soon after the explosion, rendering almost hopeless the work of rescue. The majority of the miners were foreigners, but a large number were English speaking. Cries for help issued from the shaft immediately after the explosion, but these soon ceased, indicating that the men had succumbed to the gases present in the workings.

The latest authentic report indicates that 191 men have been brought out of the mine dead. This leaves but 8 miners unaccounted for. It is possible that some of the remaining victims were buried beneath tons of rock and their bodies may not be recovered at all. The majority of the bodies recovered were burned beyond recognition. The coroner has adjourned the inquest until early in July. The generally accepted theory is that the disaster was due to an explosion of gas in the lower workings.

C. M. I. of A. Summer Meeting

Special Correspondence

SYNOPSIS—The institute held a short meeting at Monongahela, of which perhaps the most interesting features were the address by the mayor, the paper of William Lauder, the address by A. P. Cameron and the question box.

The summer meeting of the Coal Mining Institute commenced promptly at 10 a.m., June 16, in Eagle Hall, Monongahela, Penn., with Jesse K. Johnston, the president of the institute, in the chair. L. C. Isler, the mayor, made the address of welcome. His remarks were largely reminiscent of the early days of mining in the fourth pool of the Monongahela Valley. The mayor's experience was almost wholly from the workingman's point of view, for after a small explosion in the mine where he was propelling a ventilating machine, he left the mines never to return. Later he worked outside.

The Unfortunate Pioneers of the Fourth Pool

What seemed to have impressed him in those early times was the fact that, just as at present, hardly any of

Where the Institute Convened at Monongahela

the operators made any money, and the men were always pleased when a boat sank or a tipple burned down. The losses of the boss were the joys of his employees. Some of the mine owners, when the consolidation of the coal interests took place, saw a little real money for the first time. The exploitation of their properties profited them far more than operation, as has always been true of the coal business.

J. K. Johnston responded to the welcome, and Henry Louttitt and William Seddon spoke on the early history of the fourth pool and on the development of the Coal Mining Institute of America.

Timbering Papers and Discussions

In the afternoon William Lauder read a paper on "Method of Timbering and Quality of Timber." This paper, which was excellent, was unaccompanied by the necessary illustrations. This made it hard to follow, but it was otherwise a clear presentation of a somewhat well worn subject. William Seddon, of Brownsville, Penn., then read a paper on "Method of Timbering with Reference to Overlying Strata and Geological Formation." This was followed by an address by H. I. Smith, assistant mining engineer, U. S. Bureau of Mines, on "Possible Substitutes for Mine Posts." In the discussion of this paper, W. R. Crane, dean of mining at State College, Henry Louttitt and R. D. Hall took part. The remarks, however, were rather supplementary than critical.

In the evening, H. I. Smith exhibited some slides showing mining conditions, and a discussion took place on the possibility of adding such agglutinants to hydraulic filling as would make it less susceptible to reflushing by water should the breaking of the measures subject the flushed material to erosion; the purpose of such agglutinant material being not to give strength to the aggregate, but to prevent its being washed away when not protected by uncrushed supports. Mr. Smith said that sand under high pressure was rendered almost solid and could be pulled apart only with difficulty, but he was unable to give any information relative to the addition of agglutinating matter, such as iron-bearing clays, etc.

The Last Word in Mining Machinery

Later, S. A. Taylor gave his interesting lecture on the "Advancement of Bituminous Coal Mining during the Last Forty Years," with slide pictures on the screen. Mr. Taylor does not look with scepticism on the many attempts to make coal mining a really mechanical operation. He thinks we shall soon reach the period when coal will be not only undermined but displaced and loaded by machinery. The present tendency seems somewhat unfavorable toward face conveyors and favors cutting the coal and loading it directly into cars without the intervention of shovelers.

On the second day, A. P. Cameron, general superintendent, Westmoreland Coal Co., Irwin, Penn., delivered an interesting address on "Accidents Caused by Machine Mining as against Pick Mining." Reference is made to this in an editorial, and the importance of the matter cannot be over-rated, as legislation ruling that machines be excluded from pillar work nearly passed the State House and Senate.

One law has been prepared excluding electric currents from mines, and the legislators are largely pledged to exclude electric mining machines from pillars and from gaseous workings. The arguments put out by the friends of the latter bill allege that the explosion at the Cincinnati mine originated from a mining machine. Everyone knows, however, that the accident in that colliery has been ascribed by all authorities to an open light, and the statement to the contrary has evidently been coined to suit the argument of those who oppose the electric mining machine.

Employment of Foremen by State

Following Mr. Cameron's paper, W. E. Fohl conducted the question box. The first question was:

Would it be of advantage to the coal-mining industry to have the supervision of the operation of mines, as regards safety, in the hands of officials paid by the state, permitting the owners of the mines to place in control of operation, men who do not have state certificates of competency?

George E. Gay, mining engineer of Uniontown, gave a lengthy review of the subject, and from what we were able to discover, he felt that the certificate of competency was an important safeguard and needed by all the men in authority around mines, and was not demanded from the mine foreman solely because he had to enforce the law and take care of the safety of the miners. Consequently, even if the safety and economic duties of the mine foreman were separated and given to two different men, he did not believe it would be justifiable to permit either man to be uncertificated.

William L. Affelder, general manager of the Bessemer Coke Co., Pittsburgh, Penn., thought that the presence of an officer of the state in the mine at all times would probably cause continual friction. He regarded the question almost as a proposition to have the state operate the mines. On the other hand, R. D. Hall suggested that the proposal on the whole had its merits, as it released the foreman from the necessity of keeping the operator in obedience to the law in cases where the latter was not any too well disposed to follow its requirements.

Foreman While Paid by Operator Enforces State Law

The foreman was now both a servant of the state, enforcing the law, and an employee of the operator. He receives all his emoluments, looks for all his advances in position and derives all the honor he secures from the operator, while he is serving the state. He is thus serving two masters, and in a degree the operator might as well pay the legislators as pay the mine foreman, who is really a deputy of the state.

Any operator who had followed the requirements of a resident inspector would be excused in the eyes of the public for many of the accidents which in mines are unavoidable. The provision would also have the advantage that the state would regulate the number of foremen to meet the duties imposed by the law. Some foremen, under the present ruling, are required to do more than can be done in the time allowed and they seriously neglect their safety duties. Mines which obey the law find it difficult to meet their obligations to the state in face of the competition of their more negligent neighbors.

A. P. Cameron declared that the suggestion that the state pay the local inspectors or mine foremen, or whatever they should be called, made it unlikely that the proposal contained in the question would receive popular favor, seeing that the general tendency was to make every industry shoulder its own burdens.

Coal-Land Values

The next question was:

What is a proper basis of coal-land valuation for purposes of taxation?

It was answered by Dr. W. R. Crane. His reply was at some length, full of valuable material, but withal so carefully guarded that it does not lend itself freely to condensation. W. L. Affelder stated that the real objection was to the method of assessment and not to valuation. If the assessors would only try to evaluate all the properties at their true value, all would be well. The millage would drop so that the burden on all would be equitable. But unfortunately the assessment is arbitrary and depends on the will of the assessor. S. B. Smith said that the duty of the assessor was clear, but he usually violated his sworn oath and did not attempt to ascertain what the property was worth. As every property was assessed below value, it was hard for anyone to make complaint, but the burden fell largely on those whose assessments, while too low, were not nearly so low as those of their neighbors.

The Dime Royalty

R. Dawson Hall took exception to the evaluations based on a dime royalty, as if the value of a property could have any direct relation to a unit of coinage chosen at random. On it, however, had been based a most abstruse valuation scheme, with results which were evidently erroneous, as they did not result in large areas of coal land being sold, at least for purposes of coal mining. He thought the price of coal land in neighboring plots of land the best criterion wherever coal land was actually being sold, though in some places the dearth of lots for sale made such an estimate impossible. As a rule such estimates as were made were as clever and as useful as studies of a possible fourth dimension.

George E. Gay countered by quoting the biblical tithe, and W. E. Fohl even referred to Adam Smith, who said that one-tenth of the cost of the product was a fair, and one-fifth a high royalty. In America 10c. was fair for bituminous coal and 20c. was high, thus justifying Adam Smith. Anyone who would venture to confute such authorities as these two would be guilty of atheism and Anglophobia, so no one tried.

The next question was ill-conceived:

What precautions against individual accidents are most frequently overlooked in bituminous mining practice?

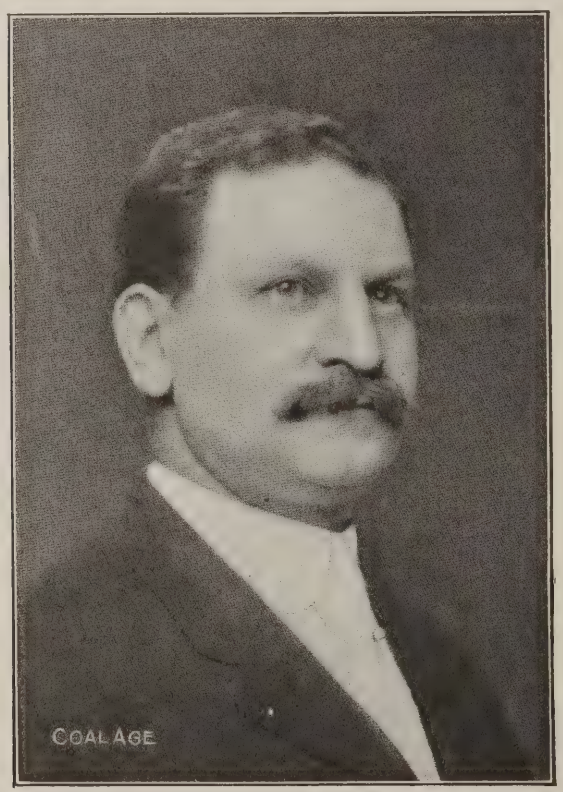
James B. Dunmire, of South Fork, Penn., replied by sending a list of nine important sources of accident. As might be expected, no one wished to give such an overdiscussed subject further consideration, especially along enumeratory lines.

The last question came at the point of adjournment and therefore was not answered:

Would it be of advantage to have the drilling and shooting of coal performed by men in company employ? If this were done, what is the best form of drill? How many drillers would be required to each pair of shotfirers, and, approximately, how many tons of coal would be shot down in an 8-hr. shift in a 5-ft. vein by one drilling and shooting crew?

The attendance at the meeting was at all times disappointing. At no time were 50 present and at the opening meeting only 22. The mine inspectors' meeting the week before was partial cause for this small attendance and the selection of Monongahela as the convening point was also partly responsible. But it would be a folly to overlook the fact that institute activity as a whole has fallen on evil days.

Woodward and Pettebone First-Aid Meet



The united first-aid corps of the Woodward and Pettebone collieries, will hold their annual meet on Saturday, Aug. 15, 1914, at Kingston, Penn. The prizes to be distributed are as follows: First adult team, $50; second, $25; third, $15; and fourth, $10. A safety lamp also goes to the captain of each winning team. The prizes for teams under 17 years of age are: First, $15; second, $10; third, $5.

Who's Who in Coal Mining

William H. Taylor

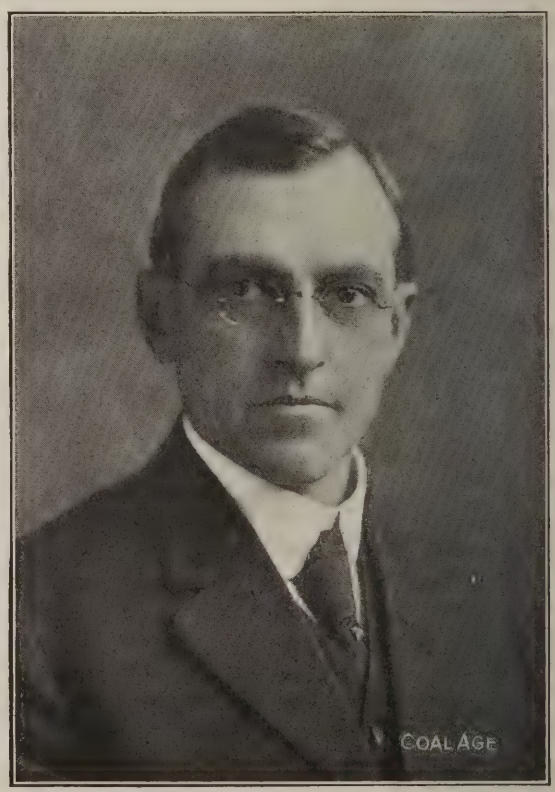
Some of the most successful coal operations in this country are controlled and directed by men whose training has been along commercial rather than mining lines. In fact, the time has arrived when sound business judgment is as necessary to the success of a coal corporation as technical training and experience in engineering. One type of business man who has been successful in the mining fields is represented by William H. Taylor, president of the St. Clair Coal Co., Pottsville, Penn.

Mr. Taylor was born at Paterson, N. J. He spent his early boyhood in Paterson and Allentown, Penn., attending the public schools in both cities. He entered Dickinson Seminary, Carlisle, Penn., but left that institution at the age of 18 and entered upon his business career.

William H. Taylor

He started as a clerk in his father's machinery-supply house, working his way up, so that upon the death of his father he was able to take charge of the business, which is now known as the Scranton Supply & Machinery Co.

Mr. Taylor is also president of the Franklin Coal Co., president of the Goodwin Car Co., of New York, director of the Coal & Iron National Bank, of New York, and a member of the Chamber of Commerce, of New York. He is a member of the Scranton Club and the National Geographical Society.



Mr. and Mrs. Taylor have four children—two daughters and two sons. Mrs. Taylor is a daughter of the late Samuel C. Barker.

Jesse S. Cheyney

The Stonegap Colliery Co., of Glamorgan, Va., has a live wire for vice-president and general superintendent in the person of J. S. Cheyney. Born at Rahway, N. J., in 1873, Mr. Cheyney received his early education in Pennsylvania schools, graduating from the "Friends' Boarding School," at Westtown, Penn., in 1889.

Two years after leaving school he identified himself with Williams, Brown & Earle, a Philadelphia concern dealing in engineering supplies. Then for five years he was employed in the Philadelphia offices of the Reading Coal & Iron Co. After this, he served three years on the engineering corps of the Lehigh Valley Coal Co., at Wilkes-Barre, Penn.

Leaving the anthracite field, Mr. Cheyney served for

Jesse S. Cheyney

nearly two years as engineer with the Fairmont Coal Co., at Enterprise, W. Va. His next job was division engineer for the Pennsylvania Coal & Coke Co., at Cresson, Penn., where he remained five years. Leaving the Pennsylvania company, he became superintendent of mines for the Straight Creek Coal & Coke Co., in Kentucky, and 18 months later he accepted a position as division superintendent for the New River Collieries Co., Eccles, W. Va. Since 1909 he has served in his present position.

The Stonegap company is owned by the Sheffield Coal & Iron Co., of New York and Alabama. The furnaces at Sheffield, Ala., receive their supply of coke from the Glamorgan ovens.

Editorials

Methane in Mine Air

Because the estimation of methane is a chemical operation, mine managers think it is necessary to have a chemist and a laboratory if they would analyze its presence in mine air. As a matter of fact, the work has been so simplified of late that no knowledge of chemistry is needed of the sampler or analyst. There is no reason why a mine foreman who has the simple apparatus outlined by G. A. Burrell, of the Bureau of Mines, and who has received an hour's instruction, should not be able to make a correct analysis with precision.

In fact, real chemists around industrial works are getting somewhat scarce. They are being driven out by the practical men who, working by rule-of-thumb methods, will make simple analyses without demanding a salary such as a chemist should receive. But this work of analyzing methane in mine air is even easier than sulphur determinations of coal, and any operator who will buy the apparatus and send an ordinarily bright man to the laboratory of the Bureau of Mines, can have such analyses made at a purely nominal cost.

It is probably true that large numbers of mines have in the return air a percentage of firedamp which would alarm the operator did he but know it. The extent to which the explosion spread in No. 5 Eccles suggests general methanization rather than the presence of an explosive mixture in one split only. The fact that analyses were never taken makes any such suggestion a mere assumption in which we may not be justified. Certain it is, however, that where the return air is likely to have a higher percentage of methane than is safe, the operator should ardently desire to know it and he is unduly negligent if he does not.

Should Electricity Be Debarred from Mines?

There have always been people who feared the introduction of machinery and there will be such timid creatures till the end of time, and indeed there is something wholesome as well as unfortunate in that fear. We should always inquire carefully whether the introduction of advantages balances their dangers, but in sizing up the situation, we must be careful lest romancing creeps in to add imagination to risk.

The remarks of A. P. Cameron, at the Monongahela meeting of the Coal Mining Institute of America were quite relevant, in view of the great desire on the part of the less intelligent union men to shut out machinery from the mines. The miner wears machine-made clothes, lives in a house of machine-made lumber, uses a machine-made pick and carries a machine-made lamp and hardly touches anything from the cradle in which he reposes when he is born to the coffin in which he reclines in death but what is made by machinery and is cheapened by its use—yet he now tries to declare he will have none of it. Others may labor for him with the utmost efficiency; he himself will work in the old-fashioned way. Cheap clothing, housing, picks, lamps, cradles and coffins for him, but dear coal for all others.

He has not been able to put this in the mining agreement, so he will see if he can insert it in the law, and so he has been inquiring in Pennsylvania of those candidates who are ignorant of mining whether they will help him drive the electric mining machine and even the electric current from the mines. And some have so pledged themselves, for the vote of the miner is the hope of the would-be representative.

Dangerous machinery is to be avoided, but we cannot admit that as a whole, electrical machinery, properly safeguarded, can be so classed. We don't believe Pennsylvania by any means a leader in proper precautions against trolley-wire accidents. We have seen more care in the West and there has been more agitation, at least, in Ohio, and probably the legislation in that state has had beneficial effect. Yet in the bituminous mines of Pennsylvania in 1912 only 5 men in 182,000 were killed by electricity on entries.

Nineteen machine runners and scrapers were killed in the bituminous mines of the state in 1912. Of these only one was removing pillars when killed, yet we are threatened with legislation prohibiting the removing of pillars by machinery. Of course, more machine coal is mined in rooms than in pillars, but nevertheless it remains significant that in 1912, only one man in the bituminous mines of the whole state of Pennsylvania, which produced over 30 per cent. of whole bituminous product of the United States in that year, was killed in the mining of ribs with a machine. On the other hand, 75 men were killed while removing pillars by hand and one man was killed at the deadly operation of going to work.

Four men were killed by the machines themselves. This was due either to carelessness or to inefficiently guarded machines and could well have been avoided. Two were killed by electricity at the face and one by electricity on the entry. Eleven were killed by falls at the face of the workings, showing that pillar drawing is possibly not as risky as work at the face. Until we know just how much coal is mined from pillars and how much from the solid face, the relative danger of face and pillar working will not be known.

At present, statistics as they stand show the face as 11 times more dangerous than the rib, but no one contends that such a calculation is fair, for it is obtained only by overlooking the greater amount of work done by machines at the face, and by disregarding the fact that more careful men usually work on the ribs, that bad ribs are usually withdrawn by hand and that the shortwall machine is largely used in such pillar recovery. However, with such a proportion against the agitators who would legislate to forbid the use of machines in rooms, it is a wonder that such propagandists do not withdraw their case with apologies to the public.

Thomas K. Adams' contention at the banquet of the Coal Mining Institute of America in 1912 was that the increased death rate in the last decade in the Pittsburgh district was due to the introduction of machinery, and this he considered proved by the fact that the mines in 17 counties around central Pennsylvania, which were somewhat backward in their machine development, did not show at the same time nearly such a fatality ratio. As a matter of fact, this was a conclusion which was not justified. Central Pennsylvania has a lower death rate than the Pittsburgh district, not because of her pick mining, but because the mine roof is not so dangerous. The mines in that section are safer now than before for the Kittanning coal with its unexcelled roof is replacing the Freeport coal with its pot holes, kettles, slips, general weakness and vegetal impurities. Besides both sections mine coal largely by machines, though statistics are not available to prove this fact.

The argument and question therefore simmers down to the following: One man was killed in the bituminous mines of Pennsylvania drawing ribs by machinery during 1912. Shall we or shall we not, because of this one fatality, make such rib drawing prohibitory?

The Cause of the Colorado Strike

Repeatedly we have been told that the strike in the southern districts of Colorado was a natural outcome of wrongs which could not be endured and even that war seemed less fearsome to these men than peace under such humiliating conditions.

But the origin of the trouble was not so simple. The strike arose from two causes—the pressure of rival states for the unionization of mines which were seizing their markets, and the need for action to galvanize a fast-dying local labor organization into life. At no time for years had the union been so weak in Colorado as before the strike, nor had it at any time been stronger elsewhere. and so far from the Colorado miners being goaded into rebellion, they had been rendered indifferent to the union and its aims by the considerate action of the operators. Welfare work had led the men to a realization that the companies were better friends of the miner than the labor organization, and the union was losing adherents year by year.

Something had to be done and done soon, or Colorado would soon be nonunion. The only way was to declare a strike at once, for otherwise the number of those who would stand by the union would soon be too small for them to make a successful appeal to those men who prefer peace, but who, being moral cowards, cannot refuse the call even to a quarrel in which they have no faith if an appeal is made to them by any large number of fellow-workers.

So the strike was called much as the Franco-Prussian War was declared. That war occurred only because the Emperor of the French, Napoleon III, knew that his dynasty was threatened by peace, and thought his authority would be strengthened by war. Napoleon and France were ultimately defeated, and so probably the union will be in Colorado. The relative strength of the forces was then and is now being miscalculated. The advocates of discord in Colorado, as in France, will find that unsuccessful war, such as they wage, is disrupting rather than strengthening to their organization. However, we have always felt kindly toward France despite its aggression, nor in this struggle are we opposed to the union as a union, much as we must deplore its actions.

In fact, we doubt whether for many years it will be possible to say a good word for a union in Colorado, because of the large admixture of unnaturalized, unregenerate elements, it must necessarily contain. Even if we overlook the moral weaknesses of the Italian, Balkan and Greek peoples and of the Mexicans in Colorado, we cannot forget that the difficulties involved in instructing them in the proper action will always be insuperable so long as they do not acquire a knowledge of English. Ill-informed men are always irrational and employ unreasonable agents.

The Foreigner

The problem of immigration and its regulation should never be allowed to be forgotten. We are receiving for our "melting pot" such a mass of material that we sometimes wonder whether that vessel is refractory enough to do, without injury, the refining which is demanded of it. In fact, we believe that in places there are many signs of a loss of shape and color where the pot and its contents have slagged into an undesirable compound.

We are not strongly in favor of excluding the immigrant, because we believe that every man has an inherent right to seek work where it can best be obtained and to seek enlightenment and freedom wherever it may be found. This sentiment may appear academic rather than patriotic, but after all we have cast off local pride till our cities and states no longer have walls and tariffs to defend them and perhaps nations will soon be as open to the world at large.

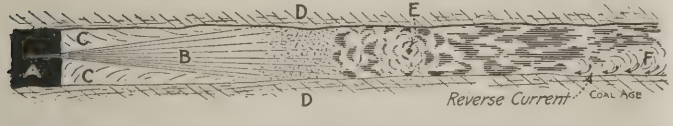
What we do think we have a right to disapprove is the entrance into America of a large body of citizens who never learn the facts of our national life, and who never obtain the power to express themselves in our language.

No man should receive papers as a citizen till he can read, write and talk in English with fluency, far better than can, today, the average non-English foreigner, who has been here 20 years. No foreigner should be allowed to stay here more than 5 years unless he has, in no small measure, made progress in the use of our language, and every alien should be required to spend an hour every week day in attendance at an approved school. With due respect to our courts, we regard this as a more pertinent matter than an inquiry into the political faith of the applicant. We have as little right to demand that a man shall not be a socialist or individualist, as we have to require that he shall not be a Buddhist or a Mohammedan.

For the education suggested, these foreigners should themselves pay, and we are not prepared to think they would be unwilling. Where there are twenty or thirty foreigners in a village, the cost would not be prohibitive, and if any objected, their deportation would be a blessing to the country. We believe that if they were compelled to learn our language, they would be less likely to return to their native lands after we have spent weary years in their remaking.

The foreigner in this country should be able to read our newspapers and books, and to understand orders. He may vote and "raise Columbia" without these qualifications, but he will never make a citizen.

Discussion By Readers



The Air Factor in Mine Explosions

I read with some interest James Ashworth's comments on Mr. Verner's theory relating to the cumulative effects of a coal-dust explosion, COAL AGE, May 2, p. 741; and Mr. Verner's reply to his queries, May 16, p. 818. I do not regard the conditions submitted by Mr. Ashworth as the basis of his interrogations, as in any way detracting from the plausibility of Mr. Verner's theory.

In regard to this theory, if I fully comprehend Mr. Verner's meaning, he advances the idea that the cumulative features of a coal-dust explosion or the ultimate range of its expansive effect is dependent on the presence of sufficient supplies of combustible material at the points where the highest temperatures prevail immediately after the explosive blast that is responsible for the ignition of the dust. I understand that Mr. Verner suggests that these supplies of combustible material are provided largely through the operation of what he has termed very properly "reverse air currents" induced by an alternate compression and expansion of the mine atmosphere.

In contemplating this condition in a mine entry, I have arrived at a fair conception of what might take place as the result of a blown-out shot discharging into the mine atmosphere, in the presence of accumulations of fine coal dust. The following graphic illustration may prove of interest and assist to a better understanding of the action of such reverse currents, setting back toward the center of the disturbance.

In the accompanying figure, the charge exploded is located at *A*. The divergent lines *B* are the projected lines

IDEAL SKETCH, ILLUSTRATING THE INITIATION OF A MINE EXPLOSION

of force resulting from the explosion of the charge. There is produced at once a zone of compression immediately in front of the discharge; and this compressive wave is driven forward at a high velocity, until its expansive force is exhausted or equalized by some opposing force. Where the diverging lines of force strike the sides, roof and floor of the entry, as at *DD*, the accumulated dust is thrown into the atmosphere. At this point, also, the diverging lines are deflected and become more or less parallel to the center line of the entry.

It is important to note, here, that there is a large space at the coal face, marked *CC* in the figure, which does not receive the direct force of the discharge of the exploding shot. The air in this space is naturally drawn into and swept away by the explosive blast, thereby producing more or less of a depression or vacuous condition behind the explosive wave. The reaction that is bound to take place between the zone of compression in front and the zone of depression behind this wave forms an important feature and eventually gives rise to the "reverse current" described by Mr. Verner. I will refer to this again.

What we must consider now are the high temperature and velocity of the expanding gases thus projected into the entry. Under this high temperature, the fine coal dust distills much gas, which at once forms an explosive mixture with the air; and, as a result, there is developed an explosive center at some point marked *E* in the figure, which becomes the initial point of the mine explosion. More heat is developed, and the explosive effects become cumulative as the explosive wave extends more or less throughout the mine, depending on the supply of combustible matter and available oxygen to support the combustion.

I may now refer to the reaction that sets in at some point *F*, where the advance of the explosive wave from *E* becomes more or less exhausted or is equalized by the inflow of air from other parts of the mine. Owing to the difference of temperature between this air and the hot gases, the former flows in toward the center of the disturbance along the floor of the entry, while the expanding gases escape along the roof, as indicated in the figure. This reaction is assisted by the effect of the zone of depression that exists in the rear of the explosive wave and to which I have referred.

I believe the point to be emphasized is that this reverse current sets up a rotation of the air in the entry with the result that more dust is thrown into the atmosphere and burned. Other explosive centers, similar to that at *E*, are formed at different points, as the explosion proceeds throughout the mine. The effect is cumulative, depending on the conditions. An important point to note, in this connection, is that the explosive force at any center, while radiating in all directions from that center, is propagated to a greater distance outby, owing to the confined space inby from this point forming a *cul de sac*.

In my opinion, the reverse current traveling along the floor is determined, in position and intensity, by three factors: (1) the relative gravity of the air and expanding gases; (2) the formation of a zone of depression in the rear of the explosion; (3) the expansive effect and high pressure accompanying the advance of the explosive wave. It is worthy of note that the reverse current will necessarily contain both combustible material and available oxygen, which makes it the important air factor to which Mr. Verner has drawn attention. Such is what I conceive to be his theory, and its plausibility is based upon the fact that it is consistent with known laws.

In reference to Mr. Ashworth's statement that "the speed of the explosive wave (in the cases mentioned) must have been far too great to allow of the operation of a reverse impulse such as Mr. Verner suggests," I believe it is generally conceded that the rapidity of any reaction is in proportion to that of the force acting. I have heard it suggested that the jagged appearance of a

bolt of lightning may be ascribed to the alternate expansion and contraction incident to the electric discharge in the atmosphere. Most miners who have worked with safety lamps have observed the rapid expansion and contraction of the flame of the lamp when a near-by heavy shot was fired. Is it not possible that these observed effects are similar or at least analogous to what takes place in a mine explosion.

I would like to see Mr. Verner's theory fully tried out or tested by the experiments, which he has suggested should be made by the Federal Bureau of Mines. I would also like to see a further study and demonstration to prove or disprove Mr. Ashworth's theory of "detonation," in its relation to mine explosions. I feel convinced that these lines of study would prove valuable.

I. C. PARFITT.

Jerome, Penn.

The "Safety-First" Call

Letter No. 2—I have been much interested in the numerous references made to the "safety-first" idea, in COAL AGE and elsewhere. Some very good suggestions have been offered; but, judging from experience, I feel that we should try and educate all employees in the mine to coöperate with the mine officials in every effort to reduce the number of accidents occurring daily. The sooner we can induce mine employees to take an active part in striving to reduce the number of accidents, the sooner results will be obtained.

We have listened to valuable papers on this subject, at mining-institute meetings and smokers; we have read many articles on the same subject in the leading mining journals. We learn from these that the majority of mine accidents are due to the carelessness of the person himself or that of others.

Granting, as is commonly believed, that our mining laws are second to none, we are driven to the conclusion that these laws are not enforced as they should be. Greater discipline is required in the mine, and the coöperation of every mine worker, in this regard, is necessary in order to reduce the accident list.

Some employees regard it as an imposition by the mine officials when they are asked to take certain precautions to guard against possible danger. Some have even gone so far as to send the mine committee to the foreman to protest against the discipline of a man who has failed to comply with the mine regulations and thereby endangered the lives of his fellow workers.

On the other hand, some mine foremen seem to think that when they have told a man to take the necessary precautions for safety, they have done all that is required of them. They forget that the law commands the mine foreman to direct and see that its several provisions are strictly observed and carried out. Every mine foreman should realize that he is personally responsible for the enforcement of the law in its relation to the mine. The suggestion of patrolling the mine with safety bosses who shall have charge of 20 or 30 men is good; but to get results, discipline must prevail throughout the mine and all employees must coöperate with the officials in charge.

It is necessary that every man in the mine should feel his individual responsibility.

Effect of Short-Circuiting Air on Speed of Fan

It is amusing to observe how many men, today, who are intelligent on most mining matters and hold certificates of competency to act as mine foremen, etc., have not seemingly observed or learned the fact that when the air current in a mine is short-circuited by opening the main or division doors at the bottom of the shaft, between the intake and return airways, the fan runs slower as a result. The greater number of these men, if asked this question, would answer unhesitatingly that the fan would increase its speed when the door was set open. It only goes to prove how we are all prone to jump at conclusions.

However, a wonderful advance is being made in this direction; and none appreciate it more than the readers of COAL AGE. In reading the article on this subject, in the issue of May 23, p. 862, and the answer there given, it occurred to me to ask, if there is not still another factor that enters into the case and causes the slowing down of the fan; or, in other words, makes the engine or motor, as the case may be, display that "tired feeling," notwithstanding the power remains constant.

Assuming the fan is exhausting the air from the mine, and the main doors are set open, so that the mine resistance is cut out, there is a rise of pressure in the fan drift and, as a result, the air enters the fan heavier, bulk for bulk, than when the doors are closed and the air circulates throughout the mine. This is in harmony with the law of the compression of air and gases, owing to an increase of pressure. It seems to me that the fan would naturally run slower when handling heavier air, at least when exhausting.

STRAWBOSS.

Farmington, Ill.

[While the reasoning suggested by correspondent, in reference to the slowing down of the fan when the air is short-circuited and the mine resistance is cut out, seems plausible, it must be remembered that the same conditions do not obtain in the *blowing* as in the *exhausting* system. In the exhaust system of ventilation, it cannot be denied that the air entering the fan is slightly heavier, bulk for bulk, when the air current is short-circuited. In the blowing system, however, the effect of cutting out the mine resistance is to relieve the pressure against which the fan is operating; and, as a result, there would be an expansion of the air, which effect would extend, to some extent, within the fan; and, by the same reasoning, the fan would then be operating upon lighter air and would thus be expected to run faster, if this reasoning were correct.

When it is remembered that the atmospheric pressure (14.7 lb. per sq.in. or 2116.8 lb. per sq.ft., sea level), is very great compared with the usual mine pressure of, say 5 or 10 lb. per sq.ft., and that the increase in density claimed when the fan is exhausting and the air is short-circuited would probably be less than one-half of one per cent., it is evident that this is an inappreciable factor, in the slowing down of the fan. The effective factor, as we previously stated, is found in the great increase in the frictional resistance within the fan, owing to the increased quantity and velocity of air passing. The effect is greatly magnified by the fact that the friction increases with the square of the velocity.—ED.]

The Mine Foreman

Referring to the recent interesting discussion of the many difficulties and discouragements that beset the work of the mine foreman, it occurs to me that these are, for the most part, the lot of every industrial worker. Many an ambitious mine foreman, perhaps possessing greater zeal than knowledge, has been permanently discouraged by the frigid reception accorded his proposed plan or scheme, by a thoughtless superior. To this foreman, the plan presented may appear as the pearl of his intellect; and he suggests its adoption with ardor and in the spirit of loyalty, believing that he has discovered what will revolutionize the work in his charge and double the production of coal or cut in half the cost of operation.

Much to the foreman's chagrin, this child of his brain is ruthlessly murdered by a few brutally frank words from his superior, accompanying the rejection of the plan. Is it any wonder that the foreman's interest wanes and that he sinks back to the level of a mediocre employee, instead of an ambitious striving foreman?

A word of encouragement or explanation, in the rejection of a plan, is seldom a bad investment of one's valuable time. To profitably handle the situation requires both tact and skill on the part of the superior. It is necessary for him to discern the foreman's particular viewpoint; or to discover the angle at which he approached the proposition. In many cases, it will be found that, viewed at that angle, the plan was feasible, and this fact should be conceded; while, at the same time, he should be shown that from another angle, the proposed plan is impracticable.

By such a conference, the foreman's ambition is stimulated. He feels that he was not mistaken, but realizes that he failed to take a large enough view of the matter in question. The result is that his next suggestion will be more carefully considered and will probably contain real worth. By thus training the man to think there is developed a more expert and successful workman.

No one likes to be mistaken in his conclusions. On the other hand, when one is shown that there are conditions that he has not taken into account, his self-confidence is not weakened; and he applies himself with greater vigor to work out a better plan and reach the right solution. We all recognize the fact that, in any complex situation, it is not always possible to consider every condition affecting the solution of a problem. One of the most important elements, in the training of efficient foremen by their superior officers, is to endeavor to view the proposition from their standpoint.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Water gage, $w.g. = \frac{p}{5.2}$ $\quad w.g. = \frac{12}{5.2} = 2.3+$ *in.*

Power on air, $u = ksv^3$ $\quad u = 0.00000002 \times 120{,}000 \times 500^3 = 300{,}000$ *ft.-lb. per min.*

$u = \frac{k\,s\,q^3}{a^3}$ $\quad u = \frac{0.00000002 \times 120{,}000 \times 25{,}000^3}{50^3} = 300{,}000$ *ft.-lb. per min.*

$u = q\,p$ $\quad u = 25{,}000 \times 12 = 300{,}000$ *ft.-lb. per min.*

$u = \left(\frac{q}{X_u}\right)^3$ $\quad u = \left(\frac{25{,}000}{373.4}\right)^3 = 300{,}000$ *ft.-lb. per min.*

$u = p\,a\,v$ $\quad u = 12 \times 50 \times 500 = 300{,}000$ *ft.-lb. per min.*

Horsepower, $H = \frac{u}{33{,}000}$ $\quad u = \frac{300{,}000}{33{,}000} = 9.09$ *hp.*

The square of the pressure potential can always be used instead of the cube of the power potential since these are equal, as expressed by the formula

$$X_p^2 = X_u^3$$

Thus, $X_p = X_u \sqrt{X_u} = 373.45 \sqrt{373.45} = 7217$, *nearly*

Or the pressure potential can be calculated directly, by the following formulas:

Pressure potential, $X_p = q\sqrt{\frac{q}{u}}$ $\quad X_p = 25{,}000\sqrt{\frac{25{,}000}{300{,}000}} = 7217$, *nearly*

$X_p = \frac{q}{\sqrt{p}}$ $\quad X_p = \frac{25{,}000}{\sqrt{12}} = 7217$, *nearly*

TANDEM CIRCULATIONS

To illustrate the formulas that apply to a tandem circulation where a single air current is carried continuously through shafts and airways of different size or cross-section, assume the following mine is passing 30,000 cu.ft. of air in a single undivided current:

1. Downcast shaft,	8 × 12 *ft.*, 600 *ft. deep*
2. Main road,	6 × 10 *ft.*, 1200 *ft. long*
3. Cross-tunnel,	6 × 8 *ft.*, 200 *ft. long*
4. Upper seam,	5 × 14 *ft.*, 2000 *ft. long*
5. Upcast shaft,	10 × 10 *ft.*, 900 *ft. deep*

The sectional areas are 96, 60, 48, 70 and 100 sq.ft.; and the rubbing surfaces, 24,000, 76,800, 11,200, 152,000 and 90,000 sq.ft., respectively.

Part potential values, $\frac{1}{X_u^3} = \frac{s}{a^3}$ $\quad \frac{1}{X_1^3} = \frac{24{,}000}{96^3} = 0.0271$

$\frac{1}{X_2^3} = \frac{76{,}800}{60^3} = 0.3556$

$\frac{1}{X_3^3} = \frac{11{,}200}{48^3} = 0.1013$

The Coal Age Pocket Book

Part potential values, *(Continued)* $\quad \frac{1}{X_4^3} = \frac{152{,}000}{70^3} = 0.4430$

$\frac{1}{X_5^3} = \frac{90{,}000}{100^3} = 0.0900$

Value for entire mine, $\Sigma\left(\frac{1}{X_u^3}\right) = 1.0170$

Mine part potentials, $X_{uo} = \frac{1}{\sqrt[3]{\Sigma\,(1/X_u^3)}} = \frac{1}{\sqrt[3]{1.0170}} = 0.9944$

$X_{po} = \frac{1}{\sqrt{\Sigma\,(1/X_p^2)}} = \frac{1}{\sqrt{1.0170}} = 0.9916$

Pressure, $p = \frac{kQ^2}{X^3_{uo}} = \frac{0.00000002 \times 30{,}000^2}{0.9944^3} = 18.3$ *lb. per sq.ft.*

Water gage, $w.g. = p/5.2 = 18.3 \div 5.2 = 3.5$ *in.*

Power on the air, $U = \frac{kQ^3}{X^3_{uo}} = \frac{0.00000002 \times 30{,}000^3}{0.9944^3} = 549{,}000$ *ft.-lb. per min.*

Horsepower, $H = \frac{U}{33{,}000} = \frac{549{,}000}{33{,}000} = 16.6$ *hp.*

SPLIT CIRCULATIONS

(Natural Division)

Equal Splits—When an air current divides naturally between two or more equal splits, the calculation of the mine potentials, velocity, pressure, power, etc., is the same as for a single undivided current, except that the sectional area (a) of the airways must be multiplied by the number of splits (n) to obtain the total **area of passage** (na).

To illustrate the application of the formulas in this case, assume an air current of 60,000 cu.ft. of air is circulated in three equal splits, the size and total length of the airways, including the returns, being 5x8 ft. and 10,000 ft. long.

Velocity, $v = \frac{Q}{na} = \frac{60{,}000}{3\,(5 \times 8)} = 500$ *ft. per min.*

Mine part potentials, $X_u = \frac{na}{\sqrt[3]{s}} = \frac{3\,(5 \times 8)}{\sqrt[3]{260{,}000}} = 1.880$

$X_p = na\sqrt{\frac{na}{s}} = 120\sqrt{\frac{120}{260{,}000}} = 2.578$

Pressure, $p = \frac{kQ^2}{X_p^3} = \frac{0.00000002 \times 60{,}000^2}{2.578^3} = 10.83$ *lb. per sq.ft.*

Water gage, $w.g. = p/5.2 = 10.83 \div 5.2 = 2.08$ *in.*

Power on the air, $U = \frac{kQ^3}{X_u^3} = \frac{0.00000002 \times 60{,}000^3}{1.88^3} = 650{,}000$ *ft.-lb. per min.*

Horsepower, $H = \frac{U}{33{,}000} = \frac{650{,}000}{33{,}000} = 19.7$ *hp.*

Inquiries of General Interest

Problems in Rescue Apparatus

For some time past, I have been studying several problems that have presented themselves during a course of training with rescue apparatus. While some of these have been solved by a longer and more intimate acquaintance with the apparatus and a better knowledge of the subject, there are some that still remain unexplained. I believe that many members of rescue corps have been or are confronted with the same problems, and, for the benefit of such as well as myself, I desire to present the following question for solution. I know of no better medium for doing this than the columns of COAL AGE.

In the description of many types of breathing apparatus used in mine-rescue work, it is stated that 2 liters of oxygen per min., or 120 liters per hour, are supplied to the wearer, by the oxygen cylinder of the apparatus. It is further stated that the capacity of the machine to absorb carbon dioxide (CO_2) is 50 liters per hr.

Now, the reaction that takes place in the formation of carbon dioxide by the combustion of carbon in oxygen is represented by the following simple equation. It is not necessary, in this case, to consider the nitrogen of the air, for the reason that little if any nitrogen enters the lungs while the breathing apparatus is being worn, assuming the oxygen contained in the cylinder is pure and there are no air leaks in the apparatus; although some assert that there is generally a small percentage of nitrogen mixed with the oxygen in the tanks supplied by many manufacturers of this gas. The reaction in oxygen is as follows:

$$C + O_2 = CO_2$$

This equation shows that for every volume of oxygen consumed there is a corresponding volume of carbon dioxide produced. If, as stated above, the capacity of the apparatus is sufficient to absorb only 50 liters of carbon dioxide per hour, and this represents a consumption of an equal volume (50 liters) of oxygen, there are still 120 — 50 = 70 liters of oxygen unaccounted for.

It is true that moisture or water (H_2O) is absorbed by the caustic potash, supplied with each apparatus for this purpose. But, I would like to ask, is it possible that the water formed in breathing absorbs so large a portion of the oxygen? In other words, is it possible that 70 liters of the oxygen go to form water, while only 50 liters per hr. are concerned in the combustion of carbon, to form carbon dioxide?

I understand that whenever the excess valve is working on the apparatus, both oxygen and nitrogen are given off at the valve; and, as the source of nitrogen, in the working of the apparatus, is extremely limited, the use of the excess valve can hardly be supposed to be necessary to eliminate this nitrogen from the apparatus. Is it a fact, then, that there is a loss of oxygen through the excess valve; or is practically all of the oxygen supplied by the oxygen cylinder consumed in the reactions due to breathing? What proportion of the oxygen in the oxygen cylinder goes to form carbon dioxide and how much of it is consumed in forming the moisture produced in breathing; and are there other compounds formed?

I would like to see an answer to these questions in COAL AGE. Perhaps some of our readers with a knowledge of physiology can explain this matter, by stating exactly what takes place. The subject of mine-rescue apparatus is too serious a one to be left wholly to the manufacturers of any particular type of apparatus.

W. H. MOORE.

Nanaimo, B. C., Canada.

It is well nigh impossible to state exactly the reactions that take place between the hydrocarbons, in the building up of the tissues of the body through the supply of oxygen to the lungs. Correspondent is quite right in the suggestion he makes that other compounds take part in the reaction.

It is well to note that in the formation of water vapor (H_2O), each volume of oxygen consumed takes up twice its volume of hydrogen, and there are formed two volumes of water vapor. Assuming, then, that of the 120 liters of oxygen per hr. supplied by the apparatus, 50 liters go to form the 50 liters of carbon dioxide that are absorbed by the caustic potash per hr., the remaining 70 liters of oxygen per hr. must combine with the hydrogen of the hydrocarbons of the body. These hydrocarbons are numerous and their constitution is often very complex. The fatty substances of the body are ethereal salts formed by the action of acids upon an alcohol (glycerin). The principal acids taking part in this reaction are three in number: Palmitic, stearic and oleic acid. Their formulas are very complex, as will be seen from the following:

Glycerin, $C_3H_8O_2$
Palmitic acid, $C_{16}H_{32}O_2$
Stearic acid, $C_{18}H_{36}O_2$
Oleic acid, $C_{18}H_{34}O_2$

It is evident, from the complexity of these formulas, that it would be practically impossible to forecast the reactions that take place and which result in the formation of carbon dioxide and water vapor. It is evident that a large amount of oxygen is derived from the hydrocarbon acids; and, in the breaking down of these complex molecules, much of the water vapor is formed directly from the hydrogen and oxygen in the molecule.

We are glad to have these questions brought up by correspondents, as they not only show that the subject is being carefully studied by those who are training for rescue work, but the questions stimulate further study on the part of those whose duty it is to investigate closely all the conditions surrounding the use of the apparatus and the reactions taking place therein. By this means only, is it possible to arrive at an intelligent solution of the problems presented, and to obtain the highest efficiency and safety in the use of the means employed. We shall be glad to have our readers take up this matter further, telling of the difficulties they have experienced in the use of breathing apparatus and the means and methods they have adopted to avoid them.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—Where a seam cuts a fault, the vertical rise is found to be 60 ft.; and the seam beyond the fault is discovered to have a dip of 4 in. to the yard. It is desired to calculate the length of a drift rising 1½ in. to the yard that will cut the seam beyond the fault.

Ans.—Since the seam dips 4 in. per yd., and the drift rises 1½ in. per yd., beyond the fault, the two will approach each other at the rate of 4 + 1.5 = 5.5 in. per yd. The total vertical rise at the fault being 60 × 12 = 720 in., the length of the drift from the fault to its intersection with the seam is 3(720 ÷ 5.5) = 392.7 ft.

Ques.—The estimated volume of gas filling the head of an entry is 25,073 cu.ft. It is desired to know how this volume of gas will be affected when the barometer falls from 30.7 to 29.9 in.

Ans.—Assuming that the temperature remains constant, the volume of air or gas expands in proportion to the fall of pressure. In other words, the volume ratio is equal to the inverse-pressure ratio or the inverse-barometer ratio. Therefore, calling the expanded volume of the gas, due to the fall of the barometer, x,

$$\frac{x}{25{,}073} = \frac{30.7}{29.9}$$

$$x = \frac{30.7}{29.9} \times 25{,}073 = 25{,}743 \text{ cu.ft.}$$

The quantity of gas given off or expanded on the entry, in this case, is 25,743 — 25,073 = 670 cu.ft.

Ques.—A careful test made in the upcast shaft shows the air current to be a 2.5 per cent. mixture of air and marsh gas (CH_4); if the quantity of air passing into the mine is 50,000 cu.ft. per min., how many cubic feet of marsh gas does the upcast current contain?

Ans.—If the volume of gas in the upcast current is 2.5 per cent., the percentage of air in the current is 100 — 2.5 = 97.5 per cent. Therefore, if 50,000 cu.ft. is 97.5 per cent., the total volume of the return current (air and gas) is 50,000 ÷ 0.975 = 51,282+ cu.ft., and the volume of gas present is, then, 51,282 — 50,000 = 1282 cu.ft. per min.

Ques.—If 20,000 cu.ft. of air is passing through a mine per minute, what amount of marsh gas (CH_4) must be taken up by the air current, in order to produce a 3-per-cent. mixture in the return airway?

Ans.—The air in the return current, in this case, forms 100 — 3 = 97 per cent. of the mixture. Therefore, if 20,000 cu.ft. is 97 per cent., the entire volume of the mixture is 20,000 ÷ 0.97 = 20,618+ cu.ft. per min. The volume of gas absorbed by the air current is, then, 20,618 — 20,000 = 618 cu.ft. per min.

Ques.—State how you would develop, arrange, equip, officer and manage a gaseous and dusty mine, to insure freedom from accumulations of gas and dust and the dangers incident thereto, keeping in view safety and economy.

Ans.—The development, arrangement and equipment of any mine must depend on a large number of conditions, which it is impracticable to assume. In a gaseous and dusty mine, the mine foreman must employ a sufficient number of competent assistants to enable the thorough inspection of every working place at frequent intervals throughout each working day. The men making this inspection must be competent to give the necessary instructions to the miners and to supervise their work in such a manner as to avoid the occurrence of accidents due to unsafe conditions existing in the mine, with respect to timbering, mining, blasting and loading coal, and the proper ventilation of the entire working face. To insure the thorough inspection of each place and to reduce the number of accidents, each assistant to the mine foreman should have charge of only such extent of territory as will enable him to thoroughly supervise every detail of the work and to see that the mining law and the mine regulations are strictly carried out. The largest economy is is insured by the greatest safety in mine operations. All fine coal and slack produced in mining must be loaded out and dust-tight cars must be used.

Ques.—What conditions are required for the successful operation of a siphon?

Ans.—1. All joints in the pipe line must be air-tight. 2. The suction end of the pipe must be sufficiently submerged in the basin to prevent the entry of air into the pipe. In most cases, it is necessary, also, for the discharge end of the pipe to be submerged, although when the pipe is running full, this is not essential. 3. The vertical lift on the suction end of the siphon should not much exceed 75 or 80 per cent. of the height of water column the atmosphere will support. 4. Where the fall of the discharge end of the siphon exceeds the height of water column supported by atmospheric pressure, it is necessary to so proportion the diameters of the discharge and suction ends, that the flow of water from the summit to the discharge under gravity, will not exceed the flow from the supply basin to the summit under atmospheric pressure. When these conditions are fulfilled, it is unnecessary to throttle the discharge of the siphon to prevent the pipe from emptying itself. 5. There is frequently a tendency of the air contained in the water to accumulate at the summit of the pipe, especially if the pipe is not running full. It is then necessary to arrange an air-trap at the summit to draw off this air as it accumulates.

Ques.—How much greater load will a crossbar 8 in. wide and 12 in. in depth, 8 ft. long, sustain than one of the same width and length but 10 in. in depth?

Ans.—For rectangular beams, the maximum possible load varies as the square of the depth of the beam; in other words, the ratio of the load supported varies as the square of the depth ratio. Therefore, for the same width of beam and length of span, a beam 10 in. in depth will support $(\frac{10}{8})^2 = (\frac{5}{4})^2 = \frac{25}{16} = 1\frac{9}{16}$ times the load that a beam 8 in. in depth will support.

Coal and Coke News

Washington, D. C.

Independent coal mine operators in Colorado have made it known that they would issue from time to time statements concerning the situation in the coal mining section of that state in order that there may be no misunderstanding on the part of the public, and no tendency to regard the issue as confined entirely to the Colorado Fuel & Iron Co. In their first official statement the independent operators including about a dozen in all, take sharp issue with the statements that have been disseminated by the United Mine Workers and assert that the only issue at stake is the question of law and order and the right of individuals to work as they find opportunity therefor. In summarizing their position the independent mine owners say:

There are today employed by the owners of coal mines in this state more than 10,000 men. They and their wives and children live in villages many of which have sustained the rifle fire of about 1500 members of the United Mine Workers of America.

We cannot remove our mines to other places, and we will not, unless forced to do so, close them at the behest of a comparatively few members of a lawless organization and set adrift the loyal employees now upon our payrolls.

If the 2000 members of the organization now militant in this state do not care to work in our mines, it is their privilege to decline to do so and go elsewhere into fields where there are conditions more to their liking; and the officers of the organization to which they belong will once and for all settle the unrest which prevails here if they will expend some small portion of their funds to remove their dissatisfied members from this field instead of further increasing their lavish expenditure in the promotion of strife and bloodshed.

The issue in Colorado has ceased to be, if it ever was, one between capital and labor. In our judgment no question of the rights of organized labor is now involved.

By the use of the vicious checkoff system, the leaders of the United Mine Workers of America have coerced thousands of industrious and law-abiding citizens into joining their organization, and these leaders, by precept and example, have converted these men into enemies of organized government.

This organization, by force of numbers, by its control of labor, and by virtue of the millions of dollars forcibly collected from its members, has become so powerful that its leaders are now defying organized society to thwart its plan, to rule or ruin.

By their criminal acts the leaders of the United Mine Workers of America have forfeited any claim that organization may ever have had to be considered a labor union, and have foreclosed any right it may ever have possessed as a pretended labor union, to demand that we have business dealings with it.

There has been great misunderstanding in Congress with reference to the actual position assumed by the operators as well as with reference to the Colorado situation in general, and it is believed that the statements which the operators are planning to issue will prove of considerable service in clarifying the minds of many legislators.

Oil Land Controversy Settled

The long contested issue between the transcontinental railroads and the government with reference to oil lands was settled by the Supreme Court in a decision handed down on June 22 in which the view was taken that patents held by the transcontinental railroads could not be set aside by other claimants merely because of their mineral value but could only be altered through a direct attack by the government if at all while the view was taken that the limitation of the time at which the government could take exception to the patent was in the 1900 or 1901.

In handing down a decision in the case, Justice Vandervanter expressed the opinion that in all previous cases of the same kind the Court had held that where law requires that only mineral or homestead lands are to be granted by the land officials such officials must do their full duty by ascertaining whether the land granted came within the law at the time and could not do it by inserting the provision that if the land should later prove not to be within the law the title should not be transferred.

This was practically the attitude taken by the attorneys for the roads, they having urged that it was too late now to introduce testimony as to the character of the lands when as a matter of fact that character was passed upon at the time when the grants were actually made.

The decision is expected to dispose of the controversy with reference to the large volume of oil lands said to be worth $700,000,000 which have been held by the roads but whose title has been contested by various persons on the ground that the finding of oil made the lands mineral in their nature, and hence not properly patented at the time the railroads took title to them. The roads have claimed that the oil deposits did not constitute the lands "mineral" lands and further alleged that in any event the title that they had acquired could not be attacked. In a statement immediately given out on behalf of the Southern Pacific Ry. as soon as the decision was rendered the following assertions were made:

The suit decided by the Supreme Court, today, involved the validity of patents issued to the Southern Pacific under a certain land grant or grants from the United States Government. It was claimed that the discovery of oil on the lands covered by the patents voided such patents and put an end to the Southern Pacific's title to the lands. The main grounds for this contention were:

1. That oil was a mineral;
2. That the patents contained a reservation that they should not cover mineral lands;
3. That by accepting patents with such mineral reservation clause therein the Southern Pacific was stopped from questioning the validity or effect of such reservation.

The Supreme Court has decided that the mineral reservations of our patents are void; that the Secretary of the Interior had no right to insert the same; and that the railroad company was not responsible for the presence of such reservations in the patents, and was, therefore, not bound by them. The Court further declared that it was the duty of the Secretary of the Interior to investigate and come to a conclusion as to whether the lands to which patents were applied for were mineral, and that, having reached a conclusion, it was the duty of the Government to issue a patent or to refuse to issue a patent.

Having issued the patent in question, the Court held that, in the absence of fraud, the patents did not become void by reason of the subsequent discovery of minerals on the lands.

HARRISBURG, PENN.

A decision of far-reaching importance in the anthracite coal regions was made by Judge P. A. O'Boyle of Luzerne County, on June 18, when he announced that he would grant the preliminary injunction asked for by the residents of Plymouth against the Plymouth Coal Co. to restrain that corporation from continuing operations under the streets of the town. The question of granting this injunction has been up before the court for over three weeks and there have been arguments on the matter continually for this time.

The decision of the Court is along the lines of the provisions contained in the Davis mine cave bill passed by the last legislature which made it unlawful for any coal corporation to remove the support of a public thoroughfare. Actions similar to the one that has been heard during the past several weeks have been started by property owners in Lackawanna and other counties in the hard-coal regions.

The preliminary injunction will become effective as soon as the borough has filed a bond in the sum of $10,000. The injunction will be argued before the court sitting en banc on June 29. The bond to be furnished by the borough of Plymouth is to protect the coal company from damages. An area of virgin coal in the Lance vein is practically the only portion of the mine in which operations will be possible in the event that the final decree is granted.

This question is one of great importance to every anthracite community. If the coal company can be prohibited from mining under the highways and public buildings because of the danger of surface settling, a great deal of adjoining property will also be protected because of the danger of lateral sliding from under the streets and public buildings.

If the rights of the mining companies are paramount to the welfare of the public, because of the money they have paid for the coal and the contracts they have entered into then the public can have no relief. If the safety of the thoroughfare and the public buildings and the pipes of public service corporations can be secured notwithstanding the losses which the coal companies would incur by a suspension of operations, then the public interests can be safeguarded in part at least. The final decision will have a most important bearing upon the whole mine-cave problem.

PENNSYLVANIA

Anthracite

Wilkes-Barre—Five hundred employees at the Maxwell colliery of the Lehigh & Wilkes Barre Coal Co. went on strike recently, because a driver boy was discharged for killing a mine mule. The company officials claim the boy was negligent.

Deductions granted the Pennsylvania, Delaware & Hudson and the Hillside Coal & Iron companies for coal mined during the year, 1913, have made a total decrease in the county valuation for 1914 of over one million dollars. Next year all municipalities underlaid with coal will suffer great reductions as many large companies will be allowed for the coal mined during two years. While the values of surface property and buildings are constantly increasing, that of coal will decrease from year to year. This will soon be keenly felt in many municipalities.

The Board of Examiners for mine inspectors in Luzerne and Carbon Counties have announced that they will hold examinations for certificates as mine inspectors in the high-school building at Wilkes-Barre on July 6, 7 and 8, 1914.

There has been some question as to whether or not an examination would be held this year. Chief James E. Roderick, of the State Department of Mines, is of the opinion that no examination is necessary on account of the fact that there is no vacancy occurring this year in the office of inspector in the counties named. The court and the examiners, however, believe that an examination should be held in order to qualify candidates for any vacancy that may happen, and it has been decided to hold an examination at the time and place stated above.

Port Griffith—Walking into a pocket of gas with a naked lamp in the old workings of the Red Ash vein of the Hoyt shaft, Pennsylvania Coal Co., George Bradley, fireboss, and William Jefferey, mine foreman, were seriously burned on June 19. The accident happened as the two men were descending a pitch about 1000 ft. from the foot of the shaft. Bradley was walking ahead and caught the force of the explosion of the unexpected pocket of gas.

Scranton—With the leasing from the Scranton Coal Co. by the East Mountain Coal Co. of a tract of land on the East Mountain near No. 5, where the old Quinn breaker was located, plans for the erection of a modern breaker which will give employment to between 75 and 100 men are now complete.

The officers of the East Mountain Coal Co. are J. W. Sandercock, of Lake Ariel; W. Y. Moffatt, of Dunmore, and Alfred Harven, of Scranton.

Archbald—The Archbald Coal Co., on June 16, posted signs at the pay office stating that any man who did not report for work the next day would be discharged instantly. Every man was back on the job. As a result of the order hundreds of dollars have been kept from the saloons, it is said. For years it has been customary for miners and others employed around the collieries who drank intoxicants to take a day or two off to "sober up" after pay day. There will be no more "sobering" sessions at this colliery, they say.

Mt. Carmel—The Susquehanna Coal Co. following an inquiry into several accidents at the mines between here and Shamokin, discharged six employees on June 18, whe were held responsible. It was said they were under the influence of liquor. Notice was served that hereafter all men found intoxicated in and around the workings would be discharged.

Mahanoy City—Joseph Witamanski, John Montsavage and Jenkin Jarlavis, of this place, on June 16, pleaded guilty to perjury in efforts to fraudulently obtain miners' certificates and were sent to jail for nine months.

Bituminous

Johnstown—Two men were killed and eight injured as the result of a cave-in in the Quemahoning mine on June 20. All of the injured were Hungarians. The Quemahoning Coal Co. mined a special grade of bituminous coal used largely in the United States Navy.

Kittanning—The location of at least one of the several new mines, which the Shawmut R.R. will open between Kittanning and Freeport has been selected. This will be at Logansport where several openings will be made. Other openings have been decided upon, but the exact place where these will be made has not been fixed. It is said that the new Shawmut extension will be completed to Freeport, and coal will be shipped from several of the proposed new mines by the time snow flies.

WEST VIRGINIA

Charleston—The recommendations of the Conciliation Board appointed by the Secretary of Labor of the United States were accepted and approved at a meeting of operators on June 20. It is assumed that, under the terms of the recommendations, the miners will resume work at once while the terms of settlement have been submitted to a referendum vote to be taken not later than June 25.

The Hickory Ash Coal Co., employing 200 men on Coal River and the Standard Kanawha Coal Co., on Elk River, both independent of the operators' association, have signed contracts with the miners' organization granting the check-off.

The West Virginia Federation of Labor has asked by a resolution adopted unanimously that Governor H. D. Hatfield appoint a commission to revise the mining laws of West Virginia and to report a bill for enactment by the General Assembly.

Fayetteville—The annual report of the New River Co., which has just been made to the stockholders, shows a deficit of $57,421 for the operations ending March 31. The deficit for the preceding year was $211,914. Labor troubles and uncertainty of market conditions prevented the company from earning a profit on the year's business.

ALABAMA

Birmingham—Coal operators and officials of railroads operating into Birmingham will hold a conference within the next few weeks to discuss the question of freight rates. This question has been up for consideration several times, but no satisfactory settlement has ever been made. The matter will be fully discussed at the meeting, and it is expected that some agreement will be reached.

Bessemer—News from the coal mining districts shows more activity than for some months. The mines of the Woodward Iron Co., at Dolomite, are reported to be working five days per week, getting out coal for the new furnace that is expected to be blown in shortly. Reports from Blue Creek also, and further down the Mineral R.R. show mines active, working good forces and getting out more coal than for some time. Optimism prevails among coal men so far as the last half of the year is concerned.

KENTUCKY

Hemphill—The first train over the Yount's Fork branch of the Louisville & Nashville R.R. was run last week, from Neon into Hemphill, a new city in the Letcher County coal field of the Elkhorn Mining Corporation. The Potter's fork branch of the railroad, which will run into Haymond, another new city of the same mining company, is practically completed and trains will start running over it very shortly.

Louisville—Business conditions are expected to respond in a measure in Kentucky to the settlement of the differences between the state authorities and the foreign fire-insurance companies, which withdrew from the state after the passage of the Green-Glenn law by the last legislature. Negotiations had been deadlocked for some months until the business interests of the state led by the Manufacturers' & Shippers' Association, took a hand in working for a settlement. The Green-Glenn bill will not be enforced and concessions were made by both sides, while a committee will attempt between now and the sitting of the next legislature to frame an adequate insurance law which will be acceptable to all interests.

OHIO

Martins Ferry—The third fire to occur at the Barton Coal Co.'s mine in two months destroyed the fan house on June 18. The origin of the fire is unknown, but it is believed that an electric spark may have started it. Work of reconstruction was immediately started, so that the mine could be kept ventilated and ready for use in case a wage scale agreement is signed. It is expected that a new fan will be installed.

Columbus—Nothing of consequence was accomplished at the three days' conference of operators and miners in Columbus last week. Both sides appeared firm in their original demands, and as a consequence, no disposition to compromise was shown. After the vain wrangling of three days the conference adjourned Friday, June 19, to meet again Tuesday, June 23.

Wadsworth—The James Coal Co., which was recently organized has started to open a mine on the Harpley farm, located near Wadsworth in Medina County. The leases on the land has been held for six years by George C. White and Perry Winkleman.

INDIANA

Terre Haute—A strike of the 2500 miners employed in the strip pits in this vicinity was called by the United Mine Workers to take effect Saturday evening, June 20. This is the result of the break in negotiation for a new scale which recently took place at the joint meeting of the miners and operators.

When the Sugar Valley Coal Co. refused to reinstate B. J. Hixson, an engineer at the National mine, 100 miners quit work.

Linton—The Froschner Coal Co. has opened a stripping plant at Vicksburg in this field.

ILLINOIS

Herrin—One of the largest coal sales in mining properties recorded in recent years is that of the purchase by the Taylor Coal Co., of this place of the properties of the Southern Illinois Coal & Coke Co. The properties consist of three mines: Possum Ridge on the Williamson-Franklin County line, Oak Ridge, between Herrin and Johnston City, and Hemlock mine south of Herrin, approximating 2000 acres of coal rights. The Southern Illinois Coal & Coke Co. has had a somewhat checkered career, it being organized several years ago by T. R. Trundle, who succeeded in interesting Eastern capital. There have been many changes since that time in the management, but in the past few years Wm. M. Wood and W. J. Jepson, of Boston, have been active in its control. During the past winter squeezes at the Oak Ridge mine put it out of commission, and then the general depression of the coal trade brought about a feeling on the part of Eastern capitalists to dispose of the property. This will make five mines controlled by the Taylor Coal Co., all in and around Herrin.

Seatonville—It is stated that the Seatonville mine which has lain idle for ten months is soon to be reopened and operations commenced upon a considerable scale. Much cleaning up and preparation will be necessary, as a considerable amount of rock has fallen in, and the roadways have gotten into bad shape.

MISSOURI

Kansas City—Little headway had been made by the scale committees of the Southwestern Interstate Coal Operators' Association and Districts Nos. 14, 21 and 25 of the United Mine Workers of America, up to June 20. The stumbling block to negotiations was Section 1, covering arbitration. Each side eventually appointed a subcommittee of three men to reach an agreement on this question.

Appleton City—W. H. Fox and associates, who recently began an operation on the Charles Hunt farm near Appleton City, have begun selling coal in that section. About 25 tons is being mined daily. This output is being absorbed by threshermen.

Columbia—W. P. Moore and James Hudson have purchased the Ballenger farm for $9500, and will sink an operation.

KANSAS

Pittsburg—Eight hundred miners who had been on strike at the mines of the Crowe Coal Co., returned to work recently, a satisfactory settlement of the differences between the miners and operators having been reached.

Leavenworth—Neyle Fish, one of the receivers for the Home mine, recently destroyed by fire, announced that Eastern capitalists who recently inspected the mine were favorably impressed and probably will rebuild the plant at a cost of $100,000. Concrete buildings and electrical equipment throughout is proposed.

Columbus—A vein of coal was discovered on the George Hood farm near Columbus on June 17. Drilling will continue to determine the extent of the field.

ARKANSAS

Fort Smith—Peter Stewart, of McAlester, Okla., president of that district of the U. M. W. of A., with five others, has been cited to appear in the United States Court July 1 to show cause why he should not be prosecuted for contempt of court. The citation grows out of an alleged violation of an injunction granted the Mammoth Vein Coal Co. for its mine at Prairie Creek as a resnlt of the recent strike there. The defendants are charged with attacking and intimidating non-union miners.

OKLAHOMA

Gowen—The Kala-Inla mine at Gowen, Okla., has been sold by the Bache-Denman Coal Co. to A. G. Lunt. of New York, who is said to represent Eastern financiers. This operation was opened 10 years ago and has a capacity of 600 tons. It is electrically operated, and was the only mine owned by the Bache-Denman company in the Oklahoma district.

WYOMING

Centennial—Alleging fraud in obtaining title, the government recently instituted suit against the Northern Colorado Coal Co. for the possession of coal lands in North Park valued at $1,500,000. Illegality and the use of dummy entrymen will be charged by the government. Seven hundred acres of the company's holdings are not affected by this litigation.

Cumberland—The boiler house at Cumberland No. 1 was recently burned together with all the machinery contained therein. It is believed that this fire originated through spontaneous combustion, and although the fire department did good work, it had all it could do to save the tipple and engine house which were close by.

FOREIGN NEWS

Berlin, Germany—It is alleged that the coal syndicate, with the government as one of the partners, has not yet been renewed, and may not be. Its members include also iron and steel firms, and it is in the finished steel industry that dissension has appeared.

Swansea, Wales—After a night of panic above ground during which men and women prayed fervently and sang hymns, 200 miners entombed in the North Hamman colliery, near Tawdor, were liberated June 16. The men were caught by a cave-in, but all were safely rescued.

Christiania, Norway—An international conference, unique in history, was recently convened at Christiana with delegates from the United States and Russia, Norway, and other European countries in order to frame a government for the Spitzbergen Islands. Although these islands have been known to the rest of the world for centuries, it was not until within recent years that the coal deposits upon them were discovered and have started to be worked. The American interests now controlled by a Boston corporation are said to have about $750,000 there invested. There appears to be no precedent in history for the assembly of an international congress to formulate a government for a land over which no nation claims sovereignty.

PERSONALS

J. O. MacIntosh has been admitted to the firm of Renshaw & Co., coal shippers in the Land Title Building, Philadelphia.

Robert McCune on June 17 at Colorado Springs. Colo. was married to Mary Bateman Bothwell. The couple will make their home in Dawson, N. Mexico.

H. C. Hamilton, a banker of Girard, Ill., has been appointed receiver for the Farmersville Coal Co. The liabilities of this firm are placed at $30,000, while the assets are undetermined.

Hugh Ike Shott and Edward Cooper, both of Mercer County have announced their candidacy for congress from the Fifth District of West Virginia. Shott is the editor of the Bluefield Daily Telegraph, while Cooper is a coal operator of Bramwell. The primary will be held on Saturday, July 18.

William Watts, superintendent of the Banning-Connellsville Coke Co., has designed a new head for the covington coke extractor which is said to be more efficient in cleaning the oven and prevents breakage. He is now working on a device to prevent breakage in the passage of the coke from the conveyor to the car.

Thomas O'Brien, who has held the position of inside foreman at the Twin Shaft of the Lehigh Valley Coal Co.'s Seneca colliery, for the past nine years, has tendered his resignation to take effect June 30. His successor has not yet been appointed, but will probably be announced in a few days. Other changes in the inside officials of the Twin Shaft are said to be pending.

OBITUARY

Jesse Hilles, at one time head of the coal firm of Hilles, Boyd & Co., for many years sole representatives of the coal interests of the Pennsylvania R.R., died at Govans, near Baltimore, recently. He retired from business when his firm was absorbed by the coal department of the Pennsylvania in 1904.

George D. Whitcomb, the founder of the Geo. D. Whitcomb Co., died in California on Sunday, June 21. Mr. Whitcomb has been retired for a number of years and has lived at his home at Glendora, Los Angeles County, California. He was born in 1834, therefore, was in his eightieth year. He developed the "Harrison mining machine," which was the first successful mining machine of the puncher type put on the market and has been more or less identified with the mining trade, first as an operator, afterward as manufacturer of mining machines, for a great many years and has many friends among the older operators.

TRADE CATALOGS

H. K. Porter Co., Pittsburgh, Penn. "Modern Compressed-Air Locomotives." Pamphlet of 80 pp., 6x9 in., with many illustrations, tables, etc.

Schaum & Uhlinger, Philadelphia, Penn. "Centrifugal Extraction." Pamphlet of 44 pp., 6x9 in., illustrating and describing centrifugal extractors for various industries.

The Hazard Manufacturing Co., Wilkes-Barre, Penn. Price List No. 54 "Hazard Rubber Covered Wires and Cables." Twenty Seven pages, 3½x6¼ in. unillustrated. Sent free on request.

The Laidlow-Dunn-Gordon Co., Cincinnati, Ohio. Bulletin L-523-A "Cincinnati Gear Duplex Corliss Steam Driven Air Compressors." Twenty-three pages, 6x9 in., illustrating and describing class W A and X A compressors.

The Streeter-Armet Weighing & Recording Co., Chicago, Ill. Bulletin No. 2-A. "Descriptive Circular of Automatic Weight Recorders." Seven pages 8½x11 in. illustrating and describing "the application of automatic weight recording devices as applied to weighing miners coal, low grade ores or other commodities in pit cars or in trolley or stationary weigh hoppers, etc."

CONSTRUCTION NEWS

Mater, Ky.—It is announced that the Elkhorn Coal Co. here will be ready to begin shipping coal on July 15. The building operations of the company are getting well under way.

Scottdale, Penn.—The Scottdale Machine & Mfg. Co. recently secured a contract from the Conemaugh Smokeless Coal Co. for tipple, cages, head sheaves, etc., to be erected on its property at Seward Station, Penn.

Whitesburg, Ky.—A new mining town is being laid off and constructed about midway between Jenkins and Burdine, in the Elkhorn Creek coal fields. The name of the new settlement is Keithly. A considerable number of buildings is under construction.

Birmingham, Ala.—Orders have been placed and the material is now on the way with which to rebuild the coal benches in the gas plant of the Birmingham Railway, Light & Power Co. The rebuilding of these coal benches is the initial step in the complete remodeling of the gas plant.

Superior, Wis.—It has been officially announced that the Northwestern Fuel Co. will rebuild its big coal unloading rig on Dock No. 1, the work of construction to begin within two weeks. The new work will be in charge of the Heyl & Patterson Co. and will cost somewhat over $100,000. The new bridge will be ready for operation within three months.

Youngstown, Ohio—George W. Caldwell, president of the Caldwell Construction Co., who has the contract for the building of the line of the Lake Erie & Youngstown R.R., announces that the road will be constructed despite protests of financial interests. The construction of the line will mean an outlay of $4,500,000, of which two-thirds has been underwritten.

Birmingham, Ala.—In order to encourage water traffic in Alabama and to adequately serve its patrons in Mobile, it has been announced that the Pratt Consolidated Coal Co. will open some mines on the Warrior River, 8 miles from Tuscaloosa. Investigations are now being made to ascertain the best location for development on the river, which development will be started soon.

NEW INCORPORATIONS

Columbus, Ohio—Papers have been filed by the Pomeroy Coal Co., of Columbus, reducing the authorized capital from $50,000 to $5000.

Little Rock, Ark.—The Arkansas Coal & Mining Co., with Jesse Edwards as president, has increased its capital stock from $1000 to $10,000.

Boonville, Ind.—The Crow Creek Coal & Mining Co. has been incorporated here, with $15,000 capital stock. The directors are William Gough, O. M. Baldwin and L. Gough.

Columbus, O.—The Maple Hill Coal Co. has been organized for the purpose of mining coal. The capitalization is $25,000, and the incorporators are M. L. Phelps, T. C. Collins, H. G. Morse, G. I. Rose, and B. S. Morten.

Akron, Ohio—The Kimbolton Coal Mining Co. has been incorporated with a capital stock of $600,000, for the purpose of dealing in coal lands and similar properties. The incorporators are W. M. Graham, Harley J. Mots, Frank Schreider, T. C. Woodward and C. F. Schnee.

Somerset, Penn.—The Arrow Coal Mining Co. capitalized at $50,000, has been organized with William Gahagen as president, and Harry Gahagen as vice-president. The town of Arrow now consists of 57 dwelling houses, a church and a school house, but it is planned to erect possibly 100 more dwellings.

INDUSTRIAL NEWS

Nevada, Kan.—Throgmartin & Gardner, drilling five miles southwest of Nevada, struck a 4-ft. vein of coal at a depth of 400 ft. The property will be developed.

Columbus, Ohio—Permission has been granted by the Ohio Utilities Commission for the Kanawha & Michigan R.R. Co., to issue trust certificates in the sum of $1,200,000 to purchase 1160 steel Gondola cars.

Roundup, Mont.—J. H. Price & Sons, of Pittsburg, Kan., on July 1, expects to begin sinking a 200-ft. shaft for the Roundup Coal & Mining Co., a subsidiary of the Sheridan Coal Co. Several Kansas operators wish to inspect the Montana field.

Toledo, Ohio—The first cargo, a large freighter loaded with 2000 tons of coal, cleared from the new Hocking Valley docks at Toledo last week. These docks are of concrete and were erected at a cost of $2,000,000, being equipped with loading machinery of the latest approved pattern.

Baltimore, Md.—The Interstate Commerce Commission, acting on protest, has changed the date of operation of the 7c. increase on coal shipments inside the Capes from June 20 to Oct. 18. A hearing will be held to give both sides a chance to present the case before the latter date.

Harrisburg, Penn.—Complaint has been filed with the Public Service Commission, by the Eddystone Manufacturing Co., against the New York Central and the Reading railways contending discrimination in a tariff which became effective on June 20. The tariff increased the rate on bituminous coal to Port Richmond for harbor delivery.

Knoxville, Tenn.—Coal operators of eastern Tennessee and Kentucky await with interest the action of the Interstate Commerce Commission on the question of eliminating and reducing differentials on coal from the southwest Virginia mines to points in the Carolinas and Georgia. Officials of the Clinchfield, Carolina & Ohio R.R. have asked that certain differentials be eliminated.

Sellersville, Penn.—A vein of anthracite was struck by Elmer Stear, a farmer in Blooming Glen, near Sellersville, while plowing his land. A specimen was taken to J. G. Moyer's Sons Co., at Perkasie, who pronounced the discovery a fine grade of anthracite. A mining expert examined the coal and gave as his opinion that the lower stratum is richer still.

Chicago, Ill.—The interest on the Chicago & Indiana Coal Ry.'s 5 per cent. bonds due in 1936, has been defaulted. This railway is part of the Chicago & Eastern Illinois, the receivers of which have declared in a petition to the court that they have no money with which to pay the interest, and that a default would have to be made resulting in foreclosure of the mortgage, as well as a technical separation of the two properties.

Monongahela, Penn.—Coal men in the Monongahela Valley are prepared for a good coal trade during the coming month. The first shipment of Monongahela Valley coal to Panama is on its way south by way of the Ohio and Mississippi Rivers to New Orleans. For months, coal men of western Pennsylvania, Ohio and West Virginia, have been preparing for the opening of the Panama coal trade.

Columbus, Ohio—For the burning of its Perry County mine in June, 1912, the Rock Run Coal Co. recently secured an $8000 damage verdict against the Chartiers Oil Co. in Judge Kinkheads court. The coal company sought $50,000. It was alleged that oil from the Chartiers wells had percolated into the mine of the Rock Run company, making it inflammable, that when miners blasted the coal was ignited and the entire mine consumed.

Coal Trade Reviews

General Review

Anthracite rounds out the month in better form than anticipated. Eastern bituminous market at the lowest point for a long time. Situation at interior points picking up under the influence of the large crops and the long suspension in Ohio.

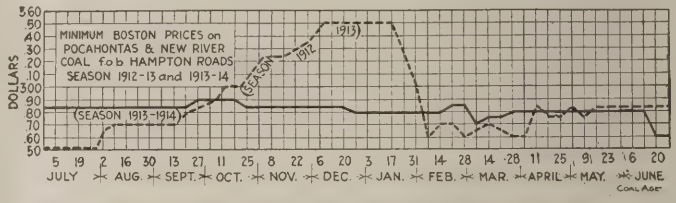
The anthracite movement for the month has been heavier than anticipated. The business carried over from May developed to unexpected proportions and the market is rounding out the current month in good form with some orders going over into July. The large companies, holding rigidly to their circular quotations, are, of course, experiencing difficulty in moving certain sizes which are in long supply. The heavier movement in the Lake trade is tending to relieve the pressure to a certain extent. While the customary summer lethargy is anticipated during the next two months, there is a generally hopeful feeling in the trade, and the opinions are freely advanced that the fall activity will set in earlier than usual.

On the Atlantic Seaboard, the various distributing centers are still flooded with bituminous coal, while even the scattering orders of a few weeks ago have disapeared. Further recessions and discouraging reversals have been the rule during the week, leaving the market in the poorest shape for a long time. With an excessive amount of coal on hand at Hampton Roads, the demand slack and the movement confined almost entirely to contract business, the outlook is not encouraging at the moment. Nominal prices are still asked, but concessions are readily obtainable. The most encouraging feature in the situation is the absence of demurrage coal, indicating that tonnages are closely held.

The manufacturing demand in the Pittsburgh district is on the increase, while a continued heavy movement into the Lake trade is keeping operations relatively active and on about 75% the nominal capacity; prices are weak in the spot market, heavy cuts being reported in some instances, but on contracts the full circular quotations are generally obtained. The complete deadlock at the wage-scale conference in Ohio last week has again thrown the trade there into a general uncertainty. Even though an agreement is reached shortly, it will require so much time to reconstruct the tipples in order to comply with the requirements of the new screen law, that it is clear the Ohio mines will not be much of a factor in the Lake trade this season. The elimination of the three million tons per month produced in the Ohio fields is undoubtedly creating a shortage in those markets, by which the adjoining districts are materially benefited.

In the Southern markets the poorer qualities are in excess supply and rather difficult to move, but the better grades are showing an improved undertone, even occasionally being reported in short supply. Restriction in mining operations is still the rule, although shipments to the gulf ports are showing up well.

The crop movement and the long suspension in Ohio are beginning to have their effects on the Middle Western situation where a gratifying improvement is noted. The opinion is general that the low point of the trade has been turned, and, although mining operations are still irregular, sacrifice prices are by no means so much in evidence.



ATLANTIC SEABOARD

BOSTON

Market listless with almost no redeeming features. Prices weak and coal still accumulating at every port. Pennsylvania operators shade quotations under pressure, but Georges Creek remains steady. Anthracite deliveries slowing up.

Bituminous—The trade is at low ebb. The Pocahontas and New River situation continues weak and while fairly strong prices were submitted to the Government for deliveries extending through the season, it is recognized that the spot market is still soft and in control of the buyers. The various New England tidewater distributing points are still glutted with consignment coal and sales are extremely hard to make. More steam colliers and sailing vessels have been laid up the past week because of the slack conditions; coal is standing in as large volume as at any time thus far, at practically all the loading piers. Where a fortnight ago there were scattering orders coming in, the market now is at a standstill and almost no sales are reported.

In addition to the already accumulated tonnage to be moved from Hampton Roads there develops an extra supply of slack coal, due to a slightly better demand from the West for prepared sizes. The market price of run-of-mine, however, is so frankly at a basis well down to $2.60 f.o.b. that a small differential less will hardly induce orders for slack. It would be hard to imagine a duller market than we are now going through.

On the Pennsylvania grades there is little that is new. A few orders dribble through to the different operators, but the movement to this territory is very light. Water freights on anthracite transportation, ordinarily diverted at this time to bituminous, are kept at so high a range from Philadelphia to Boston that consumers are either chartering transportation outside at market rates or are accepting deliveries only as they are absolutely required.

Georges Creek continues to come forward with the usual regularity, but the movement of this grade is confined almost exclusively to contract business. The shippers are still able to hold their season f.o.b. price on this grade, the only steam coal in the market of which such a statement could be made.

Anthracite—Domestic sizes are not coming forward as freely as was expected. The orders that held over into June were understood to be light, but at this writing most of the companies are a week or two behind on deliveries. Stove is still in shortest supply. June was expected to be a dull month, but now there is a good chance that there will be some business to carry over for July shipment.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.40	$1.10@1.55	$1.67@1.77	
Philadelphia*	2.15@2.65	2.35@2.80	2.92@3.02	
New York*	2.45@2.95	2.65@3.15	3.22@3.32	
Baltimore*	.....	.....	2.85@2.95

* F.o.b. †On cars.

NEW YORK

Tidewater situation duller than for a long time. Further price recession on the lower grades. Anthracite companies wind up the month with a heavier production than anticipated. General restriction expected in July.

Bituminous—The soft-coal trade during the past week has been the poorest for a long time. It has been a series of further recessions and discouraging reversals with the operators. Production in the Pennsylvania regions shipping this market was down to 40% capacity or even less. The Berwind-White Co. continues working under curtailed operations, and conditions in the bunkering and steamer trade generally have seldom been duller many vessels having been laying here for two and three months awaiting cargo.

Perhaps one of the most encouraging features in the market is the fact that there appears to be little or no coal on demurrage. This indicates a determination on the part of the operators to hold tonnage closely and close down when consumers refuse to meet their figures. A moderate increase in West Virginia gas-coal prices is also noted; this is due to a combination of causes, such as the exhaustion of surplus stocks in the hands of the consumers, a better demand in the West and Northwest, and to an incipient car shortage, which,

although not affecting operations as yet, is nevertheless causing serious apprehension over outlook this fall when the movement becomes heavy.

The better grade coals are still being firmly held at the regular circular, but the off qualities are suffering some recessions, and the market is now quotable on the following basis: West Virginia steam, $2.50@2.60; fair grades Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—About normal conditions prevail in the hard-coal trade. If anything the market seems to have held somewhat steadier than was anticipated early in the month, and it is now evident that all but a very few of the large companies will conclude the month under full-time operations. However, the outlook for next month is dubious. Even now prompt shipment can be obtained on practically any order placed, and it is clear that the current business is coming rapidly to a finish. So far, the Reading and the Susquehanna companies have been the only large operations to materially restrict production.

Stove coal, of course, still continues the leader, and there is little prospect that the mines will be able to completely satisfy the demand for this grade. Isolated cases are also reported of shortages in buckwheat, Nos. 1 and 2, but these are the exception rather than the rule. Chestnut is in long supply with considerable going into storage, and the same applies to the steam grades in general with the possible exception of the different sizes of buckwheat as already noted.

We quote the New York hard-coal market on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$4.80	$4.60@4.80	$4.75	$4.55@4.75
Egg	5.05	4.95@5.05	5.00	5.00
Stove	5.05	5.05	5.00	4.85@5.00
Chestnut	5.30	5.15@5.30	5.25	5.00@5.25
Pea	3.55@3.60	3.30@3.55	3.45@3.50	3.25@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.00@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.50@2.25
Barley	1.80	1.60@1.80	1.70@1.75	1.25@1.70

Water Freights—The "Journal of Commerce and Commercial Bulletin" reports the situation in water freight as follows: The full cargo steamer market was steady and unchanged, and a fair amount of business was reported in chartering, including two large carriers for government coal from the Atlantic range to Cavite, P. I., one for July loading, the other for September. South America and long voyage freights continue to offer sparingly. Rates hold fairly well in all trades, with owners asking an advance in some instances. The sail tonnage market shows no signs of improvement, the demand being exceptionally light.

PHILADELPHIA

Practically no change in the anthracite situation. Production still continues fairly large. Better feeling in bituminous.. Demand improving but prices on about parity with last week.

Anthracite—The close of this week finds the anthracite trade rapidly approaching mid-summer dullness. Notwithstanding the curtailment of mining, however, there is a very appreciable tonnage moving. Shipments to the Lakes are comparatively heavy, although not as great as the corresponding period of last year. The line and local trade is very dull, with demand centering mostly on stove size. Of course, this is applicable to the large companies; individuals are having no trouble in moving their output, but at greatly reduced figures.

All sizes, with the possible exception of stove, are quoted at considerably less than the circular and it is not expected that there will be any tone to the market during the succeeding two months, a situation not at all unusual at this season of the year. But there does appear to be a feeling that activity may be looked for earlier this year than usual. As a rule, the market remains in a depressed condition until well along into September, but many of the operators look for the latter part of August to show up well. New England business at Tidewater still continues in sufficient volume to keep the large fleets sailing from this port, well occupied, but it is understood that there is very little waiting to have requisitions filled.

Bituminous—There seems to be a slightly better feeling in bituminous. Stocks of coal at industrial establishments are slowly but surely dwindling, notwithstanding the fact that many of them are operating short time, and these concerns are now looking the market over. Solicitations to contract, however, are not met with any degree of warmth, the purchasing agents apparently feeling that they can do better on the open market, at the present time, than by tying themselves up to any specific figure.

BALTIMORE

Signs of activity to the Westward offer encouragement in spite of the slow local conditions. From time to time there is a little spurt. Anthracite men plug away on a fairly active call for household fuel.

While the soft coal market is generally dull there are indications of an awakening in the West that are encouraging to the trade as a whole. From spots in the Middle West as well as from points along the Lakes come inquiries for fuel in comparatively small amounts. There are no big closings and it is rather difficult to put a finger on the improvement as a whole, but there is apparently a somewhat more hopeful spirit.

Mine production is averaging not more than three or four days a week. The Northwest is being supplied largely by the Fairmont district of West Virginia and this has added a little strength there. Slack, that sold down to 50c. recently, was commanding as high as 60c. in some cases. Three-quarter gas remains steady at 85c. Little or no change is noted in the Pennsylvania market, prices holding about the same as for the past three weeks; the cheapest fuels are obtainable around 95c., medium grades at from $1.05 to $1.15 and best qualities at from $1.25 to $1.35.

Anthracite men keep plugging away locally apparently with fair success. The household trade for storage purposed is now about up to the June mark.

HAMPTON ROADS

Movements during week about normal. Government taking coal for stations on Pacific Coast and vessels in Mexican waters.

Dumpings for the past week average up well, although there have been days when little work was done at any of the piers. The demand still continues slack and it is believed that practically all coal moving has been on contract business. As is usually the case the heaviest shipments have been to New England with foreign cargoes to Naples, Venice, Brindisi, Vera Cruz, Havana, St. Lucia, Canal Zone, Montevideo, Port of Spain, Gibraltar and Santiago.

Coal has been loaded by the government for the naval stations at Mare Island and San Diego and, in addition to the coal for the Pacific Coast, two colliers have been loaded to supply vessels now stationed at Vera Cruz. Steamers for bunkers have arrived in fair numbers and it is believed that the movement so far this month is already in excess of the total for May.

Although the amount of coal on cars in the railway yards is still somewhat above normal, circular prices are still being quoted and so far as can be learned there is no prospect of any reduction being made. Present indications are that unless there is an extra-heavy arrival of vessels for cargoes this week the dumpings for the month of June will fall considerably behind the May figures.

LAKE MARKETS

PITTSBURGH

Mining operations unchanged. Lake movement fairly heavy. Manufacturing demand picking up slightly. Contracts being closed slowly. Prices somewhat irregular, particularly on prompt.

Coal production in the Pittsburgh district is at an estimated rate of about 75% of nominal capacity, though it is probably not two-thirds of what the district could mine and ship under pressure. The chief demand continues to be for the Lake trade, to which market the state of Ohio is contributing hardly anything since practically all the Ohio mines are still closed awaiting more light as to what can be done under the new Green law which provides for a mine-run basis of payment. Some lawyers express the opinion that operators could make individual contracts with miners providing for a screened-coal basis of payment. The state of Ohio is certainly suffering from the law, and it seems fairly safe to assert that Pennsylvania will never enact such a law.

Manufacturing demand for coal is picking up somewhat as the steel mills are running slightly better and stocks are now nearly exhausted. Many season contracts with manufacturers are not yet closed and negotiations are proceeding somewhat slowly. On contracts, regular open prices are shaded but little if at all, while on spot lots there are frequently large concessions, particularly for slack, which has sold down to 55c. at some points. Regular prices are: Slack, 90c.; nut and slack, $1.05; nut, $1.25; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, per ton at mine, Pittsburgh district.

BUFFALO

The bituminous market is steady, but quiet. Mines running with much caution. Canadian market more quiet. Much complaint of West Virginia competition. Anthracite doing very little.

Bituminous—There is a slight stir in the trade among small consumers, who appear to be about out of coal, but the larger concerns are buying sparingly and will not come into the market for some weeks yet, as it is hard to say just what their running needs are. The sellers do not dare to allow any coal to accumulate on their hands as they are likely to have to dispose of it at a sacrifice. All reports from the Canadian market agree that the industrial situation there is still more quiet than it is here. Iron furnaces are doing little and other factories are by no means active. Money is scarce there, so that collections are difficult to make.

There is complaint that some of the West Virginia operators had much to do with spoiling the bituminous market of this district. There was an effort there to keep the mines running, so that the men would not scatter, and the coal had to be distributed over a wide territory and sold for what it would bring. The railroads are beginning to buy cars and will probably go into repair work, very extensively next month while the large crops are bound to stimulate business. If a fair percentage of the advance in freight rates is granted it will all contribute toward greater activity. The bituminous market is fairly steady, but only the best coal can be sold at quoted prices, which are: $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes from 15 to 25c. lower.

Anthracite—The demand for anthracite is down to the mid-summer level, so that the movement is confined to storage for the winter. City demand is normal, but they did not get an average amount of business early and that means a big rush next fall. Shipments by Lake continue to increase. One leading company is loading at full capacity and most of the others are active. The amount reported for the week was 171,000 tons. Some members of the trade think there will be more Lake coal shipped this month than there was last June.

TOLEDO

Market still flat but a few more inquiries are noted and a more optimistic feeling prevails. Active business anticipated when the crop movement gets under way. Lake shipping still relatively light as yet.

Despite the continued featureless condition of the local market, Toledo dealers continue optimistic. It is generally believed that despite the depression evident among business concerns of all kinds, the coal trade is bound to pick up shortly. Orders are already beginning to come in better than for some little time and inquiries denote a more healthy tone. The large crops will make an unusually heavy demand for threshing coal and it is believed that most of the factories will resume regular operations within a short time.

The railroads, of course, are not using their normal quota as many trains have been laid off altogether. The idle cars on all roads are said to be greatly in excess of last year due, in part, to the fact that the Lake shipments are much less. It is no uncommon thing to see large freighters tied up at the Toledo docks idly awaiting a cargo, while last year every boat that could be secured was pressed into the service. A few of the railroads have placed orders for freight cars, including a large number of coal cars, but it is not believed by coal men here that the roads can begin to handle the traffic when the crop movement starts. There are some who anticipate a car shortage as bad as anything in past history a little later in the season when rush orders for Up-Lake coal begin to come in. Steam and domestic coal will also be in good demand a little later in the season.

COLUMBUS

Another adjournment of the wage-scale conferences without any agreement. Increased demand and prices showing a strong rising tendency. Lake trade improving slightly.

The wage-scale conferences, under the auspices of Governor Cox proved a total failure and the meeting adjourned with the deadlock as complete as ever. Both sides refuse to make any concessions whatever and the outlook for a settlement is discouraging in the extreme.

An increase in the demand for coal was reported during the week. Steam users are now buying from West Virginia and prices, which were formerly extremely low, are advancing. West Virginia lump is quoted at about $1.35@1.45, while ¾-in. is sold at $1.20. Mine-run is selling around 85@90c. Slack and nut, and pea and slack are still quite low. Railroads are also buying considerable fuel, and in some cases they are confiscating cargoes on their lines.

There is also an increased demand for domestic grades and prices are ruling firm. Considerable West Virginia coal is being received. Dealers stocks appear to be sufficient for current orders.

The Lake Trade is showing more activity, although there are many drawbacks. Considerable West Virginia coal is being shipped through Ohio to the Northwest.

What quotations are being made in the Ohio fields are as follows:

	Hocking	Pittsburgh	Pomeroy	Kanawha
Domestic lump	$1.50@$1.40		$1.50@$1.40	$1.50@$1.40
¾-inch	1.35@ 1.30	$1.20@$1.15	1.35@ 1.30	1.30@ 1.25
Nut	1.30@ 1.25		1.25@ 1.20	1.25@ 1.20
Mine-run	1.15@ 1.10	1.10@ 1.05	1.15@ 1.10	1.10@ 1.05
Nut, pea and slack	0.85@ 0.80		0.85@ 0.80	0.80@ 0.75
Coarse slack	0.75@ 0.70	0.85@ 0.80	0.75@ 0.70	0.70@ 0.65

CLEVELAND

Quotations for August delivery at low figures, even for current business. The Lake trade is showing signs of curtailment.

Youghiogheny operators have sold slack as low as 55c. for delivery during August making the price here $1.55 which is the same as current quotations. This competition has compelled Fairmount operators to quote slack at 40c. As the freight rate from the Fairmount field to Cleveland is $1.15, the West Virginia gas coal comes into this market at $1.55 delivered.

Although another meeting of Ohio operators and miners will be held this week, the outlook is far from promising for an immediate settlement. The Ohio operators would have to meet the competition of the two states now fighting for the local business.

The Lakes are not offering an outlet of any consequence. The Upper Lake docks are loaded down with coal that is not being moved. The demand in the harvest fields has not started and until it does the Upper Lake docks will not be relieved. With the shipping of grain Lakeward, railroads will take coal West and will also increase their own consumption. The indications are for the largest crop in years and a big demand is expected from this source within thirty days. This northwestern trade is all the Upper Lake dock companies have to look forward to. The iron ore mines are working only part time or with reduced crews and are using less than half their normal amount of coal.

The vessel situation is so easy, boats are waiting at loading ports from three to five days. The congestion is serious, from the boat owners view, at Sandusky, Toledo and Lorain. At Toledo, Monday, the Hocking Valley loaded the first cargo over its new dock. It will use the dock the rest of the season which will relieve the congestion at that port to a certain extent.

Prices quoted this week for shipment are as follows:

	Pocahontas	Youghiogheny	Fairmount
Lump	$3.05		
Lump, 1¼-in.		$2.35	
Lump, ¾-in.		2.25	$2.00
Mine run	2.60	2.15	1.90
Egg	3.05		
Nut		2.20	
Slack	2.20@2.35	1.55	1.55

CINCINNATI

Conditions not improved, but the feeling is slightly better, due to the belief that there will be a serious shortage later. Indications are that buying in all quarters will soon improve.

Manufacturers still refrain from taking any large amount of steam fuel and operators find the same difficulty in disposing of their screenings; although the demand for the prepared grades is not what it should be, the total lack of a market for nut and slack is one of the worst features just now. The improved Lake Movement and an ample car supply have encouraged the trade considerably, and it is hoped that the Northern markets will have stored their usual supply before this immediate section begins to demand coal.

In fact, many large consumers and dealers alike are beginning to realize that the prolonged strike in the Ohio field and the curtailed production in West Virginia, is going to bring about a heavy shortage on the year's production. This feeling is already evident from the increased willingness to contract at good prices for deliveries later in the summer. The prospects for an early resumption of work in the Kanawha field have not altered this tendency, the general impression being that the production there will hardly be able to keep pace with the late summer demand. The caution with which operators are contracting for July and August deliveries is one of the best possible indications of a coming improvement.

DETROIT

Market steadier with a generally better undertone. Large crops expected to stimulate more business. Full circular prices the rule.

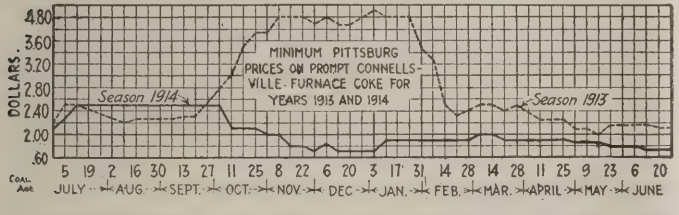
Bituminous—It is apparent that there are a number of influences now tending to strengthen the local market. These have not progressed sufficiently to have any material ef-

fect as yet, but there is a generally more optimistic feeling. One of the most important factors in the situation is the prospective improvement in railroad circles. In the event that the roads secure the advanced rates asked for, it is expected that a general improvement will result all along the line, together with a large increase in the fuel consumption.

UPPER LAKE PORTS

Duluth-Superior docks glutted with coal and little moving out. Beneficial effects of the large crops wiped out by the general pessimism in iron circles.

The coal docks at Duluth-Superior are loaded down. There is not a dock with any space and very little coal is going out. The iron country is pessimistic because the ore mines are practically at a standstill. Many of the open pits are not being worked and shaft mines are doing nothing except on special orders, which are few and small.



There is going to be good fall interior trade because the grain crop is abnormally large. The light demand for mining purposes is the principal drawback. Away from the iron country the feeling is much better. The crops look so good that people are quite hopeful and are not particularly worried over the future. This is true only among the farmers, the cities being pessimistic as a rule.

COKE

CONNELLSVILLE

Optimistic reports in the steel trade create a better undertone in coke. Prices steadier except on foundry coke.

A firmer attitude as to furnace coke prices is noted on the part of some operators, who seem to have become convinced within the past week that decidedly better times are in store for the iron and steel trade in the near future. There is less disposition than there was to shade $2 on furnace coke contracts, but prompt coke is as cheap as ever, being usually offered at $1.75 in limited quantities. An Eastern consumer is rumored to have purchased about 10,000 tons a month over second half at $2, purchasing a smaller tonnage of medium grade coke at a lower figure. As a rule negotiations on contracts proceed very slowly, and the majority of consumers not already covered will probably buy from hand to mouth after the close of this month.

Foundry coke prices have been sliding off. While two or three large operators still have an asking price of $2.65 there is hardly any prospect of their securing this figure, since at least one large interest making one of the most highly regarded cokes in the region has sold at $2.35 if not lower. Some indifferent brands are offered down to $2. The market is quotable as follows: Prompt furnace, $1.75@1.85; contract furnace, $1.85@2; prompt and contract foundry, $2.30@2.50, per ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ending June 13 at 259,615 tons, an increase of 16,006 tons, and shipments at 253,352 tons, a decrease of 1479 tons.

BUFFALO

There is a light movement of coke and a general dissatisfaction expressed with the trade. So much fault has been found with coke in recent years that the bituminous jobbers have quite often gone out of it. The seller found, as a rule, that he could dispose of two cars of coal while selling one of coke and the complaint would be less. Shippers hold that the difficulty is more often with the consumer than with the product of the ovens; one shipper states that he almost invariably had difficulty every time a customer changed foremen. The market is bound to be quiet till iron is more active, though the ovens are looking for something better in the fall. Quotations are fairly steady at $4.25 for best Connellsville foundry and $3.25 for stock coke. Domestic sizes are hardly quotable.

COLUMBUS

The coke trade is holding its own, despite the general business depression. The demand is not so heavy and shipments are not up to the usual figure.

BIRMINGHAM

Furnace and foundry coke remain quiet with scarsely anything doing. There are a number of small sales of pig iron and while the aggregate tonnage is not large, it is far ahead of the May business, with prices about the same.

CHICAGO

While dull conditions prevail in the hard-coke market, an improvement is hoped for after July 1. It is expected that prices will remain steady for several months. In anticipation of the fall rush there is more buying of byproduct cokes. The market is quotable as follows: Connellsville and Wise County, $5@5.25; byproduct egg, stove and nut, $4.65; gashouse, $4.25.

ST. LOUIS

There is some demand for coke, but it is purely in the local market. The market is quotable as follows: Gashouse, $4; byproduct, $4.75, both f.o.b. St. Louis.

SOUTHERN

LOUISVILLE

High-grade fuels much improved and occasionally in short supply. Off qualities heavy and difficult to move. Curtailed operations still general.

The local market has improved in the last week, so far as the high-grade steam coals are concerned, the supply not being equal to the demand. A recent search for two cars failed to produce that much of the quality required on the track anywhere in Kentucky. The demand for domestic sizes continues brisk in the Eastern field with the bulk of the shipments going to Northern and Northwestern points. Low-grade steam sizes go begging on the market and stocks are increasing rapidly at the mines and in the various yards. The railroads are not taking as much coal as could be wished and general industrial conditions have not improved to any appreciable extent.

BIRMINGHAM

Market on lump coal slightly off and steam coal quiet.

The market on lump coal is not quite as active as last week, the tonnage being lower due, probably to the extremely hot weather. Steam coal is moving slower this past week also, though shipments to the gulf ports is showing up well. Blacksmith coal is experiencing its usual summer depression.

MIDDLE WESTERN

INDIANAPOLIS

About normal June conditions prevail. No domestic coal moving, except shipments for threshers. Railroads the heaviest buyers of steam grades. Industrial demand not more than normal, if that. Indianapolis retailers have advanced prices 25c.

Conditions are not far from normal for this period. The demand for steam coal is not large. Several factories are closed as this is the season for overhauling machinery. The railroads seem to be taking as much coal as usual at this date and the crop moving season is at hand when their buying must increase. Working schedules at the mines are irregular, some companies doing better time than others. One of the largest has four of its seven mines on full time and the others on about half time. However, some mines belonging to all companies are running.

The fact that there is little or no market for Indiana domestic coals during the warm months naturally tends to restrict operations. It is no trouble to sell screenings, although premiums for this grade are scarce, due to competition from Pennsylvania and Virginia mines, which are working strong on domestic grades and have to find a market for screenings. These are reaching practically all parts of Indiana, but the freight rates makes it impossible to sell below Indiana prices. Were it not that over 50 per cent. of the railroads use 1¼-in. lump, the supply of Indiana slack would be much less than the demand.

CHICAGO

Improvement evident in the Chicago market. Quiet conditions prevail in anthracite, but the smokeless trade is strengthening. Hard-coke market dull. Slight improvement in byproduct coke.

It is generally agreed that the low point of the depression has arrived and that conditions will begin to improve shortly. Prospects for the future are better in every line and the coal market naturally must benefit from the general improvement. Sacrifice prices are not so much in evidence as during the previous weeks and the disposal of the tonnage is much easier.

Various reports concerning anthracite conditions and the volume of business are in circulation. Some companies report an increase while others are just the opposite. This might be explained by the fact that June is seldom a good anthracite month.

A cleaning up of demurrage coal in the splint market has effected an improvement. Conditions also are aided somewhat by the curtailment at the mines and the general market is firm. Until recently several Franklin County operators have been naming one price for all lump coal, but within the last week a change has become effective. Sales are made to retail dealers only and the circular price, in some cases $1.25, and in others $1.50 is obtained.

Screenings form the principal feature of the Springfield district, with the demand exceeding the supply. There is only fresh-mined coal to satisfy the demand, prices being about 90c. a ton for the ordinary qualities and $1 for the better grades.

Prevaling prices at Chicago are:

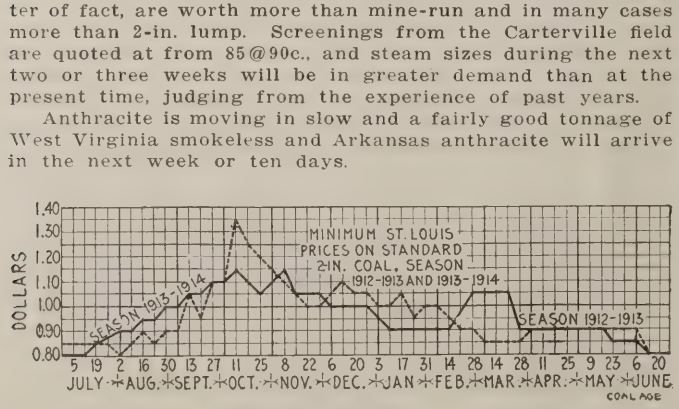
	Springfield	Franklin Co.	Clinton	W.Va.
Domestic lump	$2.07	$2.30@2.40	$2.12	
Steam lump	1.97		1.97	
Egg		2.30@2.40		$3.95
Mine-run	1.87	2.15@2.25	1.87	3.05@3.30
Screenings	1.62@1.67	1.95	1.62@1.67	

KANSAS CITY, MO.

Threshing on in full blast and the situation materially improved. Some competition developing with oil and gasoline.

Further improvement has been shown in the situation in Kansas City. The Kansas harvest is on in full force, and is responsible for a heavy movement of coal to the wheat fields. On the basis of one ton of coal to 50 acres of wheat, it is estimated that 175,000 tons will be required in Kansas alone. Missouri will take less than half of that amount. The railroads are handling the situation in good shape, though the crisis has not yet arrived. Coal seems to be holding its own in the harvest field, though in a few instances threshermen are utilizing oil and gasoline.

ST. LOUIS



Generally better tone than for some time, although low prices still prevail in sections. Coöperative mines continue to be a leading feature in the situation.

There has been a better tone to the local market during the past week than for a long time. There seems to be a good demand for high-grade coal in the threshing fields, and this has affected to some extent the washed-coal market, which has been holdnig its own until the past week or ten days, when it went to pieces. The movement of high-grade has also been affected to some extent by the local demand.

The condition in the fifth and ninth district is still the same as it has been with coal going below cost. Conflicting opinions in this district as to the proper way to eliminate the present low prices is perhaps the principal reason for these. It is felt in some quarters that concerted action by the operators against the United Mine Workers giving permission to their men to engage in the operation of coal mines, would have the desired effect.

Standard screenings are holding their own, and, as a matter of fact, are worth more than mine-run and in many cases more than 2-in. lump. Screenings from the Carterville field are quoted at from 85@90c., and steam sizes during the next two or three weeks will be in greater demand than at the present time, judging from the experience of past years.

Anthracite is moving in slow and a fairly good tonnage of West Virginia smokeless and Arkansas anthracite will arrive in the next week or ten days.

PORTLAND, ORE.

Mines on Vancouver Island are again in operation and Washington properties resume work in a small way. Demand light, owing to mild weather.

In the Puget Sound country the lignite mines are preparing to work at least a couple of days a week. Some of these mines have been closed down for a time because of the fact that the mild winter weather left consumers pretty well stocked up and the opinion is that coal for next season will be put in rather late this year.

The demand here is very light for the present.

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for April and the ten months ending Apr. 30, 1912 and 13, in short tons:

	April				Ten Months			
Destination	1914	%	1913	%	1914	%	1913	%
Tidewater	352,414	22	273,623	30	2,940,162	19	2,993,645	23
East	213,990	13	169,265	18	2,201,691	15	2,201,364	17
West	972,771	59	435,898	47	9,136,656	60	7,245,245	55
Total	1,539,175		878,786		14,278,510		12,440,254	
From Connections								
Bituminous	98,039	6	41,571	4	923,990	6	536,270	4
Anthracite	1,903		2,176	1	13,324		11,314	1
Total	1,639,117	100	922,533	100	15,215,824	100	12,987,838	100
Coke	36,215		28,471		328,320		256,021	

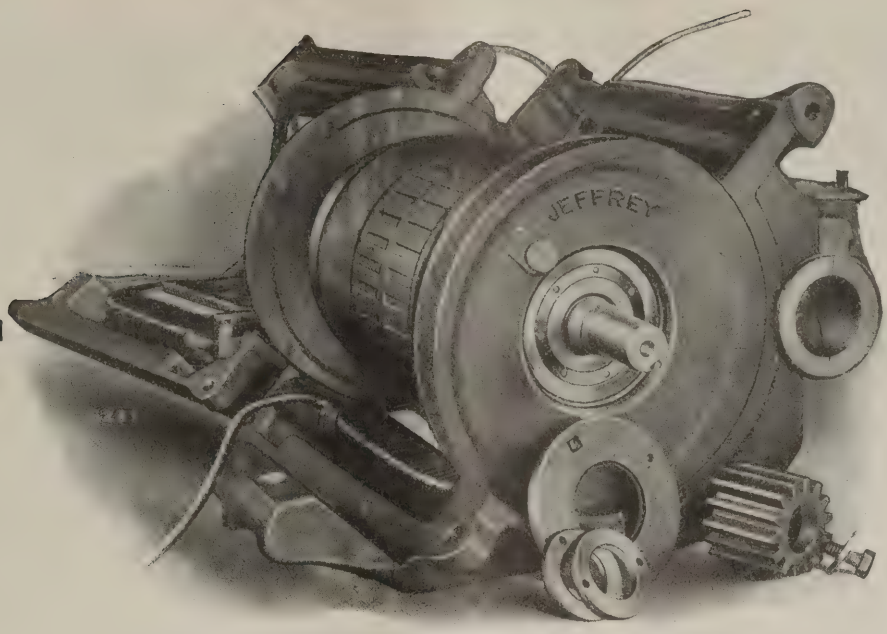
FOREIGN MARKETS

GREAT BRITAIN

June 12—Conditions in the steam coal trade are apparently as strong as ever so far as very best Admiralty descriptions are concerned. Prices of second-class coals are, however, inclined to weaken, and the same may be said of Monmouthshire large descriptions. Smalls are more plentiful and prices slightly easier. Quotations are approximately as follows:

Best Welsh steam	$4.80@5.04	Best Monmouthshires	$4.08
Best seconds	4.62	Seconds	3.84
Seconds	4.32	Best Cardiff smalls	2.58
Best dry coals	4.41	Seconds	2.52

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are net f.o.b. Newport; both exclusive of wharfage, and for cash in 30 days.



Coke is quoted at: Special foundry, $6.24; good foundry, $4.80@5.52; furnace, $4.08@4.56.

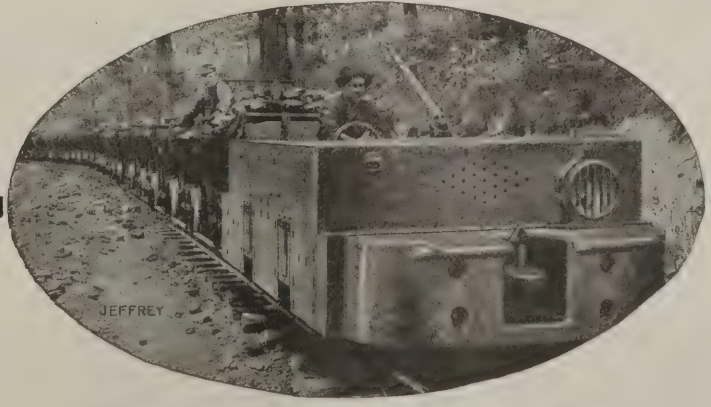
A 40 H. P. Ball Bearing Motor used on 8-Ton Jeffrey Mine Locomotives showing the ball bearing in place on the armature shaft.

90% of Locomotive Motor Troubles are Eliminated by the use of

Jeffrey Heavy Capacity Ball Bearing Motors



Consider these advantages over all other Motors for Mine Service:

Armature Never on Pole Pieces.
Continuous Service.
No Maintenance Charge for Bearings.
No Perceptible Wear.
Least Maintenance on Armature.
Better Commutation.
Less Lubrication Necessary.
Less Wear on Gears.
Motors are of ample power to slip the wheels continuously without overload to any part.

Send for Mine Locomotive Bulletin No. 117, also complete catalogs on Jeffrey Coal Cutters, Drills, Coal Crushers, Car Hauls, Dumps, Screens, Picking Tables and Loading Booms, Mine Fans, etc. Free upon request.

The Dreaded Pipe Destroyers—Corrosion and Electrolysis
The Greatest Factor in Pipe Cost—Constant Repairs
The Frequent Cause of Pipe Failure—Flaws

These—and many other pipe problems—overcome by

BYERS GENUINE WROUGHT IRON PIPE
FULL WEIGHT GUARANTEED

BYERS Pipe offers greatest resistance to the attacks of corrosive agents, and to the disintegrating action of electrolysis. It possesses the highest known factor of safety in these important phases of pipe service.

Byers Pipe gives uniform, dependable, continuous service. It is remarkable for its freedom from sudden failures, and for its ability to meet the most excessive demands of emergency. This reliability is due to its absolute genuineness, full weight, and the absence of flaws. Byers Pipe is made from the best grade of pig iron, by careful, hand-controlled processes. It is tough, fibrous, ductile—capable of withstanding great torsional, tensile and pressure stresses, incessant vibration, and the fracture forces exerted by sudden changes of temperature.

Byers Pipe represents the highest degree of pipe economy. Its lasting, low-cost service is in marked contrast with the expensive repairs and replacements that must constantly be made on inferior pipe installations.

These qualities of Byers Pipe have been completely demonstrated by actual service. They have been proved real—not merely theoretical—by the continuously recorded experience of fifty years.

The year 1914 marks the Fiftieth Anniversary of Byers. Since 1864 the Byers reputation for careful, hand-controlled methods, highest quality of material, and manufacturing independence has been consistently maintained.

Send for the Byers Book—"The Control of Quality in Every Process." It contains valuable information for every pipe user.

THE BALDWIN

The Miner's Lighting Bug

Still Satisfactory After Eight Years of Service Without Any Radical Changes

Does this mean anything to you? If you have kept in touch with the various lighting devices that have been put on the market in this space of time, it proves that what we have claimed for the Baldwin is true, it operates under the only known method for accurately controlling the generation of gas in a carbide pit lamp.

The valve lamp has been offered in a dozen different forms in the past five years. Why? Simply because a valve feed lamp is not practical and it has been found necessary to make continual changes to overcome difficulties that have cropped up when the lamps have been put in use.

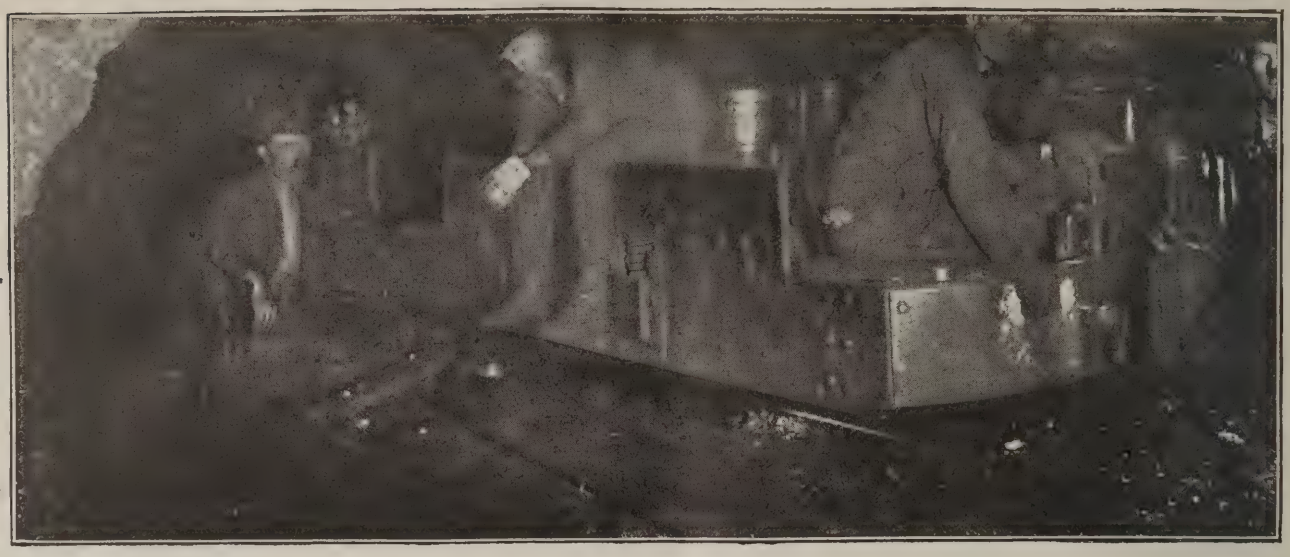
Compare the Baldwin No. 32 lamp of to-day with that of 1906. There has been a gradual, steady development of the Baldwin Lamp, those two illustrations do not tell the history of the Baldwin—simply show the advance in appearance. The advance in strength—serviceability and efficiency cannot be shown in a picture but it's well told in the lamp. Many of these changes were made at the suggestions of practical men who used the lamps daily in their work. We are always on the lookout for improvements that will add to the efficiency of the Baldwin Lamp, but unless a change will stand up under the rigid tests we put it to, it is not put in a stock lamp. We do not sell experimental lamps. That is why the Baldwin Automatic Water Feed has stood unequaled for over eight years.

In the Baldwin, the water flow is determined by the gas pressure itself, which checks or holds the water in reserve until it is required thus insuring a steady, even flame at all times, whether the miner is standing still or swinging a pick. The only attention a Baldwin Automatic Feed lamp needs is a turn of the raking wire a few times a day.

More lamps of this feed are in use than all others combined and further proof of the value of the Baldwin Automatic Feed is found in the number of valve feed lamps from which the valve has been removed and a Baldwin water tube and raking wire inserted.

These are facts, but we invite you to investigate the Baldwin Lamp—find out what it can do—has done—and will do.

Our Proof Is the Lamp Itself



Equipped With or Without Sparker Lighters

Lamps are guaranteed satisfactory to user—get one at your dealer's today. If you don't find it just as represented, take it back and your money will be refunded.

G-E Storage Battery Locomotive, Abrams Creek Coal & Coke Co., Oakmont, W. Va.

"Your Motor Gives Wonderful Satisfaction Doing More than You Claim for It."

This statement was made by Mr. James Christopher, Supt. Abrams Creek Coal & Coke Co., Oakmont, W. Va. We invite your attention to his report of work done by G-E Storage Battery Locomotive for ten successive days commencing March 3, 1914, which follows:

"March	3	105	Loads	210	Ampere	Hours.
"	4	79	"	185	"	"
"	5	67	"	170	"	"
"	6	105	"	210	"	"
"	7	106	"	200	"	"
"	8	109	"	200	"	"
"	10	101	"	185	"	"
"	11	110	"	175	"	"
"	12	94	"	160	"	"
"	13	105	"	200	"	"

"We are pleased to state that motor replaced 4 mules each day and if we had a sufficient number of men on this haul to produce the coal it would have delivered at least one-third more coal without exhausting all the power stored. The longest time required to recharge motor any one of these days was $3\frac{1}{2}$ hours. We find it does not require any more oil than any other haulage motor and the more familiar the motorman becomes with it the less sand is required."

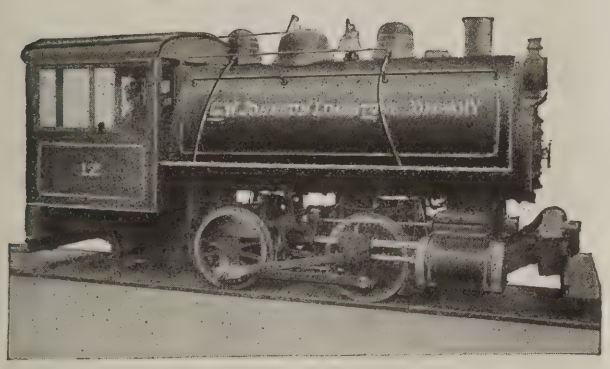
BALL BEARINGS

Superior because of Superior Manufacture

A high grade ball bearing demands that all of its parts, namely, the races, the cage and the balls, shall be composed of the finest material and made with the utmost precision and accuracy.

In other words, the value of a ball bearing is in direct ratio to the accuracy attained in the manufacture of its component parts, and the suitability of the material entering into them.



EVERY PART OF A HESS-BRIGHT (HB-DWF) BALL BEARING IS MANUFACTURED IN OUR OWN FACTORIES.

Write us for full details.

LOW MAINTENANCE COST LOCOMOTIVES

The life of a locomotive depends upon the care taken in manufacturing. Care in manufacturing increases profits by decreasing cost of maintenance and repairs.

From their long experience in locomotive building, our engineers have learned what is necessary to increase the life and usefulness of this class of equipment. They are qualified to co-operate with you in selecting the locomotive best suited for your work. Let them help you.

SKF Self-Aligning Ball Bearings Lengthen the Locomotive's Life

Durability is obtained because by the use of S K F Self-Aligning Ball Bearings rolling is substituted for rubbing friction.

Further—the balls and races of S K F Ball Bearings are made of Swedish Crucible Steel, which eliminates the uncertain wearing quality of plain bearings.

Specify S K F Self-Aligning Ball Bearings on your mine locomotive motor.

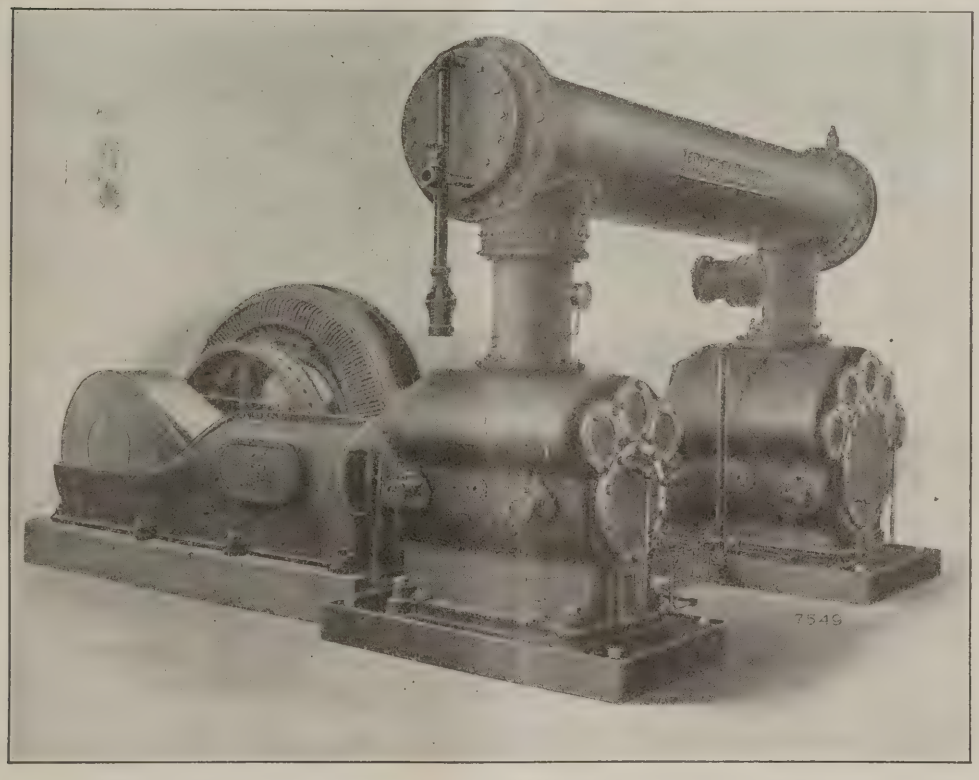
THE LEADER



AMONG AIR COMPRESSORS

SIMPLICITY EFFICIENCY INGERSOLL ROGLER ACCESSIBILITY DURABILITY

To the CLASS "PRE" INGERSOLL-ROGLER Air Compressor has been accorded this distinction by users of compressed air.

It is a direct-connected electrically driven compressor of the highest refinement of design, pre-eminent for large permanent or semi-permanent plants where the highest attainable economy is essential.

Every detail of this machine will satisfy the most exacting demands. No better design of air compressor can be purchased—No better workmanship is known.

It is the one machine to deliver compressed air at the minimum cost, combining the best all-around compressor practice, assuring years of high duty performance.

"Ingersoll-Rogler" Valves, automatic flood lubrication, enclosed dirtproof construction and automatic clearance controller are features you cannot afford to overlook.

Full information upon request.

VULCAN Hoists

No. 5—Drums

Winning Features of

Vulcan Hoist Design

THE DIAMETER and width of Vulcan drums is calculated from rope diameter, number of feet to be wound and the loads and speeds that will be encountered. The heavy cast iron shells in Vulcan drums, with their end flanges, are fitted with stiff cast iron spiders. These distribute the winding strains along the shaft, and are accurately bored and key-seated if tight, and brass-bushed if driven through a friction clutch. The arms in the spiders have generous cross-section and are placed so as to equalize rope pressure on the shell. The spiders—cast separately—are joined by fitted bolts in reamed holes to the end flanges. A study of the illustration reveals the sturdiness of Vulcan drums and other hoist parts, that together make possible the uniformly high-grade and reliable service for which Vulcan Hoists are noted. **Let us assist you with your hoist problems.**

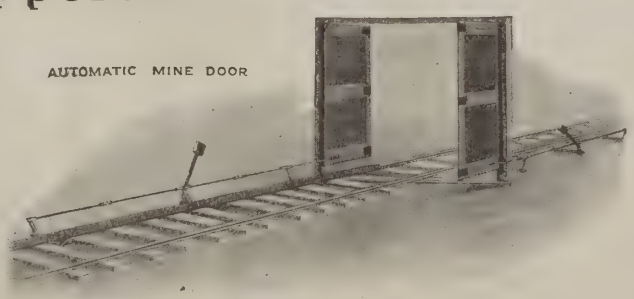
Works and Executive Offices—Boston, Mass.



2.68% of All Trappers Are Killed

in the anthracite region alone.

The AMERICAN Automatic Mine Door Prevents 100% of Such Accidents

by eliminating the trapper or door boy altogether. These doors **always** work—they never go to sleep and they never take chances—no matter what the speed of the trip.

Of interest to every mine operator who has to use doors is our special trial installation offer. In justice to yourself and your men—write for full details. Ask for the **catalog.**

The American Mine Door Company, Canton, Ohio

Provides an Even Draft

You can burn the cheapest grades of coal under your boilers if you equip them with

The Coppus Turbo-Blower

*It's Noiseless

These economical under grate blowers provide an even draft under the full grate area with a steam consumption amounting to only ½ to ¾ of that required by any other similar equipment.

The **Coppus** has replaced many other blowers. No other blower has ever replaced a **Coppus**. Write.

Coppus Engineering & Equipment Company
168 Union Street Worcester, Mass.

* Noiseless in operation by comparison with other blowers and absolutely noiseless under certain conditions.

This Coal Tipple is an example of our construction. We also design and build Coal Pockets, Washeries and Storage Plants.

The Watt Mining Car Wheel Co.
JAN 2 1914
BARNESVILLE, OHIO.

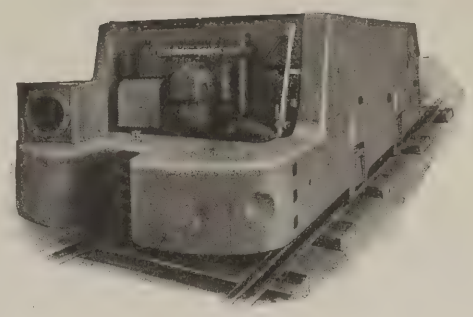
The Watt Mining Car Wheel Company,
Barnesville, Ohio.

Gentlemen:

Replying to your favor of the 29th inst., beg to say that I have been using nothing but solid steel cars for a number of years and find that they are more economical than any car that I have used.

When handled with proper care they require absolutely no repairs and so far we have not had a single car damaged so badly by wrecks or roof-falls that it could not be readily repaired in our shops.

The spring bumpers and outside bearings are very desirable features for mine cars. The spring bumpers save the cars from hard jambs, which have a tendency to shake off considerable coal and they put elasticity into a trip of cars, thereby making them easier to start and keep in motion than the solid bumper cars.



They are lighter and hold more coal than a wooden car of the same outside dimensions.

Trusting this is the information you desire, I am

Yours very truly,

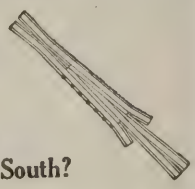
BS. Wm. Leckie

PRESIDENT.

WHITCOMB
Gasoline Mine Motors
Are a Proven Success

They have passed the experimental stage and the successful results obtained from the 150 now in use are your guarantee that they will save for you.

The saving involved varies from ½c. to 50% of the haulage cost per ton and amounts to over $3000 per year per motor in one mine.



If you are still hauling your coal by mules you are losing money—lots of it—every day.

Want proof? A card from you brings it.

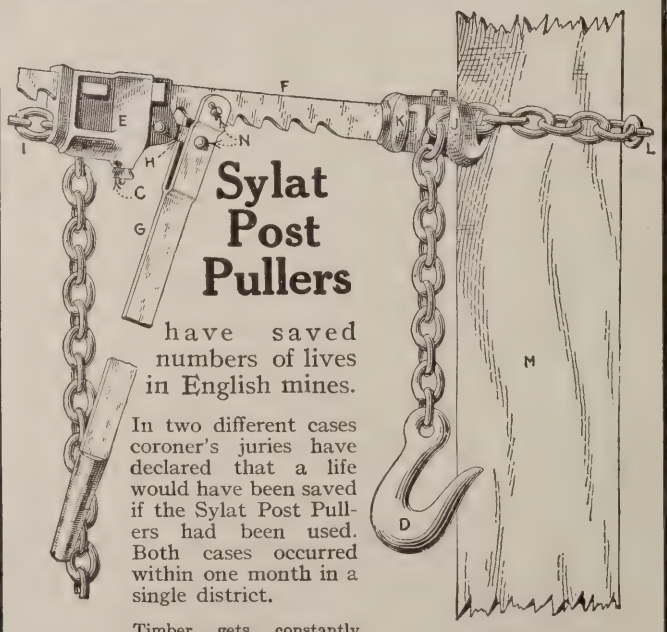
BUFF Mining Transits And Levels

The "Buff" is very difficult to purchase from a second-hand dealer. He will tell you—"None are offered me."

Send for Catalog 19.

Buff & Buff Mfg. Co., Jamaica Plains Station, Mass.



Begin the protection of metal surfaces with DIXON'S SILICA-GRAPHITE PAINT

and repainting will occur less often. **Booklet No. 59-B upon request.**

Made in Jersey City, N. J., by the Joseph Dixon Crucible Company

Established 1827

What is a Man's Life Worth?

Sylat Post Pullers

have saved numbers of lives in English mines.

In two different cases coroner's juries have declared that a life would have been saved if the Sylat Post Pullers had been used. Both cases occurred within one month in a single district.

Timber gets constantly more expensive. One Colliery Manager wrote his mine had saved cost of machine in a single day where a roadway of old posts had to be cleared.

One Month's Free Trial.

Send for Catalog.

The Sylvester Company, Parkersburg, W. Va.

The Averill Stadiagraph

Protractor, straight edge and scale combined.

It plots stadia notes mechanically, swiftly and accurately.

Reduced horizontal distance and difference in vertical height given instantly WITHOUT CALCULATION OF ANY KIND.

Results on the map in less time than taken for calculations by old methods.

Compare with other instruments designed to save time in stadia work and *note difference.*

An eminent coal mining engineer after six weeks' use writes, "It is a great time saver in the plotting of stadia notes, eliminating, as it does, the use of charts and tables, and permitting stadia 'shots' to be plotted as rapidly, or more rapidly, than they could be taken in the field."

Send for Circular CA.

The Averill Stadiagraph Co.
141 Broadway New York

Titles of the Eight Volumes in the Power Plant Library:

Practical Mathematics. (Mathematics Self Taught) by Claude Irwin Palmer.

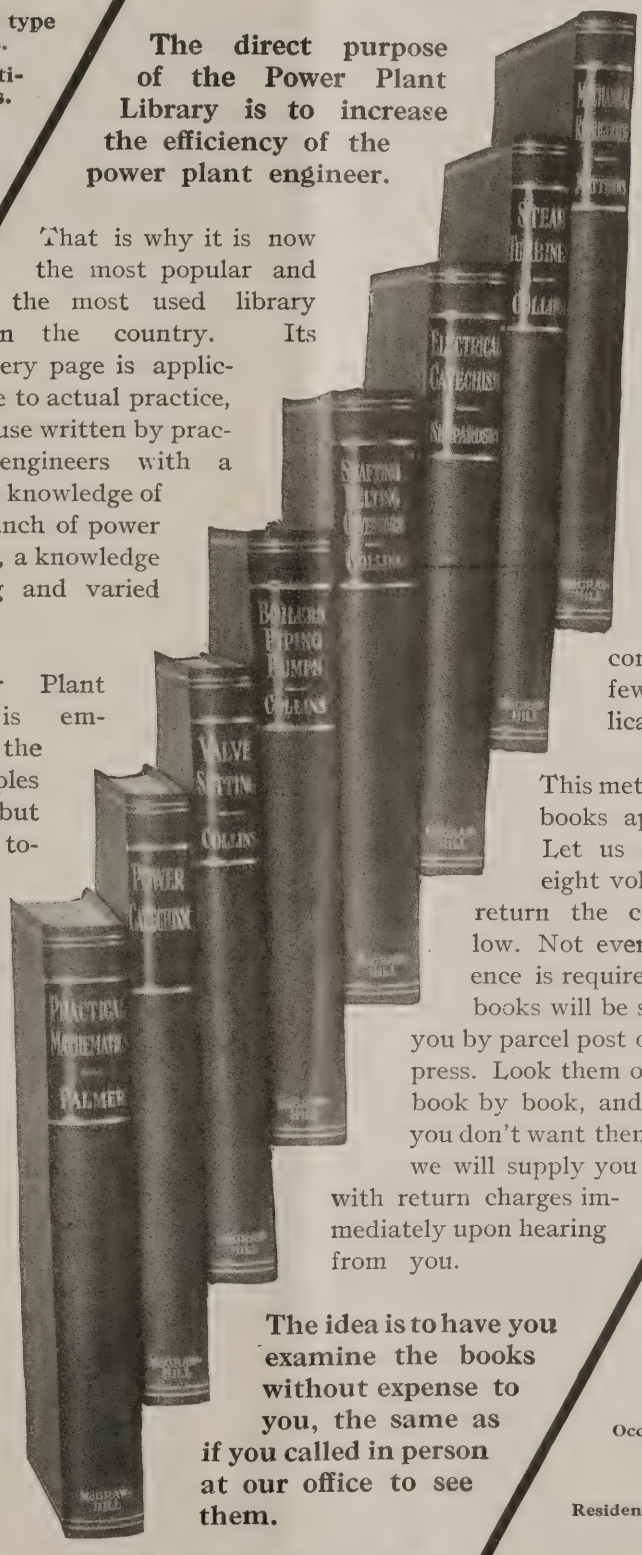
Power Catechism. (Practical Engine Running) by Fred R. Low.

Valve Setting. (Applies to every type of engine) by Hubert E. Collins.

Boilers, Piping, Pumps. (A Practical treatise) by Hubert E. Collins.

Shafting, Belting, Governors. (Taken from actual practice) by Hubert E. Collins.

Electrical Catechism. (Electricity Simplified) by George D. Shepardson.



Steam Turbines. (Practical operation of turbines and auxiliaries) by Hubert E. Collins.

Mechanical Refrigeration. (Ice making and cold storage) by Fred E. Matthews.

Are You Efficient?

The direct purpose of the Power Plant Library is to increase the efficiency of the power plant engineer.

That is why it is now the most popular and the most used library in the country. Its every page is applicable to actual practice, because written by practical engineers with a working knowledge of every branch of power plant work, a knowledge born of long and varied experience.

In the Power Plant Library there is embodied not only the rudiments and principles of approved practice, but its general trend is toward advancement for its readers. Its pages are veritably thronged with the very nucleus of power plant efficiency.

You cannot well afford to neglect such an important matter as your personal efficiency. It means everything to you. It means dollars and cents, independence or stagnation. If there is a trace of doubt in your mind as to your personal efficiency it will pay you to investigate the Power Plant Library at once.

Our method of selling the Power Plant Library is approved by engineers everywhere. We ship the eight volumes before even a deposit is made and allow ten days for examination, and twelve months to pay if you are satisfied.

This method of selling the books, and the fact that they have met the requirements of the most exacting, accounts for the exhaustion of two complete printings in a few months after publication.

This method of selling the books applies to you. Let us send you the eight volumes. Just return the coupon below. Not even a reference is required. The books will be sent to you by parcel post or express. Look them over, book by book, and if you don't want them we will supply you with return charges immediately upon hearing from you.

The idea is to have you examine the books without expense to you, the same as if you called in person at our office to see them.

McGraw-Hill Book Co., Inc., 239 W. 39th St., New York

Gentlemen—Ship to me, charges paid, your new Power Plant Library, eight volumes, price $12.00. If satisfactory after examination, I will send $1.00 in ten days and $1.00 per month until paid. If not wanted, I will write for shipping instructions.

PERFORATED METALS
Of every description

Perforated Steel Screen Plates

For Coal and Coke, Crushed Stone, Phosphate Rock, Gravel, Sand, etc.

With perforations round, square or oblong of any size to ten inches in diameter and from No. 10 U.S.S. Gauge to ½ inch thick, according to the size of holes.

The Plates are made flat for shaking screens, rolled to radius for cylindrical, or cut into sectors for conical screens, and made for either lap or butt joints with bolt holes as required.

For Bituminous Coal Screens, Coal and Ore Washing Plants, etc., the variation in diameters of round sizes is about as follows: from 1-16″ to ⅜″ dia. by 32nds; ⅜″ to ¾″ by 16ths; ¾″ to 1½″ by ⅛ths; 1½″ to 4″ by ¼ths; and 4″ to 10″ by ½ inches, with many intervening sizes, all standard centers—and the same in a measure with oblongs and squares.

Variations in thickness of metal run from No. 18 U.S.S. Gauge (1-20th in.) to one-half inch, according to size of holes.

Manganese Bronze Screens for Sulphurous Mine Waters.

Three Grades of Rust Armor

What is the cost of corrosion?

You know that millions of parasites swarm in acid and alkaline water, damp earth and in the air, eating metal. The damage, you will admit, is countless thousands yearly.

Now figure the value of a shield for metal that prevents this destruction.

Highland Non-Corrosive Coating has already saved mines from wreck and ruin. It has prolonged the life of concrete and structural surfaces, as well as pipe lines, from 10 to 50 times.

This shield comes in three grades to meet all conditions. It may be applied, inside and out, to pipes by dipping the latter in it. Or it may be applied like paint on large surfaces.

Grade No. 1 is a highly efficient protection for surfaces exposed to weather, coke-smoke or other chemical gases.

Grade No. 2 is made specialiy for mine piping or metal similarly exposed to water, acids and damp earth underground.

Grade No. 3 is a cheap coating for weather-exposed surfaces for which the first two grades are not urgently required.

Use of this coating will without fail save you from an enormous expense.

Write to our mining department for free trial offer.

When People Want To Find A Telephone Number

they naturally look in the 'phone book—when they want to find who makes machinery or equipment for coal mines they naturally look in the Classified Directory. There's a proper place to find everything and that is the place for things used at mines.

STEEL MINE TIES
CAR HAULS
CAR RETARDERS
SELF OILING WHEELS

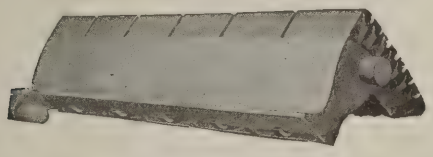
FAIRMONT
COAL MINE EQUIPMENT

POWER COAL AUGERS
BOX CAR LOADERS
PORTABLE MINE PUMPS
MINE FANS

Eliminates Spilling and Saves Labor

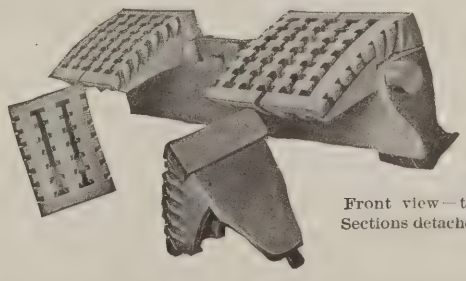
Irrespective of weather, slippery tracks or bad brakes, the

FAIRMONT Railroad Car Retarder



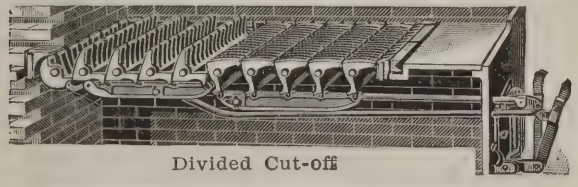
gives the dumper on the tipple com plete control of the cars to be loaded.
Easy to install and operate. Effects saving in labor, often enabling owners to dispense with the services of one man.
Feeds the cars regularly and prevents spilling of coal over tracks. Soon pays for itself.

Write for Bulletin.

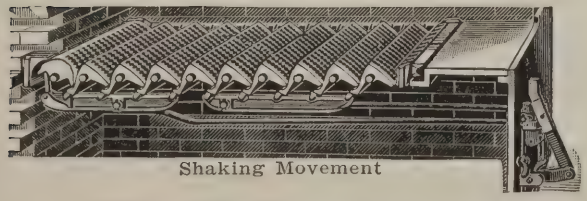


Fairmont Mining Machinery Co., Fairmont. W. Va.

How About Grate Repair Costs At The Mine?



Back view of McClave Removable Sectional - Top Grate Bar No. 2



Front view—two Sections detached

McClave Grate No 2

They are probably running high. But by use of this Removable Sectional Top Bar you can reduce them to a minimum. The removable tops fit down securely on each bar, protecting the body from burning or breakage, and any section can be lifted off at any time and a new one substituted at trifling expense. An enormous cutter of repair costs in grate bars undergoing severe usage.

Divided Cut-off

Shaking Movement

The McClave Grates

McCLAVE GRATES
AND
ARGAND BLOWERS

Make a complete combustion System for burning low-grade fuels. Investigation of these will pay you. You can use up ordinarily considered "waste" fuels at the mine plant and sell all your high grade fuel.

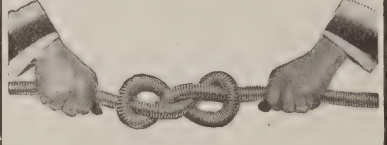
Facts About "National" Pipe That Every Coal Operator Should Know



The first of a series under this heading will be published in a two-page announcement to appear in the July 4th issue of Coal Age. Be sure to read the first number!

NATIONAL TUBE COMPANY, Pittsburgh, Pa.

The Master Hose

You Just Can't Kink It

Why?—Bend it. See how it flies back sharp and true. Stand on it. Drop tools on it. Abuse it. Pull it around rough corners. Yank it over jagged surfaces.

You just *can't* kink it. You just can't wear it out. You must do something mighty unusual before anything happens.

That's Kantkink Hose. Made by the Goodyear Company. They call it the Master Hose.

Use it for any pressure. It laughs at a pressure of 1,000 lbs. to the square inch.

The oil-resisting tube and cover of the all-air hose protects it. Vaporized oil from compressors can't affect it.

GOODYEAR AKRON, OHIO
KANTKINK HOSE

Special tube compounds for steam and water purposes. Best duck and rubber throughout.

Armor wires of high carbon steel. The standard of manufacture — "Goodyear."

Where it is Master

In the mine, quarry, boiler room, round-house, shaft, tunnel, machine shop. Use it for compressed air, gas, water or steam.

No Distortion

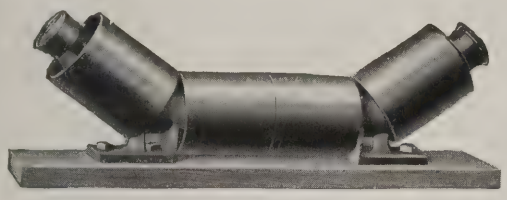
Won't elongate. Won't get out of shape through expansion and contraction.

Use Goodyear Efficiency Service

Let Goodyear help you solve your hose problems. The Goodyear Efficiency Bureau is at your service. Costs nothing to ask questions. No obligation. Write today—NOW.

The Goodyear Tire & Rubber Company

Hose Dept., AKRON, OHIO



Toronto, Canada **London, England** **Mexico City, Mexico**

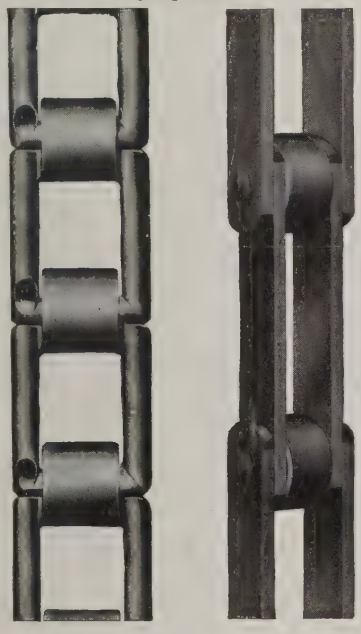
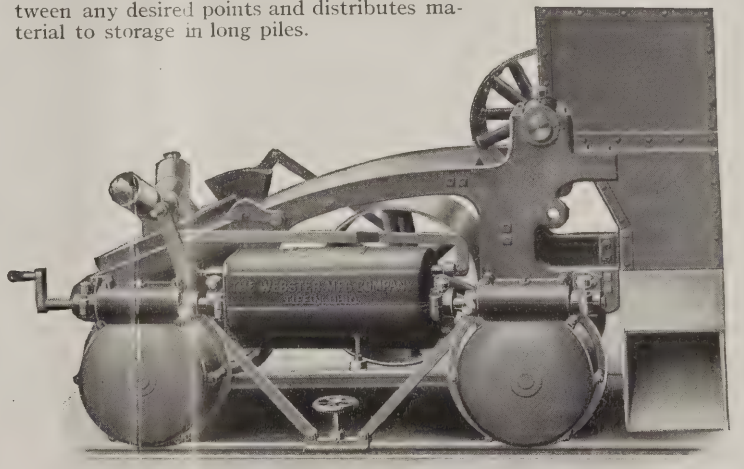
STAND-UP-TO-IT-IVENESS

Is an element of prime importance in equipment for Handling Coal—at Mine, Yard or Dock

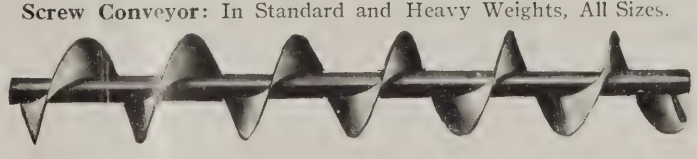


Our manufacturing formulas all include large percentages of this essential ingredient—and that's just one reason why you buy our machinery to get best possible service through the longest period of time.



For Belt Conveyors: Improved Troughing Rolls and our Automatic Tripper, which travels back and forth between any desired points and distributes material to storage in long piles.

Chains: All types and sizes, for all purposes.



The Perkins Pivoted Bucket Carrier: Best known device for handling coal and ashes in the power house.

Elevator Buckets: In Malleable Iron or Sheet Steel. All Patterns.

Screw Conveyor: In Standard and Heavy Weights, All Sizes.

LINK-BELT

It's Service, Not Price, That Tells in Buying Conveyors

For twenty-five years and more, we have recommended, manufactured and installed large numbers of Belt Conveyors for uses to which they were best adapted; and from our long experience, manufacturing facilities, design of equipment and quality of belts has resulted the same superority that has always characterized our other products.

Service Brand Conveyor Belts for Dependability

in handling all classes of material. Belts should be purchased of a Company that has had experience in their use, and a reputation for maintaining the *quality* of its product.

Our catalog No. 79 gives some interesting facts about Belt Conveyors.

The Peck Overlapping Pivoted Bucket Carrier

The Most Durable Conveyor for Ore, Stone, Gravel and similar materials.

The recognized Standard Conveyor for coal and ashes in the modern power house.

Our Catalog No. 120 not only illustrates a wide range of Peck Carrier installations but gives the reasons for its superiority over all other types.
